## G O B

Cobboobro (Pietro Paolo Cortonese, fo called), a celebrated painter of fruit and landfcapes, was born at Cortona in 1580, and learned the principles of defign from his father; but was afterwards the difciple of one Ciefentio at Rome, and perfected liimfelf in the mofleflential parts of his profeffion, by Itudying after nature, with judgment and accuracy. His merit foon recommended him to the notice and efleem of the molt able judges at Rome; and as he excelled equally in painting fruit and landfcape, he found a generous patron in cardinal Borghefe, who employed him to adorn his palace. The fruit which be painted had fo true and expreflive an imitation of nature, that nothing could polfibly be more exact; and by his thorough knowledge of the chiaro-fcuro, he gave an extraordinary roundnefs and relief to every object. But his greatef excellence conlifted in his colouring; for in defign he was not remarkably fuperior to others. He died in 1640 .

GOBELIN (Giles), a famous French dyer, in the reign of Francis I. difcovered a method of dying a beautifil fcarlet, and his name has been given ever fince to tlie fineit French fcarlets. His houfe, in the iuburb of St Marcel at Paris, and the river be made ufe of, are thill callid the Gobelins. An academy for drawing, and a manufactory of fine tapeftries, were crected in this quarter in 1666; for which reafon the tapeltries are called the Gobelins.

GOBIUS, in ichthyology, a genus of fithes belonging to the order of thoracici. They have two holes between the eyes, four rays in the membrane of the gills, and the belly-fins are united in an oval form. There are eight fpccies, principally dillinguithed by the number of rays in their fins.

GOBLET, or Gobelet, a kind of drinking cup, or bowl, ordinarily of a round figure, and without either foot or handle. The word is French, gobeld; which salmafius, and others, derive from the barbarous Latin cupa. Buctus deduces it from the Greck xutandow, a fort of cup.

GO1), one of the many names of the Suprome Being. See Christanity, Metaphysics, Moral Philosophy, and Theology.

Gon is alfo ufed in fpeaking of the falfe deities of the leathens, many of which werc only creatures to which divine honours and worfhip were fuperflitioully paid.

The Greeks and Latine, it is obfervable, did not mean by the name God, an all-perfect being, whercof eternity, infinity, omniprefence, $\& \in$, were effential at-

Vol. VILL. 「art L .

tributes: with them, the word only inplied an excel- God. lent and fuperior nature ; and accordingly they give the appellation gods to all beings of a rank or clafs higher and more perfect than that of men; and efpecially to thofe who were inferior agents in the divine adminillation, all fubject to the one Supreme. Thus men themfelves, according to their fyitem, might become gods after death ; inafmuch as their fouls might attain to a degree of excellcnce fuperior to what they were capable of in life.

The firlt divines, father Boffu obferves, were the poets : the two functions, though now feparated, were originally combined ; or, rather, were one and the fame thing.

Now the great variery of attributes in God, that is, the number of relations, capacities, and circumitances, wherein they had occation to confider him, put thefe poets, \&c. under a neceffity of making a partition, and of feparating the divine atruibutes into feveral perfons; bccaufe the weaknefs of the human mind could not conceive fo much power and action in the fimplicity of one fingle divine nature. Thus the omnipotence of God came to be reprefented under the perfon and appellation of Jupiter; the wifdom of God, under that of Minerva ; the jultiee of God, under that of Juso.

The firt idols or falfe gods that are faid to have been adored, were the itars, fun, moon, \&c. on account of the light, hear, and other beneits, which we derive from them. Afterwards the earth came to be deifed, for furnilhing fruits neceflary fir the fubfiftence of men and animals ; then fire and water became objects of divine worlhip, for their ufefulnefs to liuman life. In procefs of time, and by degrees, gods became multiplied to infinity; and there was fcarce any thing but the weaknefs or caprice of fome devotee or other elevated into the rank of deity; things ufelefs or even deftructive not excepted. See Mythology.

GODALMING, a town of England, in the county of Surry, on the river Wey, 35 miles from London. It is a corporation: by whofe charter their chief magiltate is a warden chofen yearly, who has 8 brethren his alfiltants. The parifh is divided into 9 tithings. Its river abounds with good fifh; and drives a griltmill, two paper-mills, and three corn-mills; over which river a new bridge was begun July 22d 1783. Here is a manufactory of mixed and blue kerfeys, alfo a manufactury of ftockings; and the place is alfo famous for liquorice, and itore of peat that burns better than pit-coal: but a woman of this town (Mary Tofts) in 1726 endeavoured to render it infamous, by a pretend-

Lincoln, the vifitor. 'The only entire part is finall, formerly a private chapel. Not many years fince a thone coffin, faid to have been Rofamond's, who perhaps was removed from the church to this place, was to be feen here. 'The building has been put to variuus ufes, and at prefent ferves occalionally for a table.

GOIDWIN (Francis), fuccelfively tifhop of I andaff and Herefurd, was born in 1567 . He was eminent for his leaning aud abilitie's; being a good mathematiciun, an excellent philufopher, a pure Latinit, and an aceurate liftorian. He underftood the true theory of the moon's mution a century before it was generally known. He firit farted thofe hints afterwards ynarfued by Billop Wilkins, in his "Secret and fwift meffenger;" and publithed "A catalogue of the lives of Laylith bilhops." He has neverthelefs beenaccufed as agreat fimoniac, for omitting no opportunity of difpoling of preferments in order to provide fur his children. He died in 1648 .

Godwn (Thomas), a learned Englifh writer born in 1517, was matter of the free-fichool at $A$ bington in Bukfhire; where he educated a great many : wuths, who became eminent both in church and flate. His works flow him to have been a man of great learning : fuch as, Hiforia Romane arithologia, Synopfis antiquitatam Hebraicarum, Mofes E Aaron, Florilegium Plaghcon, sic. He died in' 1642 .

Goduls, or Goodruin Sunds, famous fand-banks off the coalt of Kent, lying between the N . and S . Foreland; and as they run pardllel with the coalt for three leagues tugether, at about two leagues and a half diftant from it, they add to the fecuity of that capacious road, the Downs: for white the land fhecters Alips with the wind from fouth-w if to north-wett only, thefe fands break all the foree of the fea when the wind is at eall fouth-eafl. 'I'he moft dangerous wind, when blowing hard on the Downs, is the fouth fumth-weft. Thefe fands occupy the fpace that was formerly a large tract of low ground belonging to Godwen earl of Kent, father of King Harold; and which leeing afterward given to the monattery of St Augultin at Canterbuy, the abbut neglecting to keep in repair the wall that defended it from the fea, the whule tract was drowned, according to Salmon, in the year 110 , leaving thefe fands, upon which fo many thips have fuce been wrecked.

GODWIT, in orinthelugy. Sce Scolopax.
GOG and Magog, two names generally joined together in frripture, (Ezek. xxxviii. 2. 3. \&c. xxxix. 1,2, \&c. Rev. xx. 8.) Mufes fpeaks of Magog the fon of Japhet, but fays nothing of Gug, (Gen. x. 2 . 1. Chro i. 5.) Gog was prince of Magog, according to Ezekich. Mayog fignifies the country or leople, and Gog the king of that country. The generality of the ancients made Magog the father of the Scythians and Tartars; and feveralinterpreters difcovered nany footfeps of their name in the proviaces of Great Tartary. Others have teen of opinion that the Perlians were the defeendants of Magog; and fome have imagined that the Goths vere defecinded from Gog and Magog ; and that the wars deferibed by Ezekiel, and undertaken by Gog againft the limints, ate no other than thofe which the Goths carried on in the fifth age againft the Roman empire.

Bochart has placed Gug in the neighemarhood of Caucafus. He derives the nawn of this celebrated

Vol. Vill. Part I.

3 ] G O L
mountain frum the Hebrew Goz chafan, "the fortref, of Gog." Ife maintains that Prometheus, faid to be chained to Caucalus by Jupiter, is Gug, and no other. I'sere is a province in lberia called the Gogarene.

Latly, the gencrality believe, that Gog and Mdgog, mentioned in Ezekid and the Revelations, ate to be taken in an allegorical fenfe, for fuch prinees as were enemies to the church and faints. Thus many by Gog i. Eackichunderland Antochus Epiphanes, the perfecutor of thefe Jews wha were firm to their religion; and by the perion of the fame name in the Revelations, they fuppofe Aritichrift to be meant ; the great cnemy of the charch and faithful. Some have endeavoured to prove that Gog, ipoken of in Kexhicl, and Camby fes hing of l'eria, were one and the fana perfon ; and that Gog and Magrog in the Revelations denote all the chemics of the church, who thould be ferfecutors of to the confunmation ot ages.

GOGCLES, in furgery, are intruments wed for curing dquinting, or that diturtion of the eyes which occainons this ciforder. They ate thort conical tubes, compoied of ivory flained hack, with a thin plate of the fame ivory fixed in the tubes near their anterios extremities. Through the centre of each of thefe plates is a finall circular hule, about the fize of the pho pil of the eye, for the tranfmiffion of the rays of lighti. 1 hefe groggles mata be continually worn in the caytime, tifit the wuftes of the cye are brought to att regulatly and uniturmly, fo as to direet the pupil itraight forwards ; and by thefe neans the cure will be fuvict or later ctivesed.

GOGMAGOG-Halls, are hills fo callech, three miles foom Cambridge, remarkable for the intrenchments and other works caft up there: whence fome fuppofe it was a Ruman camp; and others, that it was the work of the Danes.

GOGUET (Antony-Y̌ves), a French writer, and author of a celebrated work, intited, L'Origine des Loix, des Arts, des Sciences, E de laur Progres cher les ancicns Peaples, 1758 , 3 vols. 4 to. His father was an advocate, and he was born at Paris in 1716. He was very unprominng as to ahilities, and rech oned even dull in his early years; but his underftanding deweloping iffelf, he applied to letters, and at lengtha pronuced the abuve work. 'The reputation he gained by it was great : but lee enjoyed it a very fhort tine, dying the fame year of the fanall pox ; which difurder, it feems, he always dreaded. It is remarkable, that Conrad Fugere, to whom he left his library and his Miss, was fo deeply affeged with the death of his frieted, as to die himfelf three days after him. The abuve nork las been tranfated into Euglifh, and publifhed in 3 vols. 8 vo.

GOLCONDA, a kingdum of Afia, in the peninfula on this fide the Ganges. It is bounded on the north by that of Orixa, on the welt by that of laalagate, on the fouth by Bifnagar, and on the ealt by the gulph of Bengal. It abounds in corn, rice, and cattle; but that which renders it moft remarkable are the diamond-mines, they being the moft confiderable in the world: they are ufually purchaid of the black merchants, who buy parcels of ground to fearel for thefe precious itones in. They fenetimes fail in meeting with any, and in others they find immenfe riches. They have alfo mines of falt, fine iron for fword-blades, and curious callicoes and chiutzes. It

(ioli), the mot valable of all the metals, is of a Briche yellove coloter whe pure, but heomes inme or wo whte in propurtion as it is alluged with other me-

It is the beavio st of all known bexkes, platim? mate ececeped, its fpecifice gravity beniog to that of diAblid water at 10 fito to 1000 . It molts in a bow White heat; requing aceording to Mr Wedrewood's alculation, $3: 37$ degrees of Fatrenhatits, or 32 of his owa, thememecer for is , fution: a heat greatly fupedior to that whin mede-fitver or copper; the former requitint only 4717 , and the latter 450 of Eahrenheit. Other metallargite, however, have differed, and atfert that enperer requiree for its fuion a greater degree of wat then erher gold or fiber.

Gold :; by far the mont tough and ductile, as well as the moft madeable, of all metals. According to Gruntedt, one crain of it may be itretched out fo as to aner ox Swedith dh, cqual to 63.66 Englifl yards afiler wire: but Wathins aferte, that a grain of -old mas loe fletched in fuch a manatr as to cover 500 Thi of wirc. At any rate, the extemon is probicinus; fir, acording th the teat of the fe calcutations, the mit!outh part of a grain of guld may be made vilibe to the naked ere. Nor is it mealteability inferior to its ductility. Doyle, qunta! by Apligny in his Trutife of Cohors, fays, that one grain and an hali of gold nay be heaten into 5 leaves of one inch fquare, which, it interfected by parallil liens drawn at right angles to each other, and dit monty the roodth part of an inch from each other, will proluce 25 millions of litte iquares, each very cafly dificenible by the naked eye. Mr Magellan tells us, that its furfaee may be extended by the hammer 159292 times. " 1 am informed (fays he) by an intellifent gold-beater in England, that the tincte gold leat is that made in new hiens, and radt hase an ämy of three stams of copper th the
 pati, over the irregulatiaies of the thins. He attirms, that qo books, of 200 toaks of goid, each meatuing 3.3 fequre inches, wh exch leaf comaining 10.84 ig pare inclues, wigh lefs than 3 reterins. Each book, therefore, or 25 haves, $=2-2.23$ inclice. weighs! $\mathrm{t}_{\mathrm{s}}$ Lan r. 8 grain ; fo that each grain of the nictal win Fowe 56.71 iquare inches." Form further calcu. Fonn it ma, be nate to appear, that the the oncis of the leaven is lefs than sfots then an inch; and that
 vie eq alat in ieng th to the whate corcuraierence of the s.

Gold : more chatic than lead or tir. lmat lefs fo than irve, or eacen copper. It grow, hard and britele by hammerins, but refuncs its ductitity on being thowly hacted. Gohl haf ahhits a fine grean colour on ining interpuled butwen the cye and the leanss of the fun or ang vether lumisums hody. Whea copoiedfor fome time to a thons he at, it becones ipmited, mat lat melts, aftuming at the fince time a tine bluith-green colour ; and, when coll, crytallizes into qualritateral pgramids. Thi, Lluilagrein culour, aceurding to Mr
the metal is interpoled betwixt the cye and the lumirous boty, isowing to tranfinted light. "The green lifhe (hay lic) in tranfinted in buth cales, lince all reflected colemis are producel by the tranimifion of lifht, as the inceniou; phofoopher Mr Delaval has intely diforered and demonftrated in lis very clabo. rate treatile on this fubject, inferted in the fecond volume of the acenoirs puhlified in 1785 by the PhiloSophical Socicty of Manchefter." Sir Ifacac Newton, in his Optics (page 162 , edition of $\mathbf{1 7 3 0}$ ), accounts for that phichomenon, faying, that "gold foliated, and hell between the eyes and the light, looks of a greenilh blue; and therefore (fays he) mafly gold lets into its body the blue rays to be refleted to and fro within it, till they be dopped and iliffed; while it reflects the vellow outwards, and therefore looks yellow:" It is therefore, in the two above cales, that fome of the blue rays are tranfmited along with the yellow ones; and Eoth :ogceber appear of a bluinh-green. If gold be esfurded to the juined rays of light, excepting only the yelow ones, which we fuppofe topped after they were fepared by a prim, it only looks white like filver; "which nows (fays Sir liaac Newton) that its yctlownefs arifes from the excefs of intercepted rays tinging that whitenefs with their colour when they are let to pars. It is a pleafingoblervation to look with a deep magnificr on varions pieces of gold, filver, and Dutch (copper) leaves between the eycand the funthine. The particles of fiker are feen in the form of obloag dark lumps, with fome inteftices, like net-work, between them: thofe of the copper leaf are more monerous and more regulaily diftrihuted; but the particles of the goldleaf appear like litele green femitranfparent and limilar particles, aniting between themfelves by nearly diaphanous juints, as if they were fored to saten in their edires, rather than they would break their mutual cohelion with one another."

Goid is more generally found native tha any other metal; though Bergman informs us, that lue does not know an inttance of its crer heing found perfeaty fre of alloy. Kirwan fiys it is feldom found fo ; being generally alloyed with tiver, copper, or iron, and fometimes with all the thate. According to Wallerins, native rehl is found, i. In folid maffes, in Hungary, Tratyheenia, and Peru. 2. In grains in the Spanifh Weal Indies. 3. Jna vegetable fornt, like the branches or twifs of phats. f. In a drafic figure, as if compofed of groupg or clallers of fmall particles united together, found in Hungary. 5. Compofed of thin plates, or thin pullicles, conering other lodies, fomd in Siberia. 6. In a crytalline form in Ilungary.

The fame author informs us, that gold, in its reguline itate, is furmed cither into angular crytals compuicd of yellow actacdrons, or into yellow irregular inafte, whith thew a gratulike texturc. Brunnich fuys, that the native gold foumt in leaves is always crytallized on the firface; and with a magnifier they nay be fien of a triangular py ramidal form. He inform, ns aho, that in Trantylvania he procured a fpecinoll of cubic native gold, but never faw it any where clie.

Goht is alfo found in the form of thick folid pieces. It is in general more frequantly imbedded in quarta, and mised with it, than with any other fone; and the quartz in which the gold is found in the Hun-
garia!

## G O L

chid
garian mines, Mr Magellan tell us, is of a pecu-
liar mild appearance. Sometimes, however, it is found in limeftone, or in hornblende, Sic.

Europe is principally fupplied with gold from Chili and Peru in South America. A fall quantity is likewife imported from China and the coalt of Africa. The principal gold mines of Europe are thofe of Hungary, and next to them the mines of Saltzburg. The mines of Adelfors in Smoland are likewife wurked to advantage; and the veins of meial appear to be diffuled over a great tract of land. Some gold from four to feven grains in the mark is alfo faid to be extracted from the filver of the mines of Oterilvarberget in the province of Dalarne. Native gold has allo been found in Lapla:d above Tornea, and in Weft. manland. In Peru it is fonnd mixed with a itony matter not well known, from which it is extracted by andigamation. Ar Pallas mentions three gold mines that are worked there, near the river Prchma, in which 500 men are employed. The metal is found in a powdery form, and alfo in thin plates or leaves. Sumetimes kernels or lumps of a fpongy texture, and very light, are met with which contain a good quantity of gold-dut. 'This gold-duft or wath gold is nfually wafhed out of fands whetein it lies in the form of loofe grains or lumps. It is dittinguithed by the rarivuny coloured fubtances wherewith it is mixed. The metal is alfo found feparate from any matrix in lumps or vifible grains mixed with fands. Thus it is met with in many rivers of Europe as well as the other quarters of the world. It is alfo vifibly difperfed through mafles of fand, particulaly fuch as is of a yellowih.red or violet coluar; and in this ftate it is fo univerfally diffufed through every kind of earth, that Mr Bergman thinks it the molt common of all the metals, iron alone excepted. If 100 pounds of fand contain 24 grains of gold, the feparation is faid to be worth attending to. In Africa 5 pounds of fand often yield $\sigma_{3}$ grains of gold, or evtn more; and the heavieft fand, which is often black or red, contains the moft. In Hungary, however, only 10 or 12 grains of gold are contained in 10,000 pounds of fand; and even this trifing quantity has been extracted, though with lofs.

Gold is brought down with moft of the large rivers; even thofe which do not take their rife in mountains where gold is found. In Tranfylvania the river of A vanyos affords fublitence to upwards of 700 Gip fey families, who collect the gold from it. In Brafil it is found in fuch abundance, that the ir torrents are often turned with great labour and expence into new beds, in order to gather the gold there depofited by the rumning waters. - I: is aifo found there mingled with the earth in various fisapes and forms.It is likewife faid to be fometimes found in veins running through beds of coals.

Gold is faid to be mineralized, when it is mixed with fome other fubRauce in fuch a manner as nut to be acted upon by aqua regia. In this manner gold is mineralized.

1. By Sulphur. Many have inlifed, that as gold and fulphur are not found to have any chemical attraction for one another, it is impolible that marcalite can contain any of the metal, or indeed that it can be found in any ore containing fulphur: but face we

5 ] G O L
know by experience, that gold can be melted out of thefe ores, even after they have been digefted in aqua regia, and that grold lilewife enters into their fulphesrated regulus, there is the greateft reafon to believe, that fome third fubttance, probubly a metal, has by its admisture enabled the fulphur to unite with a certain quanticy of gold. Marcafites, however, contain, at any rate, onls a finall quantity of the precious metal ; and none is tu be expected from rhem in places where no guld is in the weighburthoud. "I am not parfectly clear (fays Cromtedt) whether the gold is really diffotved and indurated, or, if I may fo exprefs my felf, witrifed in the fibiris; providud, by this mineral body, we mean a garnet fubtunce. But I have foen a piece of what is called /bir/, whofe texture was exactly like the Schemnitz blende; and in this cale it might perhaps hold the fame contents."
2. With Sul/bur by moans of Iron: Colden pyrites, or ma:cafitical gold-ore. This is a clole and compact fubftance of a bright yellow colour. Here the gold is faid to be mineralized by fulphur by means of iron, becaufe it camot be extracted by aqua regia or by amalgamation. A kind of gold pyrites is found at Adelfors in the province of Smoland, which contains an ounce or lefs of gold in an hundred weight of the ore. The Tranfylvania gold pyrites, according to Brunnich, in which no gold can be perveived by the naked eye, contain from 50 to 100 and 110 ounces and upwards in an hundred weight. Thofe where the gold appears in the pyrites like flrewed Spanih frutf, hold 250 ounces, but they are very fearce. The mountain of lraczebaya, near Zalathna, is remarkable for its gold pyrites; and here they feem alfo to contain feminetallic parts.
The following is M. Magellan's method of account. ing fur the union of gold with this kind of pyrites. "It is well known, that gold may be diffolved by liver of fulphur. The procefs given for this perpofe by M. Apligny, p. 156 of his Treatife on Colours, is as follows. Reduce to powder four pounds of vegetable alkali (falt of tartar), and as many of fulphur, with one of leaves of gold. Melt the mixture in a crucible with its cover; pour the fufed matter out on a marble ftone ; pound it again when culd, and put the whole in a matrefs uith hoi water; which being filtrated is of a greenilh yellow coloar, containing the gold difolved. Now, as we know that lapor fulpbaris has been funtad in feveral pyrites, and Malcagui fays that he foad it in thofe lagoons near Sienna in ltaly; is it not very natural to conclude, that this noble metal may be really mineralized in the auriferons pyrites?"
3. Aurifercus Ciunabar, in which the metal is mineralized by means of quickfilver, faid to be foend in Hungary. Mr Sage fpeaks of a foceimen of gold from Hungary, now in the French king's catinet a: Paris, which is cryllallized into quadrangular pifims of a grey-yellowih colour and a brittle confiftency, which he fuppofes to be the refult of a mercurial amalgam of native gold
4. The Schemnitz Blende, in which the gold is mineralized by means of zinc and iron. Cronitedt informs us, that the ores of zine at Schemnitz in Hungary contain a great deal of filver, and that this filver is very rich in gold. Poffflor Brunnich enumerates the following varietie of this ore. 1. Where the metal
is maneralised lye means of a coblic lead-ore, containing Gifer found in the in tes of Miehaeli and fone places in Tranfylvania. 2. Le: a copper pyrites with Galver. This kind of ore is eaticel suf in Imngary: it has a compace furface of a pale shlow colour: but mut not for that scaton be confounded with the auriferous bsites. s. Whe Cremmitu-ores in which the metal is wimeralized by means of red gilder ore. 4. By nocans of antimony, in which it fometimes appears. [hens kind is foums at the foot of the Carpathian mawndins. 5 . By cubic lcal-ore, iron, and fone unbuwn whatile parts. 'This ore, as deferibed by Sco-
 nationed whath like an iron-glimmer, with a degree of staibility. "the vein is guart\%, which is fometimes hous, and the metal featered very minutely in it. It is found in Tranfslanian 6. Native gold, with blackload (wi molybdana), has been fonnd near Rimezemhat in Upper Hunfary ; but our author (Profetion Eramich) las not had any opportunity of examming whether it is minemalised by it or not. ln all the above foceies, the grok is tither entinty mative, but lis minusty divisued, and fo lookely Satcord, that it - an only be fech through minoleopes, and often cannot be lien at all before it is Ceparated by various procollos: wit itad wot be in the fom of native goin? hut the netul an it wetc bin embryos; in which cafe tire is neceflay tobring the comtlituent parts together, and in add thole that are wanting ; in that cale likewte it is never withont hiler.
" Po thefe (lays Dr Magellan) nray be aded the fullowing ores. 1. Gold, with arlinical pyrites, is foond affu at Saltoberg in "Yyol, in momatans of quart/ and fehillus. It contains only 25 gana in the quintal; nevothelefs it affurds a protit of L. 500 per ammon. 2. With a white, red, ur vitreous hiver-ore, near Cremitz and Schomote ia Hungary. 3. With a Palphurated ore of filver, ion, lead, and mangane at Nutgay in Trumflrama. Its focetice gravity is - +3, anel it is had to atford 10 mances per quintal. a. Winh tuphurated iron, copper, and manganeic, at入axya."

of part of the glafs. Time did not permit him to vi. trify a quantity of gold entirely. He oblerves, that be reduced wi:h combuatible matters, in order to juf. tify the aflertion that it is the calx of that perfect me. tall, which would eridently appear to be the cale if it became revired into gold. But bowever this may be, Mr Fourcroy is of opinion that this otight to be confidered as a true vitrilied calx of gold; and this with the greater probability, as in many operations with this metal the purple colour is conltantly produced, and many preparations of gold are employed to give that colour to enamel and porcelain. "Gold (fays he) is therefore calcinable like the other metals; and only requires, as likenife dues filver, a flronger heat, and a longer time to unite with the bate of air than sther metallic fubtances." Mr Kirwan, on the other hand, tells us, that "gosd expoled to the utmolt heat of Mr Parker's lens for lume lours, loft no fenrible part of its weight ; yat, when in contact with earthy matters, it communicated a blue or purplifh tinge to them: fo that le believes an caceedng fmall portion of it might be dephlogiticated.'

This experment with the" lens of Mr I'star does not invaidate that of Maçuer : for either 'I'rudaine's lens may be more yowerful than Mr Parker"; or the air in France being more clear than in England, the attion of the fun mult be Atronger. We are alfured, however, that by means of the electric fire gold may be inltantancodly calcined and even vitritied: whence we mult conclude, not only that gold is realiy calcinable, but that the electric fire is at. molt intinitely more powerful than any other ; as by its means we may in a moment accumplifh what either cannot be done otherwife at all, or very imperfectiy, even by the fiercett fire we can raife. The thane of a lamap blown by dephlogiticated air is alfo found fufficient to volatilize grold.

Guld being thes indeftructible by the common gperations of fire, cqually reflls its flow action in the atmophere. It is altogither exempted from rutting; and though its rarface beconas tarmihed by expofure so the ant, it is nerely in confoname of the deporation of wreign bodies upen it. Water produces no chante, iays Mr Fourcouy ; thonsh, according to the experiments of Lagaraye, is leats cupable of dividing it merly in the fane manes ato it does iron.

Godd combinss with various metais; and is comreonly alloged in a certain proportion with copper, Wheh grives it a red culour and greater dirmuefs than it pulans when wery pure, as the fame time that it is thas radered mure fulible. In lifis hate it is ufed firpmose, plate, and toys of differnt limds. It is fomedise aho alloyed whil hilver, which deprives it of has enlour, an I readers it very pale: this alloy, how-
 of the bey cillercut feecific graviaes of the two metals, ats llomberg ubfived, who idw them leparate during them futho. The alloy of godd with filver forms the green guld of the jewcliers and gold-bcators.

## G O I

Gold. produce ao equality of value in the diferent pieces diperfed in commerce. The chemical methods by which this is accomplithed, are related under the ar. ricles Chemstry, and Essaying of Metals. To aicertain with precifion the quantity of imperfect metal it may contain, a given mais of gold is fuppofed to contain 24 parts called carats; each carat being fuppofed divided into $3^{2}$ parts called thiry $y$ - feconds of a carat. If the gold after the operation has lon one grain in 24 , it is gold of 23 carats; if it has lunt a grain and a liaff, it is gold of 22 carai- 16 thirty-fe. conds, and fo on. The weight ufed $i .3$ the ceflay of gold is called the efiey weright, and uf, waly coratits of 24 grains ; it is divided into $2+$ carats, whish are likewhe Tubdivided into $3^{2}$ parts. An effay weight is itkerife ufed whith weigh 12 grains; and is likewit diveded in$102+$ carats, fubditides again into thinty-reconds.
The fcarcity and great price of gold perent its being made imto veffls or utenlits; but as iaz brilliancy and coslour are agreable, metheds liase heen found of applying it to the furfsee of a geat mumer of bedics, which it thas not only beausities, but ty it, indeltruetibihty preferves from the injuries of the atnimptrere. 'The att of applying it in this manner is cuiled suidins: and the immente duatility of gold aheady matanate renders it capable of being applied in th is mauner at nucls lefs expence than could be imagined. It is ufed belides in gilding, cither in a flate of fulution by acid, or amalgamated with mercury, which asc cailed watergiding. It was formerly ufed in medicire, and great vitues were ateribed to it; whence the great number of golden tinctures, elixirs, \&ce. of quacks; but all thete are now defervedty expluded, and the bell practitioners allow that guid, in whatiocerernanner it be f-pared, is either inaidive or dangerous.

Gold in its metallic thate canaut be combincd with the vituiriable earths, but its culces may; for whinh reafon they are oten uled in enamcl-painting and in prosciati, where they produce a beautiful viviet-colour. Clais is tingel by them of a beantifui red; of Which we iave andeconntin iere's art of giat- makin; thuagh Dr Lewis fays the never could faceed in mahing the colour diffure itfelf equal!'y throughout the fubiarese of the glats. See Coiouring of Glass.

The preparation of gold called curnm fuminans is taben notice of under the article Chimistry, n 1103 , M.Magellan takes notice of itcextraondinary fulminating property, and lays that its frogor is $\sigma_{+}$times gitater than that of an equal quantity of gun-powder. According to Bergman, the Itrength of the explofion is $1_{7}$ (cotimes greater than that of gun-powder (zo grains of aurum filminans being equivaicit to half a pound of gun-powder). Bergman accounts for the amazing frength of this explofion, by furying it owing to the quabrity of air extricated at the thate; bat this, according to his own account, cannot be at all fufficient for fuch a purpofe; and Magellan is of opinion that "this wonderful phenomenen feenis nut yet completcIy accounted for by any hypothe fis yet known." Sce the articles Chemistry, and Explusion.
"It is on account of the fingular and excellent netural qualities of this metal (fays our author 'a which are confiderably heightened by its fearcity. thet god is formoth watued anong all the civilized mationso of the world." Mr Pation, in his Mcirologic, ip sṭ. Cay",

## $71 \quad$ G O L

that one cubic foot (French meafure) of gold is wotth 2,153,000 livers tournaifes, or 89,708 goineas and feven millings, fuppofing the Louis d'Or to be equal to the guinea; and that the refpective value of the fame cubic foot of gold is equal to 25.6 cubic feet of filser; each of this laft metal being reckoned worth about $\varepsilon_{4}, 000$ French livres, or 3503 guineas and eight thillings: fo that if we fuppore the monied ipecic in Fance o be but two milliards of Fien=h livees, as. cording to the elfimation of adr Neckar i: hin. So trifing is the thytal objua thas excites the activity of 22 withens of the haman foe ceas, !be numiner that is lad to be that of the hame tante of Fratic.
 M. Wagelian on the thate in which gold is foural in that knets of the earth, and confequaty of the onigin ot goid ores. "As to the maxal exitence of yon! i: the howets of the eartis (fars ber), there have been tw. (pinions arang mineralegith © Gme petembing that it is only found in its mathli or a ative form ; and oshers, that it is fometimes tound mineralized in an intimate. minu widh other tubitances. Mir Firwan tholds the former, and the celebrated Bergman the latter. But, foys Mr Kirwan, 'though Mr Bergman inclines to the opinion of the mineralization, yet he is candid enough to own, that the gold, when extracted frum this ore, is of a gianular or angular form. It is there. fore very doubtul, whether it was not rather mixei, than truly combined with the fulpher and iron: and its proportion being exceedingly tmall, fo that 100 ponds of the pyrites icarcely contain an uunce of zold, it is not a wonder that it fhould efcape the ation of aqua rexia : more efpecially as the ritrons acid becomes fo phagiticated by acting on the pyrites, as not to low atle to Get hatagiticate the marine. Likewife merary, by reaton of the guld particies being enveluped in the fulphureos ion, can hase no accefs to it."

- Thefe arguments (ays M Aarellain) anainoll the true miseralization of gode, aie fulty antwered by the facts alrcady montiond Euites, it is weil know, that guld can be combined and calcined, sia form, by the liver of futpore and fommetito. this imeng acknowleded on buth tites of the yuekion. who thould we infill ondeaying the ninctalsanm, when it is out of doubt. amony mincrakgills of raik, that whcanuc fires have had a great flare in the convulitons and revclutions of this globe, of which every one has the mott cunviniong proofs almof cucry whers.' The account given by Mr Haces:at of the enold mines at Nagy ag in Tranylyanis, the ancient Dacia, which liss about 45 latitude, ofiors the mon convincing pronfs of this affertiun. 'The emanty ali romd thede mines beas: an incontedable appearance of being a volcanic one; and among varion cther metals, there are at leait 13 kinds of goled ores, tholt of them mincralizenl. Thefe are, 1. Gold mineralzed by fuphor, zinc, and aficric, in a grey-vellowith volctaic ure, which is coll. en cofinets, or cution-ore, on acesmat of its lighine is and wature. 2 . By iron and arlanc, formed by Atatio ; one containing hack filver we, then fparm, is lena. çuary, and arey guld ore: it yitlds abone litif
 grey guld ore mixel with fone guart. f. In the form if croved threals mixed with quarr and gypFeons ipnth; a poormine. 5. Dendritifrm, like the mocha loris. ©t the ayate from Aberlein in the Pa1.esinatc: but thefe hack dendrites are in a redid flowe. 6. Atraphoms, very compact, in fmall grain: whe fasth and quatz. A quintal of it yichs two omces of ifold, and more of filver. 7. Byy fulpher, great past ef ziace and a little antimony and arfenic; not rich. S. Oi a black or dark-cddlih colour, containins an aurifernes pyrites; nut rich. 9. Of a bluith c.flour, mineralzed by fulphur, antimony, iron, and a litte afenic nixed with liker; why ifh in gold. 10. Pathy laminated with nechles of a backifl yellow colour: thes gives 65 ounces of goll per. $\frac{1}{2}$ of gold, according ts Scopoli. 11. Fuliated with gypfens fath and gellow pyrites. 12. In irtegular lamina, in a gresinh argille. The gold looks like fiver, and is Furrounded by fars of a pale rofy colmar: 13. In cryHallized lamine from two to four lines diameter, of an bexangular form, and very much refunbing molybitua. The vein was loft for fome time, but lately found again on inining for letting out water from the main. This ore is very rare, and has given 1,2 ounces per $\frac{2}{9}$ of a mised metal; five of which were gold, and one filer.

Mfotiod of Revoverivg Goun from Gilt Whor's. The folubility of gold, and the indifflubility of filver, in aqua regia, affords a principle on which gold may be feparated from the furface of filver: and, on this foumdation, dilferent proceffes have been contrived, of which the two following appear to be the beft. - Some powdered fal ammoniac, moittened with aquafortis into the conliftence of a patte, is fpread upon the gilt lilver, and the piece heated till the mattor fmokes and becomes nearly dry: being then thrown into water, it is rubbed with a furatch bruth compofed of tine brafs.wire bound together, by which the goll eafily comes ofl. The other way is, by putting the gilt fiver into common aqua regia, kept fo hot as nearly to boil, and turning the metal frequently till it becomes all over black: it is then to be wahed with a little water, and rubbed with the feratch brufh, to get of what gold the aqua recia may have left. This laft method appears preferable to the other; as the fame aqua regia may be made to ferve repeatedly till it becomes laturated with the gold, after which the gold may be recovered pure by precipitation with folution of viriol, as directed under the alticle Metaleugg.

For feparating gold from gilt copper, fone direct a folution of boras to be applicd on the gilt parts, bur nowhere elfe, with a pencil, and a litte puwdered fulphur to be farinked on the phaces thos moillened: the primeipal ufe of the folution of borax fecmes to be to make the fulphur athere; the picce being them made red hot, and quenched in water, the gold is faid to be fo far loofened, as to be wíned off with a brufh. Others mix the fulphur with nitre and tariar, and form the mixture with vincgar into a palte, which is fpread upon the gilt parts.

Schlutter recommem?s mechanieal means, as being generally the leaft expentive, for feparating gold from the furface both of filver and copper. If the gilt veffel is round, the gold is convenisutly got oll by turning

N Hz .
it in a lathe, and applying a proper tool. a fkin being placed underneath for receiving the havings: he fays it is cafy to collcet into trou ounces of flavings all the groh of a grilt veffel weighing thrice as many pounds. Where the ligume of the piece does not admit of this method, it is to be proptily hixed, and ferapers applied of dificent kinds according to its lize and lagure: fome laree, and furnifoed with two handles, one at each end ; others finall and narrow, for penetrating into deprefled parts. If the gold cannot be got of by cither of thete ways, the file mutt be had recourfe to, which takes of more of the metal undenneath than the turning tool or the feraper, particularly than the former. The gold ferupings or filings may be partited from the lituer or copper they contain, by the methods deferibed under the anticle Metallurgy.

The editors of the Eneyclopecthe give a method of re. covering the gold from wood that has been gilt on a water-fise: this acconnt is extrakted from a memoir on the fame fullict, prefented to the A cademy of Sciences by M. de Montany. The gilt wood is Atceped for a quarter of an hour in a quantity of water fufficient to cover it, made very hot: the fize being thas foftened, the wood is taken out, and ferubhet, piece by piece, in a little warm water, with fhort fliff brifle brufthes of diferent lizes, fome fmall for penctration into the carvings, and others large for the greater difpatch in flat pieces. The whole mixture of water, fiee, gold, \&cc. is to be boild to drynefs, the dry matter made red hot in a crucible to burn off the lize, and the remainder grom with mercury, either in a mortar, or, where the quantity is laree, in a mill.

Gold-Couff. See Guinea.
GoLn-Wire, a cylindrical ingot of filver, fuperficially gilt or covered with gold at the fire, and afterwards drawn fucceffively through a great number of little round holes, of a wire-drawing iron, each lefs than the other, till it he fometimes no bigger than a hair of the head. Sce Wiome Drawimg.
It may be obferved that, before the wire be reduced to this exceffre finenefs, it is drawn through above s to difierent holes; and that each time they draw it, it is rubbed afreth over with new wax, hoth to facilitate it spaliuge, and to prevent the filver's appeasing through it.

Gout-1 Wive falted, is the former wire flatted between two rollers of polifined flect, io fit it to be fpum on a fick, or to be ufedflat, as it is, without fininning, in certain fuffs, laces, embroidurics, ac. Bue Sruff, sic.
Gour-Thread, or Spun golh, is flatted gold, wrapped or kaid over a thread of lilis, by twilling it with whecl and iron-bobhins.

To difpofe the wire to be fpun on filk, they pars it between two rollers of a littic mill: thefe rollers are of niecly poilifhed itect, and about thrse inches in diameter. They are fet very chefe to each other, and turned by means of a handle faltened to one of them, which gives motion to the other. The gok wire in paffing between the two is rendered quite flat, bur withen lofing any thing of its gilling; and is rendered fo exceedingly thin and flexible, that it is cafly fan on filk-. thread, by means of a hand-wheel, and to wound on a fpool or bubbin. Sce $W_{i r e}$ Diurwing.

## G O L

They are ufualty tiken about Michaelnas, and foon become tame; but they differ very much in their fong. -They frequently breed in the upper part of plumtrees, making their uelps of the mofs that grows upon apple-trees, and of wool; guilting the indade with all forts of hairs they find upon the ground. They breed three timus a-year; and the young are to be taken with the nell at about ten days old, and fid as follows: Pound fome hemp feed icry tine in a moriar; then fift it through a fitve, and add io it as much whrat-bread as lom- Coed; and likewife a lienc l'our of canayfeeds: then with a frall flick or quill take up as mul as the bignefs of a white-pea, and give them feveral times addy. This ought to be made frefh every day: fror if it is fultered to four, it will fpoil their flomachs, cauling them to caft up their ineat; which if they do, it is very probable that they wild die.-Theft young birds mutt be carefully kept warm till they can feed themflves, for they are very tender. In fceding, be fure to make your bird clian his bill and mouth. If any of the meat falls upon his feathers, take it off, or clfe he will not thrive. Such as eat hemp-feed, to purge them, fhould have the fieds of melons, fuccory, and mercury ; or elfe let them have lettuce and plantane for that purpofe. When there is no need of purging, give them two or three times a. week a littic Sugar or loam in their meat, or at the bottom of the cage; for all feeds have an oilincts, fo that if they have not fomething to ablobbit, in length of time it fouls their \{tomachs, and brings on them a flux, which is very dangerous.

Gold. Fi/h. SueCyprinus.
GOLDEEN, fonething that has a relation to gold, or confilts of gold.

Gorden-Calf, was a figure of a calf, which the Ifratlites caft in that metal, and fet up in the wildernefs to worthip during Mofes's abfence into the mount; and which that legifator at his return burnt grinded to powder, and mixed with the water the people were to drink of; as rclated in Exod xxsii. 'The commentators have been divided on this article: the pulverizing of golk, and rendering it potable, is a very dificult operation in chemiltry. Many, therefore, fuppofe it done by a miracle: and the reft, who allow of nothing fupernatural in it, advance nothing bue conjectures as to the manner of the proceds. Mofes could not have done it by fimple calcination, nor amalgamation, nor autimony, nor calcination; nor is there one of thofe operations that quadrates with the text.
M. Stahl has endeavoured to remove this diffeulty. The method Mofes made ufe of, according to this allthor, was by diffolving the metal with hepar fulphuris; only, inftead of the vegetable alkali, he made uie of the Egyptian natron, which is commonenough throughout the eaft. See Chearisty, $1^{\circ} 1127$.

Golden Flece, in the ancient mythology, was the Nkin or thece of the ram upon which Phryxus and Hella are fuppofed to have fwam over the fea to Colehis; and which being faerificed to Jupiter, was hung upon a tree in the grove of Mars, graarded by two brazenhoof'd bulls, and a monttrous dragon that never flept; but was taken and carried off by Jafon and the Argo. nauts.

Many authors have endeavoured to fhow that this fable is an allegorical reprefentation of fome real hif-

Culubias or the geld which thes commenly gathered there with fecees in the risers. See Argonaters.

 It wok its danmination fomm a repefentation of the guben fluce borne hy the haights on the collars, which conbled of Hiats and deds. 'lhe king of Span is mow gromb mather of the orde, in quality of dake of largundy: the number of knights is tixal to thitsone.
It is bitally faid to have been intlituted en occafon of an immenfe pwhit which that pronee made by wool; though others will have a chenical mytery conehed un: ir it, as umder that fanous orle of the ancients, which the adepts contend to be no cther than the fecate whe slixir, wrote on the facee of a therp.

Oniser de la Marche writes, that he hed fuggelled to Phitip 1 . archduke of Autria, that the order was indtutal by his gramdather Philip the Good duke of Burgundy, with a view to that of Jafon; and that John Germain bithep of Chalons, chancellor of the crast, upon this occafon made lim change his opinion, and affured the young prince that the order had lees intlitused with a vin to the fleece of Gideon. Witliam bithop of Tournay, chancellor likewife of the cerder, pretends that the duke of Burgundy had in view buth the galden tlecee of Jafon and Jacub's Hecee, i.e. the fpockled theep belonging to this patriarch, according to agreement made with his father-in1,w Laban. Which fewiment gave birth to a great work of this prelate, in two parts: in the firft, under the Symbol of the feece of Jafon, is reprefented the virtse of magnanimisy, which a knight ought to por$f(f)$; and under the fymbol of the fleece of Jacob he reprefents the virtue of fuatice.

Paratin is of the fame mind ; and tells us, that the duke dutigned to imfonate that the fabulous eonquelt which Jafen is fuid to have made of the golden Aleece in Colchis, was nothing elfe but the conquelt of virtue, which gains a victory over thofe horrible monfters vice and our evel inclinations.

GOLDEN Number, in chronology, a number howing what far of the moon's eycle any given year is. See Chronology, $\mathrm{m}^{2} 27 \quad 30$.

Golifn Kad, in botany. Sec Solidago.
Gozonn Raje. The pope annually confecrates a solden tofe on the founh Sunday in Lent, whieh is fent to princeties, or to fome chureh, as a mark of his peculiar affection.

Golden Rule, in arithmetic, a rule or praxis, of great ufe and extent in the art of numbers; whereby we lind a fourth proportional to three quantitics given.

The golden rule is alfo ealled the Role of Thres and Rule of Proporion. Sce its mature and ufe under the article Arirhmetic, $1^{*} 13$.

GOLDENGEN, a town of Poland in the duchy of Courland, with a handfome cafte, feated on the river Weia, in 1E. Long. 22. 3 1. N. Lat. $5^{5} .4 \%$.

GOLDSMITH, or, as fome choole to exprefs it, folverfmith, an artift who makes veffels, utenils, and ornaments, in gold and filver.

The goldfmith's work is either performed in the
mould, or beat otit with the hmmer or other engine. Goldfmithe All works that have raifed figures are calt in a mould, and afterwards polifhed and finithed: plates or difhes, of filver or gold, are beat out from thin Hat plates; and tankatis, and otheer veffels of that kind, are formed of plates fohtered together, and their monuldings are beat, not eath. The bifinefs of the gohifmiths furmerly required much mose labour than it does at prefent; for they were cbliged to hammer the metal foom the ingot to the thinaets they wated: but there are now invented fattiog mills, which reduce metals to the thinnefs that is requered, at a very finall expence. The goldinith is to make his own moulds; and for that reafon ought to be a groed deligner, and have a tatte in foulpture: he alfo ought to bnow enough of metallugey to be able to afliy mixed me:als, and to mix the alloy.

The goldimiths in Loudon employ feveral hands under them for the varions articles of their trade: fueh are the jeweller, the fonf box and toy maker, the filver-turner, the gilder, the bumifler, the chafer, the refiner, and the gold beater.

Goldimiths are fuperior tradefmen: their wares mult be affayed by the wardens of the company of this name in Lundon, and marked; and gold is to be of a certain touch. Fo goldfinith may take above one fhilling the ounce of gold, befides what he has for the fathioning, more than the buyer may be allowed for it at the king's cxchange; and here any falfe metal thall be feized and forfeited to the king. The cities of Yurk, Exeter, Briftol, \&c. are places appointed for the affaying wrought-plate of goldfiniths; alfo a duty is granted on filver-plate of fixpence an ounce, \&c. Plate made hy goldfiniths thall be of a particular finenefs, on pain of forfeiting 101 . and if any parcel of plate fent to the affayers is difcovered to be of a coarfer alloy than the refpective tlandards, it may be broken and defaced; and the fees for aflaying are particularly limited.

Goldsmith (Oliver), a celebrated Englifh witer, was born at Rofcommon in Ireland in the year 1731. His father, who pofelfed a fmall ellate in that county, had nine fons, of whons Oliver was the third. He was originally intended for the ehurel ; and with that view, after being well inftructed in the clatfics, was, with his brother the Rev. Henry Goldfmith, placed in Trinity college, Duhlin, about the latter cad of the year i 7.19 . In this feminary of learning le contimued a fow ycars, when he thok a baelhelor's degree: but his brother not being able to obtain any preferment after he lefi the college, Oliver, by the advice of Dean Gollfmith of Cork, turned his thoughts to the fludy of phyfic; and, after attending fome courfes. of anatomy in Dublin, proceeded to Edinburgh in the year 1751, where he lhudied the feveral branches of medicine under the diferent profefors in that univerfity. His beneficent difpolition foon involved him in mespected difficulties; and he was obliged precipitately to lave Scotland, in confequence of engaging himfelf to pay a confiderable fum of money for a fellow- lludent.

A few days after, about the beginning of the year 1754, he arrived at Sunderland, near Newcaftle, where he was arretled at the fuit of a taylor in Edinburgh, to whom he had given fecurity for his friend.

Noidimith. By the good offices of Laughlin Maclane, Efcy; and Dr Sleigh, who were then in the college, he was foon delivered out of the hands of the bailiff; and took his paffage on board a Dutch hip to Rotterdam, where, after a Thort flay, he proceeded to Bruffels: he then vifited great part of Flanders; and after paffing fome time at Strabourg and Louvain, where he obtained a degree of bachelor of phytic, he accompanied an Englifh gentleman to Berne and Geneva.

It is undoubtedly fact, that this ingenious unfortunate man travelled on foot moil part of his tour. He had left England with very little money; and being of a philofophical turn, and at that time poffeffing a body capable of fullaining every fatigue, and a heart not eafily terrified at danger, he became an enthutial to the defign he had formed of feeing the manners of different countries. He had fome knowledite of the French language and of inutic, and he played tolerably well on the German flute; which, from an amulement, became at fome times the means of fubditence. His learning produced him a liofyitable reception at molt of the religious houles: and his mufic made him welcome to the peafants of Flanders and other parts of Germany. "Whenever I approached," he ufed to fay, "a peafant's honfe towa:ds right fall, I played one of my moft merry tunes; and that procured me not only a lodging, but fubfiftence for the next day: but in truth (his conllant exprefion) i mult own, whenever I artempted to entertain perfons of a higher sank, they always thought my performance odious, and never made me any return for my endeavours to pleafe them."

On Mr Goldimith's arrival at Geneva, he was recommended as a proper perfon for a traveliing tutur to a young maa, who had been unexpectedfy left a confuderabie fum of money by his uncle MrS —_, formerly an eminent pawnboker ncar Holborn. This youth, who had been articled to an attoracy, on receipt of his fortune determined to fee the world; and, on his engaging with his preceptor, made a provifo that he theuld be permitted to govern himFalf; and Goldinith foon found his pupil underflood the art of direiting in money concerns extremely well, as avarice was his prevailing paffion. His quellions were ufually how money might be fave.t, and which was the leatl expenfive courfe of travel; whether any thing could be boughe that wowld turn to account when difpofed of again in London? Such curiolities on the way as could be feen for nothing he was ready enough to look at; but if the fight of them was to be paid for, he wfully afferted that he lad been told they were not worth feeing. He never paid a bill that he would not obferve how andzing!y expenfive travelling was; and all this, though he was not yet twenty-one. I Muring Goldfath's contimance in Switzerland, he alidenully cultivated his portical talent, of which he had gien fome itriking proots while at the college of Eduburgh. It was here he fent the frill geetch of his delightful puetn called the Traveller to his brother the clergyman in Irclant, who, giving up fáme and fortune, had retired with an amiable wi.e to happinefs and offcurity, on an income of only 401. a-year.

From Gcneva Mr Goldfmith and his pupil vifited the fouth of Fiance; where the young man, upon

II] G O L
fome difagreement with his preceptor, paid him the Golt?mith. fmall part of his falary which was due, and embarked at Marfeilles for England. Our wanderer was left once more upon the world at large, and paited through a varizty of dificulties in traverling the greatell pait of France. At length his curiolity being fatiated, he bent his courfe towards England, and arrived at Dower the beginning of the winter 1753 . When he came to London, his tock of cafh did not amount to two livres. An entire tranger in this mettopolis, his mind was filled with the moft gloomy reftections on his embarraffed lituation. With fome difficulty lie difcorercal that part of the town in which his old acquaincance Dr Sleigh refided. This gentleman receised him with the warmeft affection, and liherally invited him to fhare his purfe till fome eltabliffment could be procured for him. Goldimith, unwilling to be a burden to his friend, a thort time after eagerly embraced an offer which was made him to anit the late Rev. Dp Milner in inltruzing the young gentlemen at the academy at Peckham; and acquited himfelf greatly to the Doctor's fatisfaction for a hort time: but having obtained fome reputation by the criticitms he had written in the Monthly Review, Mr Grillith, the proprietor, engaged him in the compilation of it ; and, refolving to purfue the profeffon of writing, he returned to London, as the mart where abilities of every kind were fure of meeting ditlinction and reward. As his linances were by no means in a good tlate, he determined to adopt a plan of the trictet economy ; and took lodgings in an obfeure court in the Old Bailer, where he wrote feveral ingenious little pieces. The late Mr Newberry, who at that time gave great encouragement to men of literary abilities, became a kind of patron to our young author; and introduced him as one of the writers in the Public Ledger, in which his Citızen of the World originally appeared, under the title of Cbincfe Letters.

Fortume now feemed to take fome notice of a man fhe had long neglected. The fimplicity of his character, the integrity of his heart, and the merit of his productions, made his company very acceptable to a number of refpectable families; and he emerged from his flabby a partments in the Old Bailey to the politer air of the Temple, where he took handiome chambers, and lived in a genteel liyle. The publication of his Praveller, and his Vicar of Wakeffild, was followed by the performance of his comedy of the Good-natured Man at Covent-Garden theatre, and placed him in the tirt rank of the poets of the prefent age.

Among many other perfons of dillinction who were detirous to know him, was the duke of Northumberland; and the circumlance that attended his introduction to that nobleman is worthy of being related, in order to flow a Itriking trait of his character. "I was invited " faid the Doctor (as he was then univerfally called) "by my friend Mr Piercy, to wait upon the duke, in confequence of the fatisfaction he thad received from the perufal of one of iny productions. I dreffed myfelf in the beft manner I could; and, afeer itudying lome compliments I thought neceffary on fuch an occation, proceeded to Nurthumberlandhoufe, and acquainted the fermants that I had paris cular bufnefs with his Grace. They thowed me into an antichamber; where, after waiting fome time, a B 2
gentlemant

## G O L [ 12 ] <br> G O L

Goidmath. genteman very sedtecty dreflud macie his appearance. Thking him for the duke, I delivered all the fore things I had compeded in order to compliment him on the honour he had done me: when, to my great allonilment, he told me I had mittaken him for his matter, who would fee foe immediately. At that intlant the duke came into the apartment; and I was fo confufed on the necelin, that 1 wanied words barely fuliecient to exprets the fenfe I entertained of the duke's politenefs, and went away extremby chagrined at the blunder 1 had comanitted."

Another featare of his character we cannot holp laying before the reader. Prerions to the pablication of his Deketed Village, the bookfller had given him a note fur une lundred guineas for the enpy, which the D) cior mentinncel a fow hours after to one of his Erients: who obferved, it was a very great fum for fo fhort a performanee. "In truth," rephied Goldimith, "I think in wo: I have not been caly fince I received is: therefure I will go back and return him his suve:" which le abfoluicly did; amd laft it entircly io the boukicller to pay him accurding to the pretis youdued by itie fale of the pieve, which turned ous very conitucrable.

Daring the lat rehearfal of his comedy intitled She twops in Conquer, which Mr Coleman had no opinion would lazceed, on the Doctor's ubjecting to the tupetion of one of Tony Lumpkin's fpecthes, being appretantive it might ingure the play, the manater with getat keennefs replied, "Pha, my dear 1) uctor, do met be feaful of fquibs, when we have bech fising alment thete two hours upon a barel of armpunder." 'I he pioce, however, contrary to Mr Cuieman's eapletation, was received with uncommon
 fo huat by the feverity of the above oblervation, that it conialy put an end to his friendhip) for the gentleman that mack it.

Nowwhatanding the great fuecefo of his pieces, by fore of shicel it is allerted, upon good authority, he cheared soce1. i.n one year, his circmmances were by sor acans in atpoferous lituation; which was partly owing on the laterulty of his difpolition, and partly S1) an muforturase habit he had conthacted of gaming; the ato of which he knew sery little of, and conle-
 coomerh to twke advantuge of his implicity.
fat befoes his death he had formed a defign for executine an DThuerfal Dictionary of Ans and Science, the proipueus of which he actually publithed. In -1 i, woth fiveral of his literary fiends (particularly Sir Juhna F: gnodds, De Johnom, Mi Bcaucierc, and Mr (aarrino! had undertaben to formh him with avticke upen difieront lubjerts. He had contertaincd

 imagined it would untonttecly zeceive; and he wfed to lament this checumbtare almult to the kat home of his exiltence.

We had been for fome years apliEicd, at different limes, with a violent diemsury, wheh rontributed nut a intle to embiter the latter part of his life; and ohnich, united with the vexations which he fulfered won cther occafions, bruugit on a hisd of labitual
defon dency. In this unhany condition he was at. Gnlffith, tacked by a nervons fuer, which, being improperly treated, terminated in his diflolution on the fth of

Asto his character, it is Atrongly illutrated by Mr Pope's line,

It u it a man, fimplicity a chids.
The leanued leifure he loved to enjoy was ton often internapted by diltreftes which arole from the liberality of his temper, and which fometimes thew him into loud lits of paffion: but this impenolity was correct. ed upon a moment's reflection ; and his fervants lave been known, upon thefe occalinns, purpufely to throw themfelves in his way, that they might profit by it immodiately after; for he who had the good fortune to be reproved, was certain of being rewarded for it. The univerfal efleein in which his poems were held, and the repeated pleafure they give in the pernfal, is a ftriking telt of their merit. He was a fudious and comect obferver of nature ; happy in the flection of his images, in the choice of his fubjects, and in the harmony of his verfitication; and, though his embarraffed dituation prevented him from putting the la hand to many of his productions, his Hermit, his Travellor, and his deferted Village, bid fair to claim a place among the moll finifhed pieces in the Englith laneruage.

Bulides the works already mentioned, he wrote, 1. Hiftory of the earth and animated nature, 6 vols 8 vo. 2. Hiflory of England, 4 vols 8 vo. 3. Hiltory of Rome, 2 vols. 4. Abridgements of the two laft, for the ufe of fichools. 5. A view of experimental philofophy, 3 vols 8 vo. ; a pulthumous work, not cfteemed. 6. Midcellanies, \&c.

GOLF, the mame of a certain game among the Scots, and faid to be peculiar to their conntry. Among them it has been very ancient; for there are flatutes prohibiting it as carly as the year 1457 , lett it thould interfere with the fport of archery. It is commonly played on rugged broken ground, covered with fort grafs, in the neighbourhood of the Seafores. A field of this fort is in Scotland called links. The gane is generally played in parties of one or two on cunh fide. Each party has an exceeding hard bail, fomewhat larget than a her's ege. This they trike with a tlender and elanic club, of aboust four feet loner, crwoked in the head, and having lead run into it, to make it lacavy. 'The ball being ftruck with this club, will lly to the ditance of 200 yards, and the game is ganed by the party who puts his ball into the hole with the feweft trukes. But the gane dores not depond folely upon the llriking of the longelt ball, but alfo upon meafuring the ttrength of the ftroke, and applying it in fuct direction as to tay the ball in fmootls ground, whence it may be eafily moved at the next Hruke. 'lo encourage this amufement, the city of Edinburgh, A. D. $17+4$, gave to the company of golfers a filver clab, to be played for annually by the company, the victor to append a gold or filver picce to the prize. It has been played for evers year fince, except the years 1746,1747 . For their better accommodation, 22 members of the company fubferibed L. 30 each in the year 1768 , for building a houfe, where their meetings might be held. The fpot chofen for this purpole was the Couthwell corner of Leith links, where

## G O L

Golius, an area was taken in feu from the magifrates of Edin. Gulezius. burgh, and a commodious houfe and tavern built upon it. GOLIUS (James), a celebrated profeffor of Ara. bic and the mathematics at Leyden, was defcended from a very honourable family, and born at the Hague in the year 1596. He was put to the univerlity of Leyden, where he ftudied under Erpinius; and ha. ving made himfelf matter of all the learned languages, applied himfulf to the mathematics, phyfic, and diviuity. He afterwards travelled in:o Aficia and Afia; and became greatly efteemed by the king of Morocco, and the fultan of the Turks. He at length returned to Leyden, loaded with manuferipts; and in 1624 , fucceeded Erpinius in the Arabic chair. As he had been an eye-witnefs of the wretched ftate of Chriftia. nity in the Mahometan countries, he was filied with the compalion of a fcllow-chrillian ; and none ever folicited for a place of honour and profit with greater eagernefs, than he for procuring a new edition of the New 'Iettament, in the original language, with a tranflation into the vulgar Greek, by an Archiman. drite; and as there are fome of thefe Chrittians who whe the Arabic tongue in divine fervice, he alfo took care to have difperfed among them an Arabic tra:1/ation of the Confeffion of the Proteftants, together with the Catechifm and Liturgy. In 1626 , he was alfo chofen profeffor of mathematics; and difcharged the functions of both profeflorthips with the greatelt applaufe during to years. He was likewife appointed interpreter in ordinary to the ftates for the Arabic, Turkih, Perlian, and other ealtern languages, for which he had an annual penlion, and a prefent of a gold chain, with a very beantiful medal, which he wore as a badge of his office. He publihed, i. The life of 'Iamerlane, written in Arabic. 2. The hitory of the Saracens, written by Elmacin: 3. Alferganus's elements of Altronomy, with a new vertion, and learned commentaries. 4. An excellent Arabic lexicon. 5. A Perfinn Dictionary. He died in 1667.

GOL'LIUS (Henry), a famous engraver and painter, born in 1558, at Mulbreck in the duchy of Juliers. He was targit the art of engrasing by Theodore Cutrenhert ; and fuccecded very wonderfully in it, notwithftanding the difadvantage of a lame hand, which was occafoned by his falling into the fire whilit young. He was firit employed by his matter, and afteswards he worked for Philip Galle. Domellic troubles and ill health occalioned lim to travel. He went through Germany into Italy ; and paffed under a figned wame, that his fudies might not be internupted. He vilited Bologna, Florence, Naples, and Venice, conflandy applying himfelf to drawing from the autique fatues, and the works of the great malters. At Rone he refided the longett ; and there he produced feveral excellent engravings from Polidoro Raphacl, and other eminent painters. On his return to his native country he eltablithed himlelf at Haerlem, where he engraved many of the drawings which he had made during his abode in Italy. He died at Haerlem in 1617, aged 59. He is faid to have been forty years old before he began to paint: yet his pictures are fpoken of with the greatelt commendation; but as he did not produce any great number of them, they are of courfe but rarely to be met with. As an engraver, he de-

## $13] \quad \mathrm{G}$ G L

ferves the higheft commendation. No man ever fur. Gilzius. paffed, and few have equalled, him in the command of Gombau d. the graver and freedom of execution. He copitd the ftyle of Albert Durer, Lucas of Leyden, and other o!d malters, with aftonifhing exactnefs. Sometimes his engravings are neat in the extreme; at other times they are performed in a bold open manner, without the leaft rettraint. He alfo engraved feveral of his own deligns on wood, in that manner which is dillinguilhed by the appellation of chiaro-fouro. Of his prints, which are very numerous, it may here fuffice to fpecify two or three of the molt celebrated: 1. Six large upright plates, known by the name of his mallorpieces. Thefe, it is faid, he engraved to convince the public that he was perfectly capable of imitatiner the tyles of Albert Durer, Lucas Van Leyden, aird other matters, whofe works were then held in higher eftimation than his own: for he had adopted a new manner, which be purfued becaufe he though: it luperior, and not becaufe he was incapable of following the others. It is reported that with one or them, the Circumailion, which he lmoked to give it the more plautible air of antiquity, he actually deceived fome of the mont capital connoilleurs of the day ; by one of whom it was bouglat for an original engraving of Albert Durer. The lubjects of the fe plates are, The Annunciation of the Virgin ; the Meeting of the Vi:gin with Elizabeth, called the Vifitation; the Nativity of Ctrift ; the Circumcifion of Chrit ; the Adoration of the wife Men; the holy Family. 2 The Judgement of Midas, a large plate lengthwite. 3. The Venetian Ball, a large plate lengthwife, from Theodure Bernard. 4 . The Boy and Dog, a middling fized upright plate, from a defign of his own; an admirable print. 5. The Necromancer, a middling fized upright oval prini, in chiaro.fcuro. 6. Night in her Chariot, the fame.

Goltzius (Hubert), a learned German, born at Venlo in the duchy of Gueldres in $\mathbf{t 5 2 6}$. His father was a painter, and himfelf was bred to the art under Lambert Lombard: but he did little at paint. ing, or at leaft his pictures are very farce; for having a peculiar turn to antiquities, he devoted himfelf to the ftudy of medals. He travelled through Germany, France, and Italy, to make collections, as well as to draw from thence all the lights he could towards clearing up ancient hillory : he was the author of fereral excellent works, in which he was fo accurate and nice, that he had them printed at his own houle, under liis own correction, and even engraved the plates and medals with his own hand. His veneration for Roman antiquities was fo great, that he gave all his children Roman names: and married, for his ficond wife, the widow of the antiquarian Martinus Suntius: probably more for the fake of Smetius's medals and inferiptions, than for his own fake ; and was punifhed accordingly by her plaguing him all his life, if the did not horten it. He died in 1583 .
GOMBAULD (John Ogier de), one of the beft French peets in the 17 th century, and one of the firit members of the French academy, was born at St Jut de Luffac. He acquired the efteem of Mary de Medicis, and of the wits of his time. He was a Protel. tant, and died in a very advanced age. He wrote

 Lonke $55^{\circ}: \therefore$ The name of Gompoon, or Comerons, Capain Hamblenatelisus, it had from the Portugucte; becande it was rowarkalle for the number of prawns and thrineps eathet on its coats, by them called comepers. 'Thas ciry owes itc weath and grandeur to the dumation of Ormas, and the downtal of the Pertuwhede empire in the Faft Indics. It is now jufty acenared one of the greateth mates in the Falk, was buit hy the geat haly Abas, and from hion, as fome think, ontanued the name of Bunder Abaff, which fignifies the court of Ahas. It atands on a bay about nine lagues to the nonthward of the catl end of the illand of Killmith, and three leagucs from the famons Srmas. The Englith beron to fettle luere about the year tojs, when, in conderation of their fervices apanat die Pontusucte, frata Abas wrated them half the cultoms of that port. This was confirmed by a phimanad, aral day regarded, till the Englifh began to negiect the fervices they find Itipulated" Whether the company has any emolument from the eutoms at prefont, is what we cannot pretend to afeetain. The town is layn, but is fituation bad; wating almont every thine that contributes to the happinefs and even fupport of lice. Toweres, the land it is excompatied by a fort of wall; and towathy the fea are feveral finall forts, with a platform, and a calle or citadel. nounted with cantion to fectire it and the road from the atempets of an eneny by fea. The houfes in mott of the itreets are fo ont of repair, fome half down, others in a lieap of rubbilh, that a Atranger would imagine the tow had been facked and ravaged by a babarons people: no: a vellige of the wedth really contained in the ghace appeariais in view. The bazars and ihops romb them ate kept, for the molt part, by Bamians, w? fe lases are generaliy in goon order. Alot of the houfes ate buile whe carth and lime, but fome of See beik with Rome. Naty of them have a fort of Fontilators at top, which contribute greatly to the Sealth of the iuhabitants in the hot fafons of the year. 'l'he mol fickly months here are April, May, Supember, and October. With hin and mutton the inhutitants ate well fuplled. Rice is imported from Incia: an 1 wheat is fo plenty, that the por fubit chichy oa breud and dates. 'The conntry hereabouts abounds in the mont delicions fruits, as apricots, paches, panegranate, pears, mangues, errapec, quavas, plums, fuect subinecs, and water-melons. The apricots, howcoer, ate fall, and extremely langerous if caten to cocer.

Thof conveniences are more than overbalanced by abe feandey of freth water, with which the inhabitants are lipplital from Affern, a place feren miles dittant, there nat being a fpring or wall in the town. Jerfons of condition keep a camel contantly employed in bringing freth and wholefome water. Captan Hamilton gives it as hin uphion, that one cante of the manWholefomenefs of this city is the refleatim of the rays of light from a lish montan to the morth of it. He fays, that when the heams are reflecterl from this zountain, they almolt fire the air, and, for two or
thee montha in the year, render the fituation into. Gombroonl lerable. For this reafon the peonic of condition retire into :he connery, to pafs the hats of Junc, July, and Gommerak. Augrath. The very fea, during this faston, is ditected, infomuch that the fench is no lefs diazarceable than that of putrid careafes; and this is increafed by the quantities of thell-fith left on the fore, from which an exhalation arifes that tamishes erold and filver, and is Iefs tolerable than the bilge-water of a tight mip. At Affeen the Englith factory have a country houf and gardens, to which they reite oceafionally. Here they have whole groves of Seville orange trees, which though not natural to the comtry, thrive very well, and are always vedunt, bearins ripe and green-fruit, wheh bluffors, all at the fame time. 'They have likewife tanks and ponds of tine frch-water, with ewery thing clfe that ean moderate the heat of the climate, and render life agrecable and clegant. About ten miles from Affeen is a place called Aminon, where are cold and hot natural baihs, reckoned infallible in the cure of all ferophulous cifocders, rheumatifms, and other difeafes, by bathing.

Gombroon is extremely populors, on account of the commerce carried on by the Duten and Einglih factories, as well as the natives. The Englith tactory is clofe by the fa, at fome diflance from the Dutch, which is a commodious and fine new building. A great part of the company's protits ariles from freights. . As the natives have not one good fhip of their own, and are extremely ignorant of navigation, they freight their goods for Surat, and other Indiun marts, in Englifh and Dutch bottoms, at an exorbitant rate. 'lihe commodities of the Gombroon market are, fine wines of different kinds, rainas, almonds, kith-mithes, prunellas, dates, pillachio-nuts, ginger, lilks, earpets, leather, tutty, galbanum, ammoniac. ala-fztida, tragatath, with other gums, and a variety of frop medicines. Thefer are in a great meafure the produce of Carmania, which they bring to Gombroon in catavans. The Englide company had onte a fmall factory in the prosince of Carmania, chitlly for the fake of a line wool produced there, and med by the hatters. The haid company had once a projuct of carrying a brecd of the Pethan goats to Si Helena; but Whether it was exceuted, or what fuccefs it met with, we camot fay, Although the company pay no cuftoms, yet they ufually make a pefent to the thaban. der, to avoid the trouble he has it in his power to give. them. All private taders with the eompanys paties, enjoy the fame privileses, on paying two for com. to the company, one to the agent, and one to the broker. All private trade, either by Luropean or country thips, has long been engiofled by the company's fervants.

GOMERA, one of the Canary ihands lying between Ferro and Tenerilte. It has one good town of the fame name, with an eacollent harbour, where the Spanith fiet oftentake in refrethments. 'liney lave corn fufficient to fupply the inhahitants, with one fugarwork, and great plenty of wine and fruics. It is fubject to the spaniards, who compuered it in $1+5 \%$. W. Long. 17.10. N. Lat. 25. 0 .

GONORRAH (anc. geos.), one of the caties of the plan or of the vale of siudim in Judxa, deltroyed

## Gom:ozia together with Sodom by fire from heaven, on account

 $\stackrel{11}{ }$ of the wickednefs of the people. To determine its particular fitination at prefent, is impoffible.GOMOZLA, in botany: A genus of the digynia order, belonging to the tetrandria class of plants. The corolla is campanalated, quadrind above ; there is no calyx; the berry is bilocular.
GOMPHOSIS, in anatumy, that kind of articula. tion by which the tecth are fixed in the jaw-bune. Sce Anatomy, in 2.
GOMPHRENA, globe amaraxth, in botany: A genus of the digynia order, belunging to the pentandria clafs of plants; and in the natural method ranking under the 5 th order, Mijeliante. The calys is coloured; the exterior one triphyllous, or diphyllous, with two carinated connivent leafets; the nectarium cylindrical, with ten teeth ; the capfale mo. nofpermous. There are feren fpeciss; but ooly one of them is commonly cultivated in our gardens, viz. the globufa. It hath an upright fi:ik branching all round, two or thrse feet high, garnifhed with oval, lanceolate, and eppofite leaves; and every branch and fide-thout terminated by a clofe globular head of flowers, compofed of bumerous, very finall harry florets, clufely covered with dry faly calices placed imlriatim, perfittent, and beautifully coloured parple, white, ied, or Itriped and variegated. The fiverers themfelves are fo linall, and cherely covered with the fcaly calices, that they fearcely appear. The nurnerous clofly placed fealy coverings being of a dry, firm, conlittence, coloured and glittering, collected into a compact round head, about the fize of an ordinary cherry, make a fine appearance. They are annual plants, natives of India ; and require artificial heat to raife and forward them to a proper groweh, fo that they may flower in perfection, and produce ripe feed. They Rower from June to November; and if the fowers are gathered when at full growth, and placed out of the fur, they will retain ther beauty feveral months.

GONAQUA, the name of a nation inhabiting about the Cape, and fuppofed by Dr Sparman to be a mixture of Hottentots and Cafies. See Hottentors.

GONDAR, the capital of Abyfinia; fituated, according to Mr Bruce's obfervations, in Let. 12. 34. 30. and Long. 37.33.0. E. from Greenwich. It lies upon the top of a hill of conlideratle height, and conlifts of about 10,000 families in tines of peace. The houfes ane cliclly of clay, with roofs thatched in the form of cones. At the weft end of the town is the king's palace; formerly, as Mr Bruce informs us, a flrusture of confiderable confequence, being a large fquare building four flories high, flanked with fquare towers, and afforoing from the top of it a magnificent view of all the country fouthward to the lake Tzana. It was built in the time of Facilidas, by mafons from India, and by fuch A byfinjans as had been inftrucied in architecture by the Jefuits before their expullion. Great part of it is now in ruins, having been burnt at different times; but there is fill ample lodging in the two lowelt flo is, the audience chamber being above 120 feet long. By the fide of this Aructure, there bave been built ty different kings apartments of clay only in the fathion of their own country. The palace, with ail its contiguous buildings, is furrounded by a duble
$15] \quad \mathrm{G} \quad \mathrm{O}$
ftone wall thinty feet high and a mile and a lays in circumference, with batclements upon the outer wall, and a parapet roof between the oiter and inner, by

Gendi, Gundins. which you can go along the whole and look into the ftreet. The hill on which the town is built rifes in the middle of a deep valley, throush which run two rivers: one of which, the Kalha, coming from the Mountain of the Sun, flanks all the fousth of the town; white the cther, called the Angrab, falling from the Muntain Wroggura, encompallis it on the north and norih-ealt ; and both rivers unite at the bottorn of the hill about a quarter of a mile fouth of the town. Upon the bank oppolite to Gundar, on the other fide of the river, is a large town of Mahometans; a great part of whom are employed in taking care of the king's and notsility's equipage both when chey take the nield and when they return from it. 'Taty are formed into a briy under proper officers; but never fight on either fide, being entirely conined to the occapation juit mentioned, in which by their care and dexterity in pitching and itriking the tents, and in leading and conducting the baggage-waggons, they are of great fervice. - The valley of Cundar is deforibed as having thice outlets; one fuath, to Dembea, Matha, and the Agows; another un the northweft, towards Sennaar, oser the Mountain of the Sun; and the third north, leading to Waggora over the high mountain Lamalinan, and fo on through ligre to the Red Sea.

GUNDI (Juhn Francis Paul), Cardinal de Retz, was the fon of Philip Emannel de Gondi, Count de Joigny, licutenant-general, \&et. and was born in 1613 . From a doctor of the Sorbunue, he firit became cuadjutor to his uncle John Francis de Gondi, whom he fuccecded in $165 t$ as archhithop of Paris; and was finally made a cardinal. This extraordinary perfon has drawn his own charater in his memoirs with impartiality. He was a man who, from the greate!t degree of debauchery. and aill languihing under its confequences, made himflf adored by the people as a preacher. At the age of 23 , he was at the head of a confpiracy againd the life of Cardinal Richelicu; he precipitated the parliament into cabals, and the people into ? edition: he was (fays M. Voleaire) the tirlt bifhop who carried on a civil war withont the matk of religion. However, his jatrigues and fchemes turned out foill, that he was obliged to quit France; and he iived the life of a vagrant exile fur five or fix years, till the death of his great enemy Cardinal Mazariu when he returned on certain itipulated conditions. After affiting in the conclave at Rome, which chofe Clement 1X. he retired from the world, and ended his life like a philolopher in 1679; which made Voltaire fay, that in his youth he lived like Catiline, and like Atticus in his old age. He wrote his Memoirs in his retirement ; the beftedition of which is that of Amilerda:n, 4 vols. 12 mo . 1719.

GONDOLA, a flat boat, very long and narrow. chiefy ufed at Venice to row on the canals. The word is Italian, gondola. Du Cange derives it from the vulgar Greek novnidas, "a balk," or "litth thip;" Lancelot deduces it from zordv, a term in Athenax for. a fort of vafe.

The middle-fized gondolas are upwards of thirty. feet long and four broad: they always tuminate at

'hes addref of the Vometian gondutiers, in paftugg abon. theis barws camals, is very temarkable : theo
ane wath two to eachgondula, and they row by puthing before them. 'llie foreman rets his oar on the lef: fude of the goneola: the hind man isplaced on the Rom, that he may fee the head over the tite or cosoing of the gondula, and retts his oar, which is resy lur-, wn the right tide of the grondula.

Govdona is alto the mance ot a palage-ionat of fix o: cible: oars, wifd in other parts of the coad of laly.

CONORRHAEA, an ctinx of white, grecnih, or Enferently-colourcd, matter from the uretha; mont comanonly owing to Pancral infection. Sce Medulae, and Silmemy.

COBRiGA (Lucretia), was one of the mot il Indrans hadies of the 1 oth century ; and much celebutud for her wit, her learning, and her celicate byle. Hortento Lando wrote a beantif! panegyric upon ber, and dedicated to hor his diadogue of moderating the palions. Iler beautifulletters have been e. lle eted with the greatik carc. Welarn from thefe, that her mariage with John l'anl Manfone was unhappy.Whe was married to him when the was not it jears of ane, and his conduet afurwards gave her infimite unchinefs. He engaged in a confiracy againtl the cuke of Feerrara; was detected and imprifoned by him; but, though condemed by the judges, not put to death. She did all in her power to obtain his enlargement, but in vain; for he died in prifon, having fhown fuch impaticnce under his misfortumes, as made it imagined he had lon his fenfes. She never would litten afterwards to any propofals of marriage, though feveral were made to her. All that came from her pen was fo much efteemed, that a collection was made even of the notes the writ to her fervants; foveral of which are to be met with in the edition of her ketters.

GOOD, in general, whatever is apt to increafe pheafure, to diminiti pain in us; or, which amounts to the fame, whatever is able to procure or preferve to us the poffefton of agrecable fenfations, and remove thole of an oppofte nature.

Moral Goon denotes the right conduct of the feveral funfes and palfions, or their jutt proportion and accommodation to their refpective objects and relations. Sec Morals.

Goon Alcaring, (lonus geflus,) fignifies an exact carriage or behaviour of a fubject towards the king and the people, whercuuto fome perfons upon their mifbehaviour art bound: and he that is bound to this, is faid to be more Atrictly bound than to the peace; becaufe where the peace is not broken, the furety de bono geflu may be forfected by the number of a man's company, or by their weapons.

Good Bubaviour, in law, an exaet carriage and behaviour to the king and his people.

A juflice of the peace may, at the requeft of another, or where he limfelf fees caufe, demand furcty for the good behaviour ; and to that end the jullice may iflue out his warrant againft any perfons whatfoever, under the degree of nubility; but when it is a nobleman, complaint is to be made in the count of chancery, or king's bench, where fuch nobleman may $\mathrm{N}^{\mathrm{o}} 141$.
be bound to keen the peace. Infants and feme coverts, who ought to find furety by their friends, may be bound over to their good holaviour; as alfo lunaties, that 7ueobs bave fometimes lucid intervals, and all others who break Lavo Dia. the peace, or being fulpectec' to do it by alfrays, affanlis, buthery, woundig, lighting, quarrulling, threatening, Se. A perfon nay be likewife bound to his good belsaviour for a feandatous way of living, keeping bawdy-ho:ice, gaming houfs, \&ec, and fo may common drunkards, whoremongers, common whores, cheats, libellers, Exe. He who demands furety for the peace, on any volence offered, mult take an oath before the jafice, that he goes in fear of his life, or tome hodily him, sec. and that it is not out of malice, but from a recead to his own fafety.

Gogd Lirceling. Sue Good MIANnfrs.
Goon Fishay, a falt of the Chititian church, in memony of the fufferings and death of Jefus Chritt. It is obfered on the Priday in boly or fa/fen week; and it is called, by way of eminence, good, becaufe of the befled eflects of our Saviour's fufferings, which were a propitiatory or expiating facrifice for the fins of the world. The commemoration of our Saviour's fufferings has been kept from the very firt ages of Chriltianity, and was alwives obferved as a day of the fricteft falling and humiliation. Among the Saxons it was called Ioner-Priady; but for what reafon, except on account of the long fallings and offices then ufed, is uncertain. On Good friday the pope fits on a plain form ; and, after fervice is ended, when the cardinals wait on him back to his chamber, they are obliged to keep a deep filence, as a teftimony of their forrow. In the night of Good-Friday, the Grecks perform the obfequies of our Saviour round a great crucifix, taid on a bed of ftate, adorned with flowers; thefe the bifhops diftribute among the affilants when the office is ended. The Armenians, on this cay, fet open a holy fepulchre, in imitation of that of monat Calvary.

Good-Hope, or Cape of Good. Hope, a promontory of A frica, where the Dutch have buit agood town and fort. It is fituated in the country of the Hottentots; fur an account of whom, and of the country at large, with its firl difcovery, fee the article Hottentots.

The Cape of Good-Hope has been generally elleemed the molt foutherly point of Africa, though it is not truly fo. In Pbillip's Vovage to Botany Bay *, we are told, that the land which projects farthett to the fouth is a point to the ealt of it, called by the Englith Cape Laçllus ; a name corrupied from the original Portuguefe das Agulbas, which, as well as the French appellation dis Aiguilles, is deferiptive of its form, and would rightly be trannated Needle Cape.

On approaching the Cape, a very remarkable eminence may in clear weather be difcovered at a confiderable diflance: and is called the Table-mountain from its appearance, as it terminates in a flat horizontal furface, from which the face of the rock defeends almoft perpendicularly. In the mild or fummer featon, which commences in September, and continues till March, the Table I and or Mountain, is fometimes fuddenly capped with a white cloud, by fome called the fpreading of the Tible-clotb. When this clond feems to roll down the fleep face of the mountain, it is a fure indication of an approaching gale of wind from the fouthealt; which generally blows with great violence, and
fome-
fometimes continues a day or more, but in common is of hort duration. On the firft appearance of this cloud, the flips in Table Bay begin to prepare for it, by flriking yards and top-mafls, and making esery thing as fnug as poffible.-A little to the weltward of the Table Land, divided by a fmall valley, ftands on the right hand fide of Table Bay a round hill, called the Sugar Loaf; and by many the Lion's Head, as there is a continuance from it contiguous to the fea, called the Lion's Rump; and when you take a general view of the whole, it very much refembles that animal with his head erect. The Sugar Loaf or Lion's Head, and the Lion's Rump, have each a flag-Itaff on them, by which the approach of fhips is made known to the governor, particularifing their numher, nation, and the quarter from which they come. To the eallward, feparated by a fmall chafin from the Table Land, ftands Charles's Mount, well known by the appellation of the Devil's Tower, or Devil's Heal; and fo called from the vioknt gufts of wind fuppofed to iflue from it when it partakes of the cap that covers the 'rable Land, though thefe gults are nothing more than a degree of force the wind acquires in coming through the chalm. When this phemomenon appears in the morning, which is by no means fo frequent as in the evening, the failors have a faying, as the Devil's Tower is almont cuntiguous to the 'rable Land, that the old gentleman is going to breakfatt; if in the middle of the day, that he is going to dinner; and if in the evenins, that the cloth is fpread for fupper. Table-mountain rifes about 3567 feet above the level of the fea; the Devil's 'Tuwer, about 3368 ; and the Lion's Head, 2764. In the neighbourhood of the latter lies Confantia, a diftrict conffiling of two farms, wherein the famous wines of that name are produced.

The above deffribed high lands torm a kind of am. phicheatre about the Tahle-valley, where the Capetown flands. This is fituated at the bottom of the middle height, or Table-mountain ; and almol in the centre of the Table Bay, fo callied from that moun-tain.-This bay, it is oferved in Pbillip's Foyage, " cannot properly be called a port, being by no means a Alation of fecurity ; it is expofed to all the violence of the winds which fet into it from the fea; and is far from fufficiently fecured from thofe which blow from the latud. The gulls which defcend from the fummit of Table-mountain are fufficient to force fhips from their anchors, and even vivlently to annoy perfons on the fhore, by dettroying any tents or other tomporary edifices which may be erected, and raifing clouds of fine dutt, which produce very troublefome effects. A gale of this kind, from the fouth-catl, blew for three days fucceffively when Captain Cook lay here in his firt voyage; at which tine, he informs us, the Refolution was the only thip in the harbour that had not dragged her anchoss. The florms from the lea are till more formidable; fo much fo, that thips have frequently been driven by them from their anchorage, and wrecked at the head of the Bay. But thefe accidents happen chiefly in the quade monfon, or winter months, from May 14. to the fame day of Augult; during which time few flips venture to anchor here. Our fleet arriving later, lay perfectly unmolelted as long as it was neceffary fur it to remain in this fation.

Vol. VIII. Part I.

- Falfe Bay, on the fonth-eall fide of the Cape, is more fecure than Table Bay during the 'prevalence of the north-well winds, but fill lefs fo in Itrong gales from the fouth-call. It is, however, lefs frequented, being $2+$ miles of very heavy road diltant from Cape Town, whence almolt all neceffaries mult be procured. The mold fheltered part of Faife Bay is a recefs on the welt fide, called Simon's Bay."

The latelt and molt particular as well as apparently the mott juit account of the Cape Town, concerning which voyagers have differed very much from one another in their reprefentations, is that given by Mr White in his Fournal of a Vorage to New Soutb Wales. From the hipping, he obferves $\dagger$, the town appears pleafantly fituated, $\dagger$ P. $8 \%$, but at the fame time fmall; a deception that arifes from its being built in a valley with fuch illupendous mountains directiy belind it. On landing, however, you are furprifed, and agreeably difappointed, to find it not only extenfive, but well built, and in a good fyle; the ftreets fpacious, and interfecting each other at right angles with great precilion. This exactnefs in the formation of the itreets, when viewed from the 'Table I, and, is offerved to be very great. The houfes in general are built of flone, cemented together with a glutinous kind of earth which ferves as mortar, and afterwards neatly plaftered and whitewahed with lime. As to their height they do not in common caceed two flories, an account of the violence of the wind, which at fome feafons of the year blows with great flength and fury. For the fame reafon thatch has been ufually preferred to tiles or fhingles; but the bad effeets that have proceeded from this mode when fires happen, has induced the inhabitants in all their new buildings to give the preference to flates and tiles. The lower parts of the houfes, according to the cultom of the Dutch nation, are not only uncommonly neat and clean in appearance, but they are really fo; and the furniture is rather rich than elegant. But this is by no means the cafe with the bed rooms or upper apartments; which are very barely and ill furnithed. The Areets are rough, uneven, and unpaved. Put many of the houfes have a fpace flagged before thic door; and others have trecs planted before them, which form a pleafant fhade, and give an agreeable air to the flreets.

The only landing-place is at the eate end of the town, where there is a wooden yuay rumaing fome paces into the foa, with feveral cranes on it for the convenience of loading and unloading the fcouts that come along fide. To this place excellent water is conveyed by pipes, which makes the watering of thips both eafy and expeditious. Clofe to the quay, on the left hand. flands the calle and principal lortref; a firong extenfive work, having wechent accummodations for the troops, and for many of the civil officers belonging to the company. Within the gates, the conpany have their principal tlores; which are fpacious as well as convenient. This fort covers and defends the eait part of the town and harbour, as Amiledam fort does the well part. The latter, which has beca built fince commodore Johnton's expedition, and whercon both French and Dutch judgment have been united to render it effectual and ttrong, is admirably plamed and calculated to annoy and harafs olips coming into the bay. Some fmaller detached fortihcations extend along the coaft, both to the eait and weef, and make landing, which was not
the cafe before the late war, hazardous and diffientt. In a word, Ca 隹 T 'own is at this time fortified with Arength, regularity, and judgment.

The governor's house is delightfully lituated, nearly in the centre of an extenfive garden, the property of the Dutch Eat India company, usefully planted, aud at the fume time elegantly laid out. 'Th: goverorer's family make what vie they plate of the produce of the garden, which is various and abundant; but the original intention of the company in appropriating fo extensive a pice of ground to this purpure was, that their holpital, which is generally pretty full when their Ships arrive after long voyages, may be well fupplied with fruits and vegetables, and likewife that their hips may receive a linilar fupply. 'This garden is as public as S: Junes's park; and for its handsome, pleafant, and with-thatal walks, is much frequented by purfons of every defcription, but particularly by the fathomable and cay. At the neper end of the principal walk is a finall face walled in for the purpose of combing forme large oiltiches and a few deer; and a little to the right of this is a foal menagery, in which the company have half a dozen wild animals and about the fame number of camions birds.

There are two churches in the town; one large, plain, and unadorned, for the Calvinists, the prevailing lect; and a faller one for the Lutherans. The hefinital, which is large and extenfive, is fituated at the upper end of the town, clofe to the company's garden; where the convalefents reap the benclit of a wholefome pure air, perfumed with the exhalations of a great varicky of rich fruit trees, aromatic fhrubs, and odorous plants and flowers; and likewise have the off of every production of it.

Bolides their hofpital, the Dutch Eat India compang lave feveral other public buildings, which tend to improve the appearance of the town. The two principal of there are, the fables and a houfe for their laves. The former is a handsome range of buildings, capable of containing an incredible number of horfes. Thole they have at the Cape are fall, fpirited, and full of life. The latter is a building of considerable extent, where the faves, both male and female, have Separate apartments, in a very comfortable fy le, to rehide in after the fatigues and toil of the day ; and there are feveral officers placed over them, who have commondons apartments, and treat them humanely.

The inhabitants of the Cape, though in their pertons large, Aleut, and athletic, have not all that phlegm about them which is the characterittic of Dutchmen in funeral. The phytical influence of climate may in forme degree account for this; for it is well known that in all fouthon latitudes the temper and difpofition of the ;eople are more gay, and that they are more inclined to luxury and amusements of every kind, than the inhabitant of the northern hemisphere. The ladies are lively, good natured, and familiar; and from a pecsliar gay $t$ urn, they admit of liberties that would be thought reprehenflele in England, though perhaps they as feldon overleap the bounds of virtue as the women of other countries.

The heavy draft work about the Cape is molly per. formed by oxen; which are heme brought to an macommon degree of ufefuhefs and docility. It is not uncommon to fee 14,16 , and foretime 18 , in one of
their teams; when the roads are heavy, they Cometimes, thu ugh randy, yoke 20; all which the Hotientots, Malays, and Cave Raves, have in the molt perfeet fubjection and obedience. One of thee fellows places humflit on the fore part of the waggon, or, when loaded, on the top, of the load, and with a tremendous long whip, which from its size he is obliged to hold in both his hands, manages the fe creatures with inexpreffible addrefs. When he fuad s expectation needful, he can make them keep whatever pace he choofes, either trot or gallop (a gait performed or kept up with difficulty by European oxen), and that with as much cafe as if he was driving hordes. They likewife manage horfes with the fame dexterity; and to fee one of them driving three, four, five, and fometimes fix pair, in hand, with one of theft long whips, woald make the molt complete matter of the whip in England cut a deficicable ligure. Carriages are not very nomerows at the Cape, as the inhabitants in general travel in covered waggons, which better fit the roughness of the country. The governor and fume fer of the principal people keep coaches, which are a good deal in the English flyte, and always drawn by his horses.

Good Manners. Sec Manners.
GOGGINGS, in fealanguage, are clamps of iron bolted on the ftem-poft of a hip, whereon to hang the rudder and keep it fundy; for which purpose there is a hole in each of them, to receive a correfpondent fyindie bolted on the back of the rudder, which turns thereby as upon hinges.

GOOSE, in ornithology. See Anas. The goode was hid in great eftem anoongh the Romans, for hasing fared the Capitol from the invasion of the Gauls by tacking and clapping its wings. Gecfe were kept in the temple of Juno ; and the cenfors, when they entired upon their office, provided meat for them. There was alfo an annual feal at Rome, at which they carfried a fiver image of a goof in late; and hanged a dog, to punith that animal because he did not bark at the arrival of the Gauls.

Goose-Ander, in ornithology. See Merges.
Goose-Berry, in botany. See Rubes.
Guoss-Neck, in a hip, a piece of iron fixed on the one end of the tiller, to which the laniary of the whip-flaff or the wheel -rope comes, for fteering the flip.

Gooss-Wing, in the fea-language. When a hip fails before, or with a duatter-wind on a frelly gate, to make the more hale, they blanch out a boom and fail on the lee-fide; and a fail fo fitted, is called a gooferaing.

GORCUM, a town of the United Provinces, in South Holland, which carries on a conliderable trade in cheese and butter. It is fituated on the rivers Ligne and Maefc, in E. Long. 4. 55. N. Lat. 51.40

GORDIANUS I. (a Roman general), was for his valour and virtues chofen emperor by the army in the reign of Maximinus, A. D. 237; but his for, whom he had affuciated with himfelf in the throne, being fain by Capetian, the governor of Mauritania for Maximinus, Gordianus killed himfelf the fame year. See Rome.

Gordianus III. (grandfon of the former), a renowned warrior, and Hyled The guarti.no of the Roman

he confulted the foothfayers; a virgin bid him facrifice to Jupiter in the capacity of king. He married the virgin, who brought forth Midas. The Perfians infructed by the oracle to fet the firft perfon they met in a wain upon the throne, met Gordius, and made him king. Midas for this good fortune dedicated to Jupiter his father's cart. The knot of the yoke, they fay, was fo well twited, that he who could unloofe it was promifed the empire of Afia; hence the proverb of the Gordian knot had its original. See Gordian Knot.

GORDON (Alexander), an excellent draughtrman and a good Grecian, who refided many years in ltaly, vifited moft parts of that country, and had alfo travelled into France, Germany, \&c. was fecretrary to the Saciety for Encouragement of Learning; and afterwards to the Egyptian Club, compofed of gentlemen who had vifited Egypt (viz. lord Sandwich. Dr Shaw, Dr Pococke, \&c.) He fucceeded Dr Stukely as Cecretary to the Antiquarian Society, which office he refigned in iffi to Mr Jofeph Ames. He went to Carolina with governor Glen, where, belides a grant of land, he had feveral offices, fuch as regifter of the province, \&ic.; and died a jutice of the peace, leaving a handfome eftate to his family. He publithed, 1. Itinerarium Septentrionnle, or a Journey through molt parts of the Counties of Scotland, in iwo parts, with 66 copperplates, 1726 , folio. 2. Supulement to the Itinerarium, 1732 , folio. 3. The Lives of Pcpe Alexander VI. and his fon Cxfar Borgia. 4. A complete Hitory of the ancient Ampitheatres, 1730, 8vo. afterwards enlarged in a fecond edition. 5. Ao Effay towards explaining the hieroglyphical figures on the Coffin of the ancient Mummy belonging to Capt William Lethieuller. 1737, folio, with cuts. 6. '「wenty-five Plates of all the Egyptian Mummies and other Egyptian Antiquities in England, 1739 , fulio.

Gordon (Thomas), noted for his tranflations and political writings, was born at Kirkudbright in North Britain. He came young to London; where he fupported himfelf by teaching languages, until he procured employment under the earl of Oxford in queen Anne's time, but in what capacity is not now known. He firlt dikinguifhed himfelf in the defence of Dr Hoadley in the Bangorian controverfy ; which recommended him to Mr ''renchard, in conjunction with whom he wrote the well-known Cato's Letters, upon a variety of important public fubjects. Thefe were followed by another periodical paper, under the title of the Indepeudent Whig; which was continued fome years after Mr Trenchard's deatl, by Gordon alone, againtt the hierarchy of the church ; but with more acrimony than was hown in Cato's Letters. At length Sir Robert Walpole retained him to defend his adminiftration, to which end he wrote feveral pamphlets. At the time of his death, July 28 th 1750 , he was firf commiftioner of the wine licences, an office which he had cnjoyed many ycars. He was twice marricd. His fecond wife was the widow of his great friend Trenchard, by whom he had children.- He publifhed En. glifh tranflations of Salluft and Tacitus, with additional difcourfes to each author, which contain much good matter. Alfo, two collections of his trafts have been preferved : the firlt intitled, A Cordial for Lowfpirits, in three volumes; and the fecond, The Pillars of Prieltcraft and Orthodoxy haken, in two vo.
lumes.

Cordonia limes. But thefe, like many other pohnumus things, Goreded. well as his other works he places the verbs at the ends of fentences, according to the Latin idiom, in a very ftiff and aftected manucr.
GORDONLA, in botany: A genus of the polyandris order, belonging to the monadelphia clats of plints. The calyx is fimple; the dyle fivecornered, with the lligma quinquetid; the capfule quinquilocular ; the feeds two-fold with a leafy wing. This is a tall and very Hraight tree, with a regular pyramidal head. Its leaves are thaped like thofe of the common bay, Dut ferrated. It begins to bloflom in May, and continues bringing forth its thowers the greate et part of the fummer. The tlowers are lixed to foot-ftalks, form or five inches long; are munopecalous. divilad into five fergments, encompafing a tuft of thmina headel with yellow apices; which flowers, in November, are fucceeded by a conic capfula having a divided calyx. The capfula, when ripe, opens, and divides into five feetions, difdofing many fmali l.alf-winged feeds. This tree retains its leaves all the year, and grows only in wet phaces, and ufually in water. The wond is tomewhat foff; yet Mis Catcloy meations his havint feen fome beautiful tables made of it. It grows in Carolina, but not in any of the mome nothern colonies.

GORL, in heraldy, one of the abatoments, which, according to Gullim, denotes a cosard. It is a figure condiling of two arch hacs drawn one from the fimiter chief, and the other from the fimilter bafe, both meeting in an acute angle in the midthe of the fe's puint. sice Heraldry.

GOREE, a fmall inand of Africa, near Cape de Ferd, fubject to the French. It is a fmall face not exceeding two miles in circumference, but iss importance anifes fom its liturtion for trade fo near Cape Verd, and it has been therefore a bone of contention between European nations. It was firl puffefled by the 1)utch, from whom, in 1663 , it wastaken by the Englifh; but in 166,5 it was retaken by the Dutch, and in 16:7 fubdard by the Ticnch, in whofe polferfon it remaived the the year 1759 , when the britifh arms wercesery where triumptant ; and it was roduced by emmodore keppel, but reftored to the Freach at the treaty of place in 1763 . It wats rataken by the Englith in the laft war, but again reftured at the peace of 1753. E. Long. 17. 20. N Lat. 14. +3 .

Goree, the capital town of an ifand of the lame name in Holland, eight miles South of Bricl. E. Long. 3.5 a N. 1.at. 5 1. 55.

GOREY, a burough, fair, and pof town in the conaty of Wexford, province of Lindter, otherwife ealled Neculoruagh. It thands atoun 18 miles nurth of Wexford town, and 45 fiom Dublin. N. Lat. 52. 40. W. Long. 6. 30. It fends two menibers to paliament; pitronage in the family of Ram.

GOKGE, in architecture, the narrowelt part of the Tufcan ard Doric capitals, lying between the allragal, above the thaft of the pillar, and the amulets.

Gorge, in fontification, the entrance of the platform of any work. Sec fortification.

GOKGED, in hecaldry, the bearing of a crown, coronet, ot the like, about the neek of a lion, a fwan, sec. and in that cafe it is fuid, the lions or cygnet is surged with a ducal corunct, \&c.

Gonged is alfo ufed when the gorye or neck of a peacock, fwan, or the like bird, is of a dificent colour or metal trom the refl.
GORGET, a lind of breaf plate like a half moon, with the arms of the prince thereon; worn by the officers of foot. They are to be either gilt or filver, according to the colour of the buttons on the uniforms.

Gorget, or Gorgeret, in furgury, is the name which the French give to the concave or cannulated conductur, ufed in lithotony. Sec Surgery.

GORGONA, a fmall ifland of Italy, in the fea of Tufcany, and near that of Corfica, about eight miles in circhmference; rumarkable for the large quantity of anchovies taken near it. E. Long. io. o. N. Lat. 43.22.

Gorgoxa, a fmall inand of the South Sca, 12 miles wefl of the coalt of Peru, in America. It is indifferent high land, very woody, and fume of the trees are very tall and large, and proper for malls. It is about 10 miles in circumference, and las feveral forings and rivulets of excellut water, but is fubject to conflant rains. WV. Long. 79. 3. S. i.at. 3. 30.

GORGONIA, in natural hiltory, a genns of zoophytes, which formerly were called ceratophypons, and are. known in Euglifh by the names of for funs, fou-fealbers, and fea-rwhips. Limnows and Dr Pallas conlider them as of a mixed nature in thacir growth, between aninals and vegetables; but Mr Ellis fhows them to be true animals of the polype kind, growing up in a branched form refemblin: a thrub, and in ino part vegetable. They differ from the freth water polype in many of their qualities, and particularly in prodinciag from their own thoblance a hard and folid fupport, ferving many of the purpofes of the bone in other animals. This is formed by a concreting juice thrown out from a peculiar fet of longitudinal parallcl tubes, running along the internal furface of the diethy part: in the coats of thefe tubes are a number of finall oritices, through which the offeons liquor exfudes, and concreting, forms the layers of that hatd part of the annular circles, which fome, judging from the conliftence rather than the texture, have croncoully denominated cover. The furface of the grorgonia is compofed of a kind of fcales, fo well adapted to each other as to ferse for defence from external injuries: and the fleth, or, as fome have called it, the hark or cortex, conifits of proper mufcles and tendons for extenting the openings of their cells; for fonding forth from the nee their polype fuckers in fearch of food; and for drawing them in fudoculy, and contracting the fohincter mulches of thefe llarry cells, in order to fecure the ie tender paits from danger; and alio of proper fecretory ducts, to furailh and depofit the ofleons matter that forms the Rem and branches as well as the bafe of the bone. Mr Ellis allirms, that there are ovaries in the fe animals, and thinks it very probable that many of them are viviparous. See Corallinfs.

GORGONS, in antiquity and mythology. Authors are not ayrect in the account they give of the Gurgons. Thie puets reprefont them as three fillers, whofe names wenc Sebeno, Euryulh, and Medufa; the later of whom was mortal, and, having been dellowered by Neptunc, was killed by Pofeus; the two former were fubject acither to age nor death. They are deferibed with wings on their thoulders, whin ferpents
round their heads, their hands were of draft, and their teeth of a prodigious frize, fo that they were objects of terror to mankind. After the death of Me hula, her fillers, according to Virgil, were appointed to keep the gate of the palace of Pluto.

> Mullogue praterco qurgiarum menfira forarum-
> Gorcones, Harpyiagu-

Diodorus Siculus will have the Gorgons and Amazons to have been two warlike nations of women, who inhaloed that part of Libya which lay on the lake Sritonidis. 'The extermination of the fe fen ale nations $w$ as not effected till Hercules undertook and performed it.

Paulanias lays, the Gorgons wee the daughters of Phorbus; after whole death Medusa, his daughter, reigned over the people dwelling near the take Mritonidis. The queen was paffionately fund of hunting and war, fo that the laid the neighbouring countries quite waite. At bal, Perfeus having made war on them, and killed the queen leetelf, when he came os take a view of the field of battle, he found the queen's corpfe fo extremely beautiful, that he ordered ier head to be cut off, which he carried with him to thaw his countrymen the Greeks, who could not behold it without being truck with allonifhment.

Others represent them as a kind of mondrous women, covered with hair, who lived in woods and forells. Others, again, make them animals, refembling wild hep, whole eyes had a puifonous and fatal in. fluence.

GORITIA, or Gozitz, a Along town of Germany, in the circle of Autria, and duchy of Carniola, with a calicle; pleated un the river Lizonzo, 20 miles north-eall of Aquileia, and 70 northeralt of Venice. E. Long. 13.43. N. Lat. fo. 12.

GORLA:US (Aerating), an eminent antiquary, was born at Antwerp. and grained a reputation by collecting medals and other antiques. He was chiefly fond of the rings and deals of the ancients, of which he fublimed a prodigious number in 160 t , under this title, Dagyliothea; five sinnuiorum Sigillarium, quorum a aud prifcos tam Graces guam Romans ufos ex faro, are, argento, st aura, Prompurium. 'I his was the bill part of the work : the fecund was intitule, Variarum Gemnarum, quibus antiquitas in fignando ul folia foulpura. "This work lias undergone several editions, the belt of which is that of 1 eejden, $1 C_{y}$ : for it not only contans a vat number of cuts, but a fo a fort explicaton "f them by Gronovius. in 56.8 , he published a coliestin of medals: which, however, if we may believe the Sralgerana, it is not life always to trull. Guliens piteleed upon Delft for the place of his refidence, and died there in ago. His collections of ancients were fold by his heirs to the prince of Wakes.

GORLITZ, a tow: of Germany, in Upper Luriatia, fubject to the lector of Saxuny. It is a hand. forme ftrong place, and lated on the river Niff, in E. long. 15.15. N. Lat. 51.10.

GOK"LERIA, in botany: A fenus of the poly. gamia frullanea order, belonging to the fyngenelia clap's of plants; and in the natural method ranking under the doth order, Comps fire. The receptacle is naked; the pappus woolly ; the Bores of the radius ligulate or plane: the calyx imbricated with Sinus feales.

GOSHAWK. See Falco.
GOSHeN (Inc. geog.) , a canton of Egypt, which

Jofepl procured for his father and his beechen when Goflar they came to dwell in Lizypt. It was the mon fruit- gill fol part of the country: and its name deems tu be deGolypiuns. rived from the Llebrew, (chen, which dignities "rain;" becaufe this province lying very near the Miditera. mean, was exposed to rains, which were very rare in other cantons, and more efpecially in Upper Egypt. Calmest does not question but that Goren, which Jofla (x.41.xi.16 xp. 51.) makes part of the tribe of Judah, is the bane as the land of Gufhen, which was given to Jacob and his foes by Pharaoh king of Egyp; (Gen xxvi. 28). It is certain inst this coontry lay between Palcutine and the city of Tanais, and that the allotment of the Ifebrews reached Southward as fay as the Nile, (Joth. xiii. 3 ).

GOSLAR. a large and ancient town of Lower Saxony, and in the territory of Brunfwick; it is a free imperial city, and it was here that gunpowder was frt invented, by a monk as is generally luppofed. It is a large place, but the buildings are in the ancient tate. In 1728,280 hones, and St Stephen's fine church, were reduced to afhes. It is fated on a mountain, near the river Gore, and nevi it are rich mines of iron. The inhabitants are fanion tor brewing excellent beer. E. Lana. 3. 37. N. Lat. 51. $55^{\circ}$

GUSPEL, the hiftury of the life, actions, death, refurrection, alcenfion, and doctrine of Jefus Chrilt.The word is Saxon, and of the fame import with the Latin termevangeliun, which dignifies glad tidings, or good news.

This, history is contained in the writings of St Matthew, sit Mark, it Luke, and St John; who from thence are called evangoliffs. The Chridian church never acknowledged any mure than the fe four gofpels as canonical: notwhthtanding which, several apocryphal guipuls are handed down to us, and others are entirely lon.

GOSPORT, a town of Hamphire, 79 miles from London, in the parish of Alveriteck. It has a ferry over the mouth of the harbour to Portmonth, and is a large town and of great trade, especially in time of war. 'Travelers chute to lodge here, where every thing is cheaper and mure commodious for them than at Portinouth. 'The mouth of the harbour, which is nut lobroad here as the "hames at Wetiminller, is fecured on this nide by four forts, and a platform of above 20 cannon level with the water. Here is a noble hofpital built for the cure of the flick and wounded failor in the fervice of the navy; betides a free fehool.

GOSSA.IER is the name of a fine filmy fubllance, like cobwebs, which is len to float in the air, in clear days in autumn, and is more observable in stubble. fields, and upon furze and uther low buthes. This is probably formed by the ling fader, which, in araverling the air for food, flouts ont thole threads from its anus, which are borne down by the dew, \&c.

GOSSIPIUM, or Cot :un: A genus of the polyandria order, belonging to the monodelphia claps of plants; and in the natural method ranking under the 37th order, Columnifera. The calyx is double, the exterior one trifid; the capfule quadrilocular; the feeds wrapt in cotton-wool. There are four fpecisis, all of them natives of warm climates 1 . The herbscum, or common herbaceous cotton, hath antherbilceuns fmouth talk two feet high, branching upwards;
hive tha fonoch leaver, End yellw fowers from the wato of the banernes, fuceeseded by roundith capfukes full of lead and cother. 2. Whe hirfums, or hairy Anctienucostu, hath hany nalks hanching l..urally swo or diree fet high: pralneted, three and five lobed hatry leaveo: :nd yellow Rowers, fuceceded by lange aral puds furnilied with feeds and cotan. 3 The barba'sute or Babadues? hratioy cotton, hath a flouby alalk thanching foum or five feet high, three lobed finoudd leaves, glanhious underneath; and yellow dowcrs fucceeded by oval pods, cobraining feeds and cotton. A. The arborem, or trec cotton, hath an upright woudy peremial flalk, branching fix or eight feet Wigh; paluated, four or five lubed fonoorh leaves; and Jchow thowers, fucceeded by large pods filled with feeds ani cotton.

The bitl three fecies are annual, but the fourth is perennial both in ront and Ralk. In warm countries thef plants are cultivated in great quantities in the fieths for the fake of the cotton they produce; but the furl feccics is moll generally cultivated. The podsare frometimes as large as middling-fized apples, clofely filted with the cotton furrounding the feed. When thefe plants are alaifed in this country, they muft be con:inual.'. liept in a warm fore, where they will prodare feeds and coton. They are propagated by leeds. Sat Cottos.

The American Inands produce cotton flrubs of varions fizcs, which rife and grow up without any cul. oure; cpecially in low and marfy grounds. Their produce is of a pale red; fome paler than others; but fo thert that it camot be fum. None of this is brought to Curope, though it might be ufefully employed in making of hats. The little that is picked up, ferves to make matraftes and pillows.

The cotton- thrubs tha! fupplies our manufactures, re, lires a dry and ltory foil, and thives bell in grounds that have already been tilled. Not but that the plant appears more flourifing in froth lands than in thofe which are exlisuted; but while it produces more wood, it bears lefs fruit.

A wethen expofure is fiteet for it. The culture of it heqina in Alarch and $A$ pril, and continues during the fitt fpring-rains. Holes are made at feven or eight feet difnance from each other, and a few feeds thrown $\therefore$ When they are grown to the height of five or fix i.ches, all the Atems are pulted up, except two or three (If the ftrongeth. Thefe are cropped twice belore the end of Augut. This precamtion is the more neceffary, as the wood bears no fruit till after the fecond proning; and, if the thrub was inflered to grow more than four feet ligh, the crop would not be the greater, nor the fruit fo cafly gathered. The fame method is purfued for three years; for fo long the hrub may continue, if it cannut conveniently be renewed oftencr with the frofpect of an adrantage that will compenfate the trouble.

This ufeful plant will not thrive if great attention is not paid to pluck up the weeds that grow about it. Frequent rains will promote its growth; but they mult not be inceffant. Dry weather is particularly neecflary in the monils of March and April, which is the time of gathering the cotton, to prevent it from being difcoloured and fpotted.

When it is all gathered in, the feeds muf be picked
out from the wool with which they ate naturaliy mixed. This is done by means of a cotton-mill; which is an engine compofed of two rods of hard wood, about 18 feet long, 18 lines in circumference, and fluted two lines deep. They are contined at both ends, fo as to leave no nore diftance between them than is necerfary for the feed to flip through. At one end is a kind of little millltone, which, being put in motion with the foot, turns the roads in contrary dirtetions. They feparate the cotton, and throw out the feed contained in it.

GOIHA, a town of Germany, in the circle of Upper Saxony, and capital of the duchy of Sase-Gotha, in E. Long. 10.36. N. Lat. 51. Some fancy this town had its name from the Goths, and that they fortitied it i: their march to Italy ; but it was only a village till furtounded with walls by the bithop of Mentz in 964 . It is fituated in a tine plain on the river Leina, wall buit and ftrongly fortified. Here are two handfome churches and a very good hofpital. Its chief trade is in dyers wood, of which they have three crops, but the third grows wild. The neighbouring country produces a vall deal of corn. The cafte or ducal palace of Gotha was rebuilt in the 1 oth century by duke Erneth, furnamed the Pious, who caufed both that and the town to be encompafled with citches and ramparts; and gave it the name of Friedenficn, or the Cafle of Peace, in op. polition to its ancient name of Grimmerficin, or the Cafte of the Firries. It is fituated in a neighbouring emineruce, from whence there is a valt profirect of a fruitful plain. In one of the apartments there is a collection of valuable rarities, and a noble library.
The dukedon of Saxe Gotha is about 30 miles long, and 12 broad. The reigning duke is Lewis Ernelt, born in 17+5, and manied to the princefs Maria Charlotte of Saxe Meningen, by whon he has iffue. He is the head of the Ernettine line of Saxony, defcended from the elector John Frederick the Magnanimons, who was deprived of the electorate by the emperor Charles V. in 1574 ; fince which the youngent branch called the Allertine lias enjoyed it. He has feveral other principalities befides that of Saxe Gotha; and his reventes are computed at L. 200,000 a year, with which he maintains about 3000 regular troops. As he is the moft powerful of all the Saxon princes of the Ernetine branch ; fo of all the courts of Saxony, next to that of Drefden, he has the mott numerous and the moll magaiticent. His guards are well clothed, his liveries rich, and his tables ferved with more elegance than profufion. And yet by the prudent management of his public finances, his lubjects are the lealt burdened with taxes of any flate in Germany. The religion is Lutheran.

GOTHARD, one of the highef mountains of Swizzertand; and from the top, where there is an hofpital for monks, is one of the linelt profpects in the world. It is eight niles from Aldorf.

GOTHEbORG, or Gothenburc, or Gotenburg. See Goftenburc.

GOTHIC, in general, whatever has any relation to the Goths: thus we fay, Gothic cultoms, Gothic architeciure, \&e. See Architecture.

GOTHLAN1, the moll fouthern province of Sweden, being a peninfula, encompafled on three lideg by the Bahic Sea, or the channel at the eutrance of it.

## G O T

Goth.

It is divided into feveral parts, which are, E? Goth. land, Wet Gothland, Smaland, Hailand, Beaking, and Schunen. It was a long time in the polfefion of the kings of Denmark, but was ceded to Sivedea in 1654. The principal towns of Gothland are Calame, Landicroon, Chritianople, Daleburg, Cothenburg, Helmullat, Lunden, Malnone, and Vexiu.

GOIHS, a wallike mation, and above all others famous in the Roman hilory, came originally one of Scandinavia (the nane by which the ancients dillin. guifhed the prefent countrics of 3 weden, Norway, Lapland, and Fimmark). According tu the mott probable accounts, they were the firil inh bitants of thofe countries ; and frum thence fent colonies into the illands of the Baltic, the Cimbrian Cherfonefus, and the acjacent places yet deftitute of inlabitauts. The time of their init fetuling in Sedndinavia, and the time when they firlt peopled with their colonies the abovementioned illands and Cherfonefus, are equaily uncertain; tho' the Guthic annals fuppofe the latter to have happened in the time of Seruy the great grandfather of Abra. ham. This firtt migration of the Goths is faid to have been conducted hy their king Eric; in which all the ancient Guthic chronicles, as well as the Danifh and Swedith ones, agree. Their fecond migration is fup. pofed to have happened many ages after; when, the abovementioned countries being overtocked with people, Berig, at that time king of the Goths, went out with a feet in queft of new fettements. He landed in the country of the Ulmerugians, now Pomerania, drove out the ancient inhabitants, and divided their lands a nong his followers. He fell next upon the Vandals, whofe country bordered on that of the Ulmerugians, and overcame them; but inftead of forcing them to a. bandon their country, he only made then fhare their poffeflions with the Guthis.

The Guths who hat fetted in Pumerania and the adjacent parts of Germany being greatly increafed, infomuch that the country could no longer contain them, they undertook a third migration in great numbers, under Filimer furnamed the Great, their fifth prince after leaving Scandinavia; and taking their route eaftward, entered Scythia, adranced to the Cimmerian Bofphorus, and, driving uot the Cimmerians, fetted in the neighbourhood of the Palus Mreotis. Thence in procef's of time, being greatly increafed in Scythia, they refolved to feek new fettements; and, accordingly taking their ronte eathard, they traverfed feveral countries, and at length returned into Germany.

Their leader in this expedition was the celebrated Woden, called alio Voden, Otben, Oden, Golin, and Guadain. Of this Woden many wonderful things are related in the Saeu-gothic chronicles. Hie was king of the Afgardians, whom the northern writers will have to be the fame with a pcople called Apurgiasis men. tioned by Strabo and Ptolemy. By Sirabo they are placed near the Cimmerian Borphorus. Afpurgia was the metropolis of a province which Strabo call's Afia: and Woden and his followers are Atyled by the ancient Gothic writers Aja, Afiana, and Afote. The kings of Afpurgia were mallers of all that part of Scythia which lay to the weftward of Imaus, and was by the Latins called Sajubia inita Inoum, or "Seythia within Imaus."

As what ime Poncen reigned in this country, is cothe. quite unconain; but all hitorians agree, that he went $\rightarrow$. out in queit of new fetilementa with incredible marm. bers of people following lim. He fint entered linxo. Lunia, comprehending the countries of Prullia, Lavotia, and great part of Mufory. From thence he went by fea into the north parts of Germany ; and haviag reduced Saxony and Jutand, he at lat fetted in Sweden, where he reigned till his death, and became for famous that his name reached all countries, and he was by the northern nations worfopped as a gold. He is fuppofed to have brough: with him the Runic chatac. ters out of Alin, and to have taught the northern na. tions the ant of poetry; wherece lie is dyled the father of the Scaldi or Scaldri, their poets, who defcribed ia verfe the exploits of the great men of their nation, as the barts did among the Gauls and Dritons.

The Romans ditinguitiod the Goths into ixo clafo fes; the Onfoguths am Vifigoths. Thete names they receired before they left Scancinavia, the $I$ fiforbs be-
 who inhabied the weftern part of Scandinavia, as the OArnguths were thofe who inhabited the caltern part of that country. 'Their hillory' affords nothing of moment till the time of their quarrelling with the Romans; whic! happened under the reign of the emperor Caracalla, fon to Severus. After that time their hittory becomes @ clofely intewoven with that of the Romans, that for the molt remarkable particulars of it we mut refer to the artide Rome. After the deftructon of the Roman empire by the Heruli, the Ofrogoths, under their king Theodorio, became mathers of the greate!t part of Italy, having overoome and put to death Odoacer king of the Heruli in $48+$. They retained their dominion in this country till the year 553 ; when thes were linally conquered by Narles, the cmperor Juitinian's general: See (Hiflury of) Iracy. The Viligroths ferad ia Spain in the time of the em. feror Honurius, whete they founded a kingdom which continued tiil the country was fubdued by the Satacens; fre the article Spais.

The Goths were famous for their hofpitality and kindnefs to iltrangers, evelt before they enbraced the Chrittian religion. Nay, it is faid, that flum their being eminently good, they were called Goths, by the neighbouring nations; that name, according to Grotius and molt other writers, being derived from the German ward gaten, which lignities "good." 'They encuuraged, fajes Dio, the lludy of philufophy above all other barbarous or foreign nations, and cfien chofe kiags from among their philofophers. Pulygamy was not only allowed but countenanced among them; every one being valued or refpeted according to the number of his wives. By fu many wives they had an incredible number of chideren, of whom they kept but one at home, fending out the rell in quelt of new fettlements; and heace thofe fwarms of people which over. ran fo many countrics. With them adaltery was a capital crime, and.irromimbly punifhed with death. This feverity, and likenife pulygame, prevailed anong them when they were known to the Komans only by the name of Getis (their mott ancicut uame); as appeans from the puet Menander, who was himflif one of that nation ; and frum Horace, wha greatly comands the challity of their women. Their laws fel! little fort de

Cowhofed, thofe of the ancien: Rmeans. Their cowerment was Boter- monachical; their retigion was moch the fan: with barg.
that of the ancient Germans or Celtes; and cheir defes
is deferibed by ipollinaris Sidonims in the tallowing words: "they ate thod (fays lec) with higg hoors made of hair, and reaching up to their ankles; their knecs, thighs, and kes, are withost amy coworing ; their gaments of varions colours fearce reachong to the knee ; their flesues only cover the top of :lear atms; they wear green eafocks with a red border; their betes hang on their fhonlder: their ears are conered with twited locks; they ufe booked lances and mifile wea. pons."

GOTlIOFRED, or Godiker, (Deais or Dionytius), an emment civil lawyer, born of an illutrious honfe at Paris, in 1549 . Finding his comery involved in the contution ot the leagues, he accepted of a profeffor's chair at Genera, natil he was fatronized and employed by lieny $\mathrm{N} .:$ but being afternards llripped of his employments as a huguenot, he at length retired to Hedelburg, from whence no uffers werc able to detach him. He was, however, difap. pointed of his intention to end his days thete ; for the dillurbances that broke out in the Falatinate obliges him, in 1621 , to take refuge in Stralburg, where he died the following year He wrote a great number of books; but his principal work is the Corpus Furis Ci . wilis cum metis.

Gothofrfa (Theodore), fon of the former, was born at Geneva in 1580 . As foon as he had linithed his itudies, he went to Paris; where he conformed to the lwaith reli,tom, and applied with indefatigable indully tuthe dudy of hitlory, that of France parict:larly, wherein he became very eminent, as appears by lis works. In 1632 , the king made him one of his bisheriggraphes, with a flpend of 3000 lives; and, in 8636, he was fent to Cologn, to allill at the treaty of pace negociat.ug there, on the part of France, by the combal of Lyous. This treaty being removed to Munder, Gothufred was fent thitleer, where he diew 1 p Memuirs on the fubject; and continued in that city, in the king's fervice, to his death in 1649 . His princifal work is his "Account of the Coremonial of the kings of France."

Gouhofrid (James), brother of the preceding, was horn at Geneva in 1587 . Applying himetef to the fludy of the law, he obtained the profeflor's chair there, was made counfellor of the city, and was fevetal times cmployed in France, Germany, Piccomont, and $S$ sitzerland, to negociate their affais in the mame of the republic. He died in 1562 ; and his chief work is his Codes: Theorlofunus, cum ferpetuis commentasiis, Ẽ̛c.

Gothertd (Denis), fon of Theodore above mentioned, was bornat Paris in 1615. He lludied hiftory after his fathos's cxample; became as eminetit in that department of knowledge; and obtainced the reverfion of his father's place of hiltoriographer royal, from Lou's XIII. When he was bat 25 years of ise. Ite
 Atmoirs of Platip de Comanes; and was proparing a IIjRosy of tobwh l'/II. when he died in 1681. It was

CUTFLNEUURG, a rich and thong town of Welt Gothland, in Sicden, with a gord harbour, at the
mouth of the risc: Gothetba ; which is the beft fituated for forcign made of any in Sweden, as it lies without the Sound. It occupies the lite of an ancient town, naned Lodfe, which was buit by Gullavus Vafa; and beins end wed with conliderable privileges, foon became the great emporium for the trade of the weflern Irovinces. Charles IX when duke of Cothland, having in 1 foc laid the founda:ions of a new town in the inand of Hifingen at no grat difance from Lodele, called it Gobledarg (lince comnted in:o Gotenlurg), in honour of his duchy. Upon his acedfion to the throne, he erected in his new town a tradine company; drew thither many foreigners, particularly the Duteh, to whom he allowed an exemption from allduties of export and import during 20 yenrs; a corps of Enstith and Scotch troops, under 1te command of Wilhan Stewart; and granted to the Catinits eflablithas thersin the fice exercife of their religion, the tirlt place in Sweden where this tole. ration was permitted. The town, being in 1611 recuced to athes by the Danes, was rebuitt in the reign of Gattawns Adolphus in its prefent fituation, and obtaine a conlirmation of its ancient rights, with the grant of feveral i.dditional privileges.- It is built in a vory limgular lituation. At a imall dillance from the fea is a marlly plain, fcarcely more than half a mile in breadth, watered by the rivers Cotha and Moldal, and almoll entirely inclofed with high ridges of rocks, fo bare and rugged, that they fearcely produce a lingle blade of grals, and exhibit as barren an appearance as the fumnits of the lofticil Alps. Gottenturg fands partly upon the ridges, and partly in the plain; and is divided from thefe different lituations into the Upper and Lower Town. The latter is entirely level, intellected by feveral canals in the manner of the Dutch towns; and its houfts are alf conftucted upon piles: the upper pat hangs on the declivities; and rows of buildings rife one above the other like the feats of an amphitheatie. The whoke is regularly fortified; and its circumference is near three miles, excluhive of the fubmbs, called $H_{\text {ard }}$, which lie towards the harbour. The Atects are all uniformly lataght: a few of the houfes are of brick; but the generality are conftucted with wood painted red. The harbour is formed by two chains of rocks, and is about a quarter of a mile in breadh. It sentrance is defended by the fort of New Elftborg, which llauds upon a fmall rucky illand, and eontaias a garrifon of 250 men . There has been lately ettablithed at Gottenburg a Royal Society of Sciences and Literature, upon the plan of that of Uprala. Mr Cose was intormed by a merchant who had ectided 22 years at Gottenburg, that, during that period, its population had increafed confiderably, and that it now contained sbout 30,000 inhabitants. This flourilhing thate is ateributed to the extemfion of its commerce, particularly its Eatt India Company, and the fuccefs of the herring lifiery. An Englifh conful and feveralmerchants of our nation relide at Gottenburg: and a chapel, with a regnlar chaplain, is appropriated to theirule. E Long. 1t. 50 . N. Lat. $57 .+4$.

GOTTINGEN, a conliderable town of Lower Saxony in ( emmany, and in the duchy of Bunfwick ; formerly frce and imperial, but now fubject to the clector of Hanover. Here his late Majefty George II. founded an univerfity. It is feated on the river Leine, in E. Lomy io. 5. N. Lat. 51.32.

Go:ten-
burg, Gottugen.

GOTTORP, a town of the duchy of Hetwic, in Deamark, and capital of the duchy of Holltein Guttorp, where the duke has a very fine palace.

GOUANIA, in botany: A genus of the moncecia order, belonging to the polygamia clafs of plants. The calyx of the hermaphrodite is quinquefid; there is no corolla; there are five anthere covered with an elaflic calyptra or hood; the fyle trifid ; the fruit, inferior to the receptacle of the flower, divifible into three feeds. The male is like the hermaphrodite, but wanting ftigma and germen.
GOUDA, or Turgow, a confiderable town of South Holland, in the United Provinces, remarkable for its ftately church. It is feated on the river Iffel, in E. Long. 4. 37. N. Lat. 52. 2.

GOUDT (Henry), ufually called Count Goudt, was born of a noble family at Utrecht, in 1570 ; and was a knight of the Palatinate. Being paflionately fond of the arts, particularly painting and engraving, and defirous of engaging in them, he applied himfelf diligently to drawing, and made a great proficiency therein. He went to Rome, to examine the works of the great mafters in that city. Here he contracted an intimacy with that excellent artilt Adam Elfteimer; Iludied his manner of penciling, defigning, and colouring; and made his works models for his own imitation. He pre-engaged all the pictures that his friend and favourite could finifh, and even paid liberally for them before-hand; by which means he found himfelf in poffeffion of a moft defitable treafure. Thofe pictures which Goudt himfelf painted wore neatly and delicately touched, in colour and peucil refembling Elfheimer, though they were in no degree equal to the paintings of that admirable malter. On his return to -his native country, a young woman who was in love with hin, and defirous of fixing his affections upon her, gave him in his drink a love philtre: which, however, terminated in a very melancholy manner, by depriving him totally of his fenfes; and in the dreadful flate of idiotifm he dragged on a miferable life to the age of 69 , his death happening in 1639 . It is remarkable, that though loft to every other fubject, when painting was fpoken of he would difcourfe upon it in a very rational manner.

Goudt practifed engraving as well as painting, and made feven beautiful prints after the pictures of Elfheimer, which are well known to the cirious, and are to be met with in moft choice collections. He worked with the graver only, in a very neat ftyle; and produced a mofl powerful effect, not by frengthening the flrokes, according to the ufual method, but by crofling them with additional Atrokes, equally neat, and that five or fix times, one over another, io the deep hadows. Confidering the precifion with which he executed his ent gravings, the freedom of handling the graver which may be difcovered in them, is very aftooifhing. The weeds and other parts of the fore ground in that admirable print of the Ceres, are very finely expreffed. The heads of the figures are correctly drawn, and the other extremities are managed in a judicious manner. The feven prints done by him, from Elfheimer, mentioned above, are, 1. Ceres drinking from a pitcher. An old woman appears holding a candle at the door of the cottage, and a boy naked Ilanding by her is langhing and pointing at the goddefs; for which contempt he Vol. VIll. Part 1.
was metamorphofed by her into a frog. The powerful and ftriking effect of this engraving cannot be properly defcribed. This print is diltinguifhed alfo by the name of the forcery. 2. The flight into Egypt: A niglatfcene, in which the moon and flars are iutroduced with great fuccefs. 3. The angel with Tobit, who is drawing a fith by his fide. The back-ground is a landfcape; the weeds in the foreground, and the branches of the trees in front, as well as the foliage and weeds hanging from them, are beantifully exprefled. 4. The angel with Tobit, croffing a ftream of water: The bachground, a landfcape. 5. Baucis and Philemon entertaining Jupiter and Mercury. 6. A landicape, called the Aurora, reprefenting the dawn of day. The effect is very beautiful. 7. The beheading of St John in prifon, a very fmall upright oval print, which is by far the fearcent.

GOVERNMENT, in general, is the polity of a Rate, or an orderly power conflituted for the public good.

Civil government was inflituted for the prefervation and advancement of mens civil interefts, and for the better fecurity of their lives, liberties, and propertiez. The ufe and neceffity of government is fuch, that there never was an age or country without fome fort of civil authority: but as men are feldom unanimous in the means of attaining their ends, fo their differences in opinion in relation to government has produced a variety of forms of it. To enumerate them would te to recapitulate the hiftory of the whole earth. But, according to Montefquieu, and mof other writers, they may in general be reduced to one of thefe three kinds. 1. The republican. 2. The monarchical. 3. The defpotic.-The firlt is that, where the people in a body, or only a part of the people, bave the fovereign power; the fecond, where one alone governs, but by fixed and eflablifhed laws; but in the defpotic government, one perfon arane, without law and without rule, directs every thing by his owth will and caprice. See the article Law, $n^{\circ}$ 1. 3-10.-On the fubject of government at large, fee Montefquicu's $L$ 'Efprit des Loix, 1. 2. c. 1.; Locke, ii. 129, \&c. quarto edition, 1768; Siduey on Guvernment; Sir Thomas Sinith de Repub. Angl. and Acherly's Britannic Conftitution.As to the Gothic government, its original and faults, \&c. fee Montefquieu's L'E/prit des Loix, l. 11. c. 8. -With refpect to the feudal policy, how it limited government ; fee Fsodal Sy. cm .

Government is alfo a poft or office, which gives a perfon the power or right to rule over a place, a city, or a province, either fupremely or by deputation.

Gupernment is likewife ufed for the city, country, or place to which the power of governing is extended.

GOUGE, an inflrument ufed by divers artificers, being a fort of round hollow chiffel; ferving to cut holes, channels, grooves, \&c. in wood, flone, \&c.

GOULART (Simon), a famous minifter of Gene va, was born at Senlis in 5543 ; and was one of the moft indefatigable writers of his time. He made confiderable additions to the Catalogue of witneftes of the truth, compofed by Illyricus; and acquired a great reputation by his worls ; the priucipal of which are, 1. A tranlation of Seneca. 2. A collection of memorable hiftories. 3. A tranlation of St Cyprian De

D
laptis.

Gourd laspore 4. Sewral dowional and moral treatifes. H $\| l$ died at Crenera in 102R.

GOLTRGELES (Domisigne ce), an illumtions Fronsh patiot, a pricutcegenteman of (Gatoony. The Spaniard, lassinc inhumamy mandered a colony of Trenchmen whathad feteled in llonida, Cromgues took a leserestenne on them, an accoms of which is given umke the aticke liaroma. Oo his meturn, he was received with acelamations by his countrymen, but was forbid to ajpear at court. Queen Eiisabeth invited him to command an En:pifh dect againat the Spaniards in 1593 ; but he died at Tours in his way to Emylan!

GOURNAY, a town of Prance, in the dachy of Norman's and tumiory of Bray, ctebrated for its louter markse. It is lituated on the river Ept, in Li. kong. u. 33. iv. Lat 4925 .

Guersay (diary de Jars de), a lady celebrated for her learning, was the danghter of Writham de Jans, lord oi Neufvi and Gomonay. After the death of her father, fh: was protected by Montaigne and Cardinal Rielselun. To the daughter of the former the dedicated hor Nefegay of Pindus; and compoled feveral other works, the molt combiderable of which is Les Avis. She died at Paris in 1685 , aged So. The crities are divided concerning the reputation of this lady: by fome de is Ayled the Syren of Frane: o others fay her works fhould have been buried with her.

GO1t'. See (Index \{ubjoined to) Medicine.
GOWER (John), one of our mot ancient Englith ports, was cotemporary with Chancer, and his intimote frime. Of what family, or in what county he was burn, is uncertain. Hedtudied the law, and was fome time a menber of the fociety of Lincoln's-inn, whem his acquaintance with Chaucer began. Some dave affred that he was a jodge : but this is by no means cortain In the fint yoar 6 Hemy IV. he becane blind: a nusfortune which he laments in one ot his Latin poens. He ded in the year $1 \not+2$ : and was buried in St Mary Overie, which church he lad aebuile chicty at his own expence, fo that he mut have lived in amment circumptances. His tomb was magnificent, and curioufy ornamented. It itill temains, but hath been repaired in later times. Fron the collar of $S S$ round the neck of his efagies, which lies upon the tumb, it is conjectared that he had lnew knighted. As to his character as a man, it is impofible, at this dillance of time, to fay any thing with certainty With regard to his poctical talents, he was undoubt. edly admired at the time when he wrote, thongh a sudern reader may find it sifficule to ditiover much harmony or geuius in any of his compofitions. He wrote, 1. Sepeculum maditantis, in French, in tea books. There are two copies of this in the Bodeian dibary. 2. Fox chamartis, in Latin verfe, in feven looks. Preferved alfo in the Bu deian library, and in that of AllSouls. It is a chronicle of the infurrcetion of the commons in the reign of Richard Il. 3. Corfeglio amantis; printed at Vedtaintter by Caxton in 14リ3. Lond. 1532, 1554 It is a fort of poetical fytten of morality, interfpoffed with a varicty of moral tales. 4. De rege Henrico /V. I'sinted in Chauct's works. "There ane likewife feveral hitorical trates, in mannfelipt, witten by ourathor, which are to be found

He in different libaries; alfo fome fort poems printed in Chamer's works.

GOWN, robe, a long upper garment, worn by lawyers, divincs, and ofher gianatob; who are hence called nen of the zawn, or gotemen.

The gown is in anple lont of grament, won over the ordinary cloaths, hanging dawn tw the iect.- It is fahioned differenty for cecenatics and tor hay aren.

At lions tug gate the name "vaile grown." loga virilis, to a plan kind of gown which their youth arfuned when arrived at puoerty. ints they partich-

"The remarkalle drefs of our britifl ancestors (Nir Whitaker ublerve), which continued very nearly Mifory of the fame to the commencement of the balt century i. 302 . anoog the natice uf lreland, and has aitwally difeended to the pretent among the momataneers of scoiland, and is therefore remered sery familar to our ideas, carried in it an alonibing appearanee to the Romans. And it feems to have been equaty the drefo of the men and women among the ubibs of Britain. But in a few yeans after the ertction of the Roman. Britidh towns in the morth, and in the progrefo of remament among them, this ancient habit broan tube difelleemed oy the chis fo of the cities, and luoked upon as the hadge of ancient barbarim. And the gawins prejudices were forn fo greatly improved, that within 20 years only after the condruction of the towns, the Britifh fagum was actually uigned, and the lioman toga or gown aliumed by many of them.
"The gown, however, never became univerfal in Britain: and it feems to have been adopted only by the barons of the cities and the offacers of the crown; and las the refore been tranimited to us as the rube of reverence, the enfign of literature, and the mantle of magitracy. The woollen and plaided garments of the chiets having maturally fuperfeded the leathern veftures of their clients, the former were litl wore by the gentrality of the Britons; and they were retained by the geatlemen of the comutry, and by the commonalty both in country and city. That this was the cafe, appears evident from the correfpondent conduct of the Gauls and Bitons; who kept therr Virgat: Bagula to the Jall, and commanicated them to the lranks and Saxons. The plaided drapery of the Britons flill appeared general in the llreas of Manchelter ; and muft have fummed a driking contrat to the gown of the chief, the dark mantle of Italy: and it and the ornamented buttons on the floulder are puefored among Us even to the prefont moment, in the parti-coloured cloathing and the tafiched houlder-knots of our footnow."

In fome univerfities phyficians wear a farlet gown. In the Sorbonne, the doctors are always in gowns and caps. Beadles, \&ic. war gowns of two or more colsurs.

Among the French officers, \&c. they dittinguih thofe of the Joort gown ur rolt; which are fuch as have not been regularly examined. They have alfu barbers of the fiort goren, who are fuch as are obliged to practife in an inferion way to thofe of the leng rube.

Gown is alfo taken in the genetal for civil magiftra., ture, or the probithon oppotite to that of arms. In this. fenfe it was that Cicero laid cedant arma logx.

Gorman GOWRAN, a borough, fair, and pot town, in the courty of Kiikemy and province of Leinfer, Ircland. N. Lat. $5^{2 .} 34$. W. Long. 7 o. It is governed by a portrieve, recorder, and tow-clerk. Here are the wins of an old church, alfoth e randfone feat of the bate lond Clifden; and three miles beyond Gowran the ruins of Ballinabola caftle.

COYEN (Juhu Van), painter of landfeapes, cattle, and fea-pieces, was born at Leyden in 596 ; and was for fome time inftructed by lface Nicholn, "ho was reputed a good painter; but afierwards he became the diciple of Efaias Vandervelde, the molt celebrated landicape painter of his time. Van Goyen very foon rote into general efeem; and his works are more univerfally fpread through all Europe than the works of any other mater, for he poffefed an uncommon reddinefs of hand and freedoan of pencil. It was his conflant plafure and practice to fletch the views of vil. lages and towns fituated on the banks of rivers or canals: of the fua-ports in the Low Countries; and fometimes of inland villages, where the fecnes atouml them appeared to him piealing or picturefque. Thofe he afterwards ufed as fubjects for his foture landeapes; enriching them with cattle, boats, and fienres in charatier, jutt as the livelinefs of his imarimation directed. He underllood perfpective extrem-ly well, and allo the principles of the chiaro-furo; which branches of knowledge enabled him to give his pistutes a flong and agreeale effet. He died in 1656 , aged 60 .His ufual fibjects were fea-pitces, or landfeapes with views of rivers, culivened with figures of peafants cither fertying over catto, drawing their nets in ftll water, or going to or returning from market. Sometimes he reprefented hats of boors on the banks of rivers, with overhanging trees, and a bedutiful rellexion of their branches from the tranfarent furface of the waters. Thele were the fubjects of his bett time, which he generally marked with his name and che year; and the high Guithed pictures of Van G yen will be for cver ellimable. But as he painued abundance of pictures, fome are Might, fome ton yellow, and fome negligently tinihad; thoush all of them have merit, being marked with a free, expeditious, and eafy pencil, and a light toreh. His pictures frequently have a gregifh call; which did not a ife from any milmanagement of the tines, on any want of $f 1 l$ in layinr on the colous: but was occationed by his ufing a colour called Haerlem bher, much approved of at thet time. though now entitely difufed, becaufe the artitts found it apt to fade into that greyith tint ; and it hath alio rendered the pictures of this matter exceedingly diticult to be cleaned without injuing the finer tenches of the finiming. His bett works are valued fo highly in mofl parts of Europe, and efpecially it the Low Countries, that they defervedy afforl latge prices being ranked in Holland with the pictures of Peniers; and at this time are not caflly procured, particulaty if they are undamaged, though his nighier poformances are fufficionily common.

GRAAF (Licgnicr de), a celebrated phyfician, boun at Schounharen, in Holland, in 1641 . He ilu. died plyfic at In iffia. He was elucated in Leyden, where lic acquired geat honcur by publithnge a trea. tife De Suces Pancreation. He alfo publifted three pieces upon the organs of gencration, both male and cmale; upon which fubject he had a controverly with

Swammertam. He dier young, in $16-3$; and his works, with his life pretixed, were publithed at Leyden in 1677 , in 8vo.

GRABE (John Ernctl), a very leamed writer in the beginuing of the 18 th century, a uative of koning $f$ berg in Piulfa. He was educated in the Lutheran religion: but the reading of the fathers led him into douhts. He prefented to the electoral conlillory at Sambia in Pruffia a memorial containing his dowhts. the elector gave orders to three eminent civines to anfwer them. Their anfwers flook him a litule in his refolution of embracing the Ruman Catholic religion; and one of them, Spener, adrued him to go to England. He went; and king William gave him a penfon, which was continued by queen Anne. He was ordained a prit it of the chanch of England, and honoured with the degree of doctor of divinity by the univerity of Oxford; upon wheh oecation D) Gcorge Smalridge ptomounced two Latin orations, which wre atterwards printed. He mote, t. Spicalgium S. S. Parrum, wh Hereitorun fecula pof Chajumatum, Bvo. 2. Anedition of the Suptuagint, from the Alexandrian manufcript in Si James's Hibrary. 3. Nutes on Juilin, \&c.; and other works, which are ellermed by the !earned.

GRACCHUS (liberius), elected tribune of the Roman people, demanded in the fenate, in their name, the cxecution of the Agrarian law: by which all perfons porffinat above 20 acres of land were to be deplived of the furplus, for the benefit of the pone citizons, amongt whon an equal ditribation of them was to be made. Having carried his plan into execution by violent meafures, he fell a victim to his zeal, being affelfinated by his own party, 133 B . C. Caius his brother, purfuing the fame lteps. was killed by the conful Opimins, 121 B. C. See (hiltory of) Rave.

GRACE, among divines, is taken, 1. Fur the free love and favour of God, which is the fpring and fource of all the benetits we receive from him 2. For the work of the Spirit renewing the foul after the image of God; and contanually guiding and llrengthen. ing the believer to obey his will, to relitt and mortify tim, and usercone it.

Grace is alfo ufed, in a peculiar fenfe, for a floort prayer fand before and after meat.
'the proofs of the menal obligation of this ceremony, drawn from different paffages of the New I'eftancont, are fo well known, that it is need!cts to mintit on them here. Some others, drawn from the practice of differtut nations, and of very remote autiunuty, may not be dilagretable to our readers.

1. whenrus tells us, in his Deignofoph. lib ii. that in the famous regulation made by Amphectyon king of Athens with relpect to the ufe of wine, buth in facribecs and at home, he required that the name of Yupiter the Sufainer fhould be decently and reverently pronounced. 'The fane witer, in lib. is. p. 149. quotes Hermeias, an author extant in his time, who informs us of a prople in Egyp:, imhabitats of the city of Nacratis, whofe cultom it was on certain occalions, alter they had placed themfelues in the ufual pollure of eating at the table, to rife again and kneel; when the prefl or precentor of the Eolemaity began to chant a grace, according to a Aited form amongft them; and when that was over, they joined in the meal in a fotemn facriticial manner. Heliodorns has a gaffage in his Aethofics to the fame purpofe, that it D 2

## $G \begin{array}{llll}\mathrm{G} & \mathrm{A} & 29 & \mathrm{G}\end{array} \mathrm{R}$ A

Grace. was the cuftuni of the Egyptian phibfophers to pour cal oceations, be fore "they took their meals, they
out libations and put ul ejaculations before they fat down to maids. Porphyry, in his treatife De alpine lh. iv. p. His. gives a great character of the Samnean Eymonophits in Egypt for the fricunefs of their life: as one article in their favour, he obferves, that at the founding of a bell before their meals, which contilted only of rice, bread, fruits, and herbs, they wont to prayers: which being ended, and not before, the bell founded again, and they fat down to eating. In general this was a religious ufage or rite among the anclient Greeks; and derived from yet older ages, if Clement of Alexandria rightly informs us He men. tons, that the fe people, when they met together to refreth themfelves with the juice of the grape, lung a piece of mute, in imitation of the Hebrew prams, when they called a forolion. Livy, hb. xxxix. Speaks of it as a feted cultom among the old Romans, that they offered sacrifice and prayer to the gods at their meals and compotations. But one of the fulled tellmonies to our purpofe is given by Quintilian, Declam. 30:. Able merriam, fays he, al guam cum venire cafimus, Dos invoranus; "We approached the table (at fupper together ), and then invoked the gods."

The Jeluit Trigautius. in his very elegant and in. Atuctive narrative of the Chritlian expedition of the ir miffonarics into China, book. p. 6g. gives this account of the people there in the particular now under confederation. "Before they place themfetves for partaking of an entertainment, the perfon who makes it fets a veffel, either of gold, or filer, or marble, or forme fuck valuable material, in a charger full of wine, which tie holds with both his hands, and then makes a low bow to the person of chief quality or character at the table. Then, from the hall or dining-roum, he goes into the porch or entry, where he again makes a very low bow, and turning his face to the fourth, pours out this wine upon the ground as a thankful chation to the Lord of heaven. After this, repeating his reverential obeifance, lie returns into the bal," \&c.

The 'Tuts pray for a bleffing on their meat; and many more intlances might be produced of infidels who Eave contently observed the like cultom in forme was or other.
2. The fact, therefore, with respect to the heathen world, being thus evident, we proceed to the fantimints and hebaviour of the Jews in this particular. Their celebrated hitlorian Josephus, giving a detail of the rites and cultoms of the Liffenes, who were confeffedly the diced and mont pious profeffors of the Jewifh religion, has this remarkable pillage to the presfont purpure: "The prick," fays he, "begs a bleming before they frefume to take any nourishment; and it is looked upon as a great lin to take or take before." 'Then follows the thankfriving before meat: and "when the mental," proceeds he, " 13 over, the pried prays again; and the company with him blefs and praife God as their preferver, and the donor of their life and nourimment."

Philos, in his book Dc vial contemplation, gives an account of a body of men and women fricter than even the Eflenes themfelves. He diftinguifhes them by no particular name, though his relation is very aecurate and circumflantial; namely, that on certain fee-
placed themfelves in a proper decent order; when, lifting up their hands and eyes to heaven, they prayed to Gold that he would be pleaded to he propitious to them in the ore of thole his good creatures."

From the Hebrew ritual it appears, that the Jews had their hymns and palms of thankfgising, not only after eating their paffovet, but on a variety of other oceations, it and after meals, and even between their feveral courles and difhes; as when the befit of their wine was brought upon the table, or their aromatic confertrons, or the fruit of the garden, \&e. On the nay of the pullover was fug Palm cxiv. "When Mirach came out of egypt," Nc.

Arillxus has a paffage full on the present fubject. " Moles," fays he, "commands, that when the Jews ate going to eat or drink, the company mould immediat ely join in facritice or prayer." Where Rabbi Eleaar (upon that author) met with this fentence, has been controverted. But fuppoling it not to be found in foripuis, it is fuffecient for us to know that the Jews did conllantly practice this cultom, upon the foundation of an ancient and general tradition and usage. That the prophet Daniel gave thanks before meat, is evident from the Apocryphal book concerning Bel and the Dragon, where, ver. 38,39 we find, that " Daniel faid, Thou hate remembered me, O God! neither hat thou forfaken them whofeek thee and love thee. So Daniel arofe, and did eat." Of this text Prodentius takes notice in Cathemirin, hymniv.

> His ismptis Danis'is a actarit
> In calls fociem, ciboque forms,
> Amer redubut, allohajub stixit.

The mu-h-beloved took the rear, And up to heart hisezes he catt; By which refiefl'd, he fang aloud. Amen, wd allolujah to his God.

Where, by the way, it nay be obferved, that the poet is a little mitaken in making the prophet give thanks after meat ; whereas, according to the text, he did it before.

Grace, or Gracefulness, in the human character; an agreeable attribute, infeparable from motion as oppofed to ret, and as comprehending ipeech, looks, getlure, and locomotion.

As come motions are homely, the oppofite to gracefula: it is to be inquired, With what motions is this attribute connected? No man appears graceful in a math; and therefore, laying afite the expreffons of the countenance, the other motions may be genteel, may be elegant, but of themfeloes never are graceful. A motion adjutted in the mot perfect manner to anfwer it send, is elegant ; but fill forme what more is requited to complete our idea of grace or gracefuhefs.

What this unknown more may be, is the nice point. One thing is clear from what is fail, that this more mut arife from the exprefions of the countenance: and from what exprefions fo naturally as from thole which indicate mental qualities, foch as fweetnefs, benevolence, elevation, dignity ? ' This promifes to be a fair analytic; becaufe of all objects mental qualities affect us the molt; and the impreffion made by graceful appearance upon every fpectator of tate, is too deep for any cafe purely corporeal.

The next Rep is, to examine what are the mental qualities.

## $G \quad R \quad A$

Graces.
qualities, that, in conjunction with elegance of motion, Froduce a graceful appearance. Swett nefs, cheerfut nefs, affahility, are not feparately fufficient, nor even in conjunction. Dignity alone, with elegant motion, produce a graccful appearance; bus fill more graceful with the eid of other qualities, thofe efpecially that are the moft exalted. See Dignity.

But this is not all. The moft exalted virtues may be the lut of a perfon whofe countenance has little expreffion: fuch a perfon cannot be graceful. Therefore to prodice this appearance, we muft add another circumflance, viz. an expreffive countenance, difplaying to every fpectator of tafte, with life and energy, every thing that paffes in the mind.

Collecting thefe circumitances together, grace may be delined, "that agreeable appearance which arifes from clegance of motion and from a countenance ex. preflive of dignity." Expreffions of other mental qualities are not effential to that appearance, but they highten it greatly.

Of all external ubjects, a graceful perfon is the mof agreeable.

Dancing affords great opportunity for difplaying grace, and baranguing itill more. See Dincing, Declamation, and Oratory.

But in vain will a perfon attempt to be graceful who is deficient in amiable qualities. A man, it is true, may form an idea of qualities he is deftitute of; and, by means of that idea, may endeavour to cxprefs thefe qualities by looks and gettures: but fuch fludied expreflion will be too faint and obfcure to be graceful.

AIA of Grace, the appellation given to the adt of parlianient 1696 , c. 32 . which allows prifoners for civil dabts to be fet at liberty, upon making oath that they have not wherewithal to fupport themfelves in prifon, unlefs thev are alinented by the creditors on whofe diligences they were imprifoned, within ten days after intimation made for that purpofe.
Days of $G_{\text {r.ack, }}$ three days immediately following the terno of payment of a bill, within which the cieditor mult proteft it if payment is not obtained, in order to intitle him to recourfe againtl the drawer.

Grace is alfo a title of dig.uity given to dukes, archbithops, and in Germany to barons and other inferior priaces.

GRACES, Gratie, Charites, in the heathen theology, were fabulous deities, three in number, who atrended on Venus. The r names are, Aglia, Thalia, and Euphrofyne; i. e. Mining, flourifhing, and gay; or, according to fome authors, Pafithea, Euphrofyne, and A:giale. They were fuppofed by fome to be the daughters of Jupiter and Eurynome the daughter of Oceanus; and by others, to be the daughters of Bacchus and Venus.

Some will have the Graces to have been four; and make them the fane with the Hore " hours", or rather with the four feafons of the vear. A marble in the king of Pruffia's cabinet reprefents the three Graces in the ufual manner, with a fourtb feated and covered with a large veil, with the words underneath, Ad So. rores IIII. But this groupe we may underftand to be the three Graces, and Venus, who was their filter, as being daughter of Jupiter and Dione.

The Graces are always fuppofed to have hold of each oiher's hands, and never parted. They were
painted naked, to fhow that the Graces borrow nothing from art, and that they have no other beauties than what are natural.

Yet in the firlt ages they were not reprefented naked, as appears from Paufanias, lile, vi. and lib. ix. who defcribes their temple and flatucs. They were of wood, all but their head, feet, and hands, which were white matble. Their robe or gown was silt; one of them held in her hand a rofe, another a dye, and the third a fprig of myrtle.

GRACILIS, a mufcle of the leg, thus called from its flender thape. See Avatomy, Table of the Mifcles.

GRACULA, the Grakle, in ornithology, a genus belonging to the order of piece. 'The bill is convex, cultrated, and bare at the point; the tongue is not cloven, but is flefly and tharpifh; it has thsce toes before and one belind. I. The religiofa, lofli grakle, or Iudian thare, is about the fize of a blackbird, the bill an inch and a half long, and of an orange colour. The general colour of the plumage is black, glofled with violet, purple, and green, in different reflections of light: on the quills is a har of white: the feathers and kg anc orange yellow, and the claws of a pale brown. This fpecies, which is found in feveral parts of the Ealt Indies, in the Ifle of Hainan, and almolt every ifle beyond the Gauges, is remarkable for whifling, finging, and talking well, much better than any of the parrot genus, and in particular very diftinct. Its food is of the vegetable kind. Thofe kept in this climate are obferved to be very fund of cleerries and grapes: if cherrics are offered to one, and it docs not inmediately get them, it cries and whines like a young child, till it has obtained its detire. It is a vely tame and familiar bird. 2. The barita, or boat-talled grakle, is about the fize of a cuckow. The bill is fharp, black, and an inch and a half in leugth; the general celour of the plumage is black, with a glufs of purple, efpecially on the upper parts; the legs and claws are black, the latter hooked. There is a fingularity in the folding up of the tail-feathers, which, inflead of forming a plain furface at top, fink into a hollow like a deep gutter. It always carries its tail expanded when on the ground, folding it up in the above lingular manner only when perched or flying. It inhabits Jamaica; and it feeds on maize, beetles, and uther infects, as well as on the fruit of the banana. It is likewife conmon in North America, keeping company with the flucks of the maize-thicves, and rectwinged oriole. Thefe breed in the fwanps, and nigrate in September, after which none are feen. 3. The quifcula, purple-jackdaw, or Barbadoes blackbird, is about the fize of a blackbird: the whole bird is black, but moft beautifully and richly gloffed with purple, efpecially on the head and neek. The female is wholly of a brown colour, despeft on the wings and tail. This fpecies inhabits Carolina, Mexico, and other parts of North America, alfo Jamaica. Thefe birds for the moft part feed on maize, whence the name of maizethieres has been given the:n ; but this is not their only foad, for they are known alfo to feed on many other things. In fpring, foon after the maize feed is put into the ground, they fcratch it up again; and as foon as the leaf comes out, they take it up with their bills, ront and all ; but when it is ripe they do fill more damage,

Gracilie. Gracula.

Plate coxxis.

Comens for at that time they come in tropps of thouiznds, and II are fo boid, that if situmbed in one part of a bield they onity gro to anther. In New Jerky and. Pentytania three penee fer deren was one given for the dead bitds, and by mans of this preminu they were neaty extirpated in $1-50$; when the perfecunton of chem was abated on accome of the great increafe of worms which hat taken place in the meathos, and which in the precoding year had Ift fo lithe hay in New Eng!and as to necation an imporation from other parts. The grakles were therefore again tolerated, as it was obferFed that they fed on thefe wormstill the maize was ripe. Thefe birds build in trees. Whey are faid to pafs the wincer in fwanp, which are quite overgrown with wood, from thence only apparing in mild weather; and after the maize is got in, are content to feed on ontur things, as the aquatic bue-grats, and if prefed by hunger, buck-wheat and oats, sce. they are faid allo to deftroy that pernicions infect the bruchus pili. Their note is pretty and asrecable; but their fleth is not groul to eat. \&. The crilfatla, or Chinefe Ataring, is a litte bieperthon a blackbied. The bill is yclow crorance: and the ecteral colour of the plumage blachifh, with a therge of blac: the legs are of a duil yel. low. Thefe bird, whishare faido talk and whille sery well, are common in China, where they are very much efterned, and the figurs of thon are feen frequently in Chinefe paintions. Their foorl is rice, infeets, worns, and firth like. They are foldon brought to Englam alive, requing the yreatelt care in the paf-fage- - There are eight wher fpecies of Gizcula.

GRACILUT, in mathogeg. Sec Corpos.
GRADATHON, in gencral, the afcendiag Atep by ftep, or in a leguar and unifurn manner.

Gradation, in logic, a form of reafoning, otherwife called Sorites.

Gradatus, in paintiag, a gradual and iufenfible change of colour, by the diminution of the teints and thades.

Gramation, in rhetoric, the fame with Clmax.
CRADISKA, a trong town of Hungary in Sclavonia, on the frontiers of Cruatia, taken by the 'Tuks in 1691 . It is feated on the river Save, in E. Long. 17. 55. N. Lat. +5.3 .

Gradiska, a itrong tomn of Italy, in a fmall illand of the fame nance on the frontiers of Friuli, in E. Long. 13.-. N. Lat. 45. G. It is fubject to the houfe of Al:tria.

GRADO, a ftrony town of Italy, in a fmall inand of the Came pane, on the cond of Priuti, and in the territory of Venice. E. Long. 13. 3j. N. Lat. 45. 52.

GRIIDUATE, a perfon who has taken a degree in the univerfy. Sie brgres.

GREDIUt (John George), one of the moft learned writers in the $17^{2}$ th emary. In the 2 th year of his ase, the elector of Brandentars mate him profefor at Duifonerg. In 16,5 , he was invited to Deventer to fuceced his former malter Gronovius. In 166, he was apponinted profelior of donquence at Utrecht; and 12 years after he had the profeforerhip of polisics and hiltory conferred on him. He fixed his thoughts here, and refufed feveral advantageons affers. He had, however, the fatisfaction to be fought
after by divers prinecs, and to fee feveral of them come Graftins. from Germany to ft: : 1 ; under him. 1le died in 1703,
 Italin, \&ec. and ohet warke, are well known.

GRAFTLNG, or Evgrattiva, ingarlening, is the taking a thoot from une erte, and infertigg it into another, in fuch a manser that both may unite clofely and become one tree. By the ancient writers on bebandry and gardenins, this operation is called incifon, to diderguifh it from inoculation or budding, which they call infervere ocalos
Grafting hath been pristifed from the mon remote antiquiey ; but its origia and invention is differemly rclated by maturalifts. Theoplurathestels us, that a bird having fwallowed a fruit whole, call it forth meno a cleft or curity of a roten tree; where mixing with fome of the putrified parts of the wool, and being wafled with the rams, it budjed, and froluced within this tree anuther tree of a diffrent kind. 'lhis led the hutbandman to certain relcations, from which foon afterwards arofe the art of engrafting.

Pliny lees the fame thing in a dificrent light: a comtryman baving a mind to make a palliade in his grounds, that it might endure the longer, he bethousht himfelf to fill up and Arenthen the boteon of the pallifade, by remning or watting it with the trunk of ivy. The effect of this was, that ihe flakes of the pallifades taking ront, became engrafted into the trunks, and prodnced large trees; which fuggetted to the linfandman the art of engrafting.

The ufe of grafting is to propagate any curious forts of fruits for as to be certain of the kinds; which eannot be done by any other method: for as all the good fruits liave been accidentally obtained from feeds, fo the feeds of thefe, when fown, will many of then degurate, and produre fuch fruit as is not worth the cultivating: hut when fhoots are taken from fach trees as produce goos fruit, thefe will never alter from their kind, whatever be their tock or tree on which they are grafted.
l'be reafon or philofophy of engrafting is fomewhat offeare: and had not accident given the firit lint, all our knowledge of nature would never have led us to it. The dfect is ordinarily attribated to the diverfity of the pore, or ducts of the graft from thofe of the thuck, which change the figure of the particles of the juces in palfing throngh them to the rett of the tree.

Mr Bradle,', on occalion of fome obfervations of Agricola, fuggells fome thing new on this heal. The itock grafted on, he thinks, is only to be confidered as a fund of vegetable matter, which is to be filtered through the cyon, and dicetted, and brought to maturity, as the time of growth in the velfels of the cyon directs. A cyon, therefore, of one kind, grafeed on a tree of another, may be rather faid to take root in the tree is is grafted in, than to unite itfelf with it: for it is vifible that the eyon prefenves its natual purity and intent, though it be fel and nourithed with a mere erab; which is, without doubt, oecationed by the difference of the reffels in the cyon from thofe of the fock: fo that grafting may be intly compared of planting.

In profecution of this :iew of that ingenions author, we add, that the natural juices of the earth, by their
fecretion

Grafting fecretion and comminution in paffing through the roots, \&c. before they arive at the cyon, muft doubtHefs arrive there half elatorated and corcocted; and fo difpofed for a more eayy, plentiful, and perfect af. fimilation and nutrition ; whence the cyon mula neceffaily grow and thrive better and fatter than if it were put immediately in the ground, there whie en coarfe dict and barder of digetlion: and the fruit produced Ly this further preparation in the cyom, mull be finer and further exalted than if fed immeliately from the more imperfeetly prepared and altered juices of the flock.

Many have talked of chansing of $f_{f e c i t s, ~ o r ~ p r o-~}^{\text {a }}$ ducing mixed fruits, by engrafling one tree on another of the fame clafs; but as the graft carries the juices from the llock to the pullo of the fruit, there is little hope of haceceding in fuch an expectation by ever fo many repeated grafts: but if, after clanging the graft and tack feveral fuccenive times, you fot the feed of the fruit produced on the gratt in a grood mould, ir is portible that a change nay happen, and a new nixed plant may be pe diced. Thus the almond and preach may, by many cortmges in the graftings, and hy interations of the fonaes of the peaches, and of the mello of the aimomls, and by tuibrations of the flen of the root here and there, alter their nature fo much, that the coas or pulp of the almond may apposach to the nature of the peach, and the peach may have its kernet enlarged irto a hind of alnond; and on the fame principle, the curions gardener may produce maly tuch muxed hindo of thing.

Mr Du Hamel has offerved, that, in grafting of trees, there is always found at the infertion of the grafl, a change in the directions of fibres, and a fort of.twilking or turning about of the veffels, which greatly imitates that in the formation of eertain glands in animal hodies: and froin thence be iufers, that a new fort of vifcus bring formed by this means, the fruit may very naturally be fo far inflatenced by it, as to be meliotated on the new branch; but that no fuch fudden and effential changes can be effected by thofe mans, as too many of the writers on agriculture pretend. He obfievts, however, that this anatomical obfervation would not have been fufficient to convince sim of the falfety of too many of thefe relarions, had not esperinent joined to contirm him in this opinion. He tried many grafts on different tees; and, for fear of error, repeatal everv expctiment of confequence feveral tumes: hut all ferved only to convince him of the trutin of what hee at finlt fufpected. He grafted in the common way thie peach upon the almond, the plum upon the apricot, the pear apon the apple, the quince, and the white thorn; one fpecies of plum on other very difirent Ipecies, and upon the peach the apricot and the almond. All the fe fucceeded alike: the fpeecies of the $f$ uit was never altered; and in thofe which would not come to fruir, the leaves, the wood, and the fowero, were all the fame with thofe of the tree from whence the graft was taken.

Authors on agriculture have alfo mentioned a very different fort of grafting; namely, the fetting grafts of one tree upon llocks of a different genus; fuch as the grafting the pear upon the oak, the clm, the maphe, or the plun, \&c. Mr Du Hamel tried a great aunber of thofe experiments carefully, and found
every one of them unfuccelfful; and the natural cor- Grahing. clufion from thus was, that there mut be fonme nateral -d alliance betwect the fucks and their grafts, oiberwife the latter will either never grow at all or very foon perifh.

Nowsithfanding the facility with which grafts generally take on quod thocks, there are nany accitents and uncortainties attending them in their diferent periods. Sume perih inunediately; fome, after appuaring healthy for many monthe, and fome even for ycars. Of thefe lat forme die without the thock fuffering any thing: others perih together with the Alocks. It is very certain, that the great.r patt of grafted trees do not live follong as they wond have dune in their natural fate; yet this is no une:ceptionable role: fir there are fone which cyidenty live the lunger for this practice; 11ay, thene ane imbences of grafes which, being placed on ttecks naturally of fhort duration, live longer than when placed on thofe which are more robult and lanling. Thefe irregularities lave been but little comfidered lithento, though they might be made productive of confiderable advantages. - One great requftice for the fucceeding of any graft is, that it be in its owa :ature capable of fo clufe amd intimate an union with the fubtance of the llock, that it becomes as it were a natural branch of it. If all trees refembled one another in their flrugure and juices, the fize and clatticity of then velfils, \&c. probably the grafts of atll tetes would foceced upon one another; Dut this is by now means the cale.

Tieces are well known to be compofed of numeroue arrangements of hollow thines, and thefe are different and unegual in every fpecies of tree. In order to the fucceeding of a giaft, it is plain that there nut be a conformity in its velfels and juices with thofe of the Aock; and the more nearly thay agree in this, proEahly the better they fucceed; and the father they i Fer, the worfe.-If there be, hoxever, fome difitro ence in the folid parts of trets, there are evidently many more in the juices. The fap in fome trees is white as milk, in others it is reddifh, and in fome as clear and limpid as water. In fone, it is thin and very fluid; in others, thick and wifous. In the tafte and fmell of thefe juices there are allo not kefo differences: fome are fweet, fome infinid, forme bittor, fone acrint, and fome fotid: the quatity of the fap thus makes a very great difference in the nature of trees; but its quantity, and derivation to the patts, is fearee leis ob. fervable. Of this we have familiar intlanecs in the willuw and the box : one of which will produce longer floots in one year than the oiler in twenty.

Another diference ytt mour ftiking, and indeed. more cffential in regard to the growth of grafts than all thefe, is the different feafon of the year at which trees foost out their leaves, or ripen their flowers. The almond-tree is in flower before other trees in general have opened their ealictt buds; and when other trees are in fiower, this is full of leaves, and has its fruit fet before tive mullecry begins to puif one its. earliell buttons. When we confider all thefe differences in trees, we cannot bat wonder how it is porlible for a branch of ore to live upon another; and it becomes a much more perplexing quetion haw iny graft can fucced, than how fuctionaderes cume to mifcarry. A graft of one pear upon another thall be

## $\left.G \begin{array}{llll}\mathrm{R} & \mathrm{A} & 22\end{array}\right] \quad \mathrm{G} R \mathrm{~A}$

Graerg. feen to fuecced prefently as if upon its own tree; and
in a fortuight will gain fix inches in length, and fo of func others. - This malt be owing to the great fimilarity between the llock and the graft in all refpects: and a great contraricty or difference in trueture of parts will make as renarkable a difirence on the other hund. An inftance of this may be obferved in the plum and the elm ; which no art ean ever make to fuccecti upon one another, whether the plum be Erated on the clon, of the elm upon the plum flock. The fe are examples of the extremes of eafy growth, and of atfolute decay; but there are many conjunetions of trees which feem of a midale nature butween the two, and neither immediately perift, nor totally fucsed. Of thefe, fuch is were grafted in autumn ufeally temain green the whole winter without pufhing; and thofe which are grafted in fpring remain green a month or longer, but till without fhooting. Sume particular ones have alfo been known to make a few fhoots the firft, or even the fecond fap feafon aficr the operation; but all perifh at the end of theie times. Of this kind are the grafts of the pear-tree upon the elm, the maple, and the hornbeam, and the mulberry upon the clm and fig, with many others.

When we come to inquine into the caufe of this, we find that thefe grafts, though unnatural, have yet had a communication with the ftock by mcans of a few fmall reffets, which has been fufficient to keep them gren, or even to make them fhoot a little, during the great afcent of the fap: But the far greater number of the fibres have lad all the while no communication, and are found putrified, dried up, or covered with a putrid juice. This has evidently hapfoned by means of the difproportion in fize between the veffels of the flock and of the graft, and the great difference between their natural juices, which are obitacles abundantly fufficient to prevent cither an union of the libes or the introduction of new fap.

The grafts of the almond on the plum, and of the flum on the almond, always grow very vigoroufly for the firlt year, and give all the appearances imaginahle of fucceceding entirely; yet they always perifh in the fecond of third year. The almond graft upon the plum-llock always purhes out very vigoroufly at firit; but the part of the flock immediately under the graft grows fmaller and perifhes, the graft abforbing too n:uch of the juices, and the graft neceflarily perifhes with it. The decay of the whole generally happens carly in the fpring; and that plainly from thic different feafon of the natural fhooting of the two trees, the almond pulting very vigorouify, and confequently draining the flock of its juices, at a time when, according to its nature, the juices are but in fmall quanity in it, and the fap does not begin to afcund. The grafts of the plum on the almond are, from the fame caufe, furnifhed with an abundance of fap which they have at that time no uccafion for; and confequently they as certuinly perifh of repletion, as the other of inanition.

The peach grafted on the plum fucceeds excellently, and lives longer than it would have done in a natural flate; the reafon feems to be, that the peach is a tender tree, fhoots with great visacity, and produces more branches than the root is able to maintain. 'Thus the peach trees are ufually full of dead wood; and often $\mathrm{N}^{\circ} 141$.
their large branches perifh, and fornetimes their whole Grafting trunk. On this occafion the plum, being a flow fhooting tree, conmunicates its virtue to the graft ; and the peach confequently lends out fhoots which are more robult and itrong, and are no more in number than the root is able to fupply with nomifhment, and confequently the tree is the more lalting.

The grafts, or cyons, with which the grafting is effected, are young thoots of laft fummer's growth, 'for they mult not be more than one year, and fuch as grow on the outfide branches, and robult but moderate thooters; fuch alfo as are firm and well ripened, fhould always be chofen fron liealthful trees: obferving, that the middle part of each fhoot is always the beft graft, cut at the time of grafting to five or fix inches in length, or fo as to have four or five good eyes or buds; but thould be preferved at full length till grafting time, and then prepared as hereafter directed.

They fhould be collected or cut from the trees in February, in mild weather, before their buds begin to fwell, or advanee much for flooting: in collecting them, choofe fuch as have not made lateral or fide fhoots; cut them off at full length; and if they are not to be ufed as foon as they are collected, lay their lower ends in fome dry earth in a warm border till grafting time, and, if fevere weather fhould happen, cover them with diy litter.

The proper tools and other materials ufed in grafting, are, 1. A ttrong knife for cutting off the heads of the ftocks, previous to the infertion of the graft; alfo a fmall hand-faw for occafonal ule in cutting off the heads of large ftocks. 2. A common grafting-knife, or Atrong fharp pen $\cdot$ knife, for cutting and fhaping the grafts ready for infertion ; alfo to llope and form the llocks for the reception of the grafts. 3. A flat graft-ing-chifel and fmall mallet for clefting large ftocks, in cleft-grafting, for the reception of the graft. 4. A quantity of new bafs-ftrings for bandages, for tying the grafted parts clofe, to fecure the grafts, and promote their peedy union with the tock. And, 5. A quantity of grafting clay, for claying clofely round the grafts after their iufertion and binding, to defend the parts from being dried by the fun and winds, or too much liquified by wet, or piuched by cold; for thefe parts ought to be elofely furrounded with a coat of clay in fuch a manner as effectually to guard them from all weathers, which would prove injurious to young grafts, and deftroy their cementing property, fo as to prevent the junction: therefore, a kind of fliff loamy mortar mult be prepared of Atrong fat loam, or, in default thereof, any fort of tough binding clay, either of which thould be laid in an heap, adding thereto about a fourth of frefh horfe-dung free from litter, and a portion of cut hay, mixing the whole well together, and adding a little water: then let the whole be well beaten with a tick upon a floor, or other hard fubllance; and as it becomes too dry, apply more water, it every beating tuming it over, always continuing to beat it well at top till it becomes flat; which muit be repeated more or lefs according to the nature of the clay, but fhould be feveral times done the firft day: next morning repeat the beating, ftill moittening it with water; and by thus repeating the beating lix or cight times cuery day for two or three days, or every other day at leafl, for a week, it will be in pro-

## G R A

per order for ufe; obferving, it hould be prepared a week at leaft before it is ufed, but if a month the better.

The feafon for performing the operation of grafting is Fcbruary and March : though, when the work is performed in February, it for the general part proves the mof fucceffful, more efpecially for cherries, plums, and pears; and March grafting is well adapted for apples.

There are different methods of grafting in practice, tèrmed Whip-grafting-Clcf-grafting-Crown-graft-ing-Cheek-grafting - Side-grafting- Root-grafting -and Grafting by approach or Inarching : but Whipgrafting and Cleft-grafting are moft commonly ufed; and Whip-grafting moft of all, as being the moft expeditious and fuccersful of any.

Whip-grafing. - This being the moft fucceffful method of grafting is the moft commonly practifed in all the nurferies; it is always performed upon finall ftocks, from about the fize of á goofe quill to half an inch or a little more or lefs in diameter, but the nearer the ftock and graft approach in fize the better ; and is called whip-grafting, becaufe the grafts and ftocks being nearly of a fize, are floped on one fide, fo as to fit each other, and tici together in the manner of whips, or joints of angling-rods, \&ic. and the method is as follows. Having the cyons or grafis, knife, bandages, and clay ready, then begin the work by cutting off the head of the ftock at fome clear fmooth part thereof; this done, cut one fide floping upward, about an inch and half or near two inches in length, and make a notsh or fmall flit near the upper part of the flope downward about half an inch long, to rective the tongue of the cyon ; then prepare the cyon, cutting it to five or fix inches in length, forming the lower end alfo in a floping manner, fo as exactly to fir the floped part of the flock, as if cut from the fame place, that the rinds of both may join evenly in every part; and make a fit fo as to form a fort of tongue to fit the fit made in the flope of the flock; then place the graft, inferting the tongue of it into the lit of the fock, applying the parts as evenly and clofe as poffible; and immediately tie the parts clofe together with a flring of bafs, bringing it in a neat manner fevcral times round the ftock and graft; then clay the whole over near an inch thick on every fide, from about half an inch or more beluw the bottom of the graft, to an inch over the rop of the flock, finthing the whole coat of clay in a kind of oval glubular form, rather longwife, up and down, cloting it cfiectually about the cyon, and every part, fo as no fun, wind, nor wet may penetrate, to prevent which is the whole intention of claying; obferving to examine it now and then, to fee if it any where cracks or falls olf, and if it does it muft be inflantly tepaired with freth clay. This fort of grafting may alfo be performed, if neceffary, upon the young fhoots of any bearing tree, if intended to alter the forts of fruits, or lave more than one fort on the fame tree. Ly the middle or latter end of May, the grafts will be well united with the llock, as will be evident by the fhouting of the graft ; then the clay fhould bc wholly taken away; but fufler the bafs handage to remain fome time longer until the unted parts feem to fwell and be too much confined by the ligature, then take the tying wholly off. Their farther culture is dirceted under Voc. VILI. Part I.
the refpective articles, whether defigned for dwarfs or Grafin\%. ftandards, \&c.

Cleft-grafting. - This is fo called, becaufe the ftock being too large for whip-grafting is cleft or flit down the middle for the reception of the graft; and is performed upon ftocks from ahout one to two inches diameter. Firll, with a ftrong knife cut off the head of the fock; or if the ftock is very large, it may be headed with a faw; and cut one fide noping upwards about an inch and half to the top; then proceed with a Arong knife or chifel, to cleave the fock at top, crols-way the nope, fixing the knife or chiifel towards the back of the flope, and with your mallet frike it, fo as to cleave the flock about two inches, or long enough to admit the graft, keeping it open with the chifel; this done, prepare the cyon, cutting it to fuch length as to leave four or five eyes, the lower part of which being floped on each fide, wedge fallion, an incli and half or two inches long, making one fide to a thin edge, the other much thicker, leaving the sind thereon, which fide mult be placed outward in the flock; the cyon being thas formed, and the cleft in the fock being made and kept open with the chifel, place the grati therein at the back of the flock the thickell fide outward, placing the whole cut part down into the cleft of the ftock, making the rind of the fock and graft join exactly; then removing the grafting chifel, each fide of the cleft will clofely fquecze the graft, fo as to hold it falt ; it is then to be bound with a ligasure of bafs, and clayed over, as obferwed in whip-grafting, leaving three or four eyes of the cyons uncovered. If intended to graft any pretty large flocks or branches by this method, tho or more grafts may be inferted in cach; in this cafe the head mut be cut off horizontally, making no flope on the fide, but finooth the top, then cleave it quite a-crofs, and place a graft on each fide, as the flock may be cleft in two places, and infert two grafts in each cleft; they are thus to be tied and clayed as in the other methods. This method of grafting may bo performed upon the branches of bearing trees, when intended either to renew the wood or change the fort of fruit. Towards the latter end of May, or the beginning of June, the junction of the graft and fluck in either method will be effectually formed, and the graft begin to thoot, when the clay may be taken off, and in a fortnight or three wecks after take off alfo the bandages.

Crozen srafing. - This kind of grafting is commonly practifed upon fuch ftocks as are too large to cleave, and is often performied upon the large branches of apple and pear trees, \&ic. that already bear fruit, when it is intended to change the forts, or enew the tree with frefl-bearing wood. It is termed crocungrafing, becaule the llock or branch being headed duwn, feveral grafts are inferted at top all around betwixt the wood and bark, fo as to give it a crown-like appearance: obferving, that this kind of grafting fhould not be performed until March or early in April; for thon the fap being in motion, renders the bark and wood of the fock much eafier to be feparated for the admifion of the graft. - The manner of performing this fort of grafting is as follows: Firft, cut off the hicad of the lhock or branch with a faw horizontally, and pare the top fmooth; then having the grafts, cut one fide of each flat, and fomewhat floping, an inch and

## G $R$ A $\quad 34] \quad$ G IR A

Gating. a kalf, foreving a furt of moulder at top of the flope to ref upon the crown of the Alock; and then raifing the rine of the flock with a wedge, fo as to admit the cyon between that and the wood two inches down, place the grafts with the flat fide next the wood, thrufting it dowa far enought for the fhoulder to relt upon the top of the Hock: and in this manner may be put three, four, five, or more grafts in one large flock or branch. When the grafis are all thus inkerted, let the whole be tied tight and well claycd: obferving to leave two or three eyes of each graft uncovered, but raifing the clay an inch above the top of the teock, fo as to throw the wet quichly off, without lodging about the grafted parts, which would ruin the whole work. Crown-grafting nasy alfo be perfornacil, by making feveral clefes in the crown of the lluek, and inferting the grafts round the top of the clefts. The grafts will be pretty well united with the flock, and exhibit a flate of growth, by the end of May or beginning of June, and the elay may then be taken away. The trees grafted by this methor will fucceed extremely well; but, for the firit two or three years, have this inconvenience attending them, of bring liable to be blown out of the llock by violent winds; which mult be remedied by tying long fticks to the body of the llock or branch, and each graft tied up tor one of the fticks.

Check-grafing.-Cut the head of the flock off, horizontally, and pare the top finooth; then cut one file floping an inch and half or two inches deep, and cut the lower part of the graft floping the fame length, making a fort of thoulder at tup of the floped part : it is then to be placed upon the floped part of the ltock, refting the fhoulder upon the crown of it : bind it with bafs, and fuilh with a covering of clay as in the other methods.

Side-grafting. -This is done by inferting grafts in. to the fides of the branches without heading then down; and may be practifed upen trees to till up any vacancy, or for the purpofe of variety, to have feveral forts of apples, pears, plums, \&e. upon the fame tree. It is performed thus. Fix upon fuch parts of the branches where wood is wanted to furnith the head or any part of the tree; there llope off the bark and a litele of the wood, and cut the lower end of the grafts to fit the part as near as poffible; then iusin them to the branch, and tie them with bafs, and day them over.

Root-grafting.-This is done by Whip.grafting cyons upon pieces of the root of any tree of the fame genus, and planting the row where it is to remain ; it will take root, draw nouriflment, and feed the graft.

Grafting ty Approach, or Inarching. - This fort of griafing is, when the ltocks defigned to be grafted, and the tree from which you intend to take the graft, cither grow fo vear, or can be placed fo near together, that the branch or graft may be made to approach the Hock, without feparating is from the tree, till after its union or junction with the llock; fo that the banch or gratt being bent to the ftock, they together form a fort of arch; whence it is called Grafting by Approach, or lareling. Being a fure method, it is ormmonly prakifed upon fuch teces as are with difficulty made to fuccud by any of the former ways of grating. When intended to propagate any kind of see or lluab by this ardiad of gradin, if the tree, sto
is of the hardy kind, and growing in the foll ground, a proper quantity of young plants for flocks mult be fet round it: and when grown of a proper height, the work of inarching nult be performed; or, if the branches of the tree yon detign to graft from is too high for the ftocks, in that cafe flocks muft be planted in pots, and a flight flage muil be erected around the tree, of due height to reach the branches, and the pots containing the focks mult be placed upon the thage. As to the method of performing the work: Obferve, that in this method of grafting, it is fometimes performed with the head of the ftock cut off, and fometimes with the head left on till the graft is united with the ftock; though, by previoufly heading the ftock, the work is much eafier performed; and laving no top, its whole effort will be directed to the nourifh. ment of the graft; having, however, the flocks properly placed, either planted in the ground, or in pots around the tree to be propagated; then make the moll convenient branches approach the fock, and mark on the body of the branches the parts where they will mott eafily join to the tlock, and in thore parts of each branch pare away the bark and part of the wood two or three inches in length, and in the fame manner pare the tlock in the profer place for the junction of the graft ; then make a fit upwards in the branch, fo as to form a fort of tonguc, and make a flit downards in the flock to admit it; let the parts be then joined, flipping the tongue of the graft into the flit of the flock, making the whole join in an exact manner, and tie them clofely together with bafs, and afterwards cover the whole with a due quantity of clay, as before directed in the other merhods. After this, let a floui ftake be fixed, if poffible, for the fupport of each graft ; to which let that part of the Atock and glaft be faftened, which is neceffary to prevent their being disjoined by the wind. The operation being performed in fpring, let them remain in that pofition about four monchs, when they will be united, and the graft may then be feparated from the mother-tree. In doing this. be careful to perform it with a tteady hand, fo as not to loofen or break ous the graft, floping it off downwands clofe to the llock; and if the head of the fock was nut cut down at the time of grafting, it mult now be done clofe to the graft, and all the old clay and bandage mult alfo be cleared away, and replaced with new, to remain a few weeks longer. Obferve, however, that if you fhall think the grafts are not firmly united with the flock in the period of time above mentioned, lat them remain another year till autumn, before you feparate the grafts from the parent-tree. By this kind of grafting, you may raife almolt any kind of tree or thrub, which is often done by way of curiofity, to ingraft a fruit bearing branch of a fruit- tree upon any common fteck of the fame fraternity or geaus, whereny a new tree bearing fruit is raifed in a few months. This is fometimes practifed upon orange and leinon trees, \&c. by grafting bearing branches upon llacks raifed from the kernels of any of the fame kind of fruit, or into branches of each other, $f_{0}$ as to have oranges, lemons, and citrons, all on the fame tree.

An anonymous author has given us in a treatife, publihed at Hamburgh, under the title Amanitues Hortanfes Nove, a new method of grafting trees, fo

## G R A

Grafting, as to have very beautiful pyramids of fruit upon them, which will exceed in brauty, flavour, and quantity, all that can be otherwife produced. This, he fays, he had long experienced, and gives the following method of doing it. The trees are to be tranfplanted in autumn, and all their branches cut off. Early in the following fummer the young fhoots are to be pulled off, and the buds are then to be ingrafted into them in an inverted direction. This, he fays, adds not only to the beauty of the pyramids, but allo makes the branches more fruitful. Thefe are to be clofely connected to the trunk, and to be faftened in with the common ligature: they are to be placed circularly round the tree, three buds in each circle, and thefe circles at fix inches diftance from one another. The old trees may be grafted in this manner, the fuccefs having been found very good in thofe of twenty years flanding; but the moll eligible trees are thole which are young, vigorons, and full of juice, and are not above a finger or two thick. When thefe young trees are tranfplanted, they mult be fenced round with pales to defend them from the violence of the wind; and there mult be no dung put to them till they are thoroughly rooted, for fear of rotting them before the fibres ttrike. The buds ingrafted mult be finall, that the wounds made in the bark to receive them, not being very large, may heal the fooner; and if the buds do not fucceed, which will be perceived in a fortnight, there mult be others put in their place. The wound made to receive thefe huds mult be a ftraight cut, parallel to the horizon; and the piece of bark taken out muft be downward, that the rain may not get in at the wound. In the autumn of the fame year, this will be a green and flourifhing pyramid; and the next fummer it will flower, and ripen its fruit in autumn. ;

GRAHAM (James), Marquis of Montrofe, was comparable to the greatel heroes of antiquity. He undertook, againt almoft every obitacle that could terrify a lefs enterpifing genius, to reduce the kingdom of Scotland to the obedience of the king; and his fuccefs was anfwerable to the greatnefs of the under taking. By valour, he in a few months almolt effectuated his defign ; but, for want of fupplies, was forced to abandon his conquefts. After the death of Charles I. he, with a few men, made a fecond attempt, but was immediately defeated by a nemerous army. As he was leaving the kingdom in difguife, he was betrayed into the hands of his enemy, by the Lord Allon, his intimate friend. He was carried to his execution with every circumftance of indignity that wanton cruelty could invent ; and hanged upon a gibbet 30 feet high, witb the book of his exploits appended to his neck. He bore this reverfe of fortune with bis ufual greatnefs of mind, and exprefled a jutt fcorn at the rage and the infult of his tnemies. We meet with many inftances of valour in this active reign; but Montrofe is the only inftance of heroifm. He was executed May $21 \mathrm{ft}, 1650$. See Britain, $\mathrm{n}^{\circ}{ }_{137}$, $138,143,165$.

Graham (Sir Richard), lord vifcount Prefton, eldeft fon of Sir George Graham of Netherby, in Cumberland, Bart. was born in 1648 . He was fent ambalfador by Charles II. to Louis XIV. and was malter of the wardrobe and fecietary of flate under James II. But when the Revolution took place, he was tritd
and condemned, on an acculation of atiempting the reftoration of that prince; though he obtained a pardon by the queen's interceffion. He fpent the remainder of his days in retirement, and publifhed an elegant tranflation of "Boethius on the confolation of phiplofophy." He died ill 1695.

Graham (George), cluck and watch maker, the molt ingenious and accurate artilt in bis time, was born in 1675. After his apprenticcfhip, Mr Tompion received him into his family, purely on account of his merit ; and treated him with a kind of paren. tal affection as long as he lived. Befide his univerfally acknowledged fikill in his profeffion, he was a complete mechanic and altronomer; .the great mural arch in the oblervatory at Greenwich was made for Dr Halley, under his immediate infpection, and divided by his own hand: and from this incomparable original, the beft foreign inftruments of the kind are copies made loy Englith artilts. The fector by which Dr Bradley firlt difcovered two new motions in the fixed ftars, was of his invention and fabric: and when the Irench academicians were fent to the north to afcertain the figure of the ea:th, Mr Graham was thought the fiteft perfon in Europe to fupply thern with inftruments; thofe who went to the fouth were not fo well furnifhed. He was for many years a member of the Royal Society, to which he commanicated feveral ingenious and importan: difcoveries; and regarded the advancemert of fcience more than the accumulation of wealth. He died in 1751 .

Craham's Dyke. See Avtonine's's Wall.
GRAIN, corn of all forts, as barley, oats, rye, \&c. See Corn, Wheat, \&c.

Grain is alfo the name of a fmall weight, the twentieth part of a ccruple in apothecaries weight, and the twenty-fourth of a penny-weight troy.

A grain-weight of gold-bullion is worth two-pence, and that of filver but half a farthing.

Grain alfo denotes the component particles of Aones and metals, the veins of wood, \&c. Hence crofsgrained, or againtt the grain, means contrary to the fibres, of wood, \&c.

Grain (Baptift le), mafter of the requelts in ordinary to Mary de Medicis queen of France's houfehold, wrote The Hijfory of Henry the Great, and of Louis XIII. from the beginning of his reign to the death of the marfhal d'Ancre in 1617. This hiftory is reckoned to be wrote with impartiality, and the $f_{i}$ init of a true patriot ; and contains many things not to be found any where elfe. He vigorouny afterts the edict that had been granted to the reformed.

GRALLA, in ornithology, is an order of birds analogous to the bruta in the clais of nammalit, in the Linnzan fyitem. See Zoology and Ornithology.

GRAMINA, grasses; one of the levell tibes or natural families, into whic! all vegetables ate diltibuted by Linnæus in his I'itigotbin Boturica. They are defined to be plants which have veiy fimple leaves, a jointed Item, a hußy calys termed gluma, and a fingle feed. This defeription includes the feveral forts of cora as well as gralles. In Tournefort they conftitute a part of the fifteenth clafs, termed apetali; and in Linnxus's fexual method, thisy are monly contained in the fecond order of the third clafs, called triandrit dгynia.

## $G R A \quad\left[3^{6}\right.$

This numerous und nutural family of the grafes has engaged the attention and refeathes of factal eminent butani's. 'The principal of thefe are, Ray, Monti, Mlicheli, and Limmers.
M. ilontt, in his Cistaltsus Pirgium agri Boncnienfos
 Bunn in 1-a of theit thow res, as, Thoophratus and Ray has divided them befoed ham intu ther fectuns on orders-"lhefo arn, I. Grall: having flowis collected in a frike. 2. Grofis bewner their Rowers collected in a panicle or loofe fpike. 3. Phats that in their habit and external appeazance are athicd to the gratles.

Thins clafo wouds have becen naturat if the author had not impropely introduced fiwect when. jumens, and ar-row-heded grafs, into the third fetion. Montiensmerates about 306 ipecies of the gralles, whech hes iedues under Tomeneforts genera; to thefe he has added thice new genera.

Schanchzer, in his Arifpographa, publifeed likewife in 1719 , divides the gralles, as Monti, from the dif polition of their flowers, into the five following tee tion: 1. Grafkes with flowers in a fpike, as phal ris, anthoxanhum and fumentum. z liregular grafies, ats ichernantus and cornucopiz. 3. Graffes with Howers growing in a fimple panicle in loofe faike, as rocd and millct. 4. Gratits with flowers growing in
a compound panicle, or diffufed fike, as oats and poa. 5. Plates by thisir ladbit acally allied to the graffes, as cyprofs-grafs, fcirpus, linagrollis, ruth, and fecuchzeria.

Scheuchzer has enumerated about four hundred fpecies, which he defcribss with amazing exactnefs.

Micheli has divided the grafes into fix fections, which contain in all $4+$ genera, and are arranged from the lituation and number of the flowers.

Gramiaa, the name of the fourth order in Linneeus's Fragments of a Natural Method, conditing of the numerous and natural fumily of the grafles ais. agroftis, aira, alopecurui or fox-tail grafs, anthoxanthum or vernal grats, arillida arund or reed, avena or oats, bobatia, briza, bromus, cimna, cornucopite or hom of plenty grafs, cynofurus, dactylis, elymus, fettuca or iffene grafs, hordeum or barky, lacurus or hare's-tail grafo, lolium or darnel, lygeum or ltooded matweed, molica, mileum or millet, nardus, oryza or rice, panicum or panic.gras's, palpahum, phalaris or canary phkum, poa, facefturum or fugar cane, fecale or rye, itipa or winged fpike-grafs, triticum or wheat, uniola or lea fide oats of Carulina, coix or Job's tears, olyra, pharus, tripfacum, zea, Indian Turkey wheat or Indian corn, zizania, xyilops or will fefcue-grafs, andropogon, apluda, cenchrus, holeus or Intian millet, ifelixmum. Sce Botany, p. 458, col. 2. and Grasses.

## $G \quad R \quad A \quad M \quad M \quad A \quad R$.

GRAMMAR is the ort of fpeaking or of wuriting any langurge weith propricty; and the purpofe of language is to conmumicate mur thoughts.
2. (irammar, confidered as an art, neceffarily fuppofes the previons ex:Atence of language; and as its dehing is to tomeh any language th the who are ignorant of it, it mult be adaptecl to the genius of that particular languarge of which it treats. A jult method of grammar, therefore, without attempting any alterafions in a lunguage alteady introduced, furnifhes certain obfervations called rales, to which the methods of fpaking ufed in that language may be reduced; and this colldetion of rukes is callat the grammar of that particular language. For the grater diltinetnefs with regard to thefe rales, grammatians have ufually divided this fulject into four ditinct heads, aiz. OrthograPH , or the art of combining letters into fyllahles, and fyiluhts into worts; Litymology, or the art of delucing
one quor. from another, and the various modifcations by aubich the fenfe of auy one word can be diverffifed confla. ently suild its original meaning or its relation to the theme culence it is derived; Syntax, or what relates to the confiruation or due dijpoffition of the woords of a language into fentences or fbrajes; and Prosody, or that which treats of the quantities and accents of fyllables, and the art of making verfes.
3. But grammar, confidered as a frience, views lan. Or unive guage ouly as it is fignificant of thonght. Neglecting fal. particular and arbitrary modifications introduced for the fake of beauty or elegance, it examines the analogy and relation between zwords and ideas; diftinguifhes bet ween thofe particulars which are effential to language and thofe which are only accidoutal; and thus furnifhes a certain flandard, by which different languages may be compared, and their feveral excellencies or defects pointed out. This is what is called Philosophic or

## UNIVERSAL GRAMMAR.

4. THE origin of language is a fubject which has emplozed nuach learned inveltigation, and about which there is fith a diverity of opinion. The defign of fpeech is to communicate to others the thouglats and perceptions of the mind of the fpeaker: but it is obvious, that between an internal idea and any external
as well as of every other animal, are indeed expreffed by fimple inarticulate founds, which as they tend to the prefervation of the individual or the continuance of the fpecies, and invariably indicate either pain or pleafure, are univerfally underftood: but thefe inarticulate and fignificant founds are very few in number; and if they can with any propricty be faid to conftitute a natural and univerfal language, it is a language of which man as a mere fonfitive being partakcs in common with the other animals. found there is no watural relation; that the word fire, for inllance, might have denominated the fubtance which we call ice, and that the word ice might have fignified fire. Some of the molt acute feelings of men,
5. Man is endowed not only with fenfation, hut alfo with the faculty of reafoning; and fimple inarticulate founds are infufficient for expreffing all the various modifications of thought, for communicating to others a chain of argumentation, or even for dillinguifhing between the different fenfations either of pain or of pleafure: a man fcorched with fire or unexpectedly planged among ice, might utter the cry naturally indicative of fudden and violent pain; the cry would be the farne, or nearly the fame, but the fenfations of coll and lieat are widely different. Articulation, by which thofe finple founds are modified, and a particular meaning fixed to each modification, is therefore abfulutely neceflary to fuch a being as man, and forms the language which diftinguines lim tron all other animal , and enables lime $_{\mathrm{p}}$ to communicate with facility all that diverfity of ideas with which his mind is fored, to make known his particular wants, and to diftinguifh with accuracy all his rarious fenfations. Thofe found thus modified are called words; and as words have confeffedly no natural relation to the ideas and perceptions of which they are fignificant, the ufe of thear mult either have been the refult of human fagacity, or have been fuggeted to the firil man by the Author of nature.
6. Whether languare be of divine or human origin, is a quettion upon which, though it might perhaps be foon refolved, it is not necelfary here to enter. Upon either fuppofition, the firf language, compared with thofe which fuccoeded it, or cuen with itfelf as afterwards enlarged, mult have been extremely rude and narrow. If it was of buman contrivance, this will be readily granted; for wbat art was ever invented and brought to a ftate of perfection by illiterate favages? If it was taught by GoD, which is at lealt the more probable fuppofition, we cannot imagine that it would be more comprehenfive than the ideas of thofe for whofe immediate ufe it was intended; that the firlt men fhould have been taught to exprefs pains or pleafures which they never felt, or to utter founds that frould be afterwards fignificant of ideas which at the time of utterance had not occurred to the mind of the fpeaker: man, taught the elements of language, would be able himfelf to improve and enlarge it as his future occafions thould require.
7. As all language is compofed of fignificant weords variouly combined, a knowledge of them is neceflary previous to our acquiring an adequate idea of language as conilructed into fentences and phrales. But as it is by words that we exprefs the various ideas which occur to the mind, it is neceflary to examine how ideas themfelves are fuggeted, before we can afcertain the various claffes into which words may be diftributed. It is the pruvince of logic to trace our ideas from their
origin, as well as to teach the art of realoning: but it is necelfary at prefent to obferve, that our earlieft ideas are all ideas of fenfation, excited by the impreffions that are made upon our organs of fenfe by the various objects with which we are furrounded. Let us therefore fuppofe a reafonable being, devoia of every poffible prepofition, placed upon this globe; and it is obvious, that his attention would in the frit place be directed to the various objects which he faw exilting around him. Thefe he would naturally endeavour to diftinguilh from one another; and if he were either learnigg or inventing a languige, his firt effort would be to give them names, by means of which the ideas of them mighe be recalled when the objects themfeives flould be abferit. This is one copious fource of words; of nouns. and forms a natural clafs which mull be conmon to crovy language, and which is dillinguifhed by the name of nouns: and as thefenouns arc the names of tex feveral fubitances which exift, they have likewife been called subitantives.
8. It would likewife be early difcovered, that every one of thefe fubtances was endowed with certain qualities or attributes; to exprefs which another clats of of attriwords would be requifite, tince it is only by their qua- butives. lities that fubftances themfelves can attract our atten. tion. Thus, to be weight, is a quality of matter; to think, is an attribute of man. Therefore in every language words have been invented to exprefs the known qualities or attributes of the feveral objects which exitt. Thefe may all be comprehended under the general denomination of attributives.
9. Nuens and attributives mult compreliend all that is effential to language (1) : for every thing which exitls, or of which we can form an idea, mutt be either a fubflance or the attribute of fome fubitance; and therefore thofe two claffes which denominate fubtances and attributes, muft comprehend all the word that are neceffary to communicate to the hearer the ideas which are prefent to the mind of the fperktr. If any other words occur, they can only have been invented for the fake of difpateh, or intwoduced for the purpofes of eafe and ornament, to avoid tedious circumlocutions or difagreeable tautulugics. 'There are indeed grammarians of great name, who have condidencl as effential io language an order of words, of which the ufe is to connect the nouns and attributives, and which are faid to have no fisnifation of themizeres, but to become Jognjficunt by relhtion. Hence all words which can poffiliy be invented are by thefe men diviled into, two general claffes: thofe which are signimeant of themselves and thofe which ane sot. Words figuiticant of themfolves are either expreflive of the names uf fubtances, and therefore called substantives; or
(A) This is the doctrine of many writers on the theory of language, for whofe judgment we have the higheft refpect: yet it is not eafy to conceive mankind fo far advanced in the art of abllraction as to view atributes by themfelves independent of particular fubfances, and to give one gencral name to eath attribute wherefuever is may be found, without having at the lame time words expreffive of affirmation. We never talk of any attrilute, a colour for intlance, without affrming fomething concenning it; as, either that it is bripht or fainf, or that it is the colour of fome fubflunce. It will be feen afterwards, that to denote affirmation is the proper office of what is called the fubllantive-verb; as, "Milk is white." That verb therefure appears to be as neceflary to the communication of thought as any fpecies of words whatever; and if we mult sange words under a few general clafles, we fhould be inclined to fay, that nouns, atributioes, and affimatioves, comprehend all that is efential to language.
of atributes, and therefore called Attributives. Words which are not ligniticant of themfelves, mult
acquire a meaning either as defining or connecting others; and are therfore arranged under the two claffes of definitives and connectives.
10. 'That in any language thure can be words which of themfelves have no fignification, is a fuppofition which a man free from prejudice will not readily ad. mit ; for to what purpofe thould they have been invented? as they are fignificant of no ideas, they cannot facilitate the communication of thought, and mult therefore be only an incumbrance to the language in which they are found. But in anfwer to this it has been faid, that thefe words, though devoid of fignilication themflves, acquire a fort of meaning when joined with others, and that they are as neceflary to the ftructure of a fentence as cement is to the fructure of an edifice: for as fores cannot be arranged into a regular building without a centent to bind and comeett them, fo the original words dignificant of futfonces and attrilutes, cannot be made to exprefs all the variety of our iteas without being defined and conneget by thofe words which of themfelves fignify nothing. - It is wonderfal, that he who firlt fuggeited this fimile did not perceive tina it tents to overthrow the doctrine which it is ricant to illuftrate: for furely the cement is as much the mather of the building as the $\neq$ ones themfelves; it is equally folidland equally extended. By being united with the flones, it neither acquires nor lofes any one of the qualities effential to watter; it neither communicates its own foftnefs, nor acquires their hardnefs. By this mode of reafoning therefore it would appear, that the words called clefinitives and connesives, fo far from hasing of themfelves no fignification, are equally cffential to language and equally fignificant with thore which are denominated futflantives and attributives; and upon iuvefligation it will be found that this is the truth. For whatever is meant by the defnition or connetion of the words which all men confets to be fignificant, that masuing muit be the fenfe of the words of which the purpofe is to define and connect; and as there can be no metaning where there are no idens, every one of thefe lefinitives and connctives mutt be fignificant of fome idect, although it may not tee always cafy or cuen poffible to exprefs that idea by another word.
11. Thefe different inodes of dividing the parts of fpeech we have juft mentioned, becaufe they have been langely treated of by grammarians of high faine. But it does not appear to us, that any man can feel himfelf much the wifer for having learned that all words are cither substantives or attributives, olfinitifes or connectives. The divifion of words into thege which are significant of themsetves, and thofe whichate significant be relation, is abfolute nomfenfe, and has been productive of much error and much myflery in fone of the moft celebrated treatifes on grammar. It is indeed probable that any attempt to ettablifl a different claffification of the parts of fpeech from that which is commonly received, will be found of little utility either in practice or in Jpeculation. As far af the firmer is cnncerned, the vulgar divifion feems fufficiently commodious; for every man who knows any thing, knows when he ufers a noun and when a vorb. With refpect to the later, not to mention that all the grammarians from Aristotle to

Horve Tores, have differed on the fubject, it fhould feem to be of more importance, after having afeertained with precifion the nature of each fpecies of words, to determine in what cireumftances they difer than in what they a aree.

10
12. In moft languages, probably in all cultivated The comlanguages, grammarians diftinguith the following parts mon divi. of fpeech: Noun, pronoun, verb, participle, adverb, pre fion of the Doftion conjusion- The Latin and Enjlifh gramma parts of rians admit the interizttion among the parts of fpeech, and although it is confeifedly not neceflary to the conftruc-per. tion of the fentence, being only thrown in to exprefs the affection of the fpeaker; and in the Greck and $E_{n}$ lijb tongues thare is the article prefixed to nouns, when they figuify the common names of things, to point them out, and to fhow how far their fignitic ation extends. In the method of arrangement commonly followed in grammars, adjectives are claffed with fub. flantives, and both are denominated youns; but it is certain that, when examined philofophically, an effential difference is difcovered between the fubpantive and the adjative; and therefore fome writers of eminence, when treating of this fubject, have lately given the following clafification of words, which we fhall adopt: The article, noun, pronoun, verb, particlple, adjective, adverb, preposttion, conjunction, interjection. Ah thefe words are to be found in the linglibl language: and therefore we thall examine each clafs, endeavour to afcertain its prccife import, and fhow in what refpeets it differs from every other clafs. It is impoffible to inveftigate the principles of grammar without confining the inveltigation in a great meafure to fome particular language from which the illultrations mult be produced; and that we fhould prefer the Engli/b language for this purpofe can excite no wonder, as it is a preference which to every tongue is due from thofe by whom it is fpuken. We trult, however, that the principles which we flaall eflablifh will be found to apply univerfally; and that our inquiry, though principally illuftrated from the Englifl language, will be an enquiry into philofophical or univerfal grammar.

## CHAPTERI.

## Of the Noun or Substantive.

13. Nouns are all thofe zuorls by zubich oljets or fubpances are denominated, and which difinguiß shem from one auother, without marking either quantity, quality, ac- The noun dion, or relation. The fubfantive or noun is the name defined, of the thing fpoken of, and in Greek and Latin is called name; for it is oroua in the one, and nomen in in the other; and if in Englifh we had called it the name rather than the noun, the appellation would perhaps have been more proper, as this laft word, being ufed only in gramnar, is more liable to be mifunderItood than the other, which is in conflant and familiar ufe. Thast nowns or the names of things mult make a part of every language, and that they mult have been the words firit fuggelled to the human mind, will not be difputed. Min conld not feak of themfelves or of duy thing elfe, without having names for themfelves and the various ohjects with which they are furrounded. Now, as all the objects which exift muft be either in the fame tlate in which they were produced by nature, or changed fiom their original flate by art, or ab/ana.
ed from fubtances by the powers of imagination, and conceived by the mind as having at leaft the capacity of being eharacterized by qualities; this naturally luggefls a divifion of nouns into natural, as man, aregetable, trel', \&c. artificial, as boufe, jbip, watch, \&c. and abstract, as whitenefs, motion, icmperance, \&c.
14. But the diverfity of objects is fo great, that had each individual a difing and proper name, it would be imponfible for the moft tenaciuus memory, during the courfe of the longeit life, to retain even the nouns of the narroweft language. It has therefore been found expedient, when a number of things refemble each other in fome imporiant particulars, to arrange them all under one fpecies; to which is given a mame that belongs equally to the whole fpecies, atid to each individual comprehended under it. Thus the word man denotes a species of animals, and is equally applicable to eqery buman being: The word borfe denotes annther Species of animals, and is equally applicable to every individual of that \{pecies of quadrupeds; but it cannot be applied to the fpecies of men, or to any individual comprehended under that fpecies. We find, however, that there are fome qualities in which feveral fpe. cies sefemble each other; and therefore we refer them to a bigber order called a genus, to which we give a name that is equally applicable to every fpecies and every individual comprehended under it. Thus, men and borfes and all living things on earth refemble each other in this refpect, that they have life. We refer them therefore to the genus called animal; and this word belongs to every Species of animals, and to each individual animal. The fame elaffitication is made both of artificial and abfrat fubitances; of cach of which there are genera, fpecies, and individuals. Thus in $n a-$ tural fubflances, animal, vegetable, and foffle, denote genera; man, borfe, trie, metal, are species; and Alexander, buceplalus, oak, gold, are swovideals. In ariofrial fubilances, edifice is a gevvs; bonfe, cburch, souer, are spectes; and the $V$ 'atican, St Paul's, and the Tower of London, are individuals. In abfrad fubltances, motion and virtue are gexera; fight and temperance are species; the fight of Mabomel and ienperance in avine are inonvidals. By arranging fubitances in this manner, and giving a name to each gonus and $\sqrt{x} c c i e s$, the nouns neceffary to any language are comparatively few and eafily acquired: and when we meet with an object unknown to us, we have only to examine it with attention; and comparing it with other objects, to refer it to the genus or fpecies which it molt nearly refembles. By this contrivance we fupply the want of a proper name for the individual; and fo far as the refemblance is complete between it and the $\sqrt{p}$ ecies to which it is referred, and of which we have given it the name, we may converfe and reafon about it without danger of error: Whereas had each individual in nature a difing and proper name, words would be innmmerable and incomprehentible; and to employ our labours in language, would be as idle as that ftudy of numberlefs written fymbols which has been attributed to the Chinefe.
15. Although nouns are thus adapted to exprefs not the individuals but the genirat or Species into which fubAances are claffed; yet, in fpeaking of the fe fubtances, whether nalural, arificial, or abfraf, all men mult have occafion to mention fometimes one of a kind, and fometimes more thanone. In every language, therefure, nouns muf admit of fome variation in their form, to denose
unity and plurality; and this variation is called number. Thus in the Englith language, when we foeak of a lingle place of habitation, we call it a boufe; but if of mure, we call them boufes. In the firt of thefe cafes the noun is faid to be in the fingular, in the lall cafe it is in the plural, numher. Greek nouns have allo a dual number to exprefs avo individuals, as have likewife fome Hebrew nuuns: but this variation is evidently not effential to language; and it is perhaps deubeful whether it ought to be confidered as an elegance or a deformity.
16. But although number he a natural accident of of nouns, it can only be contidered as efential to thofe which denote genera or fpecies. Thus we may have oceafion to fpeak of one animal or of many animals, of one man or of many nen; and therefore the nouns animal and man mall be capable of expreffing plurality as well as unity. But this is not the cale with refpect to the proper names of individucls: for we can only fay Xenophon, slrifotie, Plato. \&c. in the fingular; as, were any one of thele names to affume a plural form, it would ceafe to be the proper nante of an individial, and become the common name of a jpecies. Of this, indeed, we have forne examples in every language. When a proper name is confidered as a general appellative under which many others are arranged, it is then no longer the name of an individual but of a Species, and as fuch admits of a plural; as the Cafars, the Howards, the Pelbams, the Montagues, \&c.: but Sacrites can never become plural, fo long as we know of no more than one man of that name. The reafon of all this will be obvious, if we confider, that every genus may be found whole and entire in each of its fpecies; for man, burfa, and $\log$, are each of them an entire and complete animal: and every fpecies may be found whole and entire in each of its individuals: for Socrates, Plato, and $X_{c}$ nophon, are each of them completely and entirely a man. Hence it is, that every gemus. though ane, is multiplied into many; and every ficies, though ove, is alfo multiplied into maxy, by reference to thofe beings nubich are bleir fubordinates: But as no individual hus any fuch fubordinatics, it can never in thrictnefs be confidered as maxy; and fo, as well in noture as in name, is truly an individual which cannot admit of nember.
17. Belides number, another characterific, vilible in fubllances, is that of sEX. Evely fubllance is either male or female; or both male and female; or neither one nor the other. So that with refpect to fixes and their negation, all fubllances conceivable are comprehended under this fourfold confideration, which language would he very imperfect if it could not exprefs. Now the exiftence of bermaphrodites being rare, if not doubtful, and language being framed to anfwer the ordinary occalions of life, no provifion is made, in any of the tongues with which we are acquainted, for expreffing, otherwife than by a name made on purpofe, or by a periphrafis, duplicily of fix. Whe regard to this great natural characteriltic, grammarians have made only a threefold diffinction of nouns: thofe which denote males are fuid to be of the mafouline gender; thofe which denote femules, of the fenimine; and thofe which denote fubHances that admit not of fex, are faid to be neuter or of raibler gender. All animats have fex; and therefore the names of all animals thould have gender. But the fex. of all is not equally obvious, nor equally worthy of at-. tertion. In thofe fpecies that are molt coamon, or
of which the male and the fombleare, by their fize, form, colour, or vither outward civeumfances, eminently difinsuiked. the nork is tonctimes called by ome name, which is nowh whene: aud the fenchl by a different name, which io fominine "Thus in Linghth we fay, huforal, wife; hing. 2asen ; forlior, motion ; fon, dumbere, Se. In others of timitar ditinaction, the uane of the mate is applied to the fom le only by pretixing a fyllable or by altering the termination: as man, ceman; lion, lionefs; emperor, empref, ancicutly en.perefs; mujler, miflerfs, anciently maydirefs, Ece. When the jow of any anmal is not obvions, or nut material to be known, the lame name, in fome langoges, is applied, without variation, to all the frcies, and that name is faid to be of the common sonker. Thus in Latin bos albus is a white ox, and los alle a white cow. Diminntive infects, thongh they are doubtlefs male and femate, feem to be confidered in the Enstith language as if they were really creeping fhings. No man, fpecking of a romm, would fay be crecps, but it crecps, upon the ground. But although the origin of genkers is thus clear and obrions; yet the Englith is the mly language, with which we are acguainted, that deviates not, except in this fingle inHance of intects, foom the order of nature. Grack and Lafim, and many of the modern tongues, have nouns, fome mafeoline, fome feminine, which denote fubHances where fex never lad exillence. Nay, fome languages are fo particularly defective in this refpect, as to clafs every object, inanimate as well as anmate, under either the mafouline or the fominine gender, as they have no neuter gender for thofe which are of neither f(x. This is the cate with the Hobrea, French, Holtom, and Spanigh. But the Engli/h, Atrictly following the order of nature, puts every noun which denotes a male animal, and no other, in the mafouline gender; every name of a fomale animal, in the fominime; and every animal whole fex is not obvious or known, as well as every inanimate object whatever, in the neater gender. And this gives our language an advantage above moll others in the poetical and Ifectorical ilyte: for when nouns naturally neuter are converted ino mafendine and feminine, the ferfonification is more ditinctly and more forcibly marked. (Sce Personification.) Some very learned and ingenious men have endeavoured, by what they call a more fubile kind of reafoning, to dif. cern even in things wibbout fix a diftant analogy to that natukal distincion, and to account for the mames of inanimate fubftances being, in Greek and Latu, mufculine and fominine. But fuch fpeculations are wholly fanciful; and the principles upon whicl they proced are overturned by an appeal to faets. Many of the fubftances that, in one language, have moforitne nomes, have in others names that are fominine; which could not be the cafe were this matter regulated by reafon or nature. Indeed for this, as well as many other anomalies in laguage, no other reafon can be afligned than that cajfom-

Quem peres arbieriu'n eft, et jus, et norma, lo puctudi.
18. It has been already obferved that moll nowers are the names, not of inditiduals, but of whole clatles of objects termed genera and pocios (B). In clalfing a num. $\mathrm{N}^{\mathrm{c}} 14 \mathrm{I}$.
ler of individuals under one fpecies, we contemplate only thofe qualities which appear to be important, and in which the feveral indivduals are found to agree, $a b-$ flracting the mind from the confideration of all thofe which appear to be kifs eflential, and which in one in. dividual may be fuch as have nothing exactly fimilar in any other individusl upon earth. Thus, in elafing the indiedduls whieh are comprehended under the fpecies denominated borfa, we pay no regard to their colour or their fize ; becaufe experience teaches us, that no fartizalar eolour or fize is eficntial to that individual living ereature, and that there are not perhaps upon earth tau horfes whole colour and fize are exaclly alike. But the quaitics which in this procefs we take into view, are the gencral /hape, the fymmetry, and proportion of the parts; and in hort every thing which appears evidently effental to the life of the individual and the propagation of the race. All thefe qualities are flrikingly immar in all the individuals which we call horfes, and as Arikingly diffinitar from the com refponding qualiticsofevery ofter individual animal. The colour of a barfe is of: ten the fame with that of an or: but the thape of the one animal. the fymmetry and propontion of his parts, are totally dillerent from thofe of the other; nor could any man be led to clafs the two individuals under the fame focies. It is by a finiar procels that we afcend from one firecies to another, and through all the fpecies to the highett gemus. In each fpecies or genus in the afeending feriesfeaver parricular gualities are attended to than were condidered as effontal to the genus or fpecies immediately below it; and our conceptions become more and more general as the particular qualities, which are the objects of them, become fiwer in nunter. The ufe of a general term, thereiore, can recal to the mind only the common qualities of the clafs, the genus or [pecies which it reprefents. But we have frequent occafion to fpeak of individual objects. In doing this, we annex to the seneral berm certain words fignificant of particalar qualities, which diferiminate the object of which we fpeak, from every other individual of the elats to which it belongs, and of which the gencral term is the common name. for inttance, in advertifing a bliff, we we obliged to mention his beigh, complevion, gail, and whatever may ferve to dillinguifh him trom oll Giber men.

The procels of the mind in rendering her conceptions farticular, is indeed exactly the reverfe of that by which the gonoralizes them. For as in the procefs of grtatraizailun, the whltach from her ideas of any number of fecies certain qualities in which they difer foom each other, and of the reanining $q^{\prime a}$ litios in which they agres, conllitates the firlt germs in the afending feries; fo when the wifhes to make her con-
 semus tha fe quatios on circumllances which were before abtracted from it; and the arem, whith this ammexa. dion, conllitutes the fint fpecins in the difending feries. In like manner, when the withes todelecod from any fireits to an individuat, the has only to annex to the isea of the fpecies thoie parion'ar qualities which dif. criminate the indivilud imended fiom the obler individuals of the fame kind.
(b) It is almoft needlefs to obferve, that the words genus and forcies, and the phrafes bisber geaus and baver fpecies, are taken here in the lorical [enfe; and not as the words genus, fpecies, orrher, chifs, are often employed by naturalilts. For a farther accuunt of the mental procefs of generalization, fee Logie and Metaphysics.

This particularizing operation of the mind points out the manner of applying the general terns of language for the purpofe of exprefling particular ideas. For as the mind, to limit a general idea, connects that idea with the idea of fome particular circumfance; fo language, as we have already oblerved, in order to limit a general term, connects that term with the word denoting the particular circumftance. Thus, in order to particularize the idea of horfe, the mind connects that general idea with the circumflance, fuppofe, of whitenefs; and in order to particularize the evord horfe, language connects that word with the trrm white; and fo in other inflan-ces.-Anmexation, therefore, or the connceting of generel words or terms in language, fits it for expreffing particular conceptions; and this muft hold alike good in all languages. But the methods of denoting this annexation are various in various tongues. In Englif and moft modern languazes we commonly ufe for this purpofe little words, which we have chofen to fyle particles; and in the Greck and Latin languages, the cafis of nouns anfwer the fame end.
19. Cafes, therefore, though they are accilents of nouns not abfolutely nuceffary, have been often confidered as fuch; and they are certainly worthy of our examination, fince there is perhaps no language in which fome cales are not to be found, as indeed without them or their various powers no language could readily an. fwer the purpofes of life.

All the oblique cafes of nouns (if we except the vocative) are merdy marks of annexation; but as the connedions or relations fubfifting among objects are very various, fome cafes denote one kiad of relation, and fome another. We flall endeavour to inveftigate the connection which each cafe denotes, beginning with the genitive. - This is the nog? general of all the cafes, and gives notice that fome connection indeed fubfits between tzvo oljects, but does not point out the particular kind of connection. Tbat we mult infer, not from the nature or termination of the geniivize itfelf, but from our previons knowledge of the oljects connered. That the genitive denotes merely relation in general, might be proved by adducing innumerable examples, in which the relustions expreffed by this cafe are different; but we fhall content ourfelves with one obfervation, from which the truth of our opinion will appear beyond difpute. If an exprefion be ufed in which are, connected by the genilive cafe, two words fignificant of qujejects between which a twofold relation may fubfift, it will be found impolithle, from the exprefion, to determine aubich of thefe tiwo relations is the true one, which nuft be gathered wholly from the eontext. Thus, for example, from the phrafe injuria regis, no man can know whether the injury mentioncd be an injury fuffered or an injury inflized by the king: but if the genitive cafe notified any particular relation, no fuch ambignity could exift. This cafe therefore gives notice, that two objects are, foomebow or otber (c), connected, but it marks not the particalar fort of connection. Hence it may be trarflated by our particle of, which will be feen afterwards to be of a fignification equally general.

Vol. Vill. Part I.

The dative and accufative cafes appear to have nearly 19 the fame meaning; each of them denoting appofition, or of the dathe junction of one oljed weith another. Thus when any tive andac. one fays, Comparo V'irgi'um Homero, Homer and Virgil cafes. are conceived to be placed befide one another, in ordier to their being compared; and this fort of connection is denoted by the dative cafe. In lik: manner, when it is faid latus bumeros, breadth is conceived as joined to or connected in appofition with houlders; and the expreffion may be tranflated "broad at the houlders."

This appofition of two objects may happen either without previous motion, or in confequence of it. In the foregning inflances no motion is prefizppofed; but if one fay, Mifit aliquos fubffidio corum, the appofition is there in confequence of motion. In like manner, when it is Caid, Profecius efl Romam, his appofition with Rome is conceived as the effed of his motion thither.

From this idea of the accufative, the reafon is obvious why the object after the active verb is often put in that cafe; it is becaufe the action is fuppofed to proceed from the agent to the patient. But the fame thing happens with refpect to the dative cafe, and for the fame reafon. Thus, Antonius lafit Ciccronem, and Antonius nocuit Citcroni, are expreffons of the fame import, and in each the action of leurting is conceived as procetding from Antony to Cicero; which is finely illuftrated by the pallive form of fuch expreffions, where the procedure above mentioned is exprefsly marked by the prepofition al: Cicero nocetur, Ciccro laditar ab Antonio. It is therefore not true, that " the accufutive is that cafe, at leatt the only cafe, which to an efficient nominative and a verb of action fubjoins either the effect or the paffive fubjeet ; nor is the dative the only cafe which is formed to exprefs relations tending to itfelf." The only thing effential to thefe two cafes is to denote the appoftion or junaion of one oljeat avith another; and this they do nearly, if not altogether, in the fame manner, although from the cuffom of language they may not be indifferently fubjoined to the fame verb.

The Greek language has no ablative cafe; but in Of the abo the Latin, where it is ufed, it denotes concomitancy, or lative cafe. that one thing accompianies another. From this concomitancy we fometimes draw an inference, and fometimes not. For example, when it is faid, Templum clamore petebant, clumour is reprefented as concomitemit with their gning to the temple; and bere no inference is drawn: but from the phrafe falleo metu, although nothing more is cxprefed than that palenefs is a conconitant of the fear, yet we inflantly infer that it is alfo the effra of it. In moft inttances where the ablative is ufed, an inference is drawn, of which the foundation is fome natural connection obferved to fubfift between the objegs thus conneeted in language. When this inference is mot meant ts be drawn, the prepofition is commonly added: as, interfectus eft cess gladio," he was flain with a fword about him ;" interfecius ef gladio, "hee was flain with a fword as the infrument of his death."
The remaining cafes, which lave not been noticed, of the noare the nominalive and the vocative. Thefe are in moft inative inftances alike in termination, which makes it probable and voraF that
(c) The Greek grammarians fetm to have been aware of the nature of this cafe when they called it noust poun, or the gencral cafe: of which name the Latin grammarians evidently miftook the meaning when they tranflated it cafus genitivus, or the generative cafe; a name totally foreign from its nature. The infor: Gernan among the moldern languages, exprefs dilferent
ithe $i$ reck connections of rclations of onc thing with another by and Lain conne hons or fccations of one for another by and Lain confe. In Engli/h this is done for the moll part by monly ex- prepofitions; but the Einglith, being derived from the yrefled in fame origin as the German. that is, from the 'Tcutonic, yrefed in fame origin as the Germano. that is from the I cultonice,
Engith by has at leatt one variation of the fubfantive to anfwer preroli. cions.
20. The Greek and Latin among the amcient, and the the fame purpofe. For inflance, the relation of pof. fulion, or lethoging, is often expreffed by a different encine of the fubitantive, which may be well called a cals. This cafe anfwers nearly to the genitive coffo in Lation; but as that is not a denomination lignificant of the nature of the cafe in any hantuage, it may pethaps in Englim be more properly called the pofforve cafe. Thus, God's graw', anciently Godis grace, is the grace belons.

that they were orypinally one and the fome cafe. The foundation of this conjicture will apprar fiom conlidering the abe to whith each of thefe eafes is applite. The nominative is amployed to call up the idea of ary - figet in the minel of the hearer. But when a man hears his ostm nome mentioned, his attention is intantIy ronfed, and he is naturally led to liflen to ewhent is to tefine. Hence, when a man meant particularly to folicit one's attention, lee would maturally pronuunce that perfon's nums; and thus the neminafite cafe would pafs into a rooctrize, of which the ufe is alkeqys to folicit arsention ( p ). exprefled by means of the preprolition; thus, -the grate of Col.

Athough the word Gotis is as evidentiy an inflexion of the noun Goal as the word $D_{i} i$ is an inflexion of Dous, there are grammanians who have denied that in Sughtip there is any true inflexion of the original noun, and who hase faid that the noun with the addition of that fyllable, which we confider as the fign of a cafe, erofes to be a roun, and becomes a defrilive; a word which with them is dovoid of fignification. Thus, in the exprefton Alexander's boufe, the word Cilcwandor's Peands not as a noun, but as an article or difuitive, ferजing to afcertain and point out the individualify of the hocale. Put this is a palpable miltake: the word Ah:*ander's ferees not to point out the indicilually of the houfe, bu: to thow to whom the houfe belons: and is therefore, beyond difpute, not an articie, but a noun in the folfeffer corfe. Again, when we fay $S t$ Peter's at Rome and St Paul's at London, the words St Petcer's and St Peul's are neither articlis, nor, as has beeu abfardly imagined, the proper names of edificts, like the Rotmado or the Circus; but they are. in the puffire chf: the wanes of the two apontles to whom the churches were ledicatel, and to whom they are fuppofed to delong.

But that this, which we have called the poffefive cafe, is really not in, mult be evident, it is faid, becaufe there are certain ciremontances in which it cannot be fubtituted for the noun with the prepofition prefixed. 'Thus, though a man may fay, I fpeak of Alexander, I write of Cafar, I think of Poripey'; he camnot fay, I \{peat Alexander's, I write Caffur's, or I think Pompty's. This
is indecd true, but it is mothing to the parpofe: for though I may fay, Logucr ds Allemanaro, Scribo de Cafine Cogizo de Pimpio; I cumot fay, L.0ator A-
 fore all that can be inferred foom this argument is, that as the loctin genitive is toot ahays of the fame import with the prepolition ald, fo the Englith poffefive is not alezalys of the fame import wilh the prepotition of. Upon the whele, then, we may conclude, that Eaghith nouns admit of one inllexion; and that thugh cafes are not fo effential to nouns as gender and number, no language can be wholly without them or their various powers.

## CHAPTER II.

## of Articles or Defleitipiz.

2 I . Tue intention of language is to communicate thought, or to exprefs thofe ideas which are furgorated to us by our fenfesexternal and ioternal. The ideas firf fuggefted to us are thofe of pain and pleafure, and of the objects with which we are furrounded; and therefore the words foll learned mult be nomas, or the mames of objects natural, ariificial, and ab?lract. Every object about which the human mind can be convenfant is Atrictly and properly fpaking partizular ; for all things in nature differ from one another in numberlefs refpects, which, not to mention the idsa of feparate exittence, fo circumftance and insiviluate them, that no one thing can be faid to be anothes. Now the ufe of language being to exprefs our idcas or couceptions of thefe objects, it might natually be expected that every object flould be diftinguilhed by a proper name. This would indeed be agrecable to the truth of things, but we have already feen that it is altogether impracticable. Objects have therefore been clafid into generiz and $/$ secies; and names given, not to each indarithuch, but to each stemus and foreris. By this contrivance of language, we are enabled to afcestain in fome meafure any imdisidual thet may occur, and of which we know not the proper name, only by referring it to the gentis or /pecies to which it belongs, and calling it by the gearal or Seecific name; but as there is frequent occation to diAlinguih individuals of the fame fipecies from one another, it became necefliary to fall upon fonke expedient to mark this dillinction. 10 many languages gencral and Specifice nemas are modified and rehricted by three orders (if words; the article, the adjective, and the oblieuecases of nouns. The cufis of nouns we The neaf have already conthlered : the aclipetive will employ our fity and in attention afturwads: at prefent our obiervations are of the arconfined to the article; a word fo very neceffary, that without it or fome equivalent invention men conld not employ nouns to any of the purpofes of life, or indeed communicate their thoughts at all. As the bufincis of articles is to enable us, upon occafion, to employ general terms to denote particuiar oljals, they muit be confidered, in combination with the Eeneral terms, as merely futhitutes for proper names. They have, however, been commonly called definitives; becaufe they
(D) The chief objection to this conjecture, that the nominative and vocative were originally the fime cafe, is taken from the latin tongue, in which the noms of the fecond deckenfion ending in us terminate their vocative in e. But this is eatily accounted for. The sinfuch words was often dropt, as appears from the fanning of old Latin poetry; and when this was done, the "being flort, would naturally in pronmecition pafs into e, a like fiort rowd; and thus, in the vecative calc, e would in time be written inflend of $u$.
ferve to defne and afortain any particui'ar olject, fo as to dijlinguil) it from the other ajycts of the general class to which it belongs, and, of courfe, to denote its is,lividuality. Of words framed for this purpofe, whether they have by grammarians been termed articies or not, we know of no language that is wholly deftitute. The nature of them may be explained as follows.
22. An objeft accurs with which, as an individual, we are totally unacquainted; it has a head and limbs, and appears to poffers the powers of felf-motion and fenfation: we therefore refer it to its proper fpecies, and call it a dog, a barfe, a lisa, or the like. If it belongs to none of the fpecies with which we are acquainted, it cannot be called by any of their names; we then refer it to the genus, and call it an aninual.

But this is not enough. The object at which we are looking, and which we want to diftinguifh, is not a jpecies or a genus, but an individual. Of what kind? Khoewn or unknown? Seen now for the firfl tinte, or jeen before and now remembered? This is one of the inftances in which we fhall difeover the ufe of the two articles a and the: for, in the cafe fuppofed, the article a refpects our forimary perception, and denotes an individual as undrown; whereas THE refpects our fecondury perception, aad denotes individuals as known. To explain this by an example: I fee an obicet pafs by which I never faw till now: What do I fay? There goes a begzar with a lung beard. The man departs, and returns a week after: What do I then fay? Tbere goes ghe beggar wilh the long beard. Herc the article only is changed, the reft remains unaltered. Yet mark the force of this apparently minute change. The individual once vague is now recognited as fometbing known; and that merely by the cfficacy of this latter article, which tacitly infinutes a kind of previous acquaintance, by referring a prefent perception to a like perception alceady paft.

This is the explanation of the articles $A$ and the: as given by the leanned inr Harris, and thus far what he fays on the fubject is certainly ju't; but it is not true that the article the alougrs infinuates a provious acquaintance, or refers a prefent perception to a like pereept:on already palt.-1 am in a room crowded with company, of which the greater part is to me totally waknown. I feel is difificule to breathe from the groflnefs of the inclofed atnofphere; and looking towards the windos, Ifee in it a perion whom I never faw be-
 man in the sumburu, and requef, that, if it be not inconvenient, he will have the goodnefs to let into the room a litule frefh air. Of this gentleman I lave no prosious acquambuce: my prefent perception of him is my primary perception, and yet it wotlid have been extremely mpioper to fend iny compliments, \&cc. to a gentleman ais the suindur.-Again, there would be no impropricty in faying - "A ann whom I faw yetterday exhibiting a how to the rahble, was this morning comnitted to jail charged with the crime of boufebraking." Notwilhtading the emhority, thecefore, of Fis Harris and his matler itelionius, ve may ienture to affirm, that it is not chapial to the article a to refpect a prineryperapion, or to the article the to inclicate a preehatijleat acquaniatance. Such may indeed be the manner in which thefe wond are mofe ir quennly nifed but we fes that there are intances in which they may be uled
differently. What then, it may be affed, is the im. port of each artick, and in what refipects do they differ?
23. We anfwer, that the articles $A$ and the are both of them djaniives, as by being prelixed to the names of genera and jpecies they fo circumferibe the lacitude of thofe names as to muke them for the mold part denote individuals. A nasun or fubfanative, with out any article to limit it, is taken in its widelt Cole. Thut, the word man means all mankind;
"The proper fudy of mankind is maa:"
where mankind and man may change places withou: making any alteration in the fenfe. But tet cither of the articles of which we are treating be prefixed to the word mum, and that word is imncdiaiely reduced from the name of a whole gemus to denote only a furghe individual; and initead of the nobie truth which this line afierts, the poet will be made to lay, that the proper Itudy of mankind is not the common nature which is diffufed through the whole human race, but the manners and eaprice of one individual. Thus far therefore the two articles agree: but they differ in this, that though they both limit the fpecific name to fome individual, the article a leaves the individual iffelf unafertained; whereas the article THE afcertains the individual alfo, and can be prefixed to the fpecific name only when an individual is intended, of wheh fomething may The inse. be predicated that dittinguifhes it from the other indi- linite an ! viduals of the fpecies. Thus, if I fay-a man is fif for the deffinic. treafons, my affertion may appear ftrange and vague; but the fentence is complete, and wants nothing to make it intelligible: but if I fay-quF mon is fit for trectons, I fpeak nonfenfe; for as the article the thows that 1 mean fome porticular man, it will be impofible to difcover iny meaning till I complete the fentence, and predicate fomething of the individual intersed to dittinguilh him from other individuals.

$A$ mun, therefore, mans fome one or other of the haman race indefinitely; qHE man means, dfyintely, that particnlar man who is fpoken of: the former is called the indefowite, the latter the definite, article.

The two articles differ likewie in this refpect, that as the article a ferves only to feparate onie individuall ob. ject from the general clafs to which it belongs, it cannot be applied to plurals. It has indced the Came figmification nearly with the numerical word one; and in French and Italian, the fame word that denotes unity is aho the argicle of which we now trat. But the effence of the article the being to define orjects, by pointiry them out as thofe of which fometining is atfirmed or denied which is not affirmed or denied of the other objects of the fame clafs, it is cqually applicable to $b$ oth numbers; for things may be predicated of one set of man, as well as of a fingle naan, which cannot be predicated of other men. The uie and import of caeli article will appear from the following example: " $1 H_{6, a}$ was made for luciety, and ought to extend his groudwill to all men; but a man will nefurally entertain a more particular regaad for the men with whom he has the molt frequent intercourfe, and cater into a han ciofer union with the matr whofe teaper and difpofition Guit bet with his own."
We have faid, that the article a cannot be applicel F2
to phurals, becaule it denotes unity : but to this rule there is apparently a remarkable exception in the ufe of the adjectives fow and many (the latter chiefly with the word grat before it), which, though joined with ftural fubfinnives, yet admit of the firgular arbicle a; as, a feec men, a great many men. The reafon of this is manifell from the effect which the article has in thefe pluafes: it ineaks a fmall or a great number collecpir:ly taken, to which it gives the idea of a whole, that is, of urity. Thus likewife a bundred, a thoufond, is one whole mumber, an aggregate of many collectively taken, and therefore ftill retains the article a though joined as an adjcctive to a plural fubtantive; as, a bendred yechrs. The exception therefore is only apparent; and we may affirm, that the article a univerfally denotes unity.
24. The indefinite article is much lefs ufeful than the other; and therefore the Greek and Hebrew languages have it not, thoush thcy both have a definite articte. In languages of which the noums, adjecives, and verbs, have inflexion, no millake can arife from the want of the indeffinite article; becaufe it can always be known by the terminations of the noun and the verb, and by the circumftances predicated of the noun, whether a culole fpecies or one inditidual be intended. But this is not the cale in Englith. In that language, the adjectives having no variation with refpect to gender or number, and the tenfes of the verhs being for the moll part the fame in both numbers, it might be often doubtful, had we not the indefinite article, whether the fpecific name was intended to exprefs the aubole frecies or only ore individual. Thus, if we fay in Englifh, "Man suas born fint from God,' we mult be undertood to mean that the birth of every man is from God, becanfe to the fpecific term the indefinite article is not prefixed. Yut
 no fuch meaning to any perfon acquainted with the Greek language; as the word $\alpha$ vipuntos, without any article, is reflricted to an individual by its concord with the verb and the participle; and the fenfe of the paflage is, A man was born (or exifled) fent from God. But though the Greeks have no article correfpondent to the article A, yet nothing can be more nearly related than their $O^{\prime}$ to our the. o' Bzerinus-the king; To \&efou-the giff. In one refpect, indzed, the Greek and Englilh articles differ. The former is varied according to the gender and number of the noun with which it is aflociated, being i-mafouline, $n$-feninine, to-neuter ; and ci, ai, $7 \alpha$, in the plural number: whereas the Englifh article fuffers no change, being invariably the before nouns of every gender and in both numbers. There are, however, fome modern languages which, in imitation of the Greck, admit of a variation of their article which relates to gender; but this cannot be confidered as effential to this fpecies of words, and it may be queflioned whether it be any improvement to the language. In tongues of which the nouns have no inflexion, it can only ferve to perplex and confufe, as it always pre27 . fents a particular idea of fex where in many cafes it is A greater nunter if articles in
articles in 25 . The articles already mentioned are allowed to
the Enelina be flrietly and properly fuch by every language be flrictly and properly fuch by every grammarian; than is ron: moorly ruppofed. not neceffary. but there are fome words, fuch as this, that, any, fome, all, otber, \&cc. which are generally faid to be fometimcs articks and fometimes pronouns, according to the
different modes of ufing them. That words fhould change their nature in this manner, fo as to belong fometimes to one part of fpeech, and fometimes to another, mult to every unprejudiced perfon appear very extraordinary; and if it were a fact, language would be a thing fo equivocal, that all inquiries into its nature upon principles of fcience and reafon would be vain. But we cannot perceive any fuch fluctuation in any word whatever; though we know it to be a general charge brought againt words of almoft every denomination, of which we have already feen one inftance in the polfefive cafe of notuns, and fhall now fee another in thofe words which are commonly called pronominat articles.

If it be true, as we acknowledge it to be, that the genuine pronoun aluays flands by itfelf, affuming the power of a noun, and Cupplying its place, then is it certain that the words this, th.at, any, fome, \&c. can never be pronouns. Weare indeed told, that when we fay thas is virtue, give one that, the words this and that are pronouns; but that when we fay, this habit is virtue, that man defrauded me, then are they articles or defnifives. This, however, is evidently a mittake occafioned by overlooking thofe abbreviations in conAtruction which are frequent in every language, and which, on account of that very frequency, have perhaps efcaped the attention of grammarians whofe fagacity has been fuccefffully employed on matters lefs obvious.-When we fay this is virtue, it is evident that we communicate no intelligence till we add a fulfontive to the word this, and declare what is virthe. The word this can therefore in no inftance affume the power of a noun, fince the noun to which it relates, though for the fake of difpatch it may be omitted in writing or converfacion, muft always be fupplied by the mind of the reader or hearer, to make the fentence intelligible, or this itfelf of any importance. " When we have viewed fpeech analyfed, we may then confider it as compounded. And here, in the firlt place, we may contemplate that fyntbefis, which by combining fimple terms produces a truth; then by combining two truths produces a third; and thus others and others in contimued demonftration, till we are led, as by a road, into the regions of fcience. Now this is that fuperior and moft excellent fynthefis which alone applies itfelf to our intellect or reafon, and which to conduct according to rule conftitutes the art of logic. After this we may turn to thofe inferior compolitions which are productive of the pathetic," \&c.-Here, if any where, the word this may be thought to fand by itfelf, and to affume the power of a noun; but let any man complete the conftruction of each fentence, and he will perceive that th ts is no more than a definte article. Thus,-" we may contemplate that fynthefis which by combining fimple terms produces a truth; then by combining two truths produces a third truth; and thus other traths and other trutbs in continued demonftration, till we are led, as by a road, into the regions of fcience. Now this combination of truths is that fuperior and moft excellent fynthefis which alone applies it felf to our intellect or reafon, and which to conduct according to rule conflitutes the art of logic. After we bave contemplated $\mathbf{T H}$ is art, we may turn," \&c.
The word that is generally conlidered as ftill more equivocal than this; for it is faid to be fometimes an
article, fometimes a pronoun, and fometimes a conjunfion. invention ( $F$ ), mankind could not communicate their In the following extrect it appears in all thefe capacities; and yet, upon refolving the paffage into parts and completing the conftruction, it will be found to be invariably a definite ariicle.-" It is neceffary to that perfection, of which our prefent ftate is capable, that the mind and body mould both be kept in attion; that neither the facultics of the one nor of the other be fuffered to grow lax or torpid for want of ufe: but neither thould health he purchafed by voluntary fubmiffion to ignorance, nor hould knouledge be cultivated at the expence of health ; for that mutt enable ic cither to give pleafure to its poffeffor, or affiftance to others." If this long fentence be refolved into its conftituent parts, and the words be fupplied which complete the conftruction, we thall fee the import of the word that to be precifely the fame in each claufe. "The mind and body thould both be kept in action; that action is neceffary to that perfection of which our prefent ftate is capable: neither the faculties of the one nor of the other fhould be fuffered to grow lax or torpid for want of ufe; the degree of alion proper to prevent тнAT laxnefs is neceffary: but neither thould health be purchafed by voluntary fubmiffinn to ignorance, nor thould knowledge be cultivated at the ex. pence of health; for that beuleh muft enable it tither to give pleafure to its poffeffor, or affiftance to others." Again:

## "He that's unkifful will not tofs a ball :"

"A man unkilful (he is that) will not tofs a ball." Here the word that, though fubltituted for what is called the relative pronoun ( E ), fill preferves unchanged its definitive import; and in every intance except where it may be ufed very improperly, it will be found to be neither more nor lefs than a definite article.
26. It appears then, that if the effense of an article be to define and afcertain, the words this and that, as well as any, fome, all, \&c. which are commonly called pronominal articles, are much more properly articles than aly thing elfe, and as fuch thould be confidered in univerfal grammar. Thus when we fay, this piaure 1 approve, but-тнat I diflike; what do we perform by the help of the words this and that, but bring down the common appellative to denote two individuals; the one as the more near, the other as the more diflant? So when we fay, some men are virtuous, but all men are mortal; what is the natural effect of this All and Some, but to define that univerfality and parficularity which would remain indefinite were we to take them away? The fame is evident in fuch fentences as, some fubgances bave fenfution, others want it; Cboofe any way of aeing, and some men will find fault, \&c.: for here some, other, and any, ferve all of them to define different parts of a given whole; some, to denote any indeterminate part; ANY, to denote an indefinite mode of aling, no matier what; and other, to denote the remaining part, when a patt las been a Tumed already.
27. We have faid that the article is a part of fpeech fo very neceflary, that without it, or fume equivalent
thoughts; and that of words falling under this defcription, we know of no language which is wholly deftitute. We 28 We are aware that thefe pofitions may be controvert- draicles in ed; and that the Latin may be inflanced as a language the Lasin which, without articles, is not only capable of communicating the ordinary thoughts of the \{peaker to the mind of the hearer; but which, in the hands of Cicero, Virgil, and Lucretius, was made to Cerve all the purpries of the moft profound philofopher, the molt impafloned orator, and the fublimelt poct. That the Latin has been made to ferve all thefe purpofes cannot be denied, although Lucretius and Cicero buth complain, that on the Cubject of pbilofopby, where the ufe of articles is moft confpicuons, it is a defieient language. But thould we grant what cannot be dcmanded, that thole two great men were unacquainted with the powers of their native tongue, our politions would Aill remain unthaken; for we deny that the Latin is wholly without articles. It has indeed no word of precifely the fame import with our the or the Greck: but the place of the indefinite article $A$ might be always Cupplied, if neceffary, with the numerical word unus. It may be fo even in Englifh; for we believe there is not a fingle inflance where the words one man, one borfe, one virtue, might not be fubllituted for the words a man, a borfe, a virtue, \&c. without in the nightelt degree altering the fenfe of the paffage where fuch words occur. This fubftitution, however, can be but very feldom if ever neceffary in the Latin tongue, of which the precifion is much greater than that of the Englib would be without articles ; becaule the oblique cafes of the Latin nouns, and the inflexion of its verbs, will almoft always enable the reader to determine whether an appellative reprefents a whole \{pecies or a fingle individual.-The want of the definite article $\mathbf{\tau} \boldsymbol{f}$ feems to be a greater defect; yet there are few inftances in which its place might not be fupplied by this or by that without obfcuring the fenfe; and the Latin tongue is by no means deficient of articles correfponding to thefe two. Let us fubltitute the words one and that for a and the in lome of the foregoing examples, and we fhall find, though the found may be uncouth, the fenfe will remain. Thus,
"Teat man who hath not mufic in himfetf, \&e.
" Is fit for treafons,"-
conveys to the mind of the reader the very fame fentiment which the poet exprefles by the words "THE man that hath not mulic," kंc. Again, "Man was made for fociety, and ought to extend his good-will to all men; but one man will naturally entertain a more particular regard for thofe men with whom he has the moit frequent intercourfe, and enter into a ftill clefer union with that man whole temper and difpofition fuit beft with his own." Now the words hic and ille being exactly of the fame import with the words reris and that; it follows, that wherever the place of the article тнe may in Engligb be fupplied by this or by that, it may in Latin be fupplied by hic or by alle. This
(E) Sce more of this afterwards.
(r) As in the Perfian and other eaftern languages, in which the place of our intefinite article is fupplied by a termination to thofe nouns which are meant to be particularized.

15 the afe with refuct tu i゙arssisteprouf of l) bom. where the definite aricte is inded mot emphatical. "Ilac original words might have been tranflated into Englith, " thou art Joat man," as well as "thon ant the manf" and in latin they may with the umot p,opricty be rentered, "I'n es ille homo." Indect the words Hic and thet, and we might intlance many more, though they are commonly called fromoms, are in truth nothins but defoike artickes: HI is evidently in: and ILeE is mot probably derived from the He buew word al, in the plual ate; which may be tranflated indiftrenty, ciehor tre or that. But what proves beyond difpute that thefe two words are not fronowes hut arvilis, is, that in no fingle inllance will they be fonnd to lland by themferes and aflume the power of momes. For the fake of difpatel, or to awoid difagreable repetitions, the nom may indect be witen omitted; but it is araways fupplial by the rateder or bearer, whon Hic ant ilbe appear in their proper phace, and are feen to be invaniably defmie waicles. We fanll give an example of the ufe of cach word, and difmils the fubjec.

In the dirt uration againt Catiline. Cicero berins with adurefturg himfelf in a very impultoned dyle to the tratior, who was prefent in the fenate-hover. He then exclaims pathetically againt the manners of the age, and proceeds in thefe word; : Senatus hee intelligit,
 feratiom ztnit: fit publici confini partocos. In this paffuge HIC cannot be a pronoun ; for from the beginning of tilins, and every one of his audience would lupply the now in his own mind, as we do when we trandate it, "Yec i "is tratior hives." When Tirgil Cays,
 Carmen,
it is obvious that he means, I amthat man, or a hat pot r , wholugg, Sc.; and though we may tranflate the words "I ambe who tuned his fong," se. yet when We conflue the palfase, we are moder the neality of fuppiying either rathes or aif, which fhows that ule is nothing mone than a defaite articie fonifying tant or rak. It appears then, that the lathin tongue is not wholly deflisute of ariches, as few cafes can occer where the Gorek i and ont the may not be fuphlied by the wore's HIC and ILle; which have in our upinion been very improperly termed fromoms. If there be ang fuch cafes, we can maly confefs that the Latin language is defective; whereas, had it no articks, it is not day to cosccice how it cosull anfore, to a cultivated people, due ondinay i prode of feceh.
20. The artirles ints and that, malike a and THE, are varim acording as the noun, with whith they are affe ciaterd, is in the fingular or in the phent mamber. 'lhus we day - this and the: mon in the lingelar, and tef amptrok man in the phoral. "He Latin atticles bie
 (irct., uet anly with the rambet, but alio with the gericor of thein mons. In lan fuages, whete the fornethre of a fentowe may h fo changed from the mder of matciry, as it romencuis is in Giveh and Latin, and
 the ternimutans of the words, io thenfe whith ate in cun-
coed and ther: which are not, thefe variations of the article have their ufe ; but in Englith they are of no importance. Wire it mot that the cutom of the lan-grage-the forma formoti, as I lorace calls it - has determined diherwif, there woutl be no more impropricty in lay ing this or shot mot, than in faying fome men, or the men.
29. As aredes are by their nature delinitives, it folluws of courfe', that they cannot be united with fuch words as are in their own nature as defmite as they may be; nor with Fuch words as, biting nudifinable, cannot proforlp le made ollarevife but only with thofe words ted. rulich, thongl in' 'fintic, are yt capalle through the article of luconing definie. Hence the reafon why it is abfurd to fay, the I, orthe Thou; becaufe nothing, as will be leen afierwards, ean make theie pronouns more definie than they are of thernfelves; and the fame may be「rid of proper names. Neither can we fay, the Both, becaufe the word both is in ifs onm nature perfectly delined. 'Thms, if it be faid--" I have read both pocte," -this pranly indicates a definte pair, of whom fome mention has been made already. On the contrary, if it be iaid, "I have read two pocts," this may mean amy pais out of all that ever exifted. And hence this numeral being in this fonfe indeftrite (as indeed are all others as well as itfelf), is forced to aflume the artiche whenever it would become difinite. Hence alfo it is, that as two, when taken alone, has reference to fome pinary and indefrite perception, while the article THE has reference to fome perection froondary and defmite, it is bad language to fay, twothe men, as this would be hending of incomprilles, that is, it would be seprefenting two men as define! and undrfined at the fieme find. On the contrary, to fay both the men, is gond language ; beeaufe the fubllantive canot poffibly be lefs apt by being delined, to eoalefee with a nounetal adjective which is delmed as well as itfelf. So likewife it is correct to fay, the two men, theee two man or THOSE Tw' AnEn ; becaule here the article, being placed at the beginning, esotends its poaver, as well though the numeral adjective as the fubltantive, and tunds cqually to defone them both.

3c. As fome of the above wor's atimit of no article, batafo they are by arame as bigmite ats may be; fo there are others which admit it not, bectufe they are not me difnelatai. Ofthis fort are all interpogatives. If ise queftion abont fidflaris, we cannot fay, THE WHO is retis, hut who is JHis? And the fame as to gaclitis and both quandics: for we fay, without an anticle, what sort of, mow many, how great? The reafon is, the anticle the refpeds beings of which we can poticate formhing: Lut interrogatives refpect beings alont which we are ignorant, and of which we ean thatefore frachate nebhens; for as to what we know, interrogation is fuperlluous. In a word, the natural af. W juciators raith curides are all. THOSE COMMON AbPEL With w LIMFS LATHES WHICH DENOTE THE SEVERAL GENERA AND Daturall SPTCOES OF BEIVGS: and it may be queftioned whe allociats ther, in thictares of feceh, they are ever affociated with any other words.
31. W' hase fud that proper names admit not of the artiche, heing, i. theio swo pother, delinite. This
 but is cifluent ferfors (ften go by the hame name, it is necenay to cibiaguif thefe fiom one another, in
prevent the ambiguity which this identity of name would otherwife occation. For this purpofe we are ubliged to have recourde to agjedires or epithois. For cxample, :heme were two Grecian dricfs who bore the name of $A$ ins ; and it was not without reafon that Mnefleus ifed epithers when his intention was to diAlinguith the one from the other: " lif both figaxes cannut be ipared (faid he), at lealt let mighty Telamonian Ajax come." I'ut as epithets are diffufed through various fubjects, in as much as the bame adjective may be referred to many futitantives, it has been faid to be neceflary, in orier to winder both parts of fuecels equaliy definir, that the adjective itfelf aftume an article before it, which may indicatc a refurnes so fome fiagle perfon only. It is thus we fay - Trypho rane Granmarian; Alpollodurus the Cymaian, \&ic. This is the doctrine of Alr Marris ; from which, though we have the higheit refpect for the learning of the author, we feel ourfelves obliged to diffent. In the examples given, the article atie is certainly not afociated with the words Grammarion and Cyrrnian, in the fame manner in which it is affociated with the word man in the fentence-" The mas tha: hath not mutic in himfelf," \&c. Whion we fay Cipullodorus ihe Coyenion, we may, whehout folly or imperinence, le aficel- the Cyremian, what ( $G$ ):" And the nonient this quetlion is anfwered, it will be feen that the aticle defines, not an adjecfire, but a fiefursites. It the anfwer be, the Cyrenizn philofopher, tive aricic the is affociated with the word philofopler, atid the pirare Ajpeliodorws the Cyranian, is

 grunamarian awise, or Tryino twe ai\%ita of grantmar. Such abberviations are eery common. We familiarly fay the speaker, and are undeallod to mean a bigh afficer in the Britifo parliament; yet as focoley is a name common to many men, we may, whithout impropricty, be afked, shet fpeaker we trean ? and if fu, we mutt reply, the Spectier of the lenefe of commons. But that which is eminent is fuppofed to be generaliy krousil; and therefore, in comimulitanguare, the shanker is deemed a fufficient defugnation of him who prefieles over the lower houfe of parliament. Hence, ty an eafy tranfition, the definite article, from denuting reference, comes to denote eminence alfo; that is to fay, from implying an ordinary preacquaintance, to pretume a kiad of: $e^{-}$ neral and univeryal noporisfy. Thus a king is ary king; but the kisc is that perfon whom we acknowledge for our fovereign, the king of Greai Brilain. In Grcek too, as in Finglifh, the article is often a mark of eminence; fur the poet meant Honier, and the stagyRITEmeant Arifocile; not but that these were many poets belides Itoner, and many gagyrites befides Arifoolle, but none cqually illutrions.
32. Before we difmifs the article, we mall produce one example to fow the utility of this feccies of words; which, although they may lecm to be of furill importance, yet, when properly applied, ferve to make a few gencral terms fufficient for expreffing, with accuracy, all the various objects about whith mankind can have occafion to converfe. Let mas be the general term, which I have occalion to employ for the purpore
of denoting fome particular. Let it be required to exprefs this particmar as whbesun; 1 luy A mon:-
 Indefinite ; div man:-Prfan, andrear ; 耳his man:Prefint, and at fome dijhazce; that man:-Lile to fome wher; such a man:- Difiterat foom fonse obler ; axothan mon:- an indefuite mulitutic mant men:-Adefinite mulituite ; A THOLSAND men:-The ones of a multitude, taken throwthout ; Everr man: -The fame ones taken with difintion; Esch mes:-Taken in order ; first man, SECOHD man, Sic: The whale multitnde of pariculars taken colldelively; ALL men:-Tbe nexation of that multitude ; No wan :-A nomber of particilurs frefus and near; these men:- Al Jonc ciflunce, or cppofid lo others; those men : $-A$ mamber of individuals feparated from anotber number; OTHER men:-A fmall indffaite manber; fent snea:-A proporionally greatur number ; moke men:- $A$ fmaller number ; fank meat-And fo on we might go a!moft to inlinitule. But not to dwell longer upon this fubject, we fhall only remark, " that minute changes in Principles lead to mighty changes in effects; fo that principles are well intitled to regard, however tivial they may appear."

## CHAPTER IIl.

## Of Pronouns, or SUbitantives of the fecond order.

33. Tomen who are neither intoxicated with their own abiltites, nor ambitious of the henour of building new fyftems, little pleafure can acerne from differing upon points of fcience from writers of great and deferved reputation. In fuch circumftances a man of modelly, although he will not upon the authority of a crlebrated name adopt an opinion of which he perceives rot the tuth, mult always adrance his own notions with fome degree of diffidenec, as being confeicus that the truth, which he cannot perceive, may be vifible to a keener and more perfpicacious eye. In thele cireumbances we feel ourfelves with regard to fome of the mott celebrated writers on grammar, from whom, concerning one or two points, comparatively indeed of but litile importance, we have already been cumpelled reluctanty to differ. In treating of profouns we are likely to cicviate !till farther from the beaten track; but tliat we may not be accufed of acting the part of cogmatilts in literature, and of claiming from others that implicit confidence which we refule to give, we hall flate with fairnefs the commonly reccived opinions, point out in what refpets we thiuk them erroneous, affign our reafons for calling them in guelion, and leave our readers to judge for themfelves. 'I 'he moll celelirated writer in Englifh who has treated of pronomens, and whom, fince the publication of his Her. mes, moll other writers have implicitly followed, is Mr Harris, who, after a fho:t introduction, proceeds thus:
34. "All converfation paffes between ind aiduals The cronwho will often happen to be till that inflate macgatainted noaly fr. suith cach other. What then is to be done? How thall foted in:the Speaker addrefs the other, when he knows not his th of il 2 name? or how explain himfelf by hiz own name, of feraca:s. which the other is wholly ignorar:? Nouns, as they
have been deferibed, cannot anfwer this purpofe. The firg expedient upon this oceafon feems to have been pointing, or intication ly the fugrer or hand; fome traces of which are fill to be obferved, as a part of that action which naturally attends our fpeaking. But the authors of langnage were not content with this: they invented a race of esords on fuftly this pointing; which words, as they alabays food for findianizes or nouns, were characterized by the name of prowouss. Thefe alfo they dflinguifhed into three feveral forts, calling them prorouns of the firf, the focont, and the third perfon, with a view to centain diftintions, which may be explained as follows.
"Suppofe the parties converfing to be whelly unacquainted, neither name nor conntenance on either fide known, and the fubject of the converfation to be the focuker hinfelf. Here to fupply the place of pointing, by a word of equal power, the inventors of language furnithed the fpeaker with the fro:soun I ; I serite, I foy, I defire, Ec, : and as the fpeaker is always principal with refpeet to his own difcoufe, this they called, for that reafon, the pronoun of the firfl forfon.
"Again, fuppofe the fubject of the converfation to be the forty addreffed. Here, for fimilar teafons, they invented the fremom thou; thou aricifl, тнпU ewalkill, Ec.: and as the party addrefied is next in dignity to the fpeaker, or at lean comes next with reference to the difcounfe, this pronoun the $y$ therefore called the pronicun of the ficond perfon.
" Lafily, fuppofe the fubject of converfation neither the freaker nor the party addreffed, but fome thisd objieg different from loth. Here they provided another pronoun, $\mathrm{HE}, \mathrm{SHF}$, or 1 T ; which, in diftinttion to the two former, was called the fromom of the third perfon: And thus it was that pronouns came to be dillinguifhed by their tefpective persons."
?6. The defaiption of the different pfrsons here given is taken, we are told, from Priscian, who took it from Apollonits. But whatever be the deference due to thefe ancient mafirs, their learned pupil, though gnided by them, feems not to have hit upon the trae and difingul/ing characteriftic of the ferfonal pronouns. He fuppofes, that whon the names of two perfons consenting together are known to each other, they may, by the ufe of thefe names, exptefs all that the pertonal pronouns exprefs: but this is certainly not true. To us, at leall, there appears to be a very material difference between faying, "Goorse did this," and " 1 did this:" nor do we think that the power of the fromoun would be completely fupplied by the name, even with the additional aid of indication by the lacnd. So when one man fays to another, with whom he is converling, "Fanics did fo and fo;" it is furcly not equivalent to lis faying, "rou did fo and fo." If fiech were the cafe, one might pertinently af, when both perfons are known to each other, IVhy do they ufe the ferfonal fromours? Mr Harris tells us, that "when the fubject of converfation is the fpeakor bim. felf; lie ufrel ; and when it is the party addreffed, he ules thou." lat in fact the nature of the perfonal pronows has no fort of connestion with the juljag of conarefotion, whether that converfation relate to the faraker, the farty addrefid, or a Grect book. In this fentence, "I fay that the three angles of every triangle are equal so two right angles," the flicaler is furel; not the fal$N^{2} 142$.
jeg of the difcourie : nor is the party addreffed, but the truth of bis aferion, the fuljeat of difcourfe in the followeinge fentence;-" Ton foy, that Horne Tooke's Diverfions of Purley is the moll mallerly treatife on giammar, fo far as it goes, that you have ever feen." Mir Harris wies the phrafe, becoming the fubjed of converfation, in no other fonfe than that when the Jpeaker has occafion to mention masele, he ufes $I$; when the party addreffed, Thou; and when fome obber perfon or thing, he, she, or IT: but we know that he may ufe other words, by no means equivalent to the two frifl of thefe pronouns, which will fuiticiently mark $\operatorname{bim} / \sqrt{f} f$, and the party addreffed; and that he may ufe indifferently, and without the farallet injury to the fenfe, either the third pronoum, or the word for which it is merely a fubfitufe. A man who bears various characters, may delign hinsele by any we of them. Ihus Mr Pitt may fpeak of himfrif as frog hord of the treafiry, chancallor of the exchequer, or member for the miverfity of Cambridge; and in each cafe he would be what Mr Harris calls the fubjeat of converfation: yet every one feels that none of thele defignations is equivalent to $I$. What then is the force of the perfonal pronouns?
35. It appears to be fimply this: The forff denotes $\begin{gathered}\text { '33 } \\ \text { real }\end{gathered}$ the focaker, as characterized by the present act of improte speiking, in contradifingion to every other chardfer which them. he may bear. 'The fecond denotes the party addreffed, as characterized by the present circumstance of being ADDRESSED, in contralifingion to every other charader, Exc.: And what $i$ : alled the peyon of the third pronoun ismerely a negation of the otier two, as the neufer gender is a negation of the mafouline and fominim. If this account of the perfonal pronouns be true, and we flatter omfelves that its tuth will be obvious to every body, there is but one way of exprefling by other words the force of the pronouns of the firgl and ficond perfon. Thus, "The perfon who now ipeaks to you did fo and fo," is equivalent to " $I$ did fo and fo ;" and "The perfon to whom I now addrefs my felf did fo and fo," is equivalent to " Tou did fo and fo."

Hence we fee why it is improper to fay the I or the THOU ; for each of thele pronouns has of itfolf the force of a nown with the deffitite artich prefxed, and devotes a ferjon of whem jomething is prodiatal, which dijlunguifes bin from all otber projons. I is the perfon who now Jpeaks, thou is the penton who is nutu addreffed by the fieaker: Hence too we fee the reafon why the pronoun $I$ is faid to be of the fir $/$, and the pronoun thou of the fecond perfon. Theie pronouns can have place only in convelfation, or when a man, in the character of a public fpeaker, addreffes himfelf to an andicnce; but it is obvious, that there nu/t be a fpeaks before there can be a hearer; and theselore, that the pronouns may folluw the order of nature, $I$, which denotes the perfon of the fiecker, muft take place of tane, which denotes the perion of the hatarer. Now the fieaker and the hearcr being the ondy perfons engaged in converfation or declamation, $I$ is with great propicty called the pronoun of the fref, and thou the pronoun of the $f$ comd perfon. We have faid, that, with refpect to pronouns, the third ferfon, as it is called, is merely a negation of the oflucr teco. This is evident from the flighteit attention to the import of thefe words which are called pronouns of the third perfon. He, sae, or 1 T , denotes not the perlun cither of the $\sqrt{p}$ aker or of the barer; and,
and, as we have jun obferved, no other perfon can have a fhare in converiation or declamation. An abfent perfon or an ahfent thing may be the fubject of converfation, but cannot be the fpeaker or the perfon addrefed. Hz, stue, and ir, however, as they fland by themfelews, and affume the power of nowns, are very properly denominated pronerns; but they are not perfonal pronoms in any other fenfe than as the noration of fex is the neuter gender.
38. We have alleady feen that nouns adnit of number; pronouns, which are their fubllitutes, likewife admit of number. There may be masy fpeakers at once of the fame fentiment, as well as one, who, including himfelf, fpeaks the feutiment of mavy: fpeech may likewife be addreffed to mavy at a time, as well as to one; and the fubject of the difcourfe may likewife be many. The pronoun, therefore, of every one of the perfons mult admit of number to expicfs this fingularity or plurality. Hence the pronoun of the firlt perfon $I$, has the plural we: that of the fecond perfon thou has the plural re or vou; and that of the thind perfon he, she, or re, has the plural they, which is *ually applied to all the three genders.

The Grecks and Romaus, when addreling one perfon, ufed the pronoun in the fingular number thou; whereas, in the polite and even in the familiar Ityle, we, and many other modern nations, ufe the plural you. Although in this cafe we apply you to a fingle perfon, yet the verb mull agree with it in the plural number; it mult neceffarily be, you bure, not you haf. You was - the fecond perfon plura! of the pronoun placed - in agreement with the frefl or third perfon fingular of
 which ought to be carefully avoided. In very folemn atyle, as when we addrefs the fupreme Being, we ufe tyou-perhaps to indicate that be is God alone, and that there is none like unto bina; and we fometimes ufe the fante form of the pronoun in contemptuous or very familiar language, to intimate that the perfen to whom we fpeak is the meanef of human beings, or the dearofl and n:of familiar of our friends. A king, exerting his authority on a folemn occalion, adopts the plural of the firit perfon, "we ftrictly command and charge;" meaning, that he acts by the advice of counfellors, or rather as the reprefentative of a whole people. But in all cajes in which the ufe of the pronoun deviates from the nature of things, the verb in concord deviates wuith if; fur, as will be feen afterwards, thefe two words univerfally agree in number and perfon.
39. But though all thefe pronouns have number, neither in Greck, Latin, or any modern language, do thofe of the fir $\Omega$ and fecond perfon carry the dithinctions of fex. The reafon is obvious ( H ), namely, that fex and Vol. VIII. Part I.
all other propertics and attributes wiatever, except thofe mentioned above as defcriptize of the nature of thefe pronouns, are foreign from the intention of the fpeaker, who, when he ufes the prono in $f$, mean the Person who now spraks, -n's matter whether man or woman: and when the pronoun thou-the per-sos-no matter whether man or woman-то whos HE NOW ADDRESSES HIMSELF-and nothing more. In Eís Re But the pronuan of the thid perfun denuting neither fpect the
 courfe, and being merely the fubtitue of a nour which the trin mayy be cither maficuine, foninine, or neuter, mult of ne-differ- from ceffity agree with the noun which it reptefente, and atefiritaud admit of a triple diltinetion figniticant of gender. In !eund.
Englifh, which alluws its adjectives no genders, this pronoun is Hz in the mafculture, sHe in the femirine, and IT in the neuter; the utility of which dillinition may be better found in fuppofing it away. Suppofe, for example, that we thould in hitury read thele words: He cunfed lim to dolroy bien-and were inf rased tilas the pronoun, which is here thrice repeated, ftwat cach time for lumeching different; thes is to [av, for 1 man, for a woman, and for a city, whofe names were Al'acarder, Thuis, and Perfepolis. Taking the pronown in this manner-cinthad of tito gealer-ibow would is appear which was detroysed, which the disAtroyer, and which the cau:e that moved to the deatra:tion? But there is no ambiguity when we hear the genders dittinguihed: when we are tuld, with the proper diltinctions, that SHE canfid H 1 M to delroy it, we know with cestainty, that the fromoer was the woman; that her ingrumunt was the bero; and that the fulject of their cruclty was the unformmate cily.- From this exainple we would be furpriited how the Italians, Freich, and Spaniards, could exprefs themideles with precifion or elegance with no more than two variations of this prowoun.
40. Although, in every language with which we are The cares acquainted, there is but one pronoun for each of the ef ro ro. firt and fecond perfons; and although it is obvions nouns. from the nature and import of thote words, that no more can be neceffary; yet the mere Einglilb reader may perhaps be puzzled with finding thee diftinct words applied to each ; 1, MINE, and ME, for the forg perfon; thov, thine, and thee, for the foom. The learned reader will fee at onee that the wods mase and me, thine and taee, are equivalent to the genifioe and accufative cibfes of the Latin pronouns $s$ the firit and fecond perfons. That mive is a pronoun ia the poffelive cafe, is obvious; for if I were aflid "whofe book is that before me?" I hould reply"It is mene (1);" meaning that it belungs to me. G That
(н) The reafon affigned by Mr Harris and his followers, is, that "the fpeaker and hearer being generally prefent to each other, it would have been fuperfluous to have marked a diftinction by art, which from nature and ceen drefs was commonly apparent on both fides" This is perhaps the beft reaton which rheir defcription of the perfonal pronouns admits, but it is not fatisfactory; for the fpeaker and hearer may ineet in the dark, when different dieffes cannot be diltinguifhed.
(1) If we miflake not, Dr Johnfon has fomewhere affected to ridicule Bifhup Lowth for conidering the word mixe as the polfefive cafe of the pronoun of the firt perion. According to the Doetor, mine is the lame word with the pronominal adjective MY ; and was anciently ufed before a vowel, as my was befure a conlonant. This is not faid with the great Lexicographer's ufual precifion. That mine was ancicnly ufce befure a vowd is certain; but it does not therefjre follow, that it is the fame word with wy. If it were, we might on every
fobat the word ane is the fame promun in the cafe which the Latin grammarians call the actufaive, is evident foom the impat of that word in the fentence He Anvises st, where the admivation is fup. joted :o proseed from ( $k$ ) wheryin fipsen of to the fover acon $f_{s}$ eds. It aperars therofore, that bough
 fif: fon, the $i$ raruas of that language have thece, os
 That thede are cafes, can be queltioned by no than who

 called the oblique cance of cath may hase orig mally loch derivel fhem wamatios dateras forn Leo an! 1; fut the nominnives ate usw lete ant mat and mine have, beyomd and ©!pate, the eftect of the sumitives of the Latnand Englib proncuns of the fiolt perfon. 'I'hefe varition; however, cannot be looked upon ai an effential part of language, but only as a particular retinenemt invented to present the difaresable yefetition of the pronoun, whieh null frequently have happened without Juch a contrivance. 'This feems to have been the only reafon why pronoins have been codemed with a greater vaidety of cales than mowns. Nouns are in themfelies greatly diverfined. Every gerus ard every fiuties of objects has a diftinct mame, and therefore the famenefs of found does not fo often occur amont them as it woald among the pronouns, whout rates, whare the fame I, thou, He, she, or $1 r$, auliser for every objcet which occurs in nature: hat by this diverlity in the form of the words, the cacopho1.2, which would be otherwite digufting, is in a great meafure avoided. It is, probably, for the fame reafon, that the flural of each of thede pronouns is fo very different from the finguar. Thus from I, mine, me, in the lingular, is fomed, in the plural, we, ours, us; from thou, thise, and thie, ye or you, yours, you;
 lle fingular, thmy, tumes, then, in the plural. In all of which there is not the leaft refemplance between the fingular and plural of any one worl : and except in he, els, и w ; 1t, its; alley, theirs, them; there is not any fimilarity betwetn the difuent cafes of the fane word in the fame number.
41. Trom the account here given of the perforad pronouns, it appears that the firl or fecond will, either of them. calefce with the third, but not with each other. For crample, it is good fonfe, as well as good grammar, to fay ill any language, I am he-thoe art he: We were they - you whe they; but we camot fay-l an thou-nor thon art I-nor we are you, sic. The reafon is, there is no abfurdity for the Jo eaker to be the fuljet a'fo of the difcourfe, as when it is fuid-I am he; or for the ferjon acklrefficl, as when ve fay, thou art le. But for the fame perfon, in the fame circumblances, tu be at once the fpeaker and the party addreffed, is impotifle; for which reaton the
cos?efcuse of the pronouns of the hift and fecond perfons is likewie impolfble.
 called perfond pronouns. There is another clafo of
 fometimes a ficiov pronouns, fomctimes por fous pro nouns; and by one writer of grammar they have been molt abfardly termed promominal arficies. It is not worth while to difpuse about a name; but the words in quetion ase My, THE, HER, OUR, yOer, THEIR. Thrfe
 other Englim adjectives, they have no variation to indieate either gendirr, monler, or caf ; and yet they are pat in conend whith noms of eary genker antleth num.
 soms her majguriers, \&c. But, thoush in the form of
 ia the follthes cafe: mi Boos is the book of ma, or the
 t's, or the losufe uccusicd by the persons who nots speak; her muse ind, is the heffat of a cuman who can be knotun only firen fumething precoding in the difonmese; and taieir properri is the property of thom-of any perfors, whether men or aromen, or both, who have been previcetly mentioned. Words which have the form of a.ijcaives, with the powir of pronouns, may, whthout im. propriety, be called fronomiad adeatois; aad fach is the name by which we hall henceforth ditiaguith them. To thefe pronominal adjeftives, as well as to the perfonal pronouns, are fubjoined the words own and folf-in the plural felves; in which cale they are emphatical. and imply a filent contraricty or oppofition. Thai, $I$ live in my own boufe; that is, not in a bired boufe. This I dud with my own band; that is, not ly froxy. This suas done by myfelf; that is, not by another. The word filf fubjoined to a peifonal pronoun forms alfo the recipiocal pronomin as, we burtoufaces ly vain rage; be blumad binfolf jor bis misforiune Hian-
 by corruption, for lis felf, ifs felf, their flowes; fo that fiff is always a fulfuntive or neun, and not a prononn. This feems to be a jul obfervation: for we fay, the man came bimflf; thay went themfores; where the words bimfelf and themfetwes cannot be acculatives but nominatives, and were ancently written bis fotf, their filvis.

There are cther words which are ufually ranked under the clafs of pronouns; as who, eqhich, achotr. Thete, when employed in afking quellions, are catled intergotive fronouns; thouch a namemore characterittic might furcly be found for them. Their import, however, will be more cafily afeettained after we have confidered another lpecies of pronouns, which have been denominated relutizes, and with which they are intimately conmected.
43. The pronouns already nentioned may be called rhe relaprepefilive, as may indeed all finhtantives, becaufe e:veprothey are capable of iutroducing or leading a fentence: noun.
occafion fublitute cither of thefe for the other, without offending againf grammar, however we might injure the found; but we apprehend that this is not the cafe. "That book is mine," is good Englifi; but "that book is my," would be a grofs folcifin: the reafon is, that mine is a scmine pronom, and fands by itfelf with the power of a noun; but my, being an adjective, cannut land by itfelf.
(k) See Chap. 1.18,1y uthe Cafes of Nouns.
but there is another pronoun which has a character peculiar to iefelf; and which, as it is never employed but to convect fentences, and mult therefore have always a reference to formething preceding, is called the fuliznaive or relative pronoun. This pronoun is in
 1:/b, who, wh:ch, that.
44. In order to determine with precifion the nature and import of the relative pronoun, it will be neceflary to afertain the powers which it contains, or the parts of fpecel into which it is capable of being refolved. Now, it is obvious, that there is not a fingle noun, or prepnflive pronown, which the relative is not capable of reprefenting: for we fay, I, wiol facu lim yeflerday, cams le mißuken; you, who did niot See bim, nuzy bave been mifinförened; тHEY, who weither fauv nor leard, ean know nothing of the matter; the runcis, which be exhibite.t, were revoleryfut. Fron thefe examples it is apparent, in the firt place, that the relatione contains in infelf the force of any other prosoun ; but it contains fomething more.
45. If from any fentence in which there is a rehuive, that relative be takell away, and the prepofinice pronoun, which it uprefents, be fubflituted in its flead, the fentence will hofe its bond of union, and fiand quise loofe and unconncetd. Thus, if inflead of faying the man is raife wathozks lithe, we fould fay the man is arife ue. Peaks hitle, the fentence would be refolved into two ; and what is alfirmed of the man's exifitim. would have no connection with the circamflance of his peraking litte. Hence it is evident, in the feeond place, that the relative contains the force of a conterfize as well as of the prepolitive pronout. What kind of connection it denotes, is next to be afcertained.
46. It may be laid down as a general principle, "that, by means of the relative pronoun, a clanfe of a Scrtence, in which thare is a verb, is converted into the natare of an adjecicive, and made to denote fome athribute of a uifflance, or fome property or circamplanice belonging to the antecedeut noun." Thus, when it is faid, femo qui frudentia proditus efl, the relative claule-qui prudential praliturs eff, exprofles noshing more than the quadbiey of pradence in concretce with the jilljed bomb, which might have been equally well expreffed by the adjective prubus. In like mamer, when we lay, vir japt qui pancit hugutur, the relative claule exprefes the property of pouling iithe as belonging to the onan, and as being that quality which conllitutes, or from which we in-
fer, his suifiom; but ifthere were fuch a word as passciupuens, that quality might very properly be ex. prelled by it, and the phrafe vir fapit fauciloquan: would exprefs the fame affertion with vir fapit pui patan loquitur.

Now if a relative claufe exprefes that which mi ght be exprefed by an adjective, the prefumption is, that it may be rfolved iuto the fane conilituent parts. But every adjective contains the powers of an alflract fab. flanfive, together with an exprefiion of conmetion; and may be refolved into the genitive cafe of that fubItantive, or into the nominative with the particle of pre- of he fixed, which, in Englifh, correfponds to the termina- fanc mution of the genitive in the ancient languages. That phe with the imember of a fentence, in which there is a selative, prepugitivn may, in every inflance, be analyfed in the fame manoof: ner, will be. apparent from the following examplec. Vir ciul fapit, cili fapiens, and vir fapiomtiz; "a maa who is wite, a wife man, and a man of wifdom:" ate certainy platafes of the fame import. Again, kom, cui ingratess ef animus, matios fit andicus, may he tranlated
 Euglifh, "the man of ingratiude is a bad friend."
77. Thus then it appears, that the echatize pronown contains in itfelf the furce of the prefofitiee pronom, together with that comedion impled in Euglith by the prepolition of, and in the ancient languages by the fonitive cyfe. When one faya, vir fapit qui puraca loquitur, the relative claufe gui pauta luguitur exprefles that attribute of the man from which his wildom is inferred: it is conceived by the mind, as Atript of its propofitional form, and Ilanding in the place of a fubllantive noun governed in the genitive cafe by vir. The whole fentence might be thus tranlated, "the man of lifle fpaking is wife;" or, did the ufe of the Englifh language adnit of it; "the man of lie focuks lithe is wife." In like manncr, when it is faid, "Man who is born of a woman is of few days and full of trouble;"-the relative clanfe is equivatent to an aiflety noun in the genitive cafe, and the whole might be exprefled in the following manner, "man of be is born of a woman is of few days and full of trouble."

We are fenfible, that thefe expreflons into which, in the inilanets adduced, we have refolved the relative chacies, will appear extremcly uneouth and offenlive: but we inean not to recommend them as conmoa mote. of phrafology. Againtt their being employed as fuch, prefent ufe loudly remonitrates (L). They are introduced only with a view to fhow the true ingort of the G 2
relatize
(L) It is worthy ofobfervation, bowever, that, repurnant as fuch expreflions are to the prefent idiom of the Eaglith language, there is nothing in the nature of the thing that could render the ufe of them improper. A.t frepufitions, as will be feen afterwards, are exprefive of relations fubfitting between thofe objects of which they conncet the firfns in dife, unfe. Thofe oljects may be cenuted, either by fingle words, and then the prepgifin will govern a nain; or by aflertions, and then it will govern a nominative und a verb. Thus, when it is $\mathrm{faid}^{2}$, "I came after his departure;" the prepofition after expreffes the relation between two events-my coming and lis chperture, and governs a fubtantive noun: but if it be faid, "I came after he departed," the prepofition in this cafe (for, as flath be hown afterwards, it is abfurd to call it, in the one inflance, a prepofition, and in the other a corjunction) expreffes the fane relation as before, but governs a nominative and a verb.

This laft expreflion is exadly fimilar to thofe employed above. When one fays, for example, "the man of be fpeaks little is wife ;"-however uncouth the expretfion may appear from its not being fupported by the authority of cultom, the prepofition of is ufed precifely in the fame manner, and ferves the very fame purpofe, as when it is faid, " the man of lithe fecoking is wifc." Ia both cafes it denotes the relation between the two
roturin tremen; and for that purpore they are well adapted That pronenn iecms to be of ate only when there is a defficioncy of ryetiver or fublunizes to denote fone complox attrinte by which we wime to limit a general hom or exprefion. Where fuch adjuctives or fubllantives cxit in language, we may indeed tife the relative or not at pleafure. Thus we may far, bomm quigran4ifa lugnizur. or homa sromditoques; becaufe the adjedtue and the relative doufe are precifely of the fame meaning. But if the batins were called upon to tranllate avoparos ao. fore fo we believe they muit tave made ufe of the rein or tronoun, as we know not any correfpondent adjective is their langurge.
as The learned and ingenious Mr Harric has, in his 'Tteatife on Luinerfal Crammar, given an andy tis of the relative pronoun very different from that which has been friven by us. The retult of his inquiry is, that the relaito is equivalent to another pronoun, together with an expreflon of connection of that kind which is d noted by the particle and. This analy fis he exem. plitics, and enteavours to entirn by the following fentence: "Light is a body which moves with great celerity." Now. fays he, intead of aubich lubltitute the words and it, and in their united powers you lee the force and character of the pronoun here treated. Eut let ary one attentively conider thefe two expref. fors, ", Light is a bafy wibl moves with great celerity,"一and "Light is a body anal it moves with great celerity;" and he will find that they are not preeifely equivatent. For to fpeak in the language of logic. there is in the firft but one propolition, of which the fuigetio is light, and the prechatio a complex term exorelied by the words-budy subich moves zuith great celerity. In the fecond there are two propogitions, or teoo predications concerniag light; - firtt, that it is a body; and fecondly, that it moves zuith grest celerity. The relative danfe, in the firlt cafe, exprefies a property of the anteredent haly, which with that property is predicated of the fubject light; in the fecond cafe, this property is ienoved from the pradicate of which it was an eflential 1art, and is improperly converted into a new preflication
of the fubjech. The fentence may be refolved upon our principhes, and its precife inupert preferved; d; " Light is a body of it moves suith great cencrity;", the clanfe-"it moves with great celcrity," is conceived by the mind as having the force of an abffrat fut/antive, and is conneeted with the antceedent body by the prepofition of, anfwering to the termination of the genitive cafe. This abthrat fubitantive thuc connected expreffes a quality of the body light. But by this example Mr Haris's doctrine is not exhibited in all its abfurdity: let us try it by another.

Suppose the following aflertion to be true: ". Chaples XII. was the only monath who eonquered kingdons to bettow them on his friends." Her: it is evident there is but one propofition, of which the predicate is exprefed by the words - "only monarch who conquered kingdoms to beflow them on his friends:" [o that the relatione clanfe is a neceflury part of the predicate, and has, like an abylras nom in the grenitive cale, the effet of modifying the general term monsarch. Refolve this fentence on Mr Harris's principles, and you have two propofitions, of which the firt is a notorious falichosod:-" Charles XIt. was the only monard; and be conquered kiugdoms to beflow them on his friends." But intead of and fubilitute of-faying, "Charles XII. was the only monarch of he conquered kingdoms to Leftoze then on his friends," and you preterve the truc import of the expreflion (M).
49. Are there no cafes, then, in which the relative may be refolved into the comnettive and with a prepofitive pronom? Undoubsedly there are, and we flall now endeavour to afeertain them.
Adjectives in language have two different effects up- in fone ${ }^{46}$ on the fubflantives to which they belong, according cafe- Mr to the nature of the attribute which they' exprefs. If Harrin's the attribute exprefled by the adjective be competent to analyfis of all the fecies of which the fubilantive is the fpecific wime it is plain that the adjuctive does mot me of tive may be iin, is for thittes. lins the fublantive, for this abvions reafon, that nothing can modify which is nut diferiminative. Thos,

Whens - man and little fpeaking ; only in the one it is prefixed to a noun, in the other to an affertory claufe of a sentence, the impont of which is to be taken as a noun. Cuftom hath indeed determined that prepofitions thath mose frequently govern a noun than a nominative and a verb; but they are, in their own nature, equally well adapted to anfwer both purpofes.

Dut, as the pronoun of the third perfon is merely the fabflitute of fome noun, an objector may ant, What noun is here reprefented by be?" "The man of be fpeaks little is wife!" Who is meant by the pronoun be? We anfocer, the mazn who is declared to be ruife. The objection proceeds from inattention to the radical tiznification uf the word of, which a late ingenious writer has thown to be the fragment of a Gothic or Anglo Saxon word, dignifying confequence or offsprint. If this be admitted, and, after the proofs which he has given, we think it cannot be denied, the uncouth phrafe, "The man of be Speaks little is wife," may be thus refulved, "The man, a confruerce (of his mind is) be pecths little, is wife $:$ " or, in other words, "The man, in confequence of his fpeaking little, is wife." The fame acute writer, Mr. Horme Tooke, has fhown, that of and for, though of different radical meanings, may often be fublituted the one for the other without injury to , fhe fonfe. Let this frumtitution te made in the prefent inftance, and the propriety of the plarafe will be apparent: "The man is "ire, for the fpraks little." It mult be remembered, however, that fuch a fublitution cannot be made in every intlance, hecaufe for lignifies coure, and of lignities conferyunce.
(3) Mr Harris was probally led into his opinion, from confidering the Latin qui or quis as compounded of frat ind is (fee Herners, pag. $8_{1}, x_{2}$. edit, 34.) But the notion of Perizoniss is perlaps betier fruated, who in his wotes ad Semg. Minno. contiders it as inmerliately taken from the Greek rts, which in the Doric made wis, and in the latin quis. Fur it feems hichly probable, as fome in renious witers have endeavoured to fhow, that ti.c Latin is a dialctit of the Greés, Of this at leaft we are certain, that many woods in the former are immedianly adopied from the laterer.
when Horace fays, "Prata canis albicant pruinis," the adjective canis denotes a quality common to all barfirof; and thenefore cannot modify the ful/hantion, becaufe it adds nothing to the conception of which that fuhlantive is the name. But when the attribute expreffed by the adjective is competent to fome imblividuals only of the fecies of which the fubftantive is the nance, the adjective has then the effect of morlfying or limiting the fub? antive. 'lhus, when one fays vir bomus, he makes ufe of an arljective "hich modifies the fublantive vir, becaufe it exprefles a quality or attri. bute which does not belong to all man.

The claufe of a fentence, in which there is a relative, as it is in every other refpect, fo is it in this, equivalent to an acéjedive; it either medifues, or does not modify, the antecellat, according as lhe atwibute which it exprefles is or is not characteriftic of the fpecies to which the antecedent belongs. 'Thus, when it is faid, "Man, who is horn of a woman, is of few days and full of trouble," the relative claufe - who is born of a zoman, expreffes an attribute common to all men, and therefore cannot modify. In like manner, when we fay -" Snerates, who tanght moral philufophy, was virtuous,"-the claule, subo taught meral pbilofophy, does not modify. In both thefe initances the relative chanfe might be amitted; and it might be faid with equal truth, " Man is of rew days and full of trouble,"and "Soerates was virtuous."

But if it be faid, wir fapil qui pauen 'equitur, the relative clanfe - qui pauca loquilur, modifies the antecedent vir; for it is not affirmed of every nuan, that he is wife, but only of fuch men as fpeak lithle. So-" Charles XII. was the only monarch who conquered kingdoms to beflow them on his friends;" and, "the man that endureth to the end thall be faved;" with many more cxamples that will occur to every reader.

Nose it will be found, that it is only when the relacive claufe expreftes fuch a property or circumtance of the anteccient as does not linit its fignitacotion, that the relative pronom can be retolved into a frebighive pronom with the conjunction ara', and that in thefe cales the relative claufe itfoif is of very litide importance. Thus in the alfertion, -" Charks X11. Was the only monarch who eonquered kingdoms to bettow them on his friends," - where the relative clanfe is rigrigive, the aubo cannot be refolved into and be convitently with truth or conmon fenfe. But in the expreffon, "Man, who is born of a woman, is of few days and full of trouble," the relative who may be fo refolved, at lealt without violating twuh; "- Man is of few days and full of trouble, and he is born of a woman." The only difference between the fentence with the relative who, and the fame fentence thas refoled,-is-that, in the former cafe, it contains but ene prodication; in the latter iwo, and thele but looleiy conneeted.
50. Thus then it appears that the general analy is of the relative pronoun is into the particle of, and a piepolitive pronoun; bot that there are alfo occalions on which it may be relolved into a prepofitie frenoun and the particle and, wiohout materially altering the fenfe. Now what is the reafon of this diftuction?

If the relative claufe be equivalent to an adjeaine or to an alforac jubhation in the genitive cafe, at is eaty to dee that the diative itfolf may, in evey intatice, be
refolved into another pronoun and leme paricle of; but it will not perhaps be quite to evident how it thond in any ioflume be refolved by anal. This lat amalrie has its foundation in the nathre of the particles of and and; or, to fpeak more properly, in the nature of the attribute which the relative clanfe expreftes. I 3 , th the particles of and and are ufed to link or join concen:ions together: but with this difference, that of has the effect of making the coneeptions it $c$ nnects figure in the mind as ome nljegt; whereas the conceptions connerted by and are hill conceived feparutly as before. T'o explain ourfelves by an exmmple: fuppofe we take two words, man and virtue, which denote two difinct ideas or ennecptions, and juin them together by the particie of, faying man of virtue; the mind no longer viexs them feparately as tignificant of two concentions, but of onc. Takc the fame words, and j , in them together by the particle and, faying man and virtue: the conceptions cenoted by man and vitue are ftill viewed fepaately as two; notice is only given that they are edlatcrally connected.

This being the cale, it follows, that when the rela tive modilies the antecedent, or, in other words, when the rolative claufe and the anticedent denote but one conception, the relative muft then be refolved by of, in order to prelerve this unity of concoption. But when the relative does not modify the antecedent ; that is, when its claufe does not exprefs any neceffary part of a complex conception; then the conceptions or ideas denoted by the relative claufe and the antecedent may be viewed feparately as two ; and therefore the relative may be refolved into the correlponding prepofitive pronown and the particle and.
'Io ftate this reafoning in a light fomewhat differcne. As every relative claule, which exprefles an attribute that is nut applicable to a whole genus or fpecits, mult neceflarily modify fome general term, that is, refleie its fignification ; and as that general term milt belong either to the fuljeal or to the pradicate of a propulition; it is evident, that evcry forb relacioc chate is a neceffary part of that fubjed or prodicate in which its antecedont Hands. If thencfore a relative claute, which modifies, be taken away either from the frobect or the predicate of a proputition; or if that comerection, in conjequence of rubich it modifies, be difolved (which is always done when the relative is refolved $\mathrm{b}_{;}$, $\mathrm{ms}^{2}$ ) ; the propolition itfelf will not hold true. The reaton is, that the fulfa or the prediate becomes then tuo general : for, in the ons calc, fumething is predicated of a wbole genas or fpecies, which can be prodicated only of fome imbividuals of that genus or frecies; and in the other, a general predication is made where only a particular one can be applied. 'Thus, if it be faid, "All men who tranfgrefs the laws are defersing of punihment;" the fubjed of the propotition is expreffed by the words, "all men who tranfgrefs the laws." 'lake the claule of the relative " who tranigrefs the laws"-awaj, and fay, " all men are deferving of punimment;" and you have a propolition which is not true, becaufe that is affirmed of the whole fteises which can be atirmed only of fowie insinituats. Retaining now the claufe of the relative, but refolviag it by arid, you have the fame propolition as lefore; and tugether with it, in this inflance, annHer which is equally falfe: -" All men, and they tranf-
efef the !awe, are dofeving of punifment ;" that is, ". all m-ni are defensiarg of punilhment, and all mond tranforcis the laws."

But wha the atribate exprefed by the clanfe of the relatio is charatielitic of the foms or fraies of the antecedent, and conleguenty applicable to cray indis:A, I!' which that genus or fpecies compronends, the relative claufe nay be entirily omited whout affeing the truth of the propelition, "hich is already as seneral as it can he. As in this cafe the import of the reLatine clanfe is not afridione of the lignification of the antecedent, it is af little confequence whether the attsibute be reprefeniod by the conncetive pat of the relaive, as of the matuce ? ont, or be allimed to belong to the antecedent in a forato eforion. Thus it matiers not much, whe:luer we fay, "Man, wio is fulject to death, ought not to be wo ruch elated;" that is, according to our analy Es, ..." Man ofle is fajze to colth, oughe not to be too math elatd;" or, fomming the relative claufe into a feparate affertion, and conncting the two by the particle ant, we fay, "Man, and lee is fuljece to death, ought not to be t 20 much elated." [u the one fentence, indeed, the rafon is implied andy man thould not be too mench clated, viz. his haver fuljob to doals: in the other, no reafer is affaged for this; we culy afirm that man is fubjeet to cuath, whellot rife that he hould not be too nuch elated : but as both af. firmations are equally the and evident, it is of little conSequence, in fuch a cafe asthis, whether the reafon upon
51. From the whole of this tedions inveltigation, we fatter ourfuves that the following conclutions are deduced and fufficiently eftablifhed: st , That the relaive pronoun contains in itfulf the united powers of a corincfize and another protroun. 2 dly , That of is the connective of which, together with another proncun, it contains the fowers, as in every poffible infance it may be reSolved into thefe combinicnt parts, and the import of the fertence in which it las phace remain umaltered. 3 dly, That the rclative denfe of a foulence has the impoit of an alforut fulgentive, in the ancient languages, in the genilive cafe; in Englifh, with the particle of pucfixed. 4thly, That the selative fronoun is of acoulary n/e only where there is a deficioncy of adjegives or fuifontizes to denote fome complex attrilute, by which we want to limit a gencral lorm or aftreffion; but that where fuch adjestives or fubtlanives cait in language, we may ufe the tohtive or not at plafure. And, 5 thy, That thongh, in cafes where the relative chafe does not linit a sarerat sern, the relative pronoun may, without quylating truth, be analy fed by and; yet fuch analy fis is neere proper, as it gives trum predicates to the fame fuljul, which, in the original propolition, had but one frolt. cufe.
52. If the clanfe of the relative be equivalent to an adjective, as in crosy inflance it fecms to be, it will naturally occur, that, in the ancienc languages, the relative thould agree with its antecedent in gender, num$b r$, and caffe. They do agree for the mo't prart in genher and momlur; in cufe they cannot often, becaufe the very intantion of introducing a roldite into lan-
guage is to repefont the antecedent in a different cafe. Whenever we have oceation in ufe a fibfantite or noma in a chaule of a foutence, and afterwards to exprefs by couther chats, in which there is a verb, an attrilute of
 the ranfory orai ul: Now it fethom happens that the two claufos abmit of the lame riciman; and hence the cafe of the cilatiav is often mecefraizy diferent from that of the antecedert, ss the cate of each mult be accommodited to the chafe in which it is found. Thus we camot fay, "Deus zui colimes bonus ell:" but, "Deus Guan colimus bons eat:" becaufe the "efinan of the verb colo is anays the vectratio.

This Roows the ucemity of introducing a relacive in- why ${ }^{49}$ to thofe languages which give inflexions to their nouns. relative is Were all the nouns of a hagruare indeclinable, there more ucful would be litte occafion for a relative; and accordingly in the learned lan.
 om bult authors. Suffice it to quote the following.
"Fill have bjangs twould matoy an aze." fane Shore
" I had feveral men citad in my thip of calentures." arift.
" 「hey who affer to gueft at the orjaca they car mot fee."
We are not ignorant that onr mon eminent grammarians confider fuch expreffuns as chargeabile with impropricty; and we are far from recommending them in any dignified or folerrn compoition. But in the inflances adduced there is not the fmaitelt degree of obfurity; at leal there is none occafoned by the omiffion of the relarite. The reafon fecms to be, that the mind can eafily, by an effort of itsoun, make the ontecedrn unite, lirit with the one claufe, and then with the other. Thus when it is faid--" I have Infuefs would employ an age ;" the mind can, without any difficulty, as the wond bulincfs has no intlexir,ns, confider it firt as the ohjective cale after liate, and then as the nominative to acould comsly : but this carnot be fo tally done in the ancient languages, where the termination of the nom is changed by the variation of its cafes.
53. Both in the lowncd and in the living languages the retative has different forms, correfponding to the diferent gomers of nouns; and by thefe it gives notice whethr it is applied to ferfons, or to thimss avithout life. Thas in the Engtin language we fay, The was or the zuancal who evat 10 Rmare; The TSFE whta, Ramls on yondor haia. It admits likewif, when applied to males or females, a variation of cafes fimitar to that of the perforial promuais. Thas we fily, The matia neoss book is
 dey: but the neuter admits of to fuch difinction (s) ; as we fay the tree $u$, mith I fise, as will as hetre of hich fands on yonder phin. In modern langnages the relative almits not of any diftinction to denote number: for we lay, The wav or the wen actocune yelerday; The MAN or the veN of athon $I$ grat.
$5+$ In Englifh, the word that, which by fome has rhe wo been called a danonflutive prononn, by others a pronnmi- the word nal aricic, and by us a difinitc artich; is often ufed in-fupplies Head of the echetioc, as in the following examples: the thace.
" $\mathrm{Hc}_{\substack{\text { this pro- } \\ \text { noult }}}$
(n)" Whofe is by fome authors made the pofflive cafe of athik, and applited to thing as woth as petfong I think, impropaly." Lowth.
"He is the fame man that I faw yellerday: - He was the ablell prince that ever filled a throne." With regard to the principle upon which this acceptation of the word that depends, we offer the following conjecture.

In Englifh, from the cool and phlegmatic arrangement of the language, occafioned by the want of inflexions and conjugations, the place of every part of a fentence is almof uniformly determined, and very little variety is allowed in the collocation of the words. The adjegive is almof always placed in appofition with its fubfantive, and the nominative with its reerb. In confequance of this uniformity in the collocation of the words. the mind acquires a labit of connecting in idea any kind of reord with the pluse in which it is ufed to gund; and is naturally led to confider every worl that Itands in fuch a place as belonging to fich a clafs. Hence is is, we imagine, that the definitive thut pafies into the nature of the relative prosoun; as in thofe inflances in which it occupit's the phte of the relative, it was natural to conlider it as having the fame import. Yet the word that has nadoubtedly in itielf no more the force of the relative pronoun than the or this, or any otht: definitive whatever. In fuch expreffions as the foregoing, it is not improbable that originally the claufe of the definitive that, which we now call the relalive claufe, was thrown in as a kind of modifying circumfance in the following manner: "The book (I read that) is elegant;" where the fpeakcr, finding the word book too general for his purpofe, throws in a claufe to qualify and reflrict it, or to confine his afirmation to that particular book which he is then reading. We can ealily fuppofe, that through time the detinitive that in fuch an exprefinun might be tranfoofed or removed from its own place to that of the relative: fo that the expreflion would run thas, "The book that I read is slegant;" which would be conti. dered as precifely equivalent to "The book which I nicad is elegant." This opinion is not a little conlimed by a limilar ufe of the article in Greek, which, though undoubtedly a detinitive tike the Engl! in the, is often wed inftead of the relative pronoun. Namberlefs examples may be found in Homer and hersedotio, efpecially in the latter, who feldom ufes what is properly called the relative. We fhall produce one inHance from each.

```
                                    Hersi. ilio
```

55. We have faid wat the interrogative pronouns, as they are called, roldo, oulich, solut ate intimately connected with relatives; we now affirm, that the two forld of thefe words ane nothing but relatives, and that the Inf contains in irfelt the united powers of a relafive and difinitive. With sefpect to cafes, number, and tember, the words exbo and which, when employed as intervogatives, differ not from the fane words when employed as relutives; and we hold it as a masim, without which fcience could not be applied to the fubj:Et of language, that the fune word has always the fame rediocal import in whatever different lituations it may be placed. To underfand this, it is neceffry to wherve, that all mon have a natural propenity tocommethicate their thoughts
in the feweft words paffible : hence it follows, that words are often omitted which are neallary to complete the conitruction of the fentence; atid this no where happens more frequently than in the uie of who and which. In femtences where thefe woids are confefledy reldiver, we often tind them without an antecedent; as,
"Whofteal, my fule, dea's trat." Shatefocare.
"Which who wuid leara, as foori niay telit the fan ts"

That is, "Hze who Reals my puife, s:c.;" "Whici he who would learn as foon, \&c.;" and "Ihe frui Buziun ann olit,", \&c. Such abbreviations occafion noobfcurity, bicaufe from previous circumitances the hearer knows the inind of the fipeaker and the perfons to whom he refers. Bue it is not with refpect to the relutive and ankectent oniy that fuch abbreviations have place: in funtences of a dificerent form, whole chafes are fometimes omitted, while the meaning of the fpeaker is made fufticiently plain. Thus whenk ing Richard III. having lol his horfe in batte, cxelaims,
"A lurfu! a horf:! ny kingdom fira horfe!"
there is no complete thought exprefect; but the circumftances in which the king then was, enabled thofe about him to underitand that he wamet a horje. Accordingly Catefly anfwers him,
"Withdraw, mel dod, l'l help youto a horfe"
In like maner when a parfon alks a quetion, bis expreffion is frequently incomplete; but the to:14 of his voice, or fome other circumblance, enables us to afcertain his meaning, and to fupply, if we pleafe, the words that are omitted. Thus when it is faid, $A n f_{i}-$ cifli? nothing more is expicflad than, If you did it (the I, atin an being nothing elie but the Greek $a, f(b)$; but fome circumptance enables the perfon who hiears it to know that the nuaning is, "Say if you did it." Let us apply thefe obfervations to the words ano and which. If thefe words be relations, and if cur asaly its of the relative be juit, it is obvious, that no comphe. meaning can be contained in the claufe, "Whin is your principal find?" for that clakee entams nothine more than the circumtance of beang vour prinitot fritu.t predicated of fonge undorown perfon; "of he is your paincipal friend." That this is inded the cafe. every man may be convinced, by afking himfelf what he Are inery, means by the interrogative cutho in fuch a fontenct; cutabe; for he will find it impofible to afix to it ase meanine and without fupplying an arbocalent arafic. by which that which is called an interrogulive will be iomediation converted mito the relatione promon, The cutum, il mever, of language, and the tone of voice with which the relative clanfe is uttered, intimates, withut the holp of the antcededt, the wint of the fpaker to be in. formed by the perfon addreffed of the name and defignation of his principal friend; and we know that the fentence when completed is, "Tell me the nime amal defi, nation of the perfon who is your principal friend." Again, when the prophet fuys, "Who is this that cometh from Edom, with dyed garments from Loarah?" he utters but part of a femence, which when completed will run thus: "Diserile the porfon who coneth from Edom (this is that perfora), with dyed garments from Bozah." He fics a perfon comins from Edom, of whofe name and defignation lie is iog norant ; he calls ufon fome one for marmation cun-
cermas theic particulars; and that there may be no mifas's, be deforbes the unknown perton as having dyad germents from Bozrah; but lell even that defoription mould not be fufficienty accmate, he throws in the detinitive claufe, this is that porfon, pointing at him, we mas fuppole, with his linger. - $W^{\prime \prime h} h$ b, ufed as an interrogative, indicates a wih of knowing a particular perton or thing out of more than one mentioned; as, "Which of the two did it!" that is, "Toll me the we of the two which did it ?" for in old Englifh which as a relative is often ufed, where in modern Enslith we mould fay ablo; and that mode of fpeech is Alll retained when the antecedent is omitted, and the relative elaufe employed to indicate fuch a wih as that before us. Whout includes in infelf the fignitication of a defnitive and a relative fronoun; as, " from subut has gone before, wubat follows may cafly be Lutifed;" where the word zowat is equivalent to that nobbit. When the efore we fay, "What rude fellow is that:" our meaning is, "Defirite that perfen who is
< +
anerapra-l:velenpences re. lative c.au 2es. that rude follow." Upon the whole, then, it is crid ent, that the words called interrygurices are merely rethtive proson's; and that interrogative fentencs are relaive chayes utterd in fuch circumflances as to emable the hearic to fupply the antecedonts neceflary to complete the meaning.
56. 'To conclede: We have feen that substamives are cither frimary or jeionlary; or, in other words, soness or fec nocis. Nows denote fubfacter, and thote either nutural, artificial, or alffaat They moreover dunue things either general, or Ppecial, or purticular; and a gencial or $\int$ peciffe mame is made to denote an indiquitual by means of words called articles or definitives. Proxocs are the fubtlitutes of nouss, and are either frepfifize or fuljuncitue. The prepositive is dillinguifhed ime three orders, called the fivf, the fecome, and the third putfon. The subjuncreve, otherwift called the relatise, includes the powers of all thofe there, having finpertuided as of its own the peenliar force of a comnictize.

> CHAPTER IV.
> Of VERBS.
57. $\mathrm{T}_{\mathrm{te}}$ words which we have hitherto confidered are commonly calld fulfortives prinary or fecondary, and dffintites; becaule noms are tignificant of fulfounces; pronomsts are the fubllitutes of rewns; and the auticle ferves to afeertain the extert of the nom, and to determine whether on any vecafion it be fignificant of a whole clays of fubtances, or only of ore inditiduud. But count of their various qualities or attributes; for their internal texture is a thing of which we are profoundly ignorant, and with which we have no manner of coneern. Thus, sxperience teaches us, that certain vege. tables are pleafant to the talle, and wholefome food; whill others are unpleafant and poifonons. The former kinds are valuable only for their quaties or attributes; and they are the ghetrities or athributes of the latter that make them wothets or hurtful. $\therefore$ horfe is flrong, and fwift, and doche; and may be trained to carry a man on a juermy, or to drag a plough. It is fur his Ar.nyth, fwifnofs, and docility, that the is the mont valuable of all cquadrapeds. Onc man is brave, $\mathrm{NH}^{-1+2}$
another learned, and another cloquent; and by poffefing thefe different qual tas or aftributes, wach is litted for as differem ftation in fuciety. It is plain therefore, that in contemplating fubllances, our attention mull be There ${ }^{56}$ primeipally bellowed upon their qualitics, and that the chifo of words which ferve to denote thele qualities mutt be an effential part of language. Such words are in general called attributives; and are of three furts, Werbs, Participhes, and Adjeatives. wa ds called attri-
Thefe are
58. Of all the conftituent parts of fpeech none has given the grammarians greater trouble than the vers. The vall varity of circumtances which it blends together in one word, throws very confiderable difficulties in the way of him who atteripts to analy fe it and afcertain its nature; at the fame time, that by its eminent ure in language, it is intited to all the attentign which can be bettuwd upon t. To the difeuflion of the verb, Mir Harris, whofe notions of this as of the other parts of fpech lave been generally adopted by the fubfequent waters ongranaar, has dedicated a large proportion of his boos, in which he has thrown out many excellent bfervations, mixed, as it appears to t:s, with feveral errors. We have already obferved, that no man is ignorant when he ufes what is calld a verb and when a noun. Every thoolboy knows, that the words is, loweth, walkevi, standetf, in Englif; and est, anat, amaruk, ambulat, stat, in Lain, ate verbs: be knows likewife that they are of diflerent kinds; that fone of them are faid to be aftive, fome payive, and lome newter. But it fhould feem, that the tirt object of our inveltigation ought to be the charateriflic of the verb, or that which all thefe words have in comnon, and which conttitutes them verbs, diftinguining them from every other Jpecies of worls. Now it is obvious to the lightelt attention, that ewery verb, whether actere peline or uater imay den, may racteriltic be refolved iuto the fubflantive verb 15 , and another of the verb attributive: for Lovern is of the fame import with is loving; walketh, with is ruquiking; and amat, with amans bst. But loving, qualking, and amans, are not verbs: whence ic follows, that the charaturific of the verb, that woblich conjitutes it cubat it is, and cannot be expreffed by other words, mult be that which is lignified by the word 1 s ; and to us that appears to be neither more nor lefs than affertion.

Asofrtion therefore, or predication, is certainly the very essence of the verl, as being that part of its office, and that purt cnly, which cannot be difeharged by other kinds of words. Every other circumflance which the verb includes, fueh as attribute, modt, time, sce. it may be poffille to exprefs by culjectives, purriciples, and ad. verls; hut without a verb it is impoffle to predicate, to affirm or deny, any one thing of any other thing. The office of the verb, then, when trapt of all accidental cireumtanecr, feems to be merely this, "To join together the fubject and prudicate of a propofition:" its powers are analogous to thofe of the fign + in Algethra, which does no: afiect the feparace value of the quantities between which it is placed, but only indicates their mion or coalffence. To explain by an example. When we fay, Citero cloquens, Cictro wife; thefe are imperfect fentences, though they denote a fubltance and an attributc. The reaton is, that they want an affertion, to how that fuch an attribute appertains to tuch a fubltance. But when we infett the word avas,
we join the fubfance and attribute together; we give notice that the ruifdom and eloquence are applied to Cicera, and we do nothing more; we neither increafe the wifdom nor diminifh it, we neither make it real nor imaginary; for it was fuppofed in all its extent when the words Cicero and ruj/e itoed independent of each other. We may indeed ule the verb in a form which implies not an afertion only, but likewife an attribute; as when we fay, George curieth, or George walketh: But as whiterefs or any other particular colour is not of the effence of a borfe, an animal which is found of all colours; fo in the phrafes quoted, the atiribute, thongh implied, is not of the effence of the verb; for it may be equally well expreffed by other words: George is writing, and George is walking, are phrafes of the very fame import with George writeth and George walketh.
50. In refolving every verb, whether active, paflive, or neuter, into the fubitantise-verb is and another attibutive, we have the honour to agree with all the grammarians; hut to the word is itfelf the learned antthor of Hernes has given a meaning which, as a verb, it does not admit. He oblerves, that before any thing can be the fuhject of a propofition, it mult exiff: that all exiftence is cither abfolute or qualifed, mutable or immuidit: that the verb is can by ithelf exprefs affilute exillence, but never the qualified, without fubjoining the particular form ; and that it fignilies both mufab!e and immufable exiltence, having in thrfe cafes different meanings; alcho' the fentences which hegives asexamples are evidently conflucted in the fane manner and confift of the fame parts of fpeech. His examples are: of abfolute exittence, $\mathrm{B}_{15}$; of qualified, B is an aminal; of mutable, This orange is ripe; of immutaile, The diameter of the fouare is incommenfurable with its fode. But if predication be the effence of verb, all this is nething to the purpofe, and part of it is not true. It is not true that the verb is ever varies its fignification; for it hath as werb no connection with exiltence of any kind. All fuch circumltances are fuperadded to its verbal nature; or, to fpeak more accurately, we infer fuch circumitances from our previous knowledge of the objects concerning which the predication is made. When we fay, "s this orange is ripe," we do indeed mean, as Mr Harris oblerves, that it is fo now at this prefem in oppofition to pol and futmere time: but it is not the verb is, but the definitire tats, which fixes the tinue of maturity, as well as the place of the orange; for had we faid, oranges are ripe, we might have been properly afked, When and wobere are they ripe? although the fame verb is ufed in both fentences. Even in the fentence " B is," alfolute exiftence (the moit fimple of all) is inferred, and not exprefled, by the verb; and the inference is made from this obvious principle, " That when one utters a mark of predication, we naturally conclude that he means to predicate fomething of the rubject." If he adds no fpecific predication, as B is Vol. VIII. Part I.
rovid, we apply to $B$ the mot general that we can ; and what otherfpecies is fogeneral as exiflence?

That the idea of exiftence, confidered as inutablc or immuable, is not contained in the verb is itfelf, but is derived from our knowledge of the objects concerning which the predication is made, appears manifefly from this: That if a perfon be fuppofed ignorant of the meaning of the words God and mas, whilt he knows that of is; the uttering of the two propotitious, God is bopty, and this man is hathy, will give him no notice of exittence confidered as mathle or immualle, temporary or eternal ( 0 ). His conclution with refpect to thefe modes of exiftence, if any fuch conclufion be drawn at all, mun be derived entirely from his previous knowledge of the nature of God and the nature of mun.

Some of our readers may poffably think this notion of acrb too abtract and metaphyfical; yet what other circumftance than mere predication is effential to that fpecies of words? We fay efintial; for we are here inquiring, not what is exprefled by each individual verb, but what it is which is equally exprefled by all verbs, and which ditinguifies them from the oolher ports of fpeech. And if it be true, that every thing which the verb implies, predicotion alone excested, may be expreffed by other parts of fpeech, and that no other part of fpeech can furchicote; then we think ourfeles warranted to affirm, that femple predication is the effential characieriftic of Verb, that ererty suord which predicates is a verb, and that nothing is fo which does not predicate.

It mift not, however, be concealed, that a ductrine very differert from this has beers lately maintaned by a writer of diftinguified abilities. "We have energy expreffed," fays Dr Gregory (P), "and of courfe a verb contituted, willout affrnation, when we with or command; without command, when we affirm or with; without wilk, when we command or affirm: yet in all thefe cafes we have equally and indifputably a verb."

That in all thefe cafes we have a verh, is indeed in.. difputable ; but we hold it to be equally indifputable, that in all thele cales we have afirmation. The ingenious anthor has given no direct example of a wi/b or command uttered suthout afirmation; and a feeling or fentiment which is not uttered has nothing to do with language: but he has given a feutence in which there are three verbs, that in his opinion denote no afirma. tion, but a very plain fuppofirion. If a fugpofion can be expreffed without affirmation, we fhail very readily allow that a aifb or command may be fo exprefted like. wife. The Doctor's fuppofition is thus exprefted: "Had any punifament ever overtaken you for your broken vows; were but one of your teeth growing black, or even avere but one of your nails growing lefs beautiful, I thould believe you." It is almoft fuperfluous to obferve, that to every everb not in the inlini. tive mode there mult be a momination, and to every agive verb an object, whatever be the arrangement of the fentence in which fuch verls are found. Thefe
$H$

59 tion to our theor g .
(o) The truth of this obfervation may be proved by experiment, by uttering to a man of good common fenfe thefe two propofitions, taking care to exprefs the words God and man in a language which he does not underftand. Thus, Deus is bappy, and bic bomo is bapty, uttered to a man totally unacquainted with the Latin tongue, will convey to notice of exiltence confidered as mutable or immutable, \&c.
(f) Theort of the Mouds of Verbs, publifhed in Vol. II. of the Tk_snsactions of the Rotal Soctetre of Edinburgu.
are truthe known to cery fehoolboy; the reatons of thern and! becgen aftorvards. It is ! tenife undenialke, that in the fentence betore ws, the mominative to h.s' is und fanimment; to the lirlt scere, one of your bicst and to the focond, one of wis. Wit the fentence arranged in gramatical order, with the feveral nommatives before their refpective verb; is crio dently colspated; and the conjunction if malt be fapphicd, as wetl to complete the contraction ats to make cnis of the pallare. If any phaidment had tver ovestaken you; if tut one of your teeth were growing black, or cen if but ore of your nalls were grow. ing lets beaniful, I thould baticie gon." Now it has lately been prowal, by fuchevidence as leaves no reom for doubt, that if, thomerh cribed a corguntion, is in fact a aces' in the infurative node, of the fame import with sive; fo that ve mav fibtitute the one for the other without in the frablicll degree altering the fente. The fentence will thon 1 un thes: "Give any pumifhment had ever oventalen you; give but one of your teeth were growiag black, esc. I fhot th theve you." It is therefore fo far from being tue, that bad and ware, when the fanence is completed, exprel's mo affrmation; that it is only upon granting the tomth of the afformation which they cenote, that the fpeaker lays "I froula belicre you." "Any punifment hatever over. taken you," is plainly an almation; if, giae that afirmation, aluit is truth, "I thonld believe you." But it cannot be fuppofed that lofl and ware change their fignibications by a mere change of phace, or that ky being reroord from the midtle to the begianing of a claule, they lo, their original imporf, and cone to dewote fumething tatirely diffrent. Were this the cafe, evory attempt to atcortain and tix the gentral principles of grammar would be as ridiculous as an attempt to arrell the coule of time. For what purpofe then, it may be aRed, if the verb alravys denoters affirnaton, is it removed from the middle to the beginning of the claule, when fithifition is implied as in the prefent in. fance? We antwer, that cuppolition is nether more norkefs than combtional affirmation; that when fuch affination is conplete'y exprefied, the verb is not removed to the beginiming of the claule; and that fucli remo. val takes flace or'y when the claule is elliphical, being merely an articial contrivance in language, to thow the reador of hearcr that fore fuch word as if, demanding the truth of the affumation, is omitued for the fake of difpatch. 'This is tvident; for when the word requiring the aftrmation to be granted is fupplicel. the verb mult be rettored to its phace in the middle of the claufe. Such aboreviations, and fuch contrisances to mark them, are frequent in all languares, as will be feen more clanly when we come to treat of modes.

Epon the whole, notwillfanding the deference which ne willimaly pay to this very maderly witer, we are compellad rduetantly to dffer from him, and Rill to think that fonste pre licerime is the roery efinco of the ress.

Sould we be required to accuptaly wir theory by The theor languare, and to prodiove intances of this limplified ifflfexens verb in practice, we might anifuct, diat the not being plited. able to produce fach iallaces wond te no goos argument argaint the trath of cher principles. It is the nature of langrage to experf mary circumftances by the fame word, all of wh however are not cifatial to ditinguilh the /bacies to which chat word lulungs fiom the other hacies of words; and it is the nature of man to infer from difcourfe many thing which are not uqually exproffed. Perhaps, lowever, faching nearly approaching to an excmplitication of our idea of a fompererb will be found in the following propontion: "The three angles of every phae tiangle are cqual to two right angles." What other offee the verb are here performs then fimply to join the foljed and predicale, it is difficult to perceive. It dues not give nutice of time; or fuch notice, if given, is an imferfection; for the truth of the propolition is independent on time. Neither ought it to imply exillenee; for the propolition would be true, were there neitber a triangle nor a right angle in nature.

This idea of verb, when it is well confflered, we hope will be found jult ; but hould any of our readers fulpect it of novelty, and on that account be difpofed to condemn it, we have only to requelt that he will reitrain his cenfure till he has examined the writings of others, and nicely eblerved the feveral pottures of his own mind in difcourfe ; for meditation may perhaps fhow him that our theory is not falfe, and unquiry will fatisfy him that it is not novel (c).

62
60. But although it is certain that affertion, and af-The great ferticn culy, is cflential to the verb, yet the greater parter part of of that fpecies of words which grammanians call cerbs verbs deare ufed to denote an attribute as well as an affertion; note and or, in the language of loric, they exprefs both the co-c nubined fula and the praticate of a propofition: thus, be liveth, be with an al weritath, be walketh, ate phrafes equivalent in all refpects fertion. to -he is living, be is curiting, be is walking. Now, of attrubutes, fome have their ellence in motion, as calling; fome in the priatation of motion, as refling ; and others have notbing to du evids aitlere moinh or its frivation, as qubite and block. But all nution and all privation of motion imply time as their consomitant; and a fulfinme may have an atoribute to-doy which it had not yejterday, and will not lave to marrox. This is teffevident for a man may be at relt to diy who seflerday was walling, and to norrow will be on herfobak; and a theet of paper may have ketn white yetterday, which to-day is
(a) " Defides words, which are names of ideas in the mind, there are a great many others that are mate ufe of, to fignify the connection thet the mind gives to ideas or propofitions one with another. The mind in communicating its thoughts to others, does not only need fighs of the iluas it bas then before it, but obhers. alfo, to how or intimate fome particular akion of its oneat at that time relathy to thofe ideas. This it does feveral ways; as is and is nor are the general marks of the mind achronirg or dirnying," Locke on Humaz: $U_{\text {h }}$ derfanding.
"Verbum eft pars orationis variabilis, aliquid de re aliqua diei fea affumari fignificans. Vulgaris verbi definitio cft, quod fit pars orationis, sure agere, pati, aut effe figniticet. Sed nolrra aceuratior, ragifque ex iofa verbi cujufvis natura putita videtur. Cazterum ro affrmeri haxiore hic denfu accipimms, pro co quod predicat Diakefici appellant, quo non modo affirmationes frictins lic diete, fed negationes etiam interrogationefque in sluduntur." Rudimani Grammation Infitwiones; fee alfo Di Jicalio's Thor'; of Latanats.
llack, and at fome future time will be of a diferent coleur. As, therefore, all motions and their privation imply time; and as a profofition may be true at ons time, which is not true at another; all verbs, as well thofe which denote both an atiribute and an afertion, as thofe which denote an affertion only, conse to denote tame alfo: Hence the origin and wfe of tenfes, which are fo many different forms affigned to each verb, to how, without altering its principal fignification, the valious times in which the aljertion expreffed by it may be true. Whether thefe various forms of the verb be effrtial to lanskage, it is vain to difpute. They have place in every language with which we are acquainted; and as the ufe of the verb is to affum one thing of another, it is atfolutely neceflary that the sime, when fuch or fuch an aftermation is true, be marked by tenfes, or fome other contrivance. Conceruing tenfes, therefore, we thall throw tegether fome oblervations equally applicable to every language, after premifing a general remark or two which feem neceflary in order to proceed with precition.
61. Time, although its effence confits in fueceffion continued and unbroken, may yet be confidered by the mind as divided into an infinite number of parts. There is, howeser, one grand divifion which neceffarily occurs, and to which the different tenfes of ocrls are in all lancuagts adapted.-Computing from fome portion conecived to be prefint, all sime is either paft or to come. Hence the teryes of verbs are threefold; fome denoting timo prefert, fome inve off, and others sime futiare.

Again, from the very manure of time, it mult be obvious, that all its parts are relative; i. e. that no portion of it can be afcertained by any thing inberent in iffelf, but only by referving it to fome other portion, with refpect to which it is $\hat{y}$ alt, prejett, or 10 come. In this refpect time is perfectly analogous to poce: for as the fpace in which any object exith, cannot be deferibed but by Atating its relation to fome otber fpuce; fo neither can the tine of any attribute or action be determined, but by flating its relation to fome other time. When, therefore, we would mark the time of any action or event, we mult previoully fix upon fome point to which we may refer it. If this point be known, the time referrei to it will be known alfo; but if the former he not known, neither will the later.

Lallly, in contemplating an agion, we may have occafion to confider it as ge:ng on, or as finifloed. This diftinction is likewife tenoted by the dificient tenfes of verbs. In treating therefore of the tenfes, there are two things to which attention ought principally to be turned;-the relation which the feveral tenfes have to one another in refpect of time; and the notice which they give of at âtion's being completed Cl not completed.
62. Haring premifed thofe remarks, we proceed now to the tenfes themfelves; of which Mr Harris has enumerated no fewer than sacloc. Of this enumeration we can by no means approve: for. without entering into a minute examimation of it, nothing ean be more obvious, than that his inceptite present-I am froing to wurte-is a futere tense; and his completive present-1 have euriten-a past tegcic. But, as was before obferved of the clayffication of zurds, we cannot help being of opinion, that, to take the terges as they are commonly received, and endeaveur to afcertain their natere and their difiererces, is a much more ufeful exacife, as wod as more proper for a work of
this hiad, than to raife, as might catly be done, rew and hypothetical theories on the fubject.

It has becn already obferved, that all the toreses mut neceflarily mark relmitice time. In one fenfe, this is exircmely obvious. The projent tenfe is ufed in contradifircion to both the fof and friere, and marks an attribute or action as sxitling in neither. The paff and the future are in like manner ufed in convadillinction to the prefent; aid matk an attribute or action which exills $n a t$ anze, but which in the one cafe bas cxiped fornorly, in the other will exigl at fone time corning. But belides this relation of contralijliunion fubliating anong the tenfes, there is another of coeexillence, as we may call it, to which it is of great confequence to attend - efpecially in examining the nature of the profent.
63. The presear tense refers not only to fomething of the pere which is pall or future, but alfo to fomething with fent tentis, which the attribute or active of the verb is contemporary. This reference is neceffarily implied in its very name; for we cannot fay of any thing that it is prefont, without implying at the fame time that there is fomething elfe auitl, zubich it is prefent. Hence it appears with how little reafon Mr Harris and others have given us a: a corifl of the prefent, as marking prefent time impejinitidy in contradillinction to OTHER prefents, which have been called incestive, ctoruld, and condtrive frefenis. For from what has been faid it follows, that the profent tenfe is neceffrily and from its very nature perfuct'y indefuite, and can of itfelf give notice of no $\neq 0$ ije or diterminat: portion or pintt of time whatever. A. thing may have been preforit fifty years cego, may be preFent nowi, or at any jusure periad. This tenife implies the relation of in exighace between two or more things: but, without fome auxiliary circumftance, it cannot in any language mark the particular portion of inne in which thofe things exifl. The indjinite nature of this tenfe is indeed noot clearly feen in that ufe of it in which $\mathrm{Mr}^{-}$ Harris has fyled it the aorif of the prefent ; that is, in cales where it is employed to denote the refectition of $a$, altisn wutich the agent is accultmed frequently to perfiorn, or to exprefs propofitions of aubich the trath is evinced by gencral experience; as in the following examples:

> " Ifyrocrify - the only rvil that wa:ts
> - Invifite, exsept to God alure.'
> "Ad parilen liur properat qui isto judicut," \&c.

In thefe inlances it is plain there is no farlicthar time pointed out : the propelitions are trus, or afprebendeit as true, at all times. Although the actions, therefore, of walking and bollening are expreffed as prefent, it is impoffible from the expreffions to deternine any precile poiut of time when they are profent.

But if the prefent tenfe be thus indefnite, how, it may be afked, are, we to afcertain the particular time which is intended? We anfwer, it is to be afcertained, either by fatios the action of the verl as exifing in fone time already knozen, or ly infeterce. If, for example, we fay,-" Millions of fpinitual creatures sualk the earth unfeen,"-the propofition is general, and the time of walking undterninen'. But if we add -" both auber we wake and when we flecp," - the time is by this addition afcertained and fpecibied; for if the time when men wake and Recep be known, the time when thefe fpirits acalk the earth is known alfo. When no fpecifying claufe is given by which to determine the time of the pefent tenfe, it is very commonly determined by in-
ferince.
firenie. Thus, if one ufe fuch an expreffion as-" IIe Merefs while 1 am Praking to hion,"-the time of his Jlect. irg is afeertained by the fubfequent claufe of the fenrence: but if it be faid fimply-" he neeps"-without afferuing any duta from which it may be concluded suben his fleeping is prefent, we very naturally infer that it is at the inflam we recive the injormation of his nlecping. Such inferences as this are common in language. The mind is defirous to ubtain complete information on every fubjeet; and therefore frequently fupplies to itfelf what is not expreffed in the fpeech of others.

Buth the fe ways of afertaining the freife time of the frefont tenfe, are excellently illultrated by the ufe of the word protat as appliedioforce. Take a familiar ex-ample:-"His brother and he were prefent when I read the letter." It is at fiff fight evident that this exprefion is perfectly indefinite. But if it be iaid"His brother and he were prefont at your boufe when I read the letter," - the place of action is then ilterminach, by being eferred to a fortion of fitue which is knowe. If no fuch reference be made, the perfon who hears the fpech uttered nut cither remain ignorant of the plave intenled, or be mult afertain it to himflef by infirence; and he will prohably infer it to be that in which the fpeaker is at the time of his uttering the indetiaite fentence. This leads us to offerve, that fuch inforences are not often made whithout fuffient foundation. Various circumbances may allit the reader or hearer in making them, and prevent all danger of mithake. He may have the evidence of fenfe, or of fomething preceding in the difcourfe, and a number of other particulars, to jullify and warrant his conclufion Thus, if when fitting by a Jar fe fire, one pronounce the word - "I andou warm ;" thole to whom he addreftes his fpecch are authrorized to conclude, that he is too warm at the time of $\int_{p}$ aking, unlefs he exprefly prevent the drawing of that conclution by adding fome fuch chare as - " when I wear a great coat."

It is Arietly demonitrable, and hath by Mr Harris heen in faed demonlrated, that there is no fuch thing as prefent thite. Yet do we not only conctive time as frefortandaifling, but frequently as extended to a very freat degrec. We fpeak not only of the frefont inflant, or the frigint dy, but alfo of the profent yeat, and even of the prejent cistury. This manner of conctiving time is indecd loufe and urphiblofophical; but it is fufficient for the ordinary purpofes of hanguage. To exprefs tine as it really is, we ought to fay, the pogng day, the fulfanyer, and the poging century ; but in common difconde we deno minate any portion of time frefort, in whith the prefent nore or infont is included, aithough it is obvions that purt of that portion is paz $q_{\text {, and }}$ and renninder of it fours. Prom the vary nature of time thus cons ived to be frefor. the tenfe now under confideration malt reprefent the action of the verb as commitnced, and wot foijtad: for as time is in continued fucceffon, and accompanics every action; when any ation is sot commencelt, it exilts not in day ime, thourh it ma, exill hereafter in time which is aso future; and when it is fimibed, it exil, no longer in tinie profert, but in time $p$ ff. Hence the abfurdity of intruducing into a thenry of the tenfes an inceptiave prefint and a completive trefont ; for thefe terms imply wach a direst contra. didicu.
64. After having faid fo much of the prefer tente, we thall have but little to fay of the preter-1mperFecr. It ftatis an action in refpect of time, as pofl; and in respect of progrefs, as umfinifuet. Legelam-1 was reading al fome pafl time, but my reading was then incorelete ; I hat not fimbed the look or the letter. We mult here olferve, however, as we did with refpect to the prefent tenfs, that athongh the prider imperfot reprefents the action as pofl, it does not inform us w what precife portion of paft time the unfuilhed action was going on: this circumilance mult either be given in fopa. rate zuorls, or be inferred by the hearer. If one fay "fimply-Legebum, the perfon to whom he addreffes his fuecch will conchude, that the fime of his readrag is pagd with refpect to the prefent time of his /pading. But if he fay,-Ledeglan anternam vemint, he exprefsly thates the action of readivg as pall with refpect to the lime in which his beacer came to the phace where they both are at the time of feaking. The time of the prater-imperffet is always $p_{1} / \rho_{\text {w }}$ with refpect to the frefut infout when the imporfoct is affal, and of this the tonfe itieff gives notice; but it may alfo be palt with refpect to fome ofber time, and of this it ennveys no infurmation.

If we join two proter ipperfects cogether, the expreffion will thate the co exiltence of two progreflive actions, buth of which were going on at a time payl in refpect of fome determinate time given or fuppofid. "Cum tu feribebas ego legcbam ;" " when you were writing I was reading." Hence the preter-impetfect has by fome grammarians been called the relutive prefout; a name which, however, is by no means exclufirely applicable to this tenfe. When the prater-imperfeet is by the conjunction and joined in the fame fentence with a plufquimp perfet, the two tenfes exprefs two ations, botb prior to the time of /pakians; but the one as having continuarl after the oiller was finifloch. Thus, Enitas \{peaking of the dedtruction of Troy, fays, that after having efcaped with his father and followers, he retarned to the city in quelt of his wife, and went direcaly to his owa houfe; but thare, continmes he, " irrocrant Damai, et teturn omne theban::"-"the Greeks hard rufbed in," that action suss over and completed before his arrival; but the act of "pofieffing the whole houle," teasbant, was net ooer, but fill continuing.
65. But is is necefiary that the eerb denote actions which were complete or porfoct in faft time, as well as and $p$. $x$ thofe which were imiontlete or imperfed. For this pur- ter-perfect pose, Greck and Englak verbs have an aorif, a praterperfo. 7 , and a phufurm-pargus. Of thefe the Latin has only the two latt. The prater perfeat in that language fuftains a twofold charseter: it performs the offee of the Crieck and Engligh arijp, as well as of the preter-perfeit properly fo called; that is, it denutes a finilhed action at fome incefarile polf time, as well as at forse time which is both $p a f t$ and dyinite.

In attemptiag to andyfe the fignification of comples: trons, by which we here mean words that include in their tigaification a varity of partionlars, it is of great advantage to have theie particulars fefurately exprefled by diferent avords in another language. Now the Enylifla has refolved the tenfes, which ia the Greek and Latin lauguages are denominated the aorifg and the prater-perfita, by means of what are commonly called auxiliary areds, expreffing the former by the verb did, and the lafor by the vorb have. In examiang thercfore
fore the aorift and pratio-perfe.7, it will be of wee to inquire into the import of these verts.
Did is evidently the aorijf of the verb to do; a verb of the moft general fignification, as it denotes arion of every kind. It expreffes the finifed performance of fome asion, the completion of which munt of courfe kave takeri place in fome portion of pirt sime. "I Did werite or $I$ zurote (thefe expreffions being equivalent) yetlerday, a month, a year ago," ixc. But the import of did being fo very general, it can convey no determinute manning without being limited by the addition of fome partioular afion; and this addition, however expreffed, is to be contidered in the fame light as an accufatione cafe, governed by the active verb did; for it prodaces exactly the fame effert. 'Eyexta, foripfo, I did write: that is, "at fonter for time 1 performad the alion of writing, and fanined it."
The verb bace, which is inclated in the preter ferfeit, is plainly a serb of the frefout tarle denoting pafiffron. But a man may poffefs one thing as well as aristher ; and therefore bave requires limitution, for the sery fame reafon that did requines it. namely, becalle its Gignitication is perfectly gencral. Now this fimitadicn, whatever it is, mult be conceived as the thing poffered; and in inflances where bave is limited by a nom, this is obvious, and univerfally acknowkdged: "I bave a gold watch," is, " 1 poffifs a gold watch." But to anncx the fame meaning to the word bave, when ufed as an ausilinaty verb, is an idea we believe not common, and which may perliaps be thought whimfical; yet what other meaning caia be affixcd to it ? To fuppofe that words have not each a radical and deterninate fignification, is to fuppofe language a fubjeat incapable of philofophical invelligation; and to Suppofe, with Mr HIarris, that there are words entirely devoid of feguification, is at once to render all inquiries after the principks of grammar nugatory and ridicu. lous. Tie conctive, then, that each of the phrafes,
 is rquiralent to the phraie, "I pyyts at prefent the $f$ nifked aidion of writing a letter." Such an exprefion may found harfo to the ear, becaufe it is not in ufe: but we ofen employ expreffions, to the frecife and frofer meaning of which we do not attend; and if the above be attentively confidered, however ausward it may at frift appear, nothing will be fomd in it eitter in proper or abfurd.

The auri/f, then, we conceive to ftate an action as performed and fuifted in fome folf portun of time: whilt the preter-gerfeia repiefents the paf performume and completion of that action as now pollefid. And here we may hazard a conjecture why bave, when ufed as an auxiliary verb, is alxays joined with a paf partiriple; whereas diul is joined to a word expreffing the fimple altion of the veib, or, as it is called, the profint infinitive. Of the expreffion, "I bave wrigqasi a letter," as one part, viz. the verb bave, denotes profent time; the other part, viz. Writren, mult denute fof time, to give notice that the action is performad and finilhed. Did, on the other hand, implying $p$ onf time, has no occafion for the pafl part of another verb to give notice of this circumftance: for "I did wrife a lit. ter," is equivalent to, "at fome palt time I performed and finifhed the fimple ation of wribing a letter."

The principal diftinction in practice between the 60 aorif and preter-porfold (for the diference feems little The prinin their real import) confits in the time by which the eftition performance of the action admits of being particulary 's. wen fpeciiied. The p"ater-perfeat is atways joined with a the fe ienportion of time which includes the prefont now or is. fis. flant ; for otherwife it could not fignify, as it always does, the prefent poffefion of the fanifaing of an action. But the aorigh, which fignilics no fuct foryerion, is as conflantly joined with a portion of paf time which excludes the prefent now or infont. Thus we fay, "I have wuritten a letter this day, this week," \&c. but, "I auroic a letter yefictay, laft week," \&ce.; and to interebange thefe expreftions of time in Greek and Englifo, where the cori/l and prater-ferfer have different forms, would be improper. In Aatin, indeed, where they have but one form, the inproprity does not appear.
66. Befincs the tenfes already examined, which are the phat exprellive of fofl time, in moll linguages the verb has qu na peranother tunte called the plufzame ferfeat, in which, ${ }^{\text {to }}$. however, wo diliculty occurs to detain our attention. What the proter:inferfet is to the prefont tenfe, that the phapun, ferfig is to the proper perycia. The verb bed, by which it is refoived in Englith, being evidently the paft time of bove, fufticiently explains its meaning and relation to the other tenfes: "I bad written a letter," is equivalent to the phrafe, "I folfered at fome pof time the tinithed ation of writing a letter."

It is jullly wherved by Dre Bualic, that the imperfeet and plufquam-perfect are very uff ful, and may be the fources of much kegant expreffon ; and that if one were not taught to dillinguifh, in refpect of meaning as well as of form, thefe tenfes from each other, and the praterite from both, one could nut pretend to underfiand, far lefs to tranhuie, any good claffic author.
67. Having confidered the tenfes which imply pre- Fubure teno fons and poflt time, it now remains that we examinc fes. the import of thofe which ate expreflive of time fuiture. In Latin and Enalifh there are tan terges for this purpofe; of which the fry? reprefents an action in point of time as not wetexifing, bat as about to exilt at fome perind to come; but it does not bring the completion of the action into view. The other aiferts the fulurity of an action together with its completion. Scribank, "I thall be writing:" denotes future time and incomplete asfion; for it dives not fay whecher I am to write fur a long or for a thort time, or whether I thath finis what I promife to begin. This part of the veri, therefore, to which the Greck rpus, corre foonds, is an imserfach fusure, and likewife an aorif/h. Th: futurity of any action, it flould feem, mizy always be computed from the time of fpeaking, for every action muat be future with refpect to the ninic at which its futurity is declared; but the dime of its futurity may be more precifely fpecified by tixing on fome other future time to which to refer it: "I fhall be writing after he thall have departed." Shall or will refers to future time indffnitely; and zwrive on zuriting refers to an action which is indeed to iegin and fo far to proceed, but of which nothing is faid concerning the completion.

On the other hand, frisfiro, "I thall have written," is a perfact future denoting conplete action: for /ball de. notes futhise time; writtro, frijbed arion; and bave, frefent polfefficn. So that the meaning of the whole aflertion
is．that＂at thate fatere periol of time Ithall poffers the tiniandarivnof writing．The comstetion of the ation， torether with the polfition of it，is always future with refeect to the time of afiersion；but，with refpect to fome other time expreffed ur underlond，the conpletion of
 ＂you promife to write if I thall have afked yon．＂In this fentence the action of afking is future with relation to the time of promifurs，but it is pafl with relation to that of arriting．This tenfe the Lecting granmarians call the future of the futwnative mode；but very impro－ perly．The notice which it commonicates，refpeets not the poustr or liberty of acting，whith，as will be feen by and bye，is．the characteritic of chat moode；but the asion idelf．It ought therefure to be ranked among the teafes of the indicatize miscle：for fripfero is，in every fuife，as really tan licatice as fcribant or foritheres ero．

tenfe，expretive of internal poncer or／kill．＂I cas write＂ is equivalunt to－＂There is nothing in mpfelf which incapacitates me for perfurming the operation of wri－ ting．＂This verb fecas originally to have denoted inowledre or $k$ ．．＂，and to hare teen aftermards extended to fignify poezt or asflyy of owe kind．There is little doubt of its being the farme with the oill Englifh verb soron，which fiznines to kngw．－The difference betweens the import of thefe two verbs moy and can will be bett perceived in a familiar example．surpore we fay to one of our tranfcribers．＂You nady write a treatife on grammar．＂to which he returns for anfwer＂I cannt：＂ our affertion evidally fuppofes him at liberty to write the treatife；his anfwer implies，that he is untuble or un． Alild to do it．We may conclude，then，that the pre－ fint tinfe of this mole contains a declaration of prefory
 to have reference to the teme capacities．

The obfervation is here in be repeated which was eularged upon under the prefint of the indication．The liberty or alitity fignified by this tenfe is always repre－ fented as prefint；but the time of this prefence is inde－ finte．If no particular tinc be／iccifuld，we generally re－ fer it to the time of flending ；but cunotber point may be given from which we are to compute．＂When he Thall have finitter，you may then proceed as you pro－ pofe．＂Here the libuty of procectivior is fated as pre－ fent，not at the time of／pacaing，but at the time of his finikning，which is future to the time of fyeaking．But though the hicaty，ality，or Rill，denoted by this tenfe， be reprefented as prefint，the ation itfelf is thated as contingent；for it is not neecfory that a man thould per－ form an action becaufe he has the capccity to perform it．

From this idea of the prefout of the fubjurtaise fome of its moft peculiar ufes feem capable of being explain－ ed．－And，in the firlt place，it appears to have a near affinity with the future of the indivaive；infonuch that in many infances they may be ufed promifurnuly． Without materially altering the effect of the expreflion， we may fay，＂Dico me facturum cffe qux inperet，＂or ＂quax imperalit．＂The reafon of this，pertaps，may be，that with refpect to us，fuluriu．，and contingenty are in mot cafes nearly the fame，both being involved in equal oblcurity；and therefore it is often of little con－ fequence which mode of expreffion we employ．

Secondly，The prefort of the faljunaive is utid to de． noie
（R）On this point we fubferibe to the opinion of the elegant and ingenious $\operatorname{Dr}$ Beatic．－＂It will perhaps oceur（fays he），that there are two Greck tenfes，of which I have given no account；namely，the ficond aorifl，and the fecond future．The truth is，that I confider them as unneceffary．Their place，fur any thing I know to the contrary，might at all times be fupplied by the firft aorift and the firft future．Some graminarians are of opinion，that the firf aomifl fignifies time paft in general，and the fecond，imlfonite time pall；and that the firfi future denotes a nearir，and the fecond a more reanote futurity．But this，I apprehend，is mere conjecture，monfuported by proof：and therefore I incline rather to the fentiments of thofe who teach，that the fecond future and the ficond arrift lave no meaning different from the fafl future and the firf aoilt；and that they are the prefent and imper－ feat of fome obfolete theme of the verh，and，when the other theme came into ufe，happened to be retained for the fake of variety perhaps，or by accident，with a preterite and futere fignification．Be this as it will，as thefe tenfes are peculiar to the Greek，and lase nothing correfponding to them in other tongecs，we need not Scruple to overlook them as fuperfhous．＂－The Theory of Lavisage，Part II．Chap．ii．

To thefe judicious obfervations we have nothing to add，but that they acquire no fmall degrce of confirma－ tion from this circumfance，that there are many Greek verbs which have no fecond future，and which are yet employed to denote every polible modification of future time．Of the panio－polf－futurn of the Greeks wh have 2
note the rigtt of which a perion is poffeffed. "I may, or I can, tell this book." This application, whech Dr Prifley contiders as the frimary fignitication of the tonfe, is cafly dediced, or rather follows im.nediately, from the foregoing account of its inport. Fur if one be under no refleait, cither external or internal, to pre. vent him from performing an action, he has furely a roth to perform it.

Thirdly, the prefuet of the fumatioe is often ufed to lignify command or requen; as when one fays, "You may give my compliments to fuch a perfon." 'This ufe of the tenfe under confideration fetms to have arifo from a detire to foficn the barbrees of a command, by avoiding the af pearance of clainsing fuperiority. When a man utters the abuve fentence, he cotain!y viters t:o conmane!, bat only aferts that the perfon to whom the freaks has liberty or pozer to do him a favour. This affertion, however, may contain no nirw information; and the:cfone the perfon addr:fel, refecting upon the incention of the fecaker in making it, infers that it indicatcs a evilh or difire that "his compliments hould be wade to fuch a perfon."
70. Of the fuljunciae as well as of the indicalize, the proter-ingievs at is evidently the paft lime of the prafont. As the litecr afierts liberty, or utility, to perfurm tome achiva, as caiting at freferat, the furmer alforts the fame liberty of atility to bave exject in time poff; but the fracife fortion of time palt, in which thele capacities txiltest, mut be fpecified by other words, or it will utuain unlames. Thus in the following fentence, " Dixi me facturum effe qua impcraret," the time of inferavel is ruferred to that of dixi: the perfon having the right to command, is fuppofed to have had it at the time when the viher foid that he would obey. This tenfe, as well as the prefent, flates the action as going on and incomplete; and alfo as future with refpee to the literty or ablility to perform it. It is rendered into Engilf by the verbs could or might; of which the frell is the paft time of can, the fecond of may.

From the near affinity which the prefent of the fubjub:inve has to the future of the indicatizr, the tenfe now under contideration appears, in many inflances, as the paft time of the later as well as the forner. Thus Dixime facurrn" qua imperaret, may berendered "I faid that 1 would do whatever he might, or whatever he Rould, command."
71. Of the prater-Ferfog, it is fufficient to obferve, that as the prejint tates the agent as at lilerty to be performing an unjrifbel action; fo this tenfe flates him as at liberty to perturm an action confidered as fuijfhed. " I may le curitias a létter when you come, i.e. I an at liberty to be writing a letter when you come." I may bave curitien a letter when yon come," i. c. I cm at li berty to be in poffefion of the finifoed ation of writing a letrer when you come.'

It is a common mode of expreffion to fay, "I may hare done fuch or fuch a thing in my time," when he wiso fpeaks can have little doubt whether he has done the thing or not. In that cafe, the words may have dore, caunot be confidercd as the prater.ferfeat of the
fubjuncive of the verb $d o$; for it is nonfenfe to taik of lilerty, with refpeet to the performance of an ation, which, at the time of fpeaking, is fuppoied to be folt and completed. What then is the import of the phraie? We are perfunded that it is elliptical, and that ths word fey or affrm is undertood: "I may (fay that 1) have done fuch or fuch a thing in ny time;" for liberty or contingency can relate to actions only as they are conceived to be prefent or future.
72. Of all the tenfie, the mult complex is the pluf. The pluf-

 a; the fofl ima both of the perfect future and of the prater perject of the fuljuracive: for it reprefents an action, fulure and contimpent at fone pill time, as fuibed lefore another period fipecifal; which period thecefore, though
 to the time when the fururity or contingency of the agion exifed. "Promifftit te feripturnan fuite it rogaffin;" "You promifed that you would write, if I hiould have afied ycu." I Eere the futurity of the action of ofires, which is reprefented as complete and fuifbed, is thated as coexijlmy with the poff promife; but the asion itflef nuft be fofrior to that promife: it is however fuppofed to be $p$ afi with refpect to the action of suriting, which is alfo polerior to the promile.
73. Before we difants the fubject of tenfer, it may not be improper juit to mention number and parfan; for thefe tave place in every tenfe of the verb in the kearned languages, and in many teufes even of the Englifh verb. They cannot, however, bc deemed effential to the verb; for affrmation is the fune, whether it be made by $y o u$, by $m e$, or by a third perfon, or whether it be made by one man or by a thoufand. The molt that can be faid is, that verbs in the more, elegant lan ruages are provided with a variety of terminations which refpect the number and forfon of every fubfantice:, that we may know with inore precifion, in a complex fentence, each particular fubHance with its attendant verbal attributes. The fame may be faid of fex with refpect to adjeatives. They have terminations which vary as they refpect beings male or fruale, though it is palt difpute that fubfances alone are fufceptible of fex. We therefore pafs over thefe matters, and all of like kind, as being rather among the elegomcies of particulur languages, and therefore to be learned from the particular grammar of each tongue, than amoug the efentiati of language ; which effentials alone are the fubject of inquiry in a treatife on univerjal grammar.
74. Befides tenfes, number, and perfon, in every tongue with which we are acquainted, verbs are fubject to another variation, which grammarians have agreed to call Modes. Of modes, as of tenfes, it has been warmly difputed whether or not they be effential to language. The treth feems to be, that the only part of the verb abfolutcly neceflary for the purpofe of communicating thought is the indicative mode; for all the others, as has been well obferved by Dr Gregory, are refolvable, by means of additional verbs and a word denoting the action of the primary verb, into circuitous exprefinons which
taken no notice, becaufe it is found only in the paneve woice; to which if it were neceffary, it is obvious that i: would be neceffary in all voices, as a man may be"about to $a$ as well as io fuper inmediately.
which fully convey their meaning (s). But fuch expremions continuaily repeated would make language very prolix and wholl; inaminated; for which reafon, the import of each of the commonly received modes is a fubject worthy of the philologitt's inventigation. Abuut the number of modes, whether neceffary or only expedient, as well as about the import of each, the writers on grammar have differed in opinion. Mr Harris, one of the moft celebrated of thofe writers, has entsmerated four modes of the verb, behdes the injimione; viz. 'line indicative or ineclarative, of aforl what sue bink certain; the potential or subjunetive, for
the purpo fes of coldotor wo think contrgent; the NTERROGATive, when we are doubful, , procure us inform, ticn: and the requisitive, to with us in the gratigiation of our whitions. 'The requifitive too, according to him, appsars under two diftinct fpecies; either as it is mpeR fille to inferiors, or PRECAIIVE to fuperiors.

For ellablifing fuch a variety of modes as this, no fort of foundation whatever appears. The fame reafoning which induced the author to give us an interrofrtive and requiftive mode, might have made him give us a lomative, a diffugfore, a volitive, and innumerable other modes, with which no language is acquainted. lint befodes perplexing his reader with ufelefs diflinetions, we cannot help thinking that Mr Harris has fallen into fome millakes with regard to the import of thofe modes which are univerfally acknowledged. Ac. cording to him, affertion is the characterillic of the inticotive, and that which diltinguifhes it from the fubjunctive or potenicic: but this is certainly not true, for without an affertion, the verb cannot be ufed in any mode. Of this the learned author. indeed. feems to have been aware, when he obferved of the fulimurive mode, that it is employed " when we do not /lrially affert," and that "it implies but a dulious and corjoctural aftertion." The $\mathrm{N}^{2}+2$.
truth is, that the affertion implicel in this mode, tho' it is not concerning the fame thing, is equally poftive and abjolute with that conveyed by the indicative. An example quoted by himfelf mould have fet him right as to this matter:

```
Seffucitus p,ififipofit crvous, Haseret
I lus dupis, &ivc.
```

Who does not feel that the affertion contained in haberat, is as abfolute and pofirize as any affertion whatevel?
75. Perhaps we may be afked to define what we mean by a mode. We know not that we can definte it to univerfal fatisedetion. Thus much, however, feems to be obvious, that thofe variations which are called modes do not imply different modifications of the Action of the verb. Amo, Amem, AmA, do not fignify mo.les of loving; for modes of loving are, lowing muca, loning littie, loving long, sic.-Shall we then get over the dificulty by faying, with Mr Harris, that " modes exhibit fume way or other the fonl and its affations?" 'This is certainly true: but it is nothing to the purpofe; for it does not diftinguifh the meaning of moch from the oljeet of language in general, all languages being intended no exhibit the foul and its affections.

Granmantical modes of verbs have been defined by Mode de Dr Gregory" to he "eoncife mojes of expreffing fome of fined. thofe combinations of thoughts which occur molt fre. quently, and are mofl important and llriking." This is a jull obfervacion; but perhaps he would have given a more complete definition had he faid, that grammatical modes of verth are concife modes of expreffing fome of thole combinations of thougbts which occur mofl frequent ty', and of which assertion is an effential part ( T ). This indeed feems to be the real account of the matter, efpecially if our notion of the nature of verb be well founded,
(s) The imperative, for inftance, may be refolved into a verb of commanding in the firlt perfon of the prefent of the indicative, and a word denoting the aficn of the frimary verb, commonly called the infnitive mode of that verb. Thus, I nume et arfus tecum meditare canoros, and "Fubo te nunc ire et tecum meditari," \&c. are feltences of the very fame import. The fubjuncive may be refolved in the fame manner by mans of a verb denoting power or capacity; for credam, and polfum credere, may be often ufed indifferently. The indicative mode, however, is not thas convertible with another verb of affirning in the fryl perfon of the prefent of the indicative and a word denoting the action of the primary verb; for Titius fribit, "'ritius writes," is not of the fame import with diro Titium foribere, quod Titius fribat, " 1 fay that Titius writes." The firlt of thefe fentences, as has been already hown, contains but one affertion; the fecond obvioully contains two. Titius zurites, is equivalent to Tilius is atriting; I fay that Tilius ariles, is equivalent to I a maying that Titius is zriting. The reafon why the imperative and fuljungize are refolvable into expreflions into which the indicative cannot be refolved, will be feen when the import of each of thofe modes is afeertained.
( t ) Every verb, except the limple verb am, art, is, Ex. expreffes without modes a combination of thoughts, riz. affermation and an attribute. The affirmation, however, alone is effential to the verb, for the attribute nay be expeffed by other words. It is indeed extremely probable, that, in the earlief ages of the world, the affirmation and attribute were always expreffed by different words; and that afterwards, for the fake of concifenefs, one word, compounded perhaps of thefe two, was made to exprefs both the affirmation and the attribute': hence arofe the various claffes of verbs, adive, pa/fve, and mether. Of a procefs of this kind there are evident figns in the Greek and fome other tongues. But the inprovers of language tlopped not here. The fame love of concifenefs induced them to morlify the compound verb itfelf, that it might exprefs various comlinations of thought till more complex: but in all thefe combinations ofertion was of neceffity included; for if the word had ceafed to affert, it would have ceafed to be a verb of any kind.

Soon after this thort note was written, and the whole arsicle linilled for the prefs, we accidentally met with Pirhlourn's Differtation on the Englifl Verb. Of that work it belongs not to us to give a character. Such of our readers as thatl perufe it, will fee that on many points we differ widely in opinion from the author ; but we have no painful apprebenfion of any comparifon which may be made. It gives us pleafure, however, to find,
of volitions; but ftill they all contain inditations. On this idea the three foregoing modes of amo will be thus diftinguilhed. When a man indicates his prefertf feeling of the paffion of love, he ufes the firtt ; when he indicates his prefent capacity of fecling it, he ufes the fecond; and when he indicates his prefent defire that the perfon to whom he is fpeaking would entertain that paffion, he ufes the third.
76. As to what Mr Harris calls the interrogative mode, he himfelf obferves that it has a near affinity to the indicuite. It has in fact not only a near affinity 10 it , but, as far as language is concerned, there is not between the one and the other the dighteft difference. For, in zuriten language, take away the mark of interrogation, and, in Jpoken language, the peculiar tome of acies, and the inturogative and indtcative modes appear preciffly the fante. That fuch thould be the cafe is extrenely natural.
'To illantrate this, let us for once fpeak in the finVol. VIll. Part I.
gular number, and conceive one of our readers to be prefent. I affert a thing, taking the truth of it for sranted; buc if you know me to be zurong, 1 prefume that you will fet me rifht: in this cafe, affertion produces the fame cffeet as interroration. Iuftances perpetually occur in common converfation. An acquaintance fays to me -" You sook a tide this morning :" I anfwer yes or no according to the cafe; and the fame effect is produced as if he hat faid-" Did you take a ride this morning?" In this way, at firft, would fimple affertions be employed to procure information wanted. Fecift-youdidfuch a thing; feciftine-you did it not:- eillier would produce the proper reply, and the information wanted would be gained (v). This being obferved as language improved, men would accompany tuch a fentence with a peculiartone of roice, or other marks, to fignify more unequivocally that they wanted infurmation, or that fucb information was the only oljeet of their fpeech. Farther progrefs in refinement would lead them to alter the fafition of the avords of a fentence when they meant to ajo quefion, as we do in Englifl, faying (whon we afort), "Tou bave read Euripides;" (when we interogogut), "Have you read Euripides?"

In Gretk and Latin, queftions are afked commonly enough by the particles "، and an. Thefe particles we know to be exactly equivalent to the Englifh particle if, at laft to the fenfe in whish that particle is commonly taken. An feriflt is "If you did it ;" and the fen-

I tence
that his notions refpecting the origin of fuch verbs as exprefs at once affertion and an atributc, ave the fame with thofe which hat occurred to ourfelves.
"The copula is appears (fays Mr Picklourn) to have been coeval with language itfelf. But we have not the fame evidence to convince us, that that muft neceffarily have been the cafe of any other finiee verb; for the copola is, containing only an affirntuion, is much more finple than a verb which unites in one word both an attribute and an affirmation. Since thecrefure people, in their firf attempts to exprefs their ideas by word, would fearcely think of any thing more than what was abfolutely neceflary, it is probable they wowld be fome time before they invented any other word containing in itfelf an afferign or ufirmution; for they would not rery early think of contriving words fo confec. in their nature as to include in them both the nome of an afimand an afertion.
"I conjecture, that the firft mode of exprefling acions or paffors would be by participles or tarval nouns, i. e. words fignifying the names of the agiois or palkons they wancd to deferibe; and thefe words, connected with their fubject by the copula is, might in thofe rude beginaings of language tolerably well fupply the place of 'verbs: $6 g$. from obferving the operations of nature, fuch words as rain or ruining, fhunder or thundering, would foon be invented; and $y$ adding the copula is, they would fay, thundering or thunder is or is not, raining or rain is; which, by the rapidity of pronunciation, might in time form the verbs rains, thanders, \&cc. The obfervation of their own afions. or the afions of the animals around them, would foon increafe their fock of ideac, and put them upon contriving fuitable expreffins for them. Hence might arife fuch words as thefe; flecp or freping, fuend or funding, run or running, lite or liting, burt or buring: and by joining thcie to fubtantives by means of the copula is, they might form fuch fentences as thefe,-Lion is fleping, or perhaps lion feep is, fland is, \&e. which would foon be contracted into fion fleghs, fands, runs, liter, tiurts, sec. Thus our little infinted family might become poffefed of verbs including an aftribute and an aftraction in one word"

This account of the origin of adive, palive, and nemer verb, is certainly ingenious; and, in our opinion, it is not more ingenious than jult when applied to the Grech and other ancient languages, though it is not applicable to the Englifh : but it feems to be quite irreconcileable with the detinition of cer's, which the author has a lopted from $B: / 20$ Lonth; and indecd with every other detinition except that which makes the effence of verb to conlitl in fimple ofrmation.
(u) Of a quention put in the form of an affertion we have a remarkable infance in the Gofpel of St Matthew. When Chrift food before Pilate, the guvernor afked him, faying, youo Bewavs tio infacel. That Kis fentence was pronounced with a view to obtain fome anfwer, is evident from the context; yet it is as plainly an afferation, thourh utered prohably in a foofing tonc, as the ferious confeflion of Nathaniel, sua. Gazativ: +ow regary. Had not the queftion been put in this form, which ifiets Chrilt to be the king of the Jews, the reply could not have been Euarys; for without an affrtion the governur would have faid mothing. See Dr Camptell's Tranflation of the Gofpels, where the form ufed in the original is with great propriety retaind is the verfiot.
tence may either be an abbreviation for dic an fecifi, "tell me if you did it;" or ais may perhaps be, as if certainly is, the imperative mode of fome obfolete verb equivalent to give; and in that cafe, an frofyi will he a complete interrogative fentence, fignifying, "you did it, give that." - But of the interrogative msde of Mr Hurris we have faid cnough ; perhaps, our readers will think, too much, fince it is a ufelefs dillinction not found in any language. It will, however, be proper to fay fonething of his preative mode, as far as it is the fame with
is not formally exfreffed by the fpesker, but inferred by the hearer. T'liey are therefore inftances of that tendency which mankind univerfatly difcover to abbreviate their language, efpecially in cafes where the paftions or feelings are interefted.
73. The interrogative and opative roodes being fet afide as fuperfirous, it would appear from our inveftigation, that the real diffing modes of the orerb, which are found in the moft copious and varied language, are only three; the indicative, the fubjunctive, and the imperative: and that thefe are all that can be confidered as needfury; the froft to indicate the \{peaker's feeling or alling, the fecond to indicate his capacity of feeling or acting, and the third to indicate his defire that the perfon to whom he fpeaks fhou!d fed or at.

Here again we have the misformene to find ourfelves differ in opinion with Dr Gregory; who feems to think, that a greater number of modes, if not abfolutely neceffary, would, however, the highly ufeful. His words are : "All languages, I believe, are defective in refpect of that variety and accuracy of combination and of diftinction, which we know with infal lible certainty take place in thought. Nor do I know of any particular in which language is more deficient than in the expreflang of thofe energies or mudifications of thought ; fome of which always are, and all of which might be, expretfed by the grammatical mouds of verbs. Of this there cannot be a clearer proof than the wellknown fact, that we are obliged to exprefs by the fame mood very different modifications or energies of thought. As, for inftance, in the cafe of the grammatical mood called the imporititer, by which we exprefs occalionally prayer to God, command to a lave, requeft to a fuperior, advice to an cqual or to any one, order as from an officer to his fubaltern, fupplication to one whom we cannot refit."- If thefe be, as the author calls them, fpecific oifferences of thought, he will not furcly object to their being all ranked under one genus, which may be called difire $(x)$. That the internal feelings, which prompt us to pray to God, to command a flave, to requeft a fuperior, to advife an equal, to give an order to an inferior, and to fupplicate one whom we canot refif, are all different in degree, cannot be dewied. Each of them, however, is defire; and the prediction, by which the defire is made. known to the perfon whom we addref, is the fame in all, when we utter a prayer as when we utter a command, when we requef as when we fupplicate. Lut fredication alone is that which conftitutes the verb: for defire by itfelf, lowever modified, can be cxpreffed only by an alynaal noun; and the mere cnergy of defire, when not applied to a particular energifer, can be expreffed only by a participle, or by what is commonly, though improperly, cathed the infinitioc mode. Now it is cer tainly conceivable, that a few fludes of meaning, or a few (y) degraes of one goneral energy, might be manked
(x) "Destre; -wifh; with eagernels to obtain or enjoy." Jobnfon.
" The uneafinefs a man finds in hinfelf upon the abfence of any thing, whofe prefent enjoyment carrics the ddea of delight with it, is that we call desire. Good and evil, prefent and abfent, work upon the mind; but that which immediately determincs the will, from time to time, to every voluntary acion, is the uneafincfs of Desire, fixed upon fome abfent good." Locke.

This, whether it be found phifofephy or not, is furely fufficient authority for ufing the word defire to denote the genus; of which prayer, command, advice, futplication, \&c. may be confidered as fo many diftinct fpecies.
(y) Dr Gregory feems to think, that not barcly a few, but a vaft number, of thele curgies might be fo marked,
by correfpending variations of fuch verbs as combine energy with fredication; and there could be no great impropriety in calling thofe variations modes, or rather modes of noodes: but that fuch a meltiplication of modes would be an improvement in language, is by no means evident. The verb, with the modes and tenfes which it has in all languages, is already a very complex pait of fpeech; which few are able, and till fewer inclined, to analyze: and it would furely be of no advantage to make it more complex by the introduction of new morks, efpecially when thofe desrees of encrgy which could be marked by them are with equal and perhaps greater precifion marked, in the living fpectb, by the different tones of voice adapted to them by nature; and, in written language, by the reader's general knowledige of the fubject, and of the perifons who may he occalionally introduced. If there be any particular delicacy of fentiment, or cnergy, which cannot thus be made known, it is better to exprefs it by a name appropriated to itfelf, together with the fimple and original verb of affimation, than to clog the compound verb with fuch a multiplicity of variations as would render the acquifition of every language as dificult as is faid to be that of the Chinefe written characters. The indiative, fuljungive, and imperative, are there-
fore all the rrodes of the verb which to us appear to be in any degree neceflury or expedient; and they are in fact all the modes that are really found in arry language with which we are acquainted.

For the nifinitive, as has been already obferved, feems on every account to be improperly ftyled a mode. To that name it lass no titie which we can tiveno perceive, cxcept that its ternination fometimes (for even the verb this is not true univerfally) differs in the learned lan- but an atguages from the terminations of the other parts of the fracir noun, verb. Nay, if aftrmation be, as it has been proved to be, the very efince of verb, it will follow, that the in. finitize is no part of the verb at all; for it expreftes no affirnation. It forms no complete fentence by itfelf, nor even when joined to a noun, unkess it be aided by fome real part of a veib either expreffed or underitood. Scribo, fritelan, fcriffi, fcritferam, forilam, firitferos "I am writing, I was writing, I have written, I had written, I thall write, I hall have written," do cach of them contain an affrmalion, and contlitute a complete fentence: but fcrilare " to writc," foripfife "to have written," affim nothing, and are not mors applicable to any one perfon than to another. In a word, the infnitive is nothing more than an aldruat noun $(z)$, denoting the fimple energy of the vert, in conjunction
 knowing, doubting, fuppoing, Rifulating, being able, commanding, prasing, requefting, fufflicating, loving, hating, fearing, defpairing, being accuftomed, wondering, admiring, wavering, fwearing, alvifing, refifing, exborting, difunding, encouraging, promifing, threatening, \&c. all adnit very readily of being combined with the general import of a verb." He adds, that "if evely one of them had been expreffed in all languages
 of the verb."

If all thefe words denote different energies of thought, which, however, may be doubted, and if all thofe different energies, with many othsra for which, as the author jutly obferves, it is not eafy to find names, could, like capacity and defire, be combined with the gencral afion or energy of one verb; and if thofe combinations could be marked by correfponding variations of that vcrb; we fhould indeed acknowledge fuch variations to be diftinct modes, or modes of modes, of the verb. But we doubt much if all this be poffible. We are certain that it would be no improvement: for it feems to be cvident, either that, in fome of the modes, the radical letters of the original verb muft be changed, and then it would ceafe to be the fame verb; or that many of the modes muft be expeefled by words of very unmanageable length; not to mention that the additional complication introduced by fo many minute difinctions into a part of fpeech already exceedingly complex, would render the import of the verb abfolutely unintelligible to nine-tenths even of thofe who are juftly fyled the learnetl.
(z) In our ictea of the infonilize, we have the honour to agree with the learned and excellent Ruldin:an; whofe words are, "Non ineptè hic modus a veteribus quibufdam verbi nomen eft appellatum. Eft enim (fi non verè ac femper, quad nonnulli volunt, nomen fubflantivum) fignificatione certè ei maximè aflinis; ejufque vices fultinct per omnes cafus. Et quidem manifgle fubtantivum videtur, cum alljaivum ci additur nuturi generis: ut, Cic. All, xiii. 28. Cum sivere iofum turpe fit notis.-Perf, v. 53. Velle fuum cuique ef.- Cic. Fin. i. I.
 Ovid Met. ii. 48 3. Poffe loqui cripitur, i. e. poteflas loquendi- Plaut. Bacch. i. 2. 50 . Hic vereri perclidit, i. e. verrecanciam.--Cic. Tule. v. 38 . Lopuor de docio bonine et erudito, cui vivere efl cogitare, i. e. cujus quila efl cogitatio. [Gramantic. $L$ hqinad Institetioves: Pars fecunda, lib. i. cap. 2. where the reader will find examples of the infinitive ufed by the beft Ruman writers as a fubflantive noun in every cafe.]

This opinioa of Rudidinan and his ancient grammarians has been lately controverted with much ingenuity by $\operatorname{Dr}$ Gregory; whoferms to think, that in the infinitive alone we fhould look for the effence of the verb divefted of every aecidental circumftance, time only excepted. If this be indeed the cafe, almoft every rhing which we have faid of the verb, its lenfes, and its modes, is erroneous; and he who takes his priaciples of gransmar from the Encyclopadia, will fill his head with a farrago of abfurdities. The writer of the arricle, however, bas leen at much pains to acquire correct notions of the fubjec: he has fudied the writings of others; he

With time: and want a mork, as far as we can conceive of ary thing. 'lhus, Stire fumm nithe efl, is the
 tain." with "To wite is cettain."
79. Defore we dimifs the fubjeat of moris, it may not be improper to take notice of the connection which Mr Hurris, after slpollonims, has found between commanding and futuris. "Intreating and commanding (he fays) have a ineceflary refpect to the firure only. For what have they to do with the prefent and the fuft, the natures of which are immutable and necefiary." This is furely confounding commards with the execution of commands. But the leanded witer procceds to inform ws, that "it is from the connerion of fulurity with comanals, that the furme of the indicatione is formetimes ufed for the impsratize mole.". The coune tion, of which he fpeaks, appears to us entirely imaginary; for fiuturity has nothing to do with commands, though it may
with the exacution of them. The forfert time is the time of conmanding, the future of ntrying. But fuppofing the eanoction real, it would not acoume for the futare tapis being wha imperatoch. For athough it were tive, as it is cidently falic, that rommands are future, it would not follow that the retation is conrertide, or twat employing the farure thould imply a comanati. 'The principle upen which fuch expreffions as, Thou shat sot kall, come to lave the force of a conimand, feems to te this. When a perfon, efpecially one pollefled of authority, aflerts that an afion, depending on the will of a fire agent. and therefore in its own nature coming chit, fhall or flall not actually take place; what are we to conclude from fach an aikrtion? Why furely it is natural to conclude, that it is his aifl, his commant, that his affertion be veritiod. The Englifh word foll, it we be well informed, icnuted originatly obligutitur ; a fenfe in which its part tenfe Bould is
has confulted feveral perfons of undoulted learming, who have devoted a great part of their time to grammatical inventigations; and he is extrenely unwiling to fuppofe, that all his inquirics refpecting the mort impurtant pait of fpech have ended in error. He trulls, therefore, that he fhatl not be deened a petularit cafiller, though he examine with fome feverity the principal obfervations and arguments upon which the Doetor has buile lis theory. Upon that examination he enters with difidence: for the learned Profefor's knowledge of the various poowers of the mind appears, even in this effay, to be fuch as emineritly qualifies him for afcertaining the precife import of every fecies of words employed for the purpofe of communicating thought; and with fuch a man the prefent witer would be mueh happier to agree than to differ is cpinion.

The Doctor acknowledges (Tranfact. of the Royal Society, Edinburgh, Vol. II. hit. elafs, p. 195), that the infinitive is moll improperly called a mode: and on that account he thinks we ought to turn our thoughts excheferfy it, " when we endeavour to invelligate the geneal import of the verb, with a view to afcertain the accidret which it donotes; and be led, ftep liy flep, to form a dillinet notion of what is common in the acciLhents of all verbs, and what is focelider in the accilcuts of the feveral chafiss of them, and thercoy be enabled to give good defmitions, fpecifying the ef nee of the verb," \&sc. It may be true, that to the infinitiou exchufody we fhould turn our attention, when wis with to afeertain the accilent denoted by a particular verb or clafs of verbs; i. c. the lind of afion, pulfion, or flute of hing, of which, fuperadded to atfirmation, that werb or clafs of verhs is exprefive: but in accidents of this kind it may be doubted if there be any thing thit with propricty can be faid to be common to all verbs. There feems indeed to be nothing common to all worbs but that winch is effential to them, and by which they are dillinguithed from coery otber part of fpecch; but eve.y kind of afion, pafion, and fute of leing, mas be completely exprelfed by partiophes and alfrat nouns; and thercioce in fuch aciunts we cannot fins the deme of the verb, becaufe fuch accilents difinguifh it nut frum other parts of fpecch. Were a man called upon to fpecify the effence of verfo or medre, he would not fay, that it coulhts in the Traning of the words, or in the ufing of thefe words according to the rules of fyatax. In every hivel of verfe where words ate wfed they fave indeed a meaning, and in all good verfes they are grammatically conkruked; but this is likewife the cafe in profe, and therefore it cannot be the effence of verfe. The effence of verfe mut confift in fomething which is not to be found in profe, viz. a certain harmonic fucceflom of founds and number of fyltables: and the e\%ence of the verb mult likewife conlith in fomething whieh is not to be found in any. onter part offecects; and that, we are perfuaded, is nothing but affirination. But if affirmation be the very fonce of the verb, fi would furcly be improper, when we endeavour to afectain the general impore of that pat of fpeech, to thrn our thoughts exclulively to a word which implies no afirmation; for what does not affirm, cannot in flrictnefs of tuth be either a terb or the mole of a verb.

In the fanc page it is faid, that "the infinitive denntes that kind of thought or combination of thoughts which is common to all the other modes." In what fenfe this is tue, we are unable to couccive: it denotes indeed the fame accidiat, but certainly not the fame thought or conbination of thoughts. In the cxamples
 of outs; for though eivere and valure exprefs the fame flates of leing with riva and oulco, they by no means exprefs the fane comination of thoughts. Viwo and valoo affom that $I$ andiving, and that $I$.qu well; and he
 TIVERE and vanre, on the other hand, affom notiong ; and lee who utters them thinks only of the faes of living and of teing in bealt, without appiying them to any particular perfon.

The exquificly leamed author of The Origin and Proyrefs of Language, having faid that the infinitice is ufed either as a nom, or that it ferves to connect the veri, with another verb or a nom, and fo is ulfful in fyatax, the Doctor combats this opinion, and infors the infaitive to be traly a wat; becaufe "the thought expretired

Atill commonty arp.oyed. In Englifh, thereiore, the foregoing procers of infirring a command from an affertion of futurity, feems to have been rcoorfol; and the word fonil, from denoting a comnatid or cblization, has come to denote fanurity timply.
80. Having eonfidered the eerb in its efince, its tanfes, and its modes, we might feem to have exbauled the fubjeet ; but there is titill fomething more to be cone. Gramnarians have dittingwimed verbe into feveral species; and it remains with us to inguire upron what principle in nature this diftinction is made, and how far it proceeds. Now it mult be obvious, that if prelication be the efience of acrb, all zerls, as fuch, mult be of the fanie fpecies; fur predication is the fame in every profefition, under every poffible circumpance, and by cubromfoever it is matle. But the greater part of verbs contain the predicate as weil as the predication of a pro-
prition; or, to fpeak in common languate, they denote an attrilute as well as an affirmation. thus, lego io "I am reading ;" amlula, "I am zu? ${ }^{2}$ ing ;" flo, "I am flanding;" verlero, "1 am friking;"" quericror, "I am Arichen." But the atributes exprofed Iy thefe verbs are evidently of different kinds; fone conitiang in aco Aon, fome in fugring, and fome in a lase of being which is neither ative nor fabive. Hence the ditinetion of ucrbs, according to the attrilutes whith they denote, into ariver, pafive, and neuter. Ioco\% which is an affertion that 1 am employed in the od of icating, is an afive verb; verberor, which is an aftertion :hat I am fuffering under the rod, is a pafive sered, bceaufe it denotes a pafion; and $\Omega 0$, which is an aifontion that I am fluading fill, is faid to be a uebter ererb, becaufe it denotes neitber alion nor pufforn. But it is felfevident that there cannut be action withuut an ayent, nor without
by means of it, may be expreffed in fynonymons and convertible phrafes, in different languages, by means of other parts or moods of the verb." Of thefe fynonymous and convertible phrafes he gives feveral examples, of which che fitt is taken from Hamlet's foliloquy. "To be or nos to le, that is the quettion," he thinks equivalent in mearing to, "The quefion is, whecther we foutl be or feall not be?" But we are pufuaded he is mitaken. "Whather we fall be or thall man be," is a queftion afling, whether we fhall exif at fome future and implfinite time : Lut :lee fubject of Hamlet's debate with himfelf was not, Whether, if his confcions exitence flould be interrupted, is yould be afterwards at fome future and indefrite lime reforeds but whither it was to continue uninterrutcel by hisecit from this world? This, we think, mun be felf-cvident to evely reader of the Soliloquy. It i, likewife very obvinis, that the word gaffion in this fentence does not lignify interogatory, but fulject of dhati on afiar to be excominds ; and that the word that ferves for no other purpofe than to conplete the verfe, and give adde:conl emphofis, perhape, to an inquiry fo important. "To be or not to be, that is the quefion," is therefore equivalent in all it fpect, to "The continuance or non continuance of my exiftence, is the matter to be examined:" and the infmitive is here indifputably ufd as an abllacte noun in the nominative cafe. Should it be faid, that the Dostor may have taken the fentence by ifflf, uneonnected with the fubject of Alamite's follingy; we beg leave to reply that the fuppofition is impofible; for, independent of the circombtaces with which they are conneEted, the wods "To le or not to le" have no perfect meaning: Wcre it not for the fubject of the foliloquy, from which every reader fupplies what is wanting to complete the fenfe, it might be alked, "To be or sao to le-li'hat? A coward, a murderer, a king, or a dead man! Queftions all equally icafonable, and which in shat cafe could not be anfwered.

With the fame view, to prove the infiaitive to be truly a gerb, the Doctor proceeds to remark upon the

 quat cociderib, \&c. He adds, that "the infuilites, as thus ufel, aequire not any further meaning, in addition to the radicat import of the verb with tenie, like the proper moods; , but the fubjungives after quad lofe their peculiar meaning as mools, and fignify no more than bare infinitives." In the fenfe in which this obfervation is made by the author, the very reverfe of it fectas to be the truth. The infuitio:s, as thus ufed, aequirc, at ican in the mind of the reader, fomethint like the power of albration, which they certainly have not when Handing by themfelves; whereas, the fubjumeiocs neither lofe nor acquire any meaning by being placed after
 Tivius to exill, to be well, to lie along; a mode of fpeaking which, though now not elcgant, was commun with the belt writers in the days of Sbakejpare, and is frequently to be found in the writings of $W$ arburton at the prefent day. Dica, credo, futo, qual Titius caifat, quod jaicat, See. fignities literally, Ifyy, betuer. think, that Titius may exif, raty lie along, \&ce. Renove the veibs in the indicative mode from the former fit of phrafez, and it will be found that the infinitives bad acipuirel a meaning, when conjoined with them, which they bave not when left by themfelves; for Titium exiffere, juctere; "Titius to exit, to lie along," have no complcte meaning, hecaufe they uffrun notling. On the cther hand, when the indicative verbs are removed, togecher with the wonder-working groot, from the latter fet of plarafes, the meaning of the fuljungizes remains in all refpects as it was before the remoral; for Titius exifat, jerect, Eic. fignify; Thiss may exift, may lie along, as well when they ftand by themfelves as when they make the final elaufes of a compound fontence. Every one knowo, that quod, though often called a conjunction, is always in fact the relitive pronsum. Dico, credo, puto, quot Thius exiflat, mult therefore be confrued thus: Tinius cuifat (ef itl) quat dico, crealo, s.e. "Titius may exitt is that thing, that propolition, which I fay, believe. think." In the former fet of phrafes, the infaidiens are ufed as abftraft nouns in the accufative cafe, denoting, in conjunction with Titun, one complex concertion, the e.
 Tithene evifere, "the exinnce of Titius."
whhont a porive beigs neithor con we make a prediak
: A! verhs ruw: a me c If.ry 8 preque to a boun in els か, minatuc c.lls. fon, without predicating of fom.:'ing. All werls, the re. ture, whether abian, polfor, or nemtr, have a nect. fary refernace to fome mun expreflive of the fio. ar of which the atribut, denoted by the rab, be intiatad. This noun, which in all languages mult be in the nominative cat is faid to be the nommative to the verb; and in thofe languages in which the rert has perfon and nomber, it mult in thefe refocis agree with its morathenc.

Of afien, and confequently of ards dentins action, there are obviouny two kinds. There is an afion which palfes from the asent to fome fuljet, upon which he is employed; and there is an aifion which refpects no ob. jea beyond the agent bimply. Thus lego and ambulo are verbs which equally denote asion; but the action of
 for shen a man is codern, he mult be reading fomsl'? a book, a newSpaper, or a letter, \&c. whereas, the action of andul is confined wholly to the agem; for when a man is zextions, he is employed upon nothing levnt bimelf, -his agion prodnes no efrit upon any thing external. Thele two fpecies of verbs have been denoninated trambiter and intornofite; a delignation extremely proper, as the diftindion which gave rife to it is phinisfophically juft. I'erbs of both fpecies are acive;
but the action of thofe onty whilisate caided tratmive, refpefts an expernal objef: and therefore, in thofe langutles of which the nouns have cafes, it is only after mer only arre's which are himfition is well as ation, that the
 cufutian or objeciate cafe. Vor's which are intranfitive, tive caic. thongh they be really afive, are in the fructure of fentences confidered as nenter, and govern na ca/e.

And fo much for that molt important of all words the vprb. We proceed now to the confideration of parliciples, adjeations, and adorts; which, as they have a near relation to one another, we fhall treat of in the fame chaptcr.

CHAPTER V.

## Of Participles, Anjectives, and Adverbs.

## Sect. I. Of Particirles.

Si. The nature of verbs being underlood, that of Participles participles is not of dificult comprchention. Every denote an verb, except that which is called the /ub/fantive verh, is attribute expreftive of an attribute, of time, and of an affertion. Now combined if we take away the affertion, and thus deilroy the rere, with tima there will remain the atribute and the thme; and thefe combined make the eftence of that fpecies of words call-

In conformation of the fame ides, that the infmition is truly a verb, the anthor grotes from frorace a paffage, which, had we thought quotations neceffary, we fhould have urged in fupport of our own opinion:

> ABias tentaisse domos, animoque rotundum PRKCURRISSE potum, morituro.

I's onr apmehenfon, nothing ca: be clearer than that tevtaise and percorrisse are here ufed as anoms for if I ' y be not, where fhall we find a nomination to the verb probly?' It was certainly what is lignilied by tantassa - bevias domos, aninoque rohudum FERCDRRISSE prhm, that is faid to have been of no advantage to firchytas at his death. This indeed, if there conld be any doubt about it, woult be made evident by the two profe verfons, which the profeftor fubjoins to thefe beautifal lines. The firt of which is as follows: Nic quiquam hibi prodefs

 acurate; for it contains tron propofitons, while Horase's hines contain but one. The feeond, which though it may be a crabbed inelegant fentence, expreffes the pott's fenfe with more precifion, is in thefe word: : Nee
 ituth, that this icntence lans the very fame meaning with the lines of Horace, Dr Grgrory afks, "Why are not hatasin and curfin reckoned verbs as well as teadfe and porturife:" Let thofe anfwer this quellion who believe that any of thefe words are truly verbs; for they are furely, as he adds, all very near akin; indeed for nem, that the mind, when contemplating the import of each, cannot perccive the difference. Mean while, we brg lave in our turn to afi, Why are not tentupe and porcurrife reckoned ablorat nonns as well as tenfutio :nd curivs? To this quettion it is not eafy to conceive what anfwer can be retamed upon the loctor's primeiples. In his theory there is nothing fatisfactory; and what has not been done by himfelf, we expect not from his followers. On the other hand, our principles furnifh a very obvious rafon for' excludingr tontutio and curfus from the clais of verbs; it is, becaufe the fe words exprefs no pretication. Tatafe and foriarrife indeed dencte predintion no more than tonaio and curfis; and therefore upon the fane principle we exchele them likewife from a chafs to which, if words are to be arranged according to their import, they certainly do not betong.

Shoukt the reader be inclined to think that we have dwelt too loner on this point, we beg him to refle?, that if oar iucas of the effence of the verb and of the nature of the intintive be crroneous, every thing which we have had of modes and tenfes is erroneous hikewife. We were therefore willing to try the folidity of thof primciples which hold the effence of the verb to confit in energy : and we felected Dr Gregory's theory fir th: fulject of examination, not from any difrefpect to the author, whom the writer of this article neves. St: ; but becaute we believe his abilities to be fuch, that

[^0]ed participles. Thus, take away the aferion fiom the verb ypäy auritth, and there remains the pariciple rextov euriting; which, without the afertion, denotes the fame atribute and the fome time. After the fame manser, by suithdrawing the affertion, we difcover riatas
 Soall be writing. This is Mr Harris's doctrine refpecting pariciciples; which, in our opinion, is equally elegant, perfpicuous, and juft. It has, howcyer, been controverted by an author, whofe rank in the republic of letters is fuch, that we fhould be wanting in refpect to him, and in duty to our readers, were we to pafs his objections wholly unnoticed.
82. It is acknowledged by $\operatorname{Dr}$ Beattie, that this, which we have taken, is the moft convenient light in which the participic can be confidered in univerfal grammar: and yet he affirms that prefent participles do not always exprefs prefent time, nor pretarite participles fich time; nay, that farticiples have often no counection with time at all. He thus exemplifies his affertion, in Greek, in Lalin, and in Erglifh.
"When Cebes fays, Etuy天avniv fiestatowits in ta tou ypervu ufes, 'We were walking in the temple of Saturn, the particle of the prefent walkisc, is, by means of the verh were, applied to time pagt and therefore of itfelf cannot be undertood to lignify any fort of time." Again, after obferving, that in Englifh we have but two fimple participles, fuch as zoriming and ewriten, of which the former is generally confidered as the prefent and the latter as the pogh, the Doctor adds, But "the participle wuriting, joined to a verb of cif. ferent tenfes, may denote cither $p: f^{\prime}$ or future action; for we may fay int only, I am writing, but alio, I was autiting yefterday, and IShail be arriting tomorrow;" whence he infers that notine subater is denoted by the prefent participle. But furely this is a hafty inference, drawn from the doEtrine of alfolute time and a definite prefent, which we have already fhown to be groundlefs and contradictory. When we feak fimply of an action as prefert, we muff mean that it is prefent with refpect to founthing tefidis itfelf, or we fpeak a jargon which is unintelligible, but we do not afcertain the time of its prefence. From the very nature of time, an aetion may be prefer:? nowe, it may have been frefent formerly, or it may be prefont at fome future period; but the precife time of its prefence cannot be afcertained even by the frefont of the indicative of the verb itfelf; yat who ever fuppofed that the preftin of the inditative denotes no time? The participle of the prefent reprefents the afion of the verb as going on ; but an action can. not be going on without being frefint in time with fomething. When, therefore, Cebes fays, "We were walking in the temple of Saturn," he reprefents the action of the verb wall as prefint with fornething; but by ufing the verb exprefive of bis cofertion in a pal tenfe, he gives us to underfland that the aftion was not prefent with any thing at the period of his/peaking, but as fome fortion of time prior to that period: whar that fortion of time was, mult be collceted from the fublequent parts of his difcourfe. The fame is to be faid of the phrafes $I$ tuas suriting yeflerday, and I Rall be curiting to morrow. They indicate, that the agion of the verb urdite weas prefint with me yeflerday, and will again le prefent with me to. mor. rowe. The ation, and the time of action, are denoted by the participle; that istion is affoned to belong to me by 6
means of the verb; and the time at which it belonge to me is pointed out by the tenfes of that verb, am, cours, and fall be. All this is fo plain, that it could nut have efcaped Dr Beattie's penctration, had be not hallily adopted the abfurd and contradictary notion of a definite prcfort.

Of the truth of his affertion refpecting paff farticiples, he gives a Greek and a Latin example. The former
 latter is that which is commonly called the perffia future of the paffive verb amor, amatios fucto. In thie filt inAance, he fays that the participle, though belongiag to the aorift of the paft time, mult be rendered cither by the ind:finite prefent, "he who delievth;" or by the future, "he who auill believe;" and the reafon which he gives for this rendering of the word is, that " the believing here fpoken of is confidered as poltrior in time to the anamaidition of the promif.". This is inderd true, but it is not to the purpofe; for with the enanciation of the promife, the time of the furticiple has no manner of concern. The time of tantuza: depends entirely upon the time of $\sigma$ whetrax, with refpeet to which it mult undenially be paff. Our Lord is not here aTerting, that he whofoail bulicie at the day of fand retribution, fall be fived; but that he who thall on that day be found to kawe beliesed in time pafl, thall be faved: and if the participle had not been expreffice of a finifoel adion and a paft time, the whole fintence would have conveyed a meaning not friendly to the interefts of the gofpel. In like manner, the tine of amatus is referred, not to the time of focking, but to the tinde of fuero, with reipect to which, who fees not that it is puaf? The two words, taken together, contain a declaration, that he who utters them /ball, at fome time foflerior to that of Ipeahing, buve been loved; Ball hare been loval denotes tron times, both futare with refpect to the time of 万oaking; but when the time, denoted by forll baw, eomes to be prefent, that of the participle low mast be puyl, for it is declared that the alition of it flatl thos be comefleie and finijord.

We conclude, then, that it is effential to a participle to exprefs both an attribute and timt; and that fuch words as denote no time, though they may be in the farm of participles, as duans "learned," cloqutns " eioquent," \&e. belong to cunther part of focech, which we now proced to conlider.

## Sect. II. Of Adjectives.

83. The nature of verls and participles being un-Adjectives derilood, that of adjectives becomes cafy. A acrb denote atimplies (as we lave faid) an attribute, lime, and an ofler- ributes as tion; a futticipl implies only an altribute and time ;and to fubtinan. an ADJECrive implics only an atribute as belonging 10 ces. fome fulfunce. In other words, an aujecrice las no a dertion, and it denotes only fuch an aitribute as has not its effence eilher in motion or its privaticn. Thus, in gencral, the attributes of quantity quatity, and relation, fuch as many, fow, grout, little, bluk, wi.jik, good, tad, doubie, trelí, sec. are all denoted by adjecties.

## $9:$

8+. To underfand the import and the ufe of this They bave fpecies of words, it muft be obferved that caery adjective the mpore
 tion cquivalent to of. Thus, a good man is a mun of her vi his goodacfs; where we fee the attribute denoted by the ad- the powe.
 crident iechas
coident tha: the nom sonluifs does not exprefo the ex hat.
 fes root ouls an atribute, but allo the cmation between the comitule and its jub/hane; whereas in the alyform noan, tive ater:bues is coritidered as a fol flence unonnoted with ativ opleq subitance.

In the next place, it is to be obferved, that the connatum expreffed by alfotions, like that exgrefled by of, is of a nature fo sereril and indefinte, that the particu. lar lind of connection mul, in fome languages, be inferred from our previons knosleuge of the objects between uthe中 it fublits, or it will for ever seman unknown. This miotht be proved by a variety of exampler, but will perhaps be fufferently evinent from the following. Corse fambers firmifes colour that in. dicates heath; excritation foldros, exurcife that peeferaers health: wimus form, food that ioprowe heath: molicoms folutri, medicine that rotoresheath. In all the de examples the convarion exprefled by the adjuctive form of falubris is different; and though it may be known from perevas experinci, there is nothing in any of the expreffons themefres by which it can be afeertain. ed. 'Thus, adjectives are each fignificant of an atribute and conndita; but the particular lind of connectinn is afcertained by expericnce. - The uftual effect of aljeciocs in language, is to modifyor butimatife a greneral lem, by addin fome quality or circurglance which

93
The ufual effect of ad jectives is to modify a general te:m. may diftinguith the object meaht by that term, from the other objeets of the fami ffeces. I have occation, for example, to fpeak of a particular man, of whole mame 1 am ignorant. The word math is too general for my purpofe, it being applicable to eworv individual of the human fpecies. In what way then do 1 pro. ceed, in order to particularize it, fo as to make it denote that wiry mont whom I mean to focify? I anmes or conjoin to it luch words as are figniticant of oljects and quatities with which $b_{e}$ is commetal, and which are not cqually applicable to others from whom 1 mean to difinguib bim. Thus I can [ay, a man of prudence or a furani man, a wife man, a good man, a breve man, sc. Dy thele additions the general term man is limited, or modified, and can be applied only to cerain men to whom belong the attritutes expreffed by the adjecities srulent, wife, good, and brave. If it be thill too genera! for my purpole, I can add to it other qualities and circuntlances, till 1 make it to particular as to be dip plicable to but one indivilual mon in the univare.
85. This is the way in which anjectues are com-
9.4 The reverfe of this is fometimes the cafe. monly ufed, but it is not the only way. Inflead of being employed to molefy a fulfantive, they fometimes appear as the frincipal coorls in the fentence, when the Fole wic of the fulplantive feems to be to modify the ab. frod nown, contained under the aljectioe to which that fubtantive is joined. In order to undertand this, it will be necefary to ationd to the following oblenations.

It may be laid down as a general propolition, that when any term or phrafe is cmp.eyed to denote a com. flex coureptin, the mind has a power of confoderins, in what order it pleaks, the frople ideres of which the come. plax conception is compofed. "Io illallate this onlervation ly an example: 'The word eques in Latin, denotes a complex conctation, of which the chuliment finple ideas are thofe of a mon and a horfe; with tias contiction fubliteing letwen them, theit the ma: inenceried is on $\mathrm{N}^{\mathrm{O}}: 4^{2}$.
the buid of the lenefe. In the whe of this word, it is well knum that the ;cha fogl in order, as being the primsind juther af the propatition, is commonly the was on the lakk of ili lonfe; but it is not fo always. for the mind may combder the morse as the principal oljed. Thas when Virgil fays,
the energics attributed to the nbject fignified by equrTEA, make it enident that the borge and not the man is meant: for it is not the property of a mar, infallare

Tne Came obfervation holds true where the compiex oliat is denoted by two or nooce words; an aljezive, for intance, and a fildontive. Thus in the phrafe fummus mans fi inter nubila condit, the words fumms mons reprefont a complex concotion, of which the conftuent ideas are thofe of beigly and momtain, connected torether by the adjodive form of fumanus. Either of thefe ideas may te the fubject of the propolition; and the expref. fion will accordingly admit of two different firnifications. If mons be made the fuhjeet of the propofition, the meaning will be, "the higheft mountain hides itfelf among the clonds." If the fulflantive incladed in the radical part of fummus be made the fubject of the propofition, the expreffon will lignify, " the fummit, or highelt part of the mountain, hides itfelf among the clouds." The latter is the true import of the fentence.
86. From the fe obfervations and examples, we fhail rwo 95 be enabled to undertand the treo ufes of the abieciver of the adIt is either employed, as has been already obferved, jestive. to re/lrial or modify a seneral torm; or the abprat fulfantive contained in the adjobive is modified by the moun, with which, in the concrete or adjective form, that aly:raf fulylomion is joined. The lift may be called the dirct, the fecond the inverfe, acceptation of adjectives.

The inarfe acceptation of adjectives and fariciples (for both are ufed in the func manner) has not, except in a very few inltances, been noticed by any gramathion; yet the principle is of preat extent in language In cteler to cxplain it, we thall produce a few examples; which on any othe principle ic is impoffible to underlland.

Siry, fueabing of the aboltion of the segal antho-
 all wingettana amos ductatos fizadratinta quatuor, "Monarchy lublited at Rome, not from the city built (which would convey no meaning), but lom the luilding of the cify, to its diverame," \&c. Math the participles condia and herathe are here wed in: foffor: that is, the ablrade fublamizus containcel in comithasind liberatam are modihied or seftricted by the fubtlantives urbe and wrbm, with which they unite. Again, Orid, fpeaking of the contet between Ajas and $H_{m}$ fies for the arms of Achil les, has thele lines:

Hene afo the atjeites or partiople Deseraun is taken inverlely, and the geteral nowion of demen contained in it is nudfen or rendered parlicalar by being joined with $\mathrm{t}_{\mathrm{L}}$ fobitantive Nestora. 'The meaning of the Faflage
paffage is, "I will never be induced to believe that the defertion of Nefor was not a crime." Werc defertum to be taken direaly as an adjeclive modifying its fuldfantive, the fentence mult be tranflated, "I camnot believe that Neflor defirted was not a crime." But it is evident that this is nonfenfe; as Nestor, whether diferted or not deferted, could not be a crime.

It were eafy to produce many more examples of ad. jectives taken inverfely; but thefe may fuffice to illuflrate the general principle, and to fhow, that without attending to it, it is impoflible to undertand the ancient authors. We thall adduce one inflance of it from Shakefpeare, to evince that it is not confined to the ancient languages, though in thefe it is certainly more frequent than in the modern:

> "Freeze, freeze, thou bitter fky;
> "Thou cand not bite fo nigh
> "As benefiss forgot:
> "Thungh thu the waters wa"p,
> " Thy thing is not fo harp
> "As friends remember'd not."

Here it is evident, that the aljegive forgot is taken inverfely; for it is not a benefit, but the forgetting of a benefit, which bites more than the bitter fly : and therefore, in this paflage, the acljective ferves not to modify the noun; but the noun bencfits is employed to modify the abfract fubfantive contained in the adjective forgot, which is the fubject of the propofition, and the principal word in the fentence.

Had Mr Harris attended to this principle, and reflected upon what he could not but know, that all adtjefives denote fubfances; not indeed fulfifing by themfelves, as thofe expreffed by nouns, but concretely, as the allributes of uther fubltances; he would not have clafled adjeflives with verbs, or have paffed fo fevere a cenfure upon the rrammarious for claffing them with nouns. It matters rery little how adjertives are clafed, provided their nature and offect be undertood; but they have at leaft as good a title to be ranked with nours as with ecrls, and in our opinion a better. To adopt Mr Harris's language, they are bomoreneous with refpect to nowns, as both donote fulfiances; they are beterogencous

96 Adjeclives formed from futhAnstives, with refpect to verbs, as they never do denote affertion.
87. Befides original adjectives there is another clafs, which is formed from fubllantives. Thus, when we fay, the party of l'ompey, the fyle of Cicero, the phillofiphy of Socruics; in thefe cafes, the party, the flyle, and the pbilofoploy fooken of, receive a llamp and character from the perfons whom they refpect : Thole perfons, thereforc, perform the part of attributes. Hence they aftually pafs into atributives, and aflume as fuch the form of aljectives. It is thus we fay, the Pompcian purty, the Citceronian fyle, and the Socrutic philojophy. In like manner, for a trumpet of brafs, we fay a lrazen trumpet, and for a crown of grok, a golden crown, \&e. Even prononinal fubltantives admit the like mutation. Thus, inftead of faying, the book of me, and of the we fay my book, and thy book; and intlead of faying, the country of us, and of you, we lay our country, and your country. Thefe words my, thy, our, your, \&ic. have therefore teen propenly called promominal adjeaties.

Vol. VIII. Part I.
88. It has been alrcady obferved, and muft be obvious to all, that fulfances alone are fufceptible of $f \cdot x$; and that therefore fubfantive nouns alone fhould have diltinctions refpecting gender. The fame is truc with $0^{3}$. refpect to numbir and perfon. An attridute admits fometherr of no change in its nature, whether it belong to you nature or to me, to a man or a woman, to one man or to fould have MANY ; and therefure the avords expreflive of attributes, wnon to de. ought on all occalions, and in every fituation, to be more fex, $f_{i s e d}$ and invariablc. For as the qualities good and bad, number, on black and white, are the fame, whether they be applied to a man or a quoman, to many or to ficu; fo the word which expreffes any one of thefe attributes ought in Alrictnefs to admit of no alteration with zuhativer fubAantive it may be joined. Such is the order of nature; and that order, on this as on other occations, the Englifh language moft ftrictly obferves: for we fay equally, a goobl man or a good weman; good men or good woonten; a good boufie or good houfis. In fome languages, indeed, luch as Grek and Latin, of which the nouns admit of cofes, and the fentences of an invertel. Alrucuri, it has been found neceffary to endow aljedives witia the threefold diftinction of gender, number, and porfon; but as this is only an accidental variation, occacationed by particular circumftances, and not in the leath effential to language, it belongs not to om fubject, but to the partioular grammars of thefe tongues.

Thure is, however, one variation of the adjezive, which has place in all languages, is founded in the nature of things, and properly belongs to univerfal gram- tion foundmar. It is occafioned by comparing the attribure of etin the one fubltance with a fimilar attribute of another, and nature of falls naturally to be explained under the next fection.

## Sect. IIl. Of Adverbs, and the Comparijon of AdJECTIVES.

89. As aljerives denote the attributes of fublances, fo there is an inferior clafs of words which denote the mo. difications of thefe attributes. Thus, when we fay "Ci- 150 cero and Pliny were both of them elonuent; Siatius and of empore $V_{i}$ rgil both of them atrote;" the att ibutes exprefled by the words eloquent and surote are immediately referred to Cizero, Virgil, \&c.; and as denoting the altributes of fubflunces, thefe words, the one an adjective and the other a verl, have been both called attridutives of thefirst order. But when we fay, "Pliny was moderadly eloquent, but Cibero exceedingly eloquent; Statius wrote indifercoly, but Virgil wrotic adnirably; the words moskrately, exceediugy, indificontly, and aimurably, are not referable to fubllantives, but to other aluributes; that is, to the words cloquent and awote, the lignification of which they nodify. Sach words, thenetore, having the fame effect upon adjections that adjectuves have upon fulfluntives, have beca called attributhes of the second order. By gram- por marians they lave boen called $a D$ erbs ; and, if The reafon we tale the word verb in its mot comprchenfore fir war we take the word verb in its mont compremeng fos tame. nifuation (A), as including not only areels propecty fo called, but allo every fpecies of words, which, whether affentidlly or accildentally, are tignificant of thic attributes of fubltanccs, we fhall find the name $\operatorname{ADFE}$ erb
(A) Arifothe and his followers called every word a aerb, which denotes the predicate of a propolition. This claffification was certainly abfurd; for it confounds not only adjectives and participles, but even fublhamiters, with verbs: but the authority of Ariftote was great ; and hence the name of cdeverb, though that word attarles itfelf only to an alfecive or furticiple, or a verb tignificant of an cllrilute: it docs not attach itfelf to the pure vert. to ${ }^{1}$ ? "efy juf appaliation, as denoting a part of
 fre't : this dependence in grammatical fyntax, that an atialb can no more fublith withont its aerb, i. e. withcont fome ceorel hernificant of an attributc, than a verb or acticaize cas fublif without its fithlmiver. It is the fame here as in certain natural fubjects. Every calour, for iss exiftence, as much requires a fuperficies, as the fateffies for its exiltence requires a fold body.
gi. Ameng the atributes of fubikanes are reckone: frumigy and quelity: thas we fay a white orarment, a hes momitain, Ne. Now fome of thefe quantities and qua'tics are capble of indafion or remillion; or, in other Wore', and fis in oc may have them $m$ a greater or lefs It or than arioher. Thus we fay, agarment ExCRDINGIf sifite, a monatuin tolergbly or moderatelr bigh. Hence, then, ont copions fonree of focondary attributives or n.ubses to denote there two, that is, intenfon and rervilin: fuch as gratly, blerably, rafly, extremely, inWrerab, fac.

Hut where the re are different intentions of the fame ittibute, they may be compared together: Thus, if the garment $\dot{A}$ be FXCFFDINiLD subite, and the garment B be monfretfrr abhite, we maje fay, the garment $A$ is AORE white than the garment B. This paper is subite, and frow is wolate ; but fuow is monf woble than this paper. In thefe inltances, the adverb more not ouly denotes intanfon, but ridaive intenfon: hay, we forn not here, $2 s$ we not only denote intenfon merely rilation, but relative inconfonthan echiche there is nonegreater. 'Thus wefay, Sophodes was wife. Secrut's was moke aute than he, but Solomon was the most avife of men. Even arerls, proverly focalld, which denote an atrithute as well as an aflertion, mult ablmit both of fimple and allo of compurative intorfions; but the fimple verb TO BE adnits of neither the one nor the other. 'Ihus, in the following example, Fume be worefor morf than riblues; but witue of all things be loreth vost; the worrls more and most denote the different comporative intenfors of the aftribute included umder the vab hovelh; but the affertion iticlf, which is the effutial part of the reerb, admits neither of intenfion nor remiffon, but is the fame in all poffible propofitions.

Q1. From this circumblance of quantities and qualithis being capable of intenfion and remi,jon, arife the comparisos of adjecizes, andits differcut degrees, which canaut well be more than the two fpecies above mentioned; one to denote finple excefs, and one to denote fuperlatie. Were we indced to introduce more degrees than thefe, we ought perhaps to introduce infmit, which is abfurd. For why ftop at a limited number, when, in all fubjects fufceptible of intenfion, the intermediate exceffes are in a manner infinits? Between the firt fimple ablite and the fuperlative whited, there are infinite degrees of more white; and the fame may be faid of more great, mor ltrong, more minute, \&c. the dodtrine of grammarians about thrue fuch degeecs "f centurafon, which they call the poflifie, the comperIat and the fugerlative, mult be abfurd; both becaufe wheir thfies there is no compurifon at all, and becanfe Weir juperhmize is a comperatiee as much as their compefatioc ieltil. Examples to evince this may be met whith twery where: Sor ites was the most whe of all the sthenidens; Hontio was she most seblime of all poets, \&cc. In
this Sentence Socrates is evidently compared with the Ahenians, and Homer with all other poets. Again, if it be faid that Socrifes atias mone wise than any other Athenian, hut that Solumnen was the most atse of meth; is not a comparifon of $S$ dmmon with mankind in general, as plainly implied in the late claufe of the fentence, as a comparifon of Socrates with theother Abenians in the firl?

But if hoth imply comparifon, it may be afked, In what contilks the difference between the comparative and Jupertatio? Does the fuperlatizu always exprefo a greater excefs than the comparutive? No: for though Socrates was the mul weife of the Ahenians, $y$ et is Solomon affirmed to have becn more rujpe than he; fo that here a bigher fuperiority is denoted by the comparative more than by the fuperlative mog. Is this then the difference between the fe two degrees, that the fuperlative implies a compariton of one with many, while the comparative inplies only a comparion of one zithone? No: this is not always the cafe neither. The Palmitt fays, that " he is wifer (or more aife) than all his teachers;" where, though the comparative is nfed, there is a comparifon of one with many'. 'The real difference between the fe two degrees of comparifon may be explained thus:

When we ure the /uparhative, it is in confequence of havins compared individuels with the jeries to which they belong, or one or more fitucies with the genus under which they are comprehented. Thus, Socrates avas the most mise of the Ahherians, and the Albeniuns aver: the most entightenfo of ahtiont nations. In the firit claufe of this fentence, Sucrafer, although compared wish the Ahonians, is at the fame time confidered as one of them; and in the latt, the Ahhenians, although compared with anciem nations, are yet confidered as one of thole nations. Hence it is that in Englifh the fuperlutive is followed by the prepolition of, and in Gresk and Letlin by the genitive cafe of the pluval number; to hous, that the object which has the pre eminence is confidered as belonging to that chefs of things with which it is compared.

But when we ufe the comparatiae der ree, the objects compared are fet in direct oppofition; and the one is confidered not as a part of the other or as compretended under it, but as fomething altogether dijlinct and belonging to a differcm chafs. Thus, wert one to fay, "Cicero was move rlogunt thas the Romans," he would fpeak ablurdly; becaufe every body knows, that of the clafs of men explefted by the word Romans Cicero was one, and fuch a fentence would affirm that orator to have been more cloquent than himfelf. But when it is faid that "Ciccro was more doquent than all the other Romans, or than any ofber Roman," the language is proper, and the affirmation true : for though the perfons fpokers of were all of the fame clafs or city, yet Cicero is here fet in contradiflinetion to the reft of his countrymen, and is not confidered as one of the perfons with whom he is compared. It is for this reafon that in Enghth the compratite degree is followed by a roun governed by the word of contradittinc. tion thon, and in Latin by a nom in the allative cofe governed by the prepolition pra (s) either exprefled or undstituon!. We liave already obfenved, that the whative cafe denotes concomitancy: and therefore whee

[^1]fahtough it is certandy trie, that whan we ufe the fuperhtive, we ought in propriety to confider the things
an adjective in the comparative degree is prefixed to a noun, that noun is put in the ablative cafe, to denote that two things are compared together in company; but by means of the prepolition, expreffed or underllood, that which is denoted by the comparative adjective is feen to be preferred before that which is denoted by the noun.
92. We have hitherto confidered comparatives as exprefled by the words more and $m \rho / f$; but the authors, or imprevers of language, have contrived a method to retrench the ufe of thefe adverbs, by exprefling their force by an inffetion of the arjective. Thus, inltead of more fair, they fay fairer; inttead of moff fuir, fairEst: and the fame method of comparifon takes place both in the Greek and Latin languages; with this difference, however, between the genius of thefe languages and ours, that we are at liberty to form the comparifon either in the one method or in the other; whereas in thofe languages the comparifon is feldom if ever formed by the affiftance of the adverb, but ahways by the inflection of the adjective. Hence this inflee. tion is by the Greek and Latin grammarians contid, red as a neceflury accident of the adjective; but it has reached no farther than to adjeciives, and participles flouring the nature of adjectives. The ateributes exprefled by verls are as lufeeptible of comparifon as thofe expreffed by adjecives; but they are always compared by ineans of adverbs, the verb being too much diverfified already to admit of more variations without perplexity.
93. It mult be confeffed that comparatives, as well the fimple as the fuperlative, feem fometimes to part with their relative nature, and to retain only their interfive. Thus in the degree denoting fimp? excefs:
Tristior, et tas:ymis ocutos fuffufa nitentes. Virg.

Triflior means nothing more than that $V_{\text {enus }}$ was very fac. In the degree called the fuperlative this is more ufual. Phrafes extremely common are, Vir docilifmus, vir fortifimus, " a moft learned man a moft brave man;" i. e. not the braveft and mof larved man that ever exii.ed, but a man poffe fling thofe qualities in an eninent degree. In Englifh, when we intimate that a certain quality is poffeffed in an eminent degree, with. out making any diret comparifon between it and a fimilar quality, we do it by the intenfive word very, more commonly than by mof: as, Cicero weas verr eloquent; the mind of Thellifon was very vigorous. This mode of exfreflion has been ealled the fuperlative of eminerce, to diAinguifh it from the other fuperlati:e, which is fupcrla. rite upon comparifon. Yet it may be faid, that even in
the fuperlative of eminence fomethiceg of confarigon mut be remotely or indiretly intimated, as we cannot reafon. ably call a man very eloqucit without comparing bis eloquence with the eloquence of cther nen. This is indred true; but we cannot therefure affirm that ecm. farifun is more clearly intimated in this fuperlatioe than in the fimple adjedice eloquent: for when we fay that a man is eloquent. We mark between bis eloquence and that of other men a diftinction of the fame kind, thourg not in the fame degree, as when we fay that he is aery eloquent.

In Erglifh we diftinguifh the two fuperlatives, by prefixing to the one the definite article fise, to thow that fomething is predicated of the object expreffed by it, which cannot be predicated of any olliry object; and $l_{y}$ fubjoining the prepofition of, to thow that the objcets with which it is compared are of the fame clafs with itfelf: as, "Solomen was the wifelt of men; Hector was the molt valiant of the Trojans." To the other (c) fuperlatise we on!y prefix the indefinite article $a$ : as, "he was a eery gcod man: he was a mof valiant Tuldier."
24. As there are fome quatities which admit of com. Adjective ${ }^{3}$ farifon, fo there are others which admit of none: fuch, which aifor example, are thofe which denote that gurity of lodies sit net ef arifing frem their figure; as when we fay, a circular compees of table, a quadrungulur court, a conical piece of metal, fompari\&e. The reafon is, that a million of things parcici. pating the fame figure, partieipate it equally, if they do it at all. To fay, therefore, that while $A$ and $B$ are both quadrangular, A is more or lefs quadrangular than $B$, is abfurd. The fame holds true in all attributives denoting difnite quartities of whatever nature: for as there can be no comparifon without intenfion or remi/fon. and as there can be no intenfion or remilion in things alwoys defnite, therefore thefe attibutives can adnit of no comparifon. By the fame method of reafoning, we difoover the canfe why no fublowive is fufceprible of thefe degrees of comparifon. A mountain cannot be faid more to be or go emist than a mole-Nill; but the more or le/s muft be fought for in their quantities. In like manner, when we refer many individuals to one fpecies, the lion A cannot be called nore a lion than the lion $\mathrm{B}(\mathrm{D})$; but if more any thing, he is more ficres, mote faift, or exceeding in fome fuch ateribute. So agdin, in referring many fpecies tu one getus, a crocodile is not more an aminal than a lizard; nor a tiger more than a cat : but, if any thing, the crocodile and tyger are more bulky, more grong, \&c. than K 2
compared as of the farre clafs; and when we ufe the comiparative, as of different elaftes; yet is not this dilline. lion always attended to by the bell writers in any language. In Latin and Gieck the comparative is fometimes ufed, where in Englith we fhould ufe the fuperlative; as dextera eff fortior manuum; and in the Golpel it is faid, that " a grain of multand-feed is the fnulicr (womas) of all feeds, but when grown nep it in i!.e gratio. (wusuv) of herbs." Even in Englifh, the cuftom of the language pernits us not to fay " "he is the talift of the two," it mut be the taller of the two: but we cannot fay "he is the taller of the thre,", it mufl be the talloft. For thefe and other deviations from the general rule no reafon is to be found in the nature of things; they are errors made proper by ufe.
(c) In Englifh, the termination $o f$ is peeuliar to the fuperlative of comparifon, to which the definite auticle is prefixed. Thus we may fay, "Homer was the fultimel of poets;" but we catnot fay, "Honer was a fublimeft poet." Again, we may fay, "Homer was a sory lublime poet;" but nut, "Homer was the treve fublime poet."
(D) When Pope fays of a certain perfon, that he is "a tradefman, meck, ald much a liar ;" the lat phrufe is the fame with much sivach to lying, the word har baving the clicet of an attribusi.c.
the animals with which they are compared; the exeefs, as befors, being derived from tleir astibutes.
95. Of the a.doths or fecondey altributives already nicutioned, thofe denoting interyon and romi:foen may be cal'ul spererb of ewintity cuxpmunus, as grothly,
 ADNRES Wf ANTITY DBCRETE; more and myll, his and l.th, io which may be alded equally, fropurtional-

- Ind lure is may be woth while to ubierve, how the ane that, participating the fane effence, afumes difleront gratun. tical forms from its difionent rolations For sxample, frppote it thould be aked, How
 are 10 efleme the lame: but they defier in as much as Lomel is the ath laution of: mom; bonefly, of eerb or adje thic; and hongly heins divelled of thefe its atrioutive relations, allumes the power of a noun or fallantive, fo as to ftand by itfilf
g5. The ahserbs hitherto mentioned are common 10 acrbs of every fipceies; but there are fome which are confined to ardh propely focallal that is, to luch veibs as denote motions or aemerges with their priations. All nation and $r \cdot \beta$ imply time and pletee as a kind of necel fary coincidence Hence, when we wouldexprefo the place or time of eithes, we have recourle to aterios formad for this purpofe; of PLACE, as when we lisy he food THE®E, be atent hEACF, lie came htufr: of time, as when we fay, he food THEN, be reem AFtFRI ARDS, be tratulled formeser2. To thele may be aided the adverb; which denute the intenfins and remifions peculiar 10 mogion, fuch as powity halitp, faifoly, fluau'y, sic.; as alfo adverbe of place made out of prefefitions, weh as upeurel and docensuad from up and duan It may, however, be doubted whether fome of thele words, as well as many others, which do not fo properly madify attri$b_{\text {utes, }}$ as mark fome remofe circumpleme attending an attribute or otar way of conceiving it, are truly abverbs, though fo called by the grammarians. 'The limple affrmative and negalite yps and no are called ad erbs, though they furdy do not fignify that which we hold to be the very difnce of the adserb. a modifitation of "t'rizuter. "Ishelearned? No." "Is he brave? Tis." Here the two adverths, as they are called finnify not any modigiontion of the attributes braw and larmad, but a total negation of the attritute in the one cale, and in the oiher a declaration that the attribute belongs to the perfon fpoken of.

## 110

Many of them nere chbrcviatiuns.

Aheres are indeed applied to many purpofes; and their general nature may be better undertuod by reading a litt of them, and attending to their ctymology, than by any general defeription or defnition. Many of them feem to have been introduced into language in order to exprel's by one eword the meaning of two or three; and are mere al breviations of nouns, verbs, and adjectives. Thus, the import of the phratic, in abhat place, is exprefled by the lingle word where ; to awhet place, by whither; from this phace, by hence; in a diretion afiending, by UPWARDS; at the imefont dime, by

Now; at atal time, by when; at that sime, by thex; many times, by OFTEN; not nuny times, by seldom, \&c.
97. Mi Horne Tooke has, with great induftry and accuracy, traced many of the Enghth adverbs from their ongrin in the ancient Saxon and other northern tongues, and hown them to be cither corruptions of other words or ablurchiations of phrafes and fentences. He ubferves, that " alladverbs chding in $L$ r., the moft prolific branch of the farity, are fulliciently undertlood: the termination being only the word like corrupted; and the corruption fo much the more eafily and certainly difcovered, a. the tumination temains more fune and d'ymgutlabie in the other fifter languages, in which it is written ïk, lyk, "Is, higen." He might have added, that in Sculatad the word like is, a: this day, frequently ufod mitead of the Englith ter.
 fay a g wh ine igene. Upou this principle the greater part of whoths are rolulved inso thole pats of Ipeech which we have alroaly conlidered, as bonefly into boncli like, anfly into wht-like, \&e. fo that when we fay of a man he is bongiy indigfrious, we affirm that he is bongl- hike indulfious, or that nis indufiry has the apferance of beins lionsh. Aberes of a different termination the fame acute writer relolves thas: Aghast into the pall parciciple agazed;
"The French exchin ed,-the devil was in arms
" All the whale amm tood agazedon him" Shakepeare.
Ago, into the paft participle agone or gone. Asunber he derives from asundred, feparated; the palt participle of the Anglo Sexon verb afundrian: a word which, in all its varieties, is to be found, he fays, in all the northern tongues; and is origiually from fond, i. e. fond. Towir, from wittas to kno:3; as videlicet and filficet, in Latin, are abbreviations of ridere-licet and fire-lict. NeEds, he refolves into NEED is. ufed pa. renthetically; as, "I mult needs do fuch a thing," -" I muft (need is) do fuch a thing ;" i. e. "I mufs do it, there is need of it." Anon, which our old authors ufe for immaliatdy, inf abilly, means, he fays, in one; i. $\epsilon$. in one inflent, moment, minute. As,
" int right anon withouten norl abode."
" Anun in all the halte I can."
Alone and only are refolved into all one, and onelike. Inthe Dutch, een is one; and all-efen alone; and all-efn-like, only, anciently alondy. Alive is onlize, or in life. Thus,
"Chrift ctertue on have."
Cbalicer.
Aught or ought; a whit or o whit; o heing formerly written for the article $A$, or for the numeral $O N E$; and abit or bevit, in Saxon, fignifying a fmall thing, a point or jot. Awhile, which is ufually claffed with adverbs, is evidently a $n$ oun with the indetinite article protixed; a while, i. e. a time. Whalst, anciently and move properly whiles, is plainly the Saxon hwile-es, time lijal. Aloft was formerly written on-loft: As,
" And je, my mother, mis foveregne pleafance
"Overal tha g, out take Chrif on lofte" Cbuucer. Now, fays Mr Horne Touke, lyfi, in the Anglo Saxon,
(E) Thefe words were anciontly written cpe's, twic's, therie's; and are merely the genitives of one, two, three, the fubftantive time or turn being omitted. Thus, 11 ,w ofton did you wite? Anfwer, Orice, i. e. onc's cimm. Sce: Igrale Tocki's Divarfions of Pully.
is the air or the clouds，as in lyfte cummende，coming in the clouds，（St Luke．）In the Danifh，luft is air；and ＂at fpronge i luften，＂to blow up into the air，or aloft． So in the Dutch，de loef bebben，to fail before the wind； leeven，to ply to windward；loef，the weather gage， \＆c．From the fame roct are our other words：Loft， lofty，to luff，lee，leward，lift，\＆c．It would be need－ lefs，as the ingenious author obferves．to notice fuch adverbs as，afoot，adays，afoore，aftray，afoce，aricht， abed，aliack，abreafl，afoat，aloud，afide，ijtield，aground， aland，\＆c．Thefe are at firlt view feen for what they are．Nor flall we follow him through the analyfis which he has given of many other adverbs，of which the origin is not fo ohvious as of thele．Of the truth of his principles we are fatisfied；and have not a doubt，but that upon thofe principles a man conver－ fant with our earlielt witers，and thoronghy 』killed in the prefent languages，may trace every Englifh（s） adverb to its fource，and thow that it is no part of fpeech feparate from thofe which we have already confidered．The advirls，however，of affirmation and negation，are of too much importance to be thus paffed over；and as we have never feen an account of them at all Catisfactory，except that which has been given by Horne Tooke，we fhall tranferibe the fubitance of what he fays concern aye，yea，yes，and no．Tous thefe words have always appeared improperly claffed with adverbs upon every definition which has been given of that part of feeech．Accordingly，our au－ thor fays，that AyE or yes is the imperative of a verh of northern extraction ；and means，have，poffefs，enjoy． And yes is a contration of ay－Es，have，poffefs，en－ joy，that．Thus，when it is afked whether a man be learned，if the anfwer be by the word yes，it is equi－ valent to bave that，enjoy，that，belief or that propo－ fition．（See what was faid of the nature of interrega－ tion，Chap．IV．no 76.

The northern verb of which yea is the imperative， is in Danith ejer，to poffes，bave，enjay．Eja，aye or yea；EJE，poffefion；EJER，poffefor．In Swedith it is EGA，to pollefs；of which the imperative is Ja，aye，yea： Egare．pofiffor．In German，ja fignifies aye or yea； eigener，pollefjor，ozuner；eigen，own．In Dutch， Eigenen is to poffefs；Ja，aje，yect．

Greenwool derives not and its abbreviate no from the Latin；Minhow，from the Hobrew；and Junius， from the Greek．Our author very properly obferves， that the inhahitants of the North could not wait for a word expreflive of diffent till the eftablifhment of thofe rations and lauguages：and adds，that we need not be inquititive nor doubthl concerning the origin and fig－ nification of Nor and no；fince we find that，in the

Damifh，Nodig，in the Sredih，nodig，and in the Dutch，NOODE，NODE，and No，mean averfi，unwilling． So that when it is afked whether a man be brave，if the anfwer be no，it is a declaration that he who makes it is aterfe from or unwilling to admit that pro－ polition．
$9^{8}$ ．Molt writers on grammar have mentioned a fpecies of adverbs，which they call al crbs of interroga－ tion；fuch as rubere，wubence，zubither，bow，\＆心．But the truth is，that there is no part of frecel，which，of itfelf，denotes interrogation．A quellion is never alk－ ed otherwife than by abbre：iation，by a fugsle word， whether that word be a nown，a promon，a terl，or an adverb．The word where is equivalent to－in what place；whence to－from rubut piace；and nows to－in awhat monner，\＆c．In thefe phates，in what flace，from cubat place，and in subat menner，the only word that can be fuppoled to have the force of an inhoregutionc， is what，which is refolvalie into that which：But we have already explained，in the chaser of Pronoms，the principles upon which the redulior is made to denots interrogation，and the fame reaioning will account for the adverts whore，relunce，quither，bow \＆又c being employed as interrogatives．Whan we hay，where were you ypferday？whance bate y＇s come？whither ar yon going？bow do you perform yur journey？Wh merely ule fo many abbreviations for the fullowing fentences；all us，or defcribe to us，tue plice evbere（or in which） you were geflirday；the place atheme（or from which） you bave come；the place to which yout are going；tiae manner in zubich you perform your journey．And fo much for adverbs．We now proceed to thole parts of fpeech which are ufually called prepofitions and conjuncions，ard of which the ufe is to connect the other words of a fentence，and to combine two or more fimple fentences into one compound fentence．

## CHAPTER VI．

## of Prepositions，Conjunctions，and In－ TERJECTIONS．

99．Ir has been obferved，that a man while awake IIT is confcious of a continued train of perceptions and Objers， ideas pafling in his mind，which depends little upon and of his own will；that he cannot to the train add a new himbed ec－ idea；and that he can but very feldom break its con－gether， nection．To the flightelt reflection thefe trathes muft be apparent．Our firlt ideas are thofe which we de－ rive fron external objects making impreftions on the fenfes；but all the external objects which fall mater our obfervation are linked together in fuch a manner as indicates them to be parts of one great and regular fyltom．
（s）The fame rofolution might probably be made of the Greek and Lafin adocrls，were we as intimately acquainted with the fources of thofe tongues as Mr Horne Tooke is with the fources of the Englih language． ＂Many of the Latin adverbs（fays the learned Ruddiman）are nothing tlfe but adjegive nowns or pronouns． having the prefrition and fublantrie underltood；as，quo，eo，coutem，for ad que，ca，eatem（loca），or cuit，ei，cidema （loco）；for of old thefe datives ended in o．Thus，qua，hac，illac，\＆ic．are plainly adjectives in the abl．fing． femin．the wordsia＂a way，＂and the prepofition in，being underfood．Many of them are compounds ；as， quomodo，i．e．quy modo ；qumadmodum，i．e．ad quem modum；quanohen，i，e．ob quam ron；quare，i．e．（pro） Gut re；quorfum，i．e．vorfus qum（locum）；falict，i．e．fare licet；vilelicet，i．e．quid．re licet；ilicet，i．e．ire low； illiso，i．є．in loco；magnopere，i．e．magno opere；nimirum，i．e．ni（ef）mirum；bodir，i．e．boc die；poflicite，i．c．pn－ flero dic；pridie，i．e．pre die．Profecto，certe，fune，mali，bene，plant，are obvioully adjectives．Porte is the abla－ tive of fors；and if we had leifure to purfue the fubject，and were matters of all the languages from which the Latin is derived，we doubt not but we mould be able to refolve every advirb iato a fubfanioc or adjective，
fytuon. When we take a sicw of the things by which we are furroundse. and which are the archetypes of our ideas, their iducrent quation ate not more rertations: markable than the vanious relations by which they are connected. Case and effect, contiguity in time or in place, high and iowe, prior and pollerior, refembiance and contrafl, with a thoufand other relations, conace things together without end. There is not a lingle thing which appears folitary and altogether devoid of connection. The only difference is, that fome are intimately and fome Righty connected, fome nearly and fome at a difance. That the relations by which extornal objects are thus linked torether mult have great influence in directing the train of human thonght, fo that not one perception or idea can appear to the mind wholly unconnected with all other perceptions or ideas, will be admitted hy cyery man who believes that his fenfes and intellect reprefent things as they are.
'This being the cafe, it is neceffary, if the purpofe of haguage be to communicate thonght, that the focaker be farniked with word; not only to exprefs the ideas of fubtances and attributes which he may hase in his mind, but alfo to indicate the order in with he views them, and to point out the various relation by which they are connected. In many intances all this may be done by the parts of feech which we have already conldered. The clofett connection which we can conceire is that which fublits between a fublatice and its qualities; and in every language sith which we are acquainted, that connection is inditated by the immediate codefeence of the adjetive with the fubfantire; as we fay, a good mast, a learned ron, virlomzs, sir doelus. Again, there is a comnection equally intimate, though not fo permanent, between and detet and his acion: for the action is really an attribute of the agent; and therefore we fay, the boy rads, the man werites; the noun enaleting with the werb fo waturally, that no other word is requinte to unite them. Morcover, an afion and that which is cobluon being contigutus in nature, and matually aflecting each othen, the words which denote them fhould in language be mutually attiactive, and capable of coaldenge without external aid; as, he reals alook, he builds a buale, he breaks a jlone. Further: becaufe ath atrilume and its modifications are infeparably united, an arjection or a ourb is naturally connted with the aciverl which illatlrates or modifies its fignification; and therciore, when we ay, he walls fouly, he is pradently fraze, it is plain that no uther word is neecllary to promote the coalefence of the attributes walhing and brevery with the ir modftications ol gownefs and prukence. The agreement bewcen the terns of any propotition which contitutes truch is ablolutely perfect; but as aithor of the terms may agree with many other things belides its correlac, fome word is requifite in every propolition to conoect the particular predicate with the paticular fulje日: and that is the office of the fimple verb TOBE: as, the three angles of toury railinad triungle ARF cqual to two rioth ang les.
'Thus we fee, that many of the relations fubliting between our ideas may be cleaty exprefled by means of romans. alfectives. viris, and adrorbs; and in thofe languages of which the andan. have cufes, there is perbays no relation of monch inourtance which might not be thous pointed out, withont bein, under the neceffity of employing the aid of any additional part of fpeech.

In Englih, however, the cafe is otherwife; for were we to fay, "He rode Ldinburgh, went the parliament. houfe, waiked his coundel the court met," we hould fpeak unintelligibly; is in thele expretif no there is etther a toral want of connection, or fuch a connection as produces fallehood and nonfenfe. In order to give meaning to the pallage, the fercral gaps mult be filled up by words lignificant of the varions relations by which the different ideas are connected in the mind; as, "He rode to Edinburgh, went to the parliament-Exprefled houfe, and walked with his counfel fill the court met." by I repof. Of thefe conneting words, то and with are called pre-tionsand pofitions, $A N D$ and till are ufually called conjundiuns. Although thefe pripofitions and conjuntions are not fo abjoluely meiffary in Greek and Latn as they are in Luglifh; yet as there is no language wholly without them, nor any langude in which it is not of importance to underitand their fores, they well deferve a place in univerfal grammar.
100. The fole ufe of comjunaions and prepafricns in lan- Thefe conguage is to connect cither fentences or other worls; but thet either the cheory of thefe conterioues thenfelves has certainly fenences o: never been underilood, unlefo Horne Toone have at words. lalt hit upon the truth. Mr Harris writes alout thent and about them, quoting pailages from Greek and Latin authors, and produces at latt no information. His definitions of both, as patts of lpetio void of fignification, are highly abfurd; and even the principal difliation which he makes between thein feems not to be well founded. Prepofitions and conjinnaions denote the relations fubfiting between the i eas expreffed by thofe words or fentences which they ferve to connect ; and as relations are contemplated by the mind as well as pofirive ideas themfelves, the arords which denote thofe relations cannot be irfignificant. The enential difference between the conjuntion and prepofilion, according to the fame author, conlits in this, that the former conneets fentences, and the lattar avords: bue the fact is often otherwife. An obrious example vecurs where the conjunction and connects not fentences but words. "A man of "H5DOM and vikter is a perfect character." Here it is not meant to be afferted, "that the man of wisdom is a perfect character, and that the man of virrue is a perfect character:" buch theie affertions would be falfe. This fentence therefore (and many fuch will occur) is not refolvable into two: whence it follows, that the conjunction $A, n$ does not always connect fentences; and the fame is freouratly the cafe with other conjuncions.

Horne Tooke's idea of prepfitions and conjuneions is, that they do not form diftinet clafles of words, but are merely abbrowiutions of nouns and veres: and with refpect to the Englibl language, he has been remakably fuccefoful in proving his pulition. But though fuch be undeniably the cafe in Englith, it would be rafh to conclude a priori that it is fo in all other tongues. To eftablith this gencral conclufun would require a long and tedious deduction in each particular language: and how much learning, leifure, indultry, and acutenefs, fuch an undertaking would require, even in one tongue, it is not eafy to determine. In the languages with which we are belt acquainted, many conjunaions, and moll prepofitions, have the appearance at leath of orifinal words: and thongh this molt acute grammarian, from his knowledge of the northern tongues, has been able to trace the molt important of thofe in Eaglif to
very plaufible fources, the fame thing would be difficult in other languages of which the fources are ob. fcure, and abiolutely impoffible in the fe of which they are wholly unknown. It is, however, a ftrong prefumption in favour of his opinion, that grammarians have never been athe to aflign any generai charaterific of thofe fpecies of words; which, did they conflitute difing parts of Jpech, one would think could not have fo long remained undifcovered. It is a farther prefumption in his favour, that many words in Greek and Latin, as well as in Euglifh, which have been called conjunaions, are obvioufly refolvable upon his principles, and indeed difcover their meaning and orimin upon mere infpection. We fhall therefore content ourfelves with retailing the common ductrine refpecting thefe parts of fpeech to far as it is intelligible; fubjoining at the bottom of the page the analytis given by Horne Tonke of the moft important EnSlijh conjuncions and prefofitions; and requefting our readers, who would underiland the fubject. to attend more to the relations between their various idea:, than to the frivolous difinctions which, in compliance with cuftom, we are compelled to lay befure them. We thall treat firlt of the conjunction.

## Sect. I. Of Conjunctions.

101. A conjunation is a part of jpeech of wobich, as its name indicates, the ufe is to connea either two or more words in a fentince, or to make of two fimple fentences one compound fentence. It is ufually faid, that conjunctions nevir connect words, but fentences only; and that this is the circumflance which ditinguifhes them from prepofitions. We have already given one example which proves this diftinction to be ill founded ; we fhall now give from Horne Touke one or two more, which will place its abfurdity in a till clearer light: T Two and tewo are four ; Y̌bon as'n Fane are a bandfome couple; AB and BC and CA form a triangle. Are tring four? Is Joln a couple and Fune a couple? Does one flraight line form a biangle? Fiom the fobjoined note it appears, that and ( $C$ ) may connect any two things which can be connceted, as it fignifies aldurion.

Conjunaions connecting fontances, fometimes commea their meaning, and fometimes not. For example, let us take thefe two fentences, Ronie was enflaved, Ciafar zuras anbitious, and connect them together by the comunation because; Rome cuas aflaved because Cirfur was ampibicus. IIere the meanings, as weil as the fentences, appear to be connected by that natural relation which fubfifts between an effig and its coufe; for the enilaving of Rome was the effict of Cæfar's ambition. That particular relution therefore is that which is
denoted by the conjunction recarse ( H ), which would be improperly ufid to councet two fentences between which the relation of an effect to its cazafe exills mot. But if it be fail, manners nuthl be reformed, or likerty zuil be $l_{0} f$; here the conjuction UR, though it join the fentences, yet as to their meaning is a perfect hagmerive. Between the reformation of manners and the lois of libio. ty there is certainly a natural relation; but it is not the relation of contisuity or funilitude, or of canferandera, but of contrauriety. The reluion of contraricty theretore is the fignification of the wond or (1). And thas it appears, that thouzh all conjmetions may conbine fentences, yet, with refpect to the fonge, fonie are conjuxctive and others are dojuncrive.
102. Thofe conjumations robich compin iot's fortences and their meaning are either copularives or continuations. The principal copulative in Eivoligh is, AND, which we pave arrady and nuatives are much more numitulus; IF, Av, BLCAUSE, therefoke, whfreforf, hence, \&ic. The differ. ence between them is this: The copnlatioe does no more than barely conple words or fentences, and is therefore applicable to all fobjects of wheth the natures are not incompatible ( x ). The relation which it denotes is that of justapoffition, or of one thing calluat to anstber. Continuatives, on the contrary, by a more intimate connettion, confolidate fentences into one continuous whole; and are therefore applicable only to tubjects which have an offential relation to each other, fuch as that of an effer to its caufe or of a caufe to its thet. For example, it is no way improper in fay, Lyyppus was a Autuary, AND Prifcian a grammarian; ble fun jbineth, and the jey is clear; becaule thefe are things that niay coexift, and yet imply no abfurdity. But it would be abfurd to fay, Lyfippus was a fituary bac.ause Prifcian was a grammurian; though not to fay, the firn Jinucth because the fky is clear. With refpect to the tindt, the reafon is, that the word because denotes the relution which an effeg bears to its cauke: but the dikill of Pritian in grammar could not polfibly be the caust of $L$ If Sippus's ikall in./adnary' ; the e incidence betwee: the thill of the one and that of the other, in arts fo verydifferent, was macrely accilental. With refpect to the hining of the fun and the clearnefs of the fay, the eale is widely differnt; for the cheunjefs of the fky is the cause of the jurn's Jlining, at leat fo as to be leen by us.
As to the ontinuatives, they are eit her suppositive, fuch as if, an; or positive, fich as becaufe, therefore, as, \& c. Take examples of each: Vou will live bappily if you orpulive live bonefly; you live bappily because you hive homelly; you live bonefly, therfione you live beppily. The difference between thefe continuatives is this: The fuppofitiacs denote connation, but do not alfert afiad exittence;
(G) And is a Saxom word, being (according to $\mathrm{Mr} /$. Tooke) an abbreviation of anad, the imperative of the verb anasad, to add to, or beap up. So that when we fay two asd two are four, we only declare that truo ADDEn to tze are four.
( H ) Because is compounded of the Saxon be-ly, and caufe; and by fome of our moft anciecit authors it was written by cause. Rome wuas enflaved because Ciefar weas ambilious, is therefore equivalent to, Rome suas enflaved ty the confe Casar was amsitious; taking the phate, Ciafar was ambitious as an ablliact noun in concord $n$ ith the other noun caule.
(1) Or feems to be a mere contration of the Saxon oper, which fignifics other, i. e. Comething dificent and often contrary. So that the conjunstion or mula alsays denate diverfiey, and very oficn contrariely.
(k) As duy and night, frot and cold: for we cannu: fay of the fame purtion of time, it is day ano it is night; or of the fame body, it is toth bot aiva coll.
itance; the ffefives imply both the one and the o-1-ctuve.
bleer (1.).

The pofrizes above mentioned are either causal; fuch as, ficaufic, fince, as ( m ), ixc.: Or collective; fuch N 142
as, therefore, auberefore, \&e. The difference betwen thefe is this: The caufals fubjoin caufes to efieds; as, the fun is in ectipe, bifcaese the moon intervenes: The collictives fubjoin effets to callis; as, the moon intervenes, THERE-
(L) The reafon of all this will be apparent from the analyfis given by Horne Tocke of thofe words which we have called fuppoffrime coujunctions. If and an may be ufd mutually and indifferently to fupply each other's place; for they are both eerbs, and of the fame import. If is merely the imperative of the Gothic and AngloSaxon verb gras, to give; and in thofe languages, as well as in the Englilh formerly, this fufpofed conjunction was pronounced and written as the common imperative cif. Thus,
"Hath lotted her to he your brother's miltreffe,"
"Gif fhee can be reclaimed ; Gif not, his prey."
Sal Shepherd, Ast II. Scene ift. Gutuin Doughy almof always ufes gif for IF, as the common people in fome counties of Scotland do even at this day; and it is obvious, that our $1 F$ has always the figuification of the Englith innerative give, and no other. So that the refolution of the confluction in the fentence, IF your live honcfly you will live boppily, is fimply this, Gure you lize bonflly (taking you live honglly as an abdtact noun) you will live botpily. Your living rappily is declared to depend upon your living bonefly as the condition; but gi, that, and your happinefs is pofitively afferted. In like manner may fuch fentences be refolved as,
" I wonder he can move! that he's not fixed!
"If tuat his feclings be the fame with mine."
Thus, "His feelings be the fame with mine, give that, J wonder he can move," \&r. And here we eannot forbear giving our affent to the truth of Mr Tooke', obfervation, that when the datun upon which any conchution depends is a fintence, the article tmat, if not expreffed, may always be inferted. We do not, however, think the infertion at all times abfolutely nceffiry to complete the fyintax; for active verbs govern cwbole fintences and cluyfis of fentences as well as fubtantive nomns. Inllances of this occur fo frequently in the Latiu clatics, that they can have efcaped no man's notice who has ever read Horace or Virgil with attention. We agree likewife with our moft ingenious author, that where the datum is not a fentence, but fome noun governed by the verbif or give, the article that can never be inferted. For example, if we be afked, how the weather will difpofe of us to-morrow? we cannot fay: "If that fair, it will fend us abroad; if that foul, it will keep us at home ;" but "if fair, it will fend us abroad," \&e. The reafon is obvious: the verb in this cafe directly governs the noun ; and the refolved conflruction is, "owe fair weather, it will fend us abroad; cive foul weather, it will keep us at home."

As, the other fuppolitive conjunction mentioned, is nothing elfe than the imperative of the Anglo-Saxon verb anan, which likewife means to gize or to grant. As, "As you had an eye behind you, you might fee more detraction at your heels than fortunes before you;" that i:, "Grant you had an eye behind you, you might fee," $\mathfrak{k c}$. This account of the two conditional conjunaions in Englith is io rational and fatisfactory, that we are llrongly inclined to believe that all thofe words which are fo called, are in all languages to be accounted for in the fame manner. Not indeed that they mult all mean precifely to gize or gront, but fome word equivalent ; fuch as, be it, fuppofe, allow, permit, \&c.; which meaning is to be fought for in the particular etymology of each refpective language.
(m) Of the canfal conjuntions nentioned in the text, becavse has been already confidered; and fome account mult be now given of the two words since and as. The former of thefe, according to Mr H. Tuoke, is a very corrnpt abbreviation, confounding together different words and different combinations of words. To us it appears to be compounded of SEAND, fieing; and es, that or it; or of sin, feen, and is. Seand and siv are the prefint and pal participles of the Anglo saxon verb seow, to fac. In modern Euglifh sance is ufed four ways; taio as a preposition affecting avorls, and tao as a conjuverion affecting jehtuces. When ufed as a prepofition, it has always the fignification of the palt participle seev joinced to talice (i. c. foci and thenccforauard), or elfe the fignification of the pat participle seen only. When ufed as a conjunction, it had fometimes the lignification of the profint participle semang, or seeng that; and fometimes the fignincation of the paft participle seex, or secs tuar. We hadl give examples of all thefe fignifications. At, As a propfrion fignifying sEEN and thenciforauth: "A more amialle fovercign than Gu", II l. has not fwayed the Einginh fecptre sasce the conquifl." That is, "The corguefl icon (or at the completion of the fight of the conqueth), and thenceforward, a more amiable fovereign than Gsorge III. has not twayed the Englilh fecpere." Since, taken in this fenfe, feems rather to be a corruption of sitmonas or , irbence, than a compound of shind and es. 2 diy, As a prepofition fignifying seen fimply: "Did George III. reign lyfore or sivee that example", 3dly, As a conjunction, swee means feing that: as, "If If fould labour for any other fatisfaction but that of my own mind, it weuld be an effect of phrengy in me, not of hope; sivee (or foing that) it is uot truth but opinion that can travel throngh the world without a paffport." athly, It means selv that, or tabr sfin; as, "Since death in the end takes from all whatfoever fortune or force takes from any one, it wewe foolifh madneis in the fhipwreck of worldy things, when all fanks but the forrow, to tave that:" i. e.-"Death in the end takes from all whatfoever fortune or force takes from any one ; min seen, it were a foolith madnefs," $\& 8$.
$A s$, the other caufal conjunction mentioned in the text, is an article meaning always ar, or that, or which. Take the following example :
there fores( N ) the fun is in eclipfc. We therefore ufe casfals in thofe intances where, the effed being confpicuous, we feek for its ca:ye; and collecilives, in demonitration and fcience, properly fo called, where the caufe being firlt known, by its help we difcern efegs.

As to caufal conjunctions, we may further obferve, which they are not capatle of denotilig. For example, the hateridi caufo; Thi trumpet founds eechuse it is made of nutal. The forsila ; The trumpat founds escause it is long and bollozu. The efricient; The trumpet founds bechuse an artif blowes it. The Elath; The trumpet foumls ansit it may raife our courage. It is worth obferving, that the three firf caules are exprefled by the flrongett afirnation; becaufe if the effet actually be, thefe mult be alfo. Butt this is not the cafe with refpect to the latt, whin is only affirmed as a thing that may happen. The reafon is obvious: for whatever may be the end which fet the artift firft to work, thet end it may thill be beyond his power to obain; as, like all other contiugents. it may either happen or net. Hence alfo it is comected by a particular conjunction, thar ( 0 ), abfolutely confined to this cruffe.
103. We come now to the dxjunctive conjenc. Vol.VIII. Part I.
tiows: a fpecies of words which bear this contradic. tory name, becaufe while they conyons the fentences, they disjors the fenfe; or, to rpeak a language more intelligible, they denote relations of diversity or opposition.

That there ginuld be fuch words, whether called conjumetions or not, is extremely natural. For as there is a principle of union diffufed through all things, by which THis whole is kept together and preferved from difipation ; fo is there in like manner a principle of Dnerssity diffufed through all, the fource of diflinelion, of rumber, and of ords. Now it is to exprefs in fome digree the madifications of this diverffy, that thofe words called dinuschive cosjenctions are employed.

Of theied disunditer, fome are shmple, and fome adVersatue: Simple; as when we fay, EITHfR it is day phe or adoor $n$ is night: Auberfative; as when we fay, it is not verativcs day sur it is night. The difference between thefe is, that the frmpic exprefs nothing more than a relation of DNersity; the adverfative exprefs a relation not barely of dieverfy, but alfo of opposptios. Add to this, that the aliverfifices are Definite, the finple inderinite. Thus when we fay, the number threc is not an even numbrever ( P ) an odd; we not only disjain two oppofite attributes, but we dejinitely anirm the one to belong to

That is, "She glides away (with) тبat \{wifnefs (with) which darts or feathered arrows fy." In German, where as fill retains its original fignifcation and ufe, it is written Es. So is another conjuntion of the fame import with as, being evidently the Gothic article sa or so, which fignifies it or that.
(s) As Mr Hiarris lias called therefore, wherefore, sic. colleditive conjuncions, we have retained the denomination, thouth perhaps a more proper might be found. It is indeed of little confequence by what name any clafs of words be called, provijed the import of the words themfelses be undertood. Waerefore and therefore cvidently denote the relation of a cayfe to its effecs. They are compounds of the Saxon wordshrex and ther with for or voor; and lignify, for which, for thofe or that. It is worthy of remark, that in fome parts of Scotland the common people even at this day ufe thir for the $/$.
(0) We have already conlidered the word that, and feen that it is never a conjunetion. but uniformly a definite article. "The trumpet founds (for) тнат it may raife our courage;" taking the claufe it may raife our courage as an ahitract noun in concord with that and governcd by for. Or the fentence may be refolved thus: "The trumpet may raife our courage (for) that (purpofe) it founds."
(p) Mir Horne Tooke has favoured us with fome ingenious remarks on the two different derivations of the word bur, when ufed in the two acceptation that are ufually annexed to it, viz. that which it bears in the brginning of a fentence, and that which it has in the mildlle. He has given it as his opinion, that this word, when employed in the former euty, is corruptly put for bot, the imperative of the Saxon verb botas, to loot, to fuperadd, to fupply, \&s. and that when uled in the latter it is a contraction of be-utan, the imperative of beonintan, to be out. Our ancient writers made the proper diftinction between the orthography of the one word and that of the other. Gawin Donglafs in particular, although he frequently confounds the two words, and ufes them impropely, does yet abound with many inflances of their proper ufe; and fo contratted, as to awaken, fays our author, the moll inatentive reader. Of the many examples quoted by him, we fhall content ourfelves with the two folluwing :

$$
\begin{array}{ll}
\text { "Bot thy worke fhall endure in laude and glorie, } & \\
\text { " But fpot or fault condigne eterne memorie." } & \text { Preface. } \\
\text { "A" Bor gif the fates, Bur pleid, } & \text { Booky. }
\end{array}
$$

If this derivation of the word but from botas, to fuperadl, be juft, the fentence in the text, "the number three is nut an even number but an odd," will be equivalent to, "the number three is not an even number, foperadd (it is) an odd number;" and if fo, the oppofition is not marked (at leaft diredty) by the word buT, Lut by the adjectives Even and odd, which denote attributes in their own nature oppofite. It is only when but has this fenfe that it anfwers to fed in Latin, or to mais in French. In the fecond line of the quotation from Gawin. Douglafs's Preface, the word but is evidently a contraction of be-utas, and bas a fenfe very different fiom that of eot in the preceding line. The meaning of the couplet is, " S speradd (to fomedring faid or fuppofed to be faid before) thy work fhall endure in laude and glorie, bE OUT (i. e. cuilbout) fpot or fault, \&c. In the following paflage from Donne, the word nut, although written in the fame manner, is ufed in both its meanings: "You muit anfwer, that the was brought very near the fire, and as good as thrown in : or elfe, that fhe was provoked to it by a divine infpiration. But that another divine infpiration moved the beholders to believe that the did thersia a noble act, this a t of her's might have been calumniated." That
the fabice, and deny the other. But when we fay, the number of the flars is attafer ( Q ) eien or odl; though we alfert one attribute 10 be, and the othur not to be, yet the alterastive is notwithtanding left intermile.
As to alleerfulive disjemoti-es, it has been aheady faid, after Mr Harris, that they imply oppositi n : bat the truth feems to be, that they only mita in the fane fentence curds or plrafes of oppotite meanings. Now it is obvious, that oppyfte alitributes cannot belone to the fome fuljat: as when we fay, Nercus aus betutiful, we cannot superadid to this fentence, that he atas ugly; we camot iny, bs cuas lenatiful but eygy. Whanthere is oppulision, it muat be either of the fome attribute in diforen mbjects; as when we fos, "Bratas was a patrive, but Cafer was not:" Or of different attribute: in the fome fubject: an when we fay Gorgius was a fo-
 dif ternt fubjars; as when we fav, "Pluto was a philofopher, but Hishias was a lophif." The comjuntions ufed for all thice purpores have been cailed abfolute adverfatives, we thank improperly, as the ofonform is not market by the conjencions, but by the awids or fintences which they ferve to conne?. Mr Lock, fperking of the wood but, fays, that "it fometimes intimates a loop of the mind, in the courfe it was going, before it came to the end of it :" to which Mr Tooke replies with truth, that but itfelf is the farthef of any word in the language from in imuting a Mop. On the contrary, it always imitates fomething to follow; infomuch, that when any man in diforuffe finifhes his words with but, intead of fuppoing him to have froppel, we always ath, BUT woht?

Befides the adverfatives already mentioned, there are two othor fpecies, of which the moil important are Un.
less and although. For example, "Troy will be taken, usiless the palludiun be preferved; Troy will be taken, although Hector defend it." The nature of thefe adverfatives may be thus explained. As every cown is naturally allied to its caufe, fo by parity of reafon it is oppofed to its preacntize; and as every caufe is either adicquate or imuldequate (inadequate when it chdeavours without being effectual), fo in like manner is every proventite. Now adequate preventives are expreffed by Tuch adverfatives as taless: "Troy will be taken, urilss the palladium be preferved;" that is, this alone is fufficient to pre, ont it. The inadequate arcexpreffed by fuch adverfatives as although: "Tray will be takell although Hear defend it;" that is, Ifchor's defnee will prove ineffectual. Thefe nay be called adverfatives adequate and inadegute.

Such is the ducarine of Mir Harris; which although we can difcover in it no determinate meaning, we have sentured with others to retail, in refyect to cur readers, who may be more perfpicacious than ourfelves. The author was a man of great learning; and the fubject, as he has treaied it, appoars to be intricate. But whatever fenfe or nonfente there may be in what he fays of culfis and preventives aldoprate and inadequate, we have n, hefitation to affrm that he has totaliy milaken the import of the wordeunlessandalthough. Fiom thefe being called buth freventives, theore alequate and the other imadoguate, an unwary reader might be led to infer, that they denote the fame idica or the fume reidion; and that the whule diflerence between them is, that the expref. form of the one is more forcible than that of the other. Nothing, however, ean be farther than this from the truth. The meaning of Unless is ditectly oppofite to that of althooch. Unless (r) and though
is, "Yon mult anfwer, that the was brought very neare the five, \&c. "superadd (to that anfwer) be out (or veless or without ; for, as will be feen by and bye, all thofe words are of the fame import) that another divine infpiration moved," $\mathbb{E c}$. 'To thefe remarks and cxamples it may be worth white to add, that even now got is often ufed by the illiterate Sotch for IItHote; as nothing is more common than to hear a clown fay, "He came from home but his breakfalt."

Having mentioned wrhout as a word of the fame import with but when diftingnifhed from bot, it may wot be improper to confider that word here; for though in modern Englith it is enticely confined to the wfice of a prepotion, it was formerly ufed indifferently cither as a prepofition or a conjanifion. Without then $i_{s}$ nothiag but the imperative wyrtianoutar', from the Anglo Samen and Gothic velb weorthan, withan; which in the Anglo Saxon language is ncorporated with the sob fFon, sfe. According to this derivation, which is Horne Tooke's, the word withour, whether called conjunction or prepotition, is the fame as be out; and luch will be its import, fhould it after all be nothing more than a compound of wret, which fignifies to join and fometimes to be, and vte, out.
(c) Ettuer is nothing more than the dillibutive pronoun, which every body underfands; and or we have already explainers.
(R) to low down as in the reign of queen Elizabeth (fays Herne Tooke) this conjundtion was fometimes written onk or ondeff; but more anciently it was uritten ontes and fometimes onlesse. 'Thus, in the trial of Sir John Oldcafle in 1413, "It was not pomble for them to make whole Chriftes cote without feme, onIESSE certeyn great men were brought out of the way." So, in "The image of governance" by Sir T. Elliot, $15+1$, "Men do fere to approche uato their feveregne Lord, oneces they be called." So again, in "A neceffary doctrine and erudition for any Chritlian man, fet furthe by the kinge's majellie of Entgland," " 543 , "Onles ye believe, ye thall not undertande." "No man thall be crowned, onles he lawfully fight." " The foul waxeth feeble, onlesse the fane be cheifhed." "It camot begynne, onemesse by the grace of Crod." Now, ovees is the imperative of the Anglo saxon verb oveesan, to difmifs, or remoze.

Les, the imperative of lesan (which has the fame meaning as onlesan), is likewife ufed fometimes by old writers inftead of unezs. Intances might be given in abundance from G. Douglas and Ben. Jobnfon; but perhaps it may be of more importance to remark, that it is this fame imperative les, which, placed at the enid of nouns and coalefcing with them, has given to our language fuch adjectives as bopelefs, reflefs, deatblefs, motionlefs, \&c. i. e. difmifs hope, reft, death, motion, \&c.

Mr Tooke obferves, that all the languages which have a comiunction correfponding to les or unless, as
are both zerbs in the imberative mode; the former fics. nifying ake away or difmifs; the latter, allow, permit, grant, yield, affent. This being the cafe, "Troy will be taken unless the falledium be preferved," is a fentence equivalent to "Remove the palladiumn be spefer:ed (taking the fallodiun le prefersed as an afflract noun, the prefirvation of the palladium) Troy will be taken." Again, "Troy willbe taken, alt roug h Mcäor defend it," is the fame as "Troy will be talken :llow Halor (to) defend it." The idea, therefore, exprefled by uneess is that of the removal of one thing to make auay for ano. ther; the idea exprefled by althouch (s) is that of allowisg one thing to coealst with anther, suith subich if is APPARENTly incompatible.
104. Befure we take leave of this fubject, we might treat, as others have treated, of adierlial conjunctions, and conjunctions ( T ) of various other denominations. But of multiplying fubdivifions there is no end ; and fyllems, in which they abound, convey for the mott part no information. The nature of conjunctions can be thoroughly underflood only by tracing each to its original in fome parent or cognate tongue; and when that thall be done in other languages with as much fuc-
cefs as it has latc!) been done by Mr Horne Tocke in Englif, then, and not till then, may we hope to fee a rational, comprehenfive, and confiftemt theory of this part of fpeech. Then too fhall we get rid of all that farrago of ufelefs dillinetions into conjumgive, adjunctive, dissinnaite, fubdisjungive, copulatio e, continuative, fubcontinuative, pofitice, fuppofive, caufal, collcaive, preventive aderuate and indequate, adverfative, conditional, illstive, ssc. \&ce: ; which explain nothing, and which which ${ }^{123}$ lerve only to veil ignorance and perplex fagacity. ferves onls

That Mr Tooke's principles will apply exactly to the to val ifconjunctions of every language both dead and living, is r.crance." what our limited knowledge of thefe languages does not authorife us pofitively to affirm. It is lowever a flrong prefumption in favour of his opinion, that illiterate favages, the firlt cultivators of language, are little likely to have fert out their faculties in quett of words to denote the caflrat relations fubfiling among their ideas, when we have fuch evidence as his book affords, that the names of the moil common fuiffurces and gualities could anfwer that and every other purpote, which in the ordinary intercourfe of life can be anfwered by the faculty of fpecein. It is a farther prefumption in his L. 2
favour,
well as the manner in which the place of thefe words is fupplied in the languages which have not a conjunction correfpondent to them, frongly juilify his denivation which we have adopten!. The Greck tuen, the Latin rifs, the Italian fenon, the Spanith fino, the Fiench finon, all meat le it not. And in the fane manner do we fometimes fupply its place in Englith by lut, without, be it not, but if, \&c. It may be proper jult to add, that, according to the fame author, the conjunction lest is a contraction of lesed, the paft participle of lesen; and that LEST, with the article that, either expreffed or underftood, means no more than boc dimiffo or quo dimiffo.
(s) Although is compounded of al or all, and тао' тноиси, тиas, or, as the vulgar mere purely pronounce it, thaf, thage, and thof. Now, thaf or thate is evidently the imperative thaf or teafic of the verb thariav or thafican, to allow, permit, gratt, yield, afleut; and talafig becomes thoch, thousb, thoug (and thoch, as G. Douglas and other Scotch authe's write it) by a tranfition of the fane fort, and at leatt as eafy as that by which naruc becomes bazek. It is no fmall confirmation of this etymology, that anciently they often wfed all be, alleit, all Lad, all were, all give, inftead of althouga; and that as the Latin si (if) means be it, ard msi and sive (wal/s and without) mean be not, fo etsi (although) means and be it.
(r) In a work of this kind, which profeffes to treat of uni erfal grammar, it would he impertinent to wafte our own and our readers time on a mbute analyfis of each conjunction which may occur in any one particular language. We Mall therefore purfue the fubject no farther; but fhall fubjoin Mr Horne 'Toone's table of the Englifh conjunctions, referfing thofe who are defirous of fuller fatisfaction to his ingenious work intited The Diverfions of Purley.

Since $\left\{\begin{array}{c}\text { Sithrhan } \\ \text { Sine }^{\text {Seand-es }} \\ \text { Sifhthe } \\ \text { co } \\ \text { Sin-es }\end{array}\right\}$ is the participle of Seon, to foe.
That is the article or pronoun that.
As is es, a German article, meaning it, that, or wubich. And
So is sa or so, a Gothic article of the fame import with as.
fanour, that in the ruden hanguage: there are few if any conjuations; and that even in others which are the molt highly polished, fuch as Greck and Iavin as well as Englifis, nany of thofe words which have been called conjunctions are obvioully refolvathe into other parts of feeech. Thus sax , tranllated but, is evidently the neuter gender of cither the nominalive or arcufative phoral of ancos: anothic; and when ufed as a conjuntion, it intimates that you are going to arkf fomething to what you have already faid. Coterum has the fame meaning, and is nothing but $\times$ as alyon. Mass (but in French) is the Latin mujus; ut, wti, oit, quold, is the relatize prosoun. Of quocirca, quia, prestrea, antequan, quenquam, qumais, quantunzis, quamtibet, \&c. the refolution is ton obvious to require being mentioned. Where fuch refolutions as thefe ean be made, or when the conjunctions of any purticular longrue can be traced to their erigin in ny otbor, there needs be no difpute about their true import: but when the cafe is otherwife, and the conSumgion either appears to be an original word, or is derived from a fource to which it cannot be traced, we would advite fuch of our readers as will to fpeak or The import write correctly, to difmifs from their minds all conof coujunctions in any jungives, with the reft of that jargon which we have language to already mentioned; and to inquire diligently in what be learned mannor and for what purpofe the conjunaion in queftion is from the beft authors ancient and -rodern.
not by laving no /ignification of its own. but by fignifying the relation oy which the things expreficl by the united By funify evords are connected in neture. Prefgefitions are to be "r the re accounted for in much the fare manner as the cafes of eween nouns. The neet fity of this fiectes of words, or of forme then. equivalent invention, follosis from the impofibility of having in language a diltind coms'ex tern for each diflinet collction of ideas which we may have occation to pat together in difesurfe. The addition or fubtraction of any one idea, to or from a colldite: of ideas, nukes it a difucen collection; and if, after either of thefe operations, it were to be exprefled by the fume zoorl as before, nothing could enfue but mifreprefentation and falfehood. Now, to ufe in language a diferent and diffinto corastea term for each different and diftinct collicaion of iftcas, is equally impolible, as to ule a ditinct partianlar torm for each fartioular and individual idea. To fupply, therefore, the place of the complex terns which are wanting in a language, are the cofos of noms and prepfrtions employed; by the aid of which, complex and gutheral itoms are prevented from being intinite or too numerous, and are wied only for thofe collections of ideas which we have moft frequent occafion to mention in difcourfe. By means of prefoftions theis end is obtained in the molt fimple manner. For, having occafion to mention a collection of ideas for which therc is no fongle complex tern in the language, we either take that complex term which includes the gratof mumber, though not all of the ideas we would communicate; or elfe we take that complex term which includes all, and the fewell ideas more than thofe we would communicate; and then, by the help of the prepofition, we either make up the defciency in the one eafe, or retrench the fuperffuity in the other. For infance, having occafion to mention a houfe of a fareicalar defariftion, and knowing that the term bouje is too general for our purpofe, and that the building we have in view has no appropriate name, we fay, perhaps, a boife with a partysuall, or a bonfe without a roof. - In the firlt intance, the complex term boufe is dfficient, and the propofition directs to culd what is zuanting.-In the fecond inftance, the complex term is redundant, as it denotes a complete bouff; the prepotition, therefore, directs to take azvay what is faperfiuous.

Now, confidering prepfoftions in this the moft fimple light, as ferving only to limit or modify general terms, it is abfolutely neceflary that they fould have meanings of their own; for otherwif, how could we, in the inkances before us, make known by them our intention, whether of adding to or retrenching from, the fame general term boufe. If, to a difciple of Mr Har. ris, we fhould fay, a boufe join ; he would reply, Join whar? But he would not contend that join is an indeclinalle word which has nomeaning of its own, becaufe he knows that it is the inperative of a verb, of which the other pats are ttill in ofe; and its own meaning is clear, though the fentence is not completed. If, inAlead of Join, we flould fay to him, a boufe wirh; he would still afik the fame quetion, wirn wobat? But if we were to difcourfe with him concerning the word wirt, he would probably tell us, that wirt is a frepofficion, an indeclinable word, which is itfelf devorid of Jignification, but fo formed as to unite two worls that are fignificant. And yet it would be cvident by his quethion, that he foll it had a mearing of its own; which
is in reality the fame as yoin (v). Indeed, fo far bas always been plainly perceived, that with and wirhour are directly oppofite and contradictory ; and it would puzzle the molt acute philofopher to difcover oppofition and contradiction in two words where neither of them had any lignification. Wilkins, therefore, has well exproffed their meaning, where he fays, that wirn is a prepolition "relating to the notion of focial, w circumfance of fociety affirmed; and that without is a prepolition relating to the fame notion of fucial, or circurntance of fociety Dexied."

1c6. But to denote the relations of adding and taking away, are not the only purpofes for which prepolition: are employed. They all indeed ferve to modify fome general term or general affirmation, but not precifcly in the, fame way as with and without. It has been already obferved, that words lipuificant of thofe things which coincide in nature, coalefe with one another in fyntax, without being beholelen to any auxiliary tie. For inltance, an adjective coalefces with its fulfontive, a verl with its nominative; a soun expreffing an object acted upon, with a terb denoting afion; and an ad erb wirh its zerb. Take the following example: Tue splendid sun genially warafeth tie fertile earth. But fuppofe we were dedirous to modify this affirmation by the addition of other fubftanrives, AIr. for inftance, and beams; how would thele coincide with the other words of the fentence, or under what chasacter could
they be introduced? Not as nominatizes or aceufatices to the verb, for bo:h thele places are already filled; the nomiratioe by the fubfancs sus, which is certainly the agent in this operation; the accafotion by the fublance earta, which is as certainly the objcet acted upon. Not as qualifics of the sus and farth; for qualities inhering in their fublances can only be expreffed by adjeaives, and the words air and leams are both fuhlantives. Here then we mult have recourle to prepofitions; but we can employ only fuch prepofitions as point out the relations which the arr and the beams have to the fun warning the earth. In Englifh we fhould fay, the fplendid fun with bis beams fonially sarmeth through the air the fertile earth. The fen. tence, as before, remains entire and one; the fubfuntives required are both iniroduced; and not a word which was there before is detruded from its proper place. The import of with we have already difeovered; it direits to unite the beams to the fun, as jointey with him performing the operation. But the alr has no other connection with this operation, than as the seedium or passage between the sus and the earth: and therefore the prepofition througin (x) mult denote that rclation which fublifts between an oligea in motion, and the nedium in which it moves; nor could a prepofition of a different import have been employed, without altering the meaning of the whole fentence ( y ).
107. Mr Harris is of opinion that molt, if not all,
(u) This account of prepofitions is taken from Horne Tooke; who adds, that the only difference between the two words with and jois, is, that the other parts of the Gothic and Anglo Saxon verb withan, to join (of which wirt is the imperative), have ceafed to be employed in the language. As wita means join, fo the correfpondent French prepofition avec means, and bave that, or, bave that alfo. But though with, as the imperative of withan, means join, it has fometimes a very different fignification. Mr T'yrwhit in his Glufary has truly obferved, that with and by are uften fynonymous. They certainly are fo: but then with feems to be an abbreviation of the imperative of wyrthan, tobe; as without is of wyrtaaneutan, tobe out. This being the cafe, our two inftances in the text will fland thus: a boufe join a party cuall; a boufe be out a roof. Nor let any one be furprifed that we make no difference between the conjundion without and the prepofition withe ovr. The word is the fame, whether it be employed to unite words or fentences. Prepofitions were originally, and for a long time, claffed with conjungions; and when firft feparated from them, they were only diftinguifled by the name of prepofitive conjunaions. They are generally ufed to unite words, but not alvenys; for we may fay -indifferently, I eanze affer his departure, or, I eume after hedeparted. By the greater part of grammarians indeed, after, when employed as in the firl fentence, is clafied with the prepofitions; when employed as in the fecond, it is claffed with the conjunctions. The word, however, is the fame in both fentences; its meaning is the fame, and its effed precifely the fane. The only circumfance of difcrimination is, that in the firt example it is prefixed to a noun, his departure; in the fecond, it is prefixed to a nominative and a verb, he departed. But even the nominative and the verb, thus applied, exprefs no more than a fpecifying circumance annexed to the other propofition, I came; and whenever they are rightly apprehended by the mind, they are ftript of their prepofitionary form, and confidered abjfrafly under a new phafis, his departure. Thus then, the two fentences are fynonymons in every refpect, excepting the apparent grammatical nature of the words kis deparfuri, and be departed; and even thefe are reduced to one grammatic form in the mind, whenever the import of the propofitions is rightly apprehended. Withour, and many other prepofitions, efpecially in the learned languages, are ufej exectly as after is ufed in the two inflances which we have given. Horne Tooke quotes Lord Mansfield for faying, "It cannot be read withour the Aitorney General confents to it." This, in modern Englifh, is not the common phrafeolegy; but it offends not againit any principle of grammar. The nominative and the rerb are here, as in the former inliance, conlidered as an aiffrat noun; "It cannot be read without the confent of the Atrorney General."
(x) Thorocgh, тholfocgh, тhorow, through, or thro", is no othet, fays Horne Tocke, than the Gothic fubAamive dauro, or the 'leutonic fubitantive therva, and, like them, means door, gate, paflage. So that the fentence in the text, refolved upon his principles, flands thus: "The fplendid fun- Jon his beams-genially warm-eth-passace the air, (or, the air being the falluge or medium) - the fertile earth." And in the fame manner may we tranfate the prepofition throigh in event intiance where through is ufed in Engdith, or its equivalent prepofition in any language; as from the Latin and Italian word porta, (in Spanifh puerta and in French porte), have come the 1,atin and Italian prepufition per, the French par, and the Spanifh por.
(i) If, for inflance, we were to fubritute with or of inflead of through, we hould in the one cafe alter the
prepofinons were origitally formed to denote the rehabions of place. For this opinion we fee not fufficient evidence. If inded we conld fuppofe the inventors or carlict improvers of language to have at all concerned themfelves with relutions as ablicated from the otyerts related, we muth betieve that thofe which firt attracted their attention were the relations fubbiling among themictes, and the varions bolies with which they were furroundcd. Wie mull likewife agree with our author, that ollo is the grand relation which bodics or matara! fubldunas maintain as all times to one another; but we do not therefore think that it would attraet the carlichl notice of untanght barbarians. On the conerary, we are ni orinion that mankiad mull have made very confiderable progrefs in caince before they attempted to ablibact fane from loty; an attempt which, according to fome of the moth mofuand phitufophers ( $z$ ), is not only difficult, but abfundy impracticable. But whatever be in this, the relativas of cathere and efiat, of duration and mot tom, are in themfotves as obrious, and as bikely to arrof the atemtion and obrain names, as thofe of place. Amones men totally ithiterate thev are evidenty more f: for pain and flogitere woukd fuggetl fome idea of caufe and effert as maters of innsortume. There is, however, no probatitity that the inventors of any language had the lealt idea of ablerat relations. They denbtefs exprefed complev conciptions by mons and zerth, figuilizant at once of the purtianur itucus and of the sarious relations by which they viewed thofe idess ai comlined togetuer in a comples conteption. Afterwards, when mens minds became enlarged, and when, from the fisctuation infeparable from a living language, objects or ideas received new names, the old words, whether nouns or verbs, which were origimaly employed to exprefs a farticular compha
comeper, of which coman furabular revations madea part, might be retaned for the purpofe of denoting thoge and all fomidior rtlations; and thus cerbs and no:ms would decenerate into particles bearing the numes of prefofitions and conjumzions. For inHance, one Angh, Saxan being defirous to communicate to another his own conception of a bonfe auth a party-evall, and having (we dall fuppole) no fuch word in hia tongue as a freffica, would naturally utter the word boule, deliring his friend, at the fane ime, to add to that well known found oncther found (uttering it) ligniticant of the particular circumbanee wanting to complete his complex conception;-A boufe with (i. e. join) a puty zoll. 'lise word with, as the interative of a rerb, denotes of courfe threc ideas combined together, vi\% a command or wifb, an afirmation, and the idea of jungion. But when the verb withay was difmiffed from the Engli!h language, the imperative with was fl:ll ctained; but loling its acoral and modal nature, it was thenceforth employed to denote only one of the thre itezs for which it originally tood, viz. she idea of jomerich. And thus it is, that verbs,
 guage to another, may become propoftitions (A) and eonjunctions. Thus tuo it is, that fonce of thoie preperit rions come to deante the conifgecus, and fome the ditazed, relation of body. The contiguons, as when we fay, Caius rathed with a faff; i. e. Cails, join a
 the flatue flood (the pace of its itanding) the Higher rast of a foldalal; the riover ran over a fand, i. e. the rieer foll (the place of its running) the hager fast of af fond. the decatided relation, as when we fay, hio is gromg To (c) Ilaly, i. e. He is going, tre
meaning, and in the other feak zonforfe. "The fun warmeth witr the air the fertile earth," is an affirmation that the fun quarmetb both the atr and the earth; wheras the ofiginal fentence afirmed nothing more than that be zurrmeth the farth. "The fun warmeth of the air the fertile carth," is nonfenfe, as it makes the earth a part, or a confunenc, of the air. So neceflary is it that prepolitions have a monting. and that the meaning of each be attended to.
(2) The Bithops Berkeley and Law, with the very learned and ingenions Principal Caupbell of Aberdeen.

(a) Ao the lealian fubfantive casa, a loufe, race, fimity, naion, Sx. in pafing to the lrench, becones the prepofition CHEz, to which there is not, fo far as we know, a preperition of precilaly the fame impont in any fangrase. Senta or senze in Italian becomes sans in French, and means ablowse. Nor is it necoffary that rerls and noms thenld always pais from one language to another, in order to be converted into prefefitions:
 rate. The Latin sine is sit ne, bo not. The German sonder is the imprative of sondern, which has the fame meaniag as xas dow.
(ib) irp, Upon, outr, bove, above, have all, fay; Formir Tohe, one common origin and figuification. In the Anelu Saxom, ufa, ufira, ufemest, are the afjeqions altus, altior, altissimus. Ufa or ufan,
 tran, bueav, onburanofore, aloze. If this be a juat account of the origin of thete words, the fentences in the text, where upon, con, and atoe, occur, will run thus: " 'lhe ? atue flond on mign a pedettal;" "the

 as well as at fone time. There is therefore no neceffy, whatever elegance there may be in it, for emp'oying any word to denote that rifetion, "hiel is common'y believel to be fignificd by on; but it is nceffary to infert, between the arbland pudfol, a word figuificant of place, that pedflal may not be mitaken, by an ignorant perfon, for a portion of time, or any thing elfe connected with the flanding of the flaiure.
(c) That ro is lignificant of difached rclation, is the language of Mr Harris, which, though it may be allowed in a bofe and sulgar fonfe, is certainly not philofophically jofl. The prepofition to (in Dutch written
 Guthic fublantive is itfelf no other than the palt participle tauid or tavios of the verb ravjan agere. And
end (of his journcy) Italy; the fun is rifen above the bills, i. e. the fun is rifen (the place) the top of the bills; thefe fogs canne from Turkey, i. e. thefe figs cance beginning (their journey at) Thirley.

Befides the detached relation of body, Mr Harris is of opinion that the prepofition from denotes two other relations not lefs different than thofe of motion and ref. Thus if we fay, "That lamp hangs from the cieling, the propultiva raom aflumes a charadter of quifencer.

But if we fay, That lamp is falling grom the cieling, the prepolition in fuch cafe affumes a character of motion." But this is evidently a miftake : the detached relation in the former inllance of the figs, as well as the motion and $r g l$ in the prefent inftances, are exprefled not by the frepgfition, but by the verbs came, falls, liangs. The word from has as clear, as precife, and at all times as uniform and unequivocal a meaning, as any word in the language. From means meielv beginning, and no. thing
it is obvions, that what is done, is terminated, cnded, finiled. In the Teutonic, this verb is writen ruas or tuon; whence the moden German thun, and its prepofition tu. In the Anglo- Saxon, the verb is tengan, and the prepofition to. Do, the auxiliary verb as it has been called, is derived from the fame root, and is indeed the lame word as то. The difference between a $\mathbf{T}$ and a D is fo very fmall, that an etymologit knows by the practice of languages, and an anatomil by the renfon of that practice, that in the derivation of words it is farce worth regarding. To fupport this etymun of ro, Mr Horne Tooke gives a fimilar inftance in the Latin tongue. The prepoftion $A D$, he fays, is mercly the palt participle of $A G E R E$, which palt participls is likew ife employed as a Latin fubfarfive. He exhibits the derivation of AD thus:

$$
\text { Agitum-astum } \begin{cases}\text { AGDus - } & \text { or } \\ \text { or } & \text { or } \\ \text { Acton } & \text { or } \\ \text { act }\end{cases}
$$

The mon fuperficial reader of Latin verfe (he obferves), knows how readily the Romans dropped their final umio. And a little conlideration of the organs and practice of feech will coDvince him how ealily $A G D$ or acr would becone ador AT; as indeed this prepontion was indifferently waiten either way ty the ancients. By the later writers of Rome, the prepofition was written $A D$ with $D$ only, in order to dillinguifh it from the other corrupt word called the conjungion AT; which for the fame reafon was written with the $t$ only, though that likewife had anciently been writen, as the prepofition, either AD or at. The prepofition to and the conjunction too in Englifh, are both in fyuax and in meaning ufed exactly as the prepolition an and the conjunction at in Latin. From the fpecimens prefixed to Johnfon's dietionary, as a hiftory of ont language, it appears that, as late as the reign of Elizabeth, the preptrition and conjuncign were both written with one o. And it has been fhown in the firt volume of the Tranfactions of the Royal Sociéy of Edinlurgh, that to and too, as well as ad and at, are precifely of the fame inport. The only difference, in either language, be:ween the freppfition and the corjurofiom, is, that the former dirchs, as a modification of fome previous propofition, the addition of fome fublantive or noun; the latter, fometimes a fentince or claufe of a fentence confidered abfiragly as a noun; and that, when the former is ufed, the propofition, to which the modifying circumfance is to be added, is formally exprefed, but omitied when the hater is employed. Thus Denkam fays,
". Wifdom he has, and, to his wifdom courage;
" Temper ro that, and, unto all, fuccefs."
In this example, every fucceeding circumflance is by the prepofition mo marked as an adfition to the preceding. "Wildom he has, and courage additional to his wifdom." But Denham might with equal propriety have omitted the objeet which 70 governs, or to which it directs fomething to be added, though he muft then, from the cuftom of the language, have employed the conjunaivo inflead of the propifition. As,
"Wifdom he bas, and courage too," \&sc.
This mode of expreflion, would have been more concife, and as intelligible as the other, "Wifdom he has, and courage to his suifdom," Esc.
Not only is the object governed by то orsitted, when it is reprefented by a fulfontive in the coniext, but allo when it is involved in a propgfition; and then the conjunction, as it is called, is always ufed. Thus,
"
"The daring crime, behold the vengeance roo."
So, "He made him prifoner, and killed him too." In the one example, the circumftance of beholding the vengeance is flated as an addition to the viesuing of the crime; and in the other, the killing him is flated as an addition to the making bim a prijoncr. In both examples, the object governed by roo is the amount of the preceding propofition taken allhraaly as a noun or fulfirntive. Thus then it appears, that ro and roo, though claffed the one with the prepolitions, and the other with the conjunctions, are really one and the fame word. The fame is true of an and AT. Thus, "AD boc, promiffa barba et capilli efferaverant feciem oris," lignifies, "Additional to this, his long beard and hair had given a wildnefs to his afpect." But when the object governed by $A D$ is not formally ytated, $A D$ itfelf is clafled with the conjuncions, and written differertly, at. Thus Terence, "Ph. Fac ita ut juffr, deducantur ifti. Pa. Faciam. Ph. At diligenter. Pa. Fiet. Pr. At mature." By the means of $A T$, the circumftances of diligence and bogle are fupercadled to the action commanded. "Ph. It is not enough that you do it, you mult do it carefully roo. PA. Weil, it flall be carefully done. Ph. In good time too." At, taken in this fenfe, is mofl commonly emphoyed, like the Englih but, to mark the unexpected un:on of incongruous oljegs: As, "Aulam tyrauni frequentabat, AT patiam amabat;" literally, "He frequented the court of the tyrant; joined even ro that be loved his country." "He was a courtier 2nd a patriot roo.". But if ad and at in Latin, and to and too in Englihh, be derived from verbs which fignify to Do or Act, it may be affed how they come themfelves to denote addition. The anfwer is obvious.
thing elfe. It is fimply the Anglo-Soroon and Gothic noun Frum, beginning, origin, fource, fountain, author (D). Now if this meaning be applied to Mr Harris's ithftances, from will fpeak clearly for itfelf, without the affitance of the interpreting verbs, which are fuppofed by him to vary its charaticr.
"Thefe higs came from Turkey."
"That lamp fills from the cieling."
"That lamp bangs from the cieling."
Came is a complex tem for one fpecies of motion; falls is a complex term for another fpecies of motion; and bunts is a complex ( E ) term for a Cpecies of attachment. Have we occafion to communicate or mention the commencement or beginning of thefe motions, and of this attachment, and alfo the place zobere they commence or begin? To have complex terms for each occafion of this fort is abfolutely impollible ; and therefore nothing can be more natural or more fimple than to add the fighs of thofe ideas, viz. the word beginning (which will remain always the fame) and the rame of the flace (which will perpetually vary). Thus,
"Tliefe figs came-BEGMNING Turky."
"That lamp falls-beginning ciding."
"That lamp hangs-beginning cieling." That is,
"Tukey the place of beginning to come."
"Cieling the place of beginning to fall."
"Cieling the place of beginning to hang."
It has been faid bj no lefs a man than bihop Wilkins, that fron refers primarily to place, and fecondarily to time. But the truth is, that fron relates to every thing to which legimuing relates, and to nothing elfe.
"From morn tull nigh the ete n nal larum rang.
That is, "The larum rang beginning morning (or morning being the time of its beginning) till night."

As from always denotes leginning, fo to and till always denote the emd. There is, however, this difference between them, that ro denotes the eard of any thing ; till the ent only of time. We may fay indif-ferently-"From morn ro night," or "from morn tall night, the eternal larum rang;" but we cannot fay-" Thefe figs came from Turkey till England."
$\mathrm{N}+\mathrm{I}+3$.

M A R.
That tul can, with propriety, be oppofed to faomonly when we are talking of time, is evident ; for it is a word compounded of to and while, i. e. time. Aud as the coaldience of thefe two worls to-hwile, took place in the language long hefore the prefent fuperfluous ufe of the article the, the phafe - "From morn till. night"--is neither more nor lefs than--From morn qo time nigbi. Whan we fay, "fiom morn to midht," the word time is omitted as unneceffary.

Befides from, Mr Harris mentions over as fignificant, fometimes of motion, and fometimes of refl; and quotes, as inftances, the two following paffages from Milton.

$$
\begin{aligned}
& \text { Over the bonfing moste. }
\end{aligned}
$$

Here, fays he, orer denotes mation. Again,

$$
\frac{\text { He weith lopis of corlifl lvoe }}{\text { Hurg over ber cenumaured. }}
$$

Here over denotes ri.j. But the truth is, that over. denotes neither motion nor $\mathrm{ref} \ell \mathrm{in}$ either of the paflages. In the firt quotation, indeed, morion is implied: but it is implied in the word steps; and not in orer, which denotes only that the phace of the fleps was the top of the burning marle. In the fecond quotation, $r e f$ is mm plied, and $t$ and too a particular fpecies of relt; but it is implied or rather exprefed by the verb hung, and over denotes the place of that fpecies of re't.
108. But though the original ufe of prepofitions was to denote the relations of body, they could not be contined to this office only. They by degrees exteaded themfelves to fubjects incorporeal; and came to denote rclations, as well intelieitual as load. Thus, becaufe in place he, who is above, has commonly the advantage over him who is below; hence we transfer over andunder (F) to domiuion and obedicuce. Of a king, we fay, be ruldid. over his people; of a foldier, be ferveit under his general. So too we lay, with thought : zuithout attention; thinkingo or a fubject; under anxiety; from tear ; through jealoufy, \&c. All which initances, with many others of like kind, thow, that the forl/ cuords of men, like their firft ideas, had an immedrate reference to fenfible objetis; and that in after days, when they began to difeern with their indellet, they took thofe words which.
they:

If a man thould utter a fentence, and to the end of it fubjoin the very general word do, the perfon to whom he fpoke, womh naturally ank, no what? and this queltion would, of courfe, produce an sudhitional fentence or claufa, of a fentence. Befdes, it is to be oblerved, that agere, from which the Latin prepolition is derived, as well. as the Gothic verb, which is the fource of the Englifh particles, means not ouly to do, but alfo to adduce or: bring ; fo that when we fay, " he is going to Italy," we do nothing more than affrn that "he is going," and detire the perfon to whom we fpeak, to "add Italy to the journey."

From this derivation of the prepolition to, it will be fcen at once upon what principle it is employed to mark the infinitive mode. In the learned languages that mode is generally known by its termination ; but in: Englifh it would be impofible, without the aid of to or of fome other word fignificant of agion, to diftiaguifh the vERB love from the noun or fuhfantive.
(d) This derivation is Mr Horne Tooke's; and he fupports it by the following fentence: Neremd ge sb the on frumam worthe, iie worhte wepman and wifmen; which is the Anglo-Saxon of St Matt. xix. 4. "Annon legifis, quod qui eos in principio creavit, creavit eos marem et Seminam."
(E) Thefe are complex terms becaule they are verbs. Each denotes an affimation and time; rind combined? with the fe, came and falls denote motion, and bangs denotes reff.
(E) UndFr and benpath, though by the found they fecin to have little connection, are yet inface almof the fame word, and may very well fupply each other's place. Under is nothing but un-neder, and beneath, is compounded of the imperative be and the noun hears. Neata uncompounded having nipped asay from. our language, would pertaps he unintelligible, had not the nobar nether and netuermost fill continued in. commonufe. Neath; Angle-Saxon, neothan, neothe; Dutch, nemen; Danifh, ned; German, niedre; and Swedifh, SEDRE and NFDFR; is undoubtedly as much a fublantive, asd has the fame neaning, as the word. Nadir. In common language it denotes the bothom:
they found already made, and transferred them by metaphor to intelleaual conceptions.

Among the relations which may be confidered rather as intellectual than corporeal, are thofe of cau $/ \mathrm{c}$ and confequence; and for the denoting of thefe we have two prepofitions, which fometimes afpear in direct oppofition to one another, and at other times may exchange places without injury to the fenfe.
"Well! 'tis e'en fo! I have got the London difeafe they call love. I am fick of my hufband, and for my gallant."

Wycherley's Country Wifc.
Here of and for feem almofl placed in oppofition; at leat their effects in the fentence appear to be very different ; for, by the help of thefe two prepofitions alone, and without the affiftance of any other words, the exprefics the two contrary affections of loatbing and defire. The truth, however, is, that the author, if it had pleafed lim, might have ufed of where he las employ: ed for, and for where he has put of. This is evident from the following quotation:
"Marian. Come, Amie, you'll go wuith us."
"Amie. I aun not well."
"Lionel. She's fick of the young fiepherd that beliff her." Sad Shepherd.
In the fame manner we may, with equal propriety, fay-"We are fick or hunger;" or-"We are fick ror hunger." And in both cafes we fhall have expref. fed precifely the fame thing, with only this difference, that, in the former fentence, we declare fickne/s to be a consequence; in the latter, we dechare bunger to be a cavse. But to return to the country auife; that poor lady feems to have had a complication of diftempers; the had, at leall, two diforders-a fieknefs of loathing, and a ficknefs of lave. She was fiek for difgult, and fick for love. She was

> Sick or difgult ror her bufoand;
> Sick or orve bor ber gallant.
> Sirk ror difyull or her bufband.
> Sick ror lave of her gallant.

In the fir $\mathbb{R}$ fentence, as thus flated, fikinefs is deelared to be the consequence of $d i / I^{\prime} / f$, of which ber bufband is declared to be the caluse. In the fecond, ficknefs is deelared to be the conseruence of love, of which her gallaut is declared to be the caves. In the third fentence, disgust is declared to be the cavse of ber ficknefs, and the consfluence or orfspring of her bufband. In the fourth, loec is declared to be the cause of her fickefs, and the consequence or ofrspring of her gallat:t.

Thus, then, it appears, that though the two firf of thefefentences, taken entire, convey the very fame meaning with the tuub laf, yet the import of the prepofition ror is as different from that of of, as cause is from consequence ( $G$ ). When two awords or fentences are lisked together by the former of thefe prepofitions, the objca expreffed hy the lage word or fentence is declared to be the caUse of that which is expreffed by the preceding; when two words or fentences are linked toge-

Vor. VIII. Part I.
ther by the latter prepolition, the objea exprefled by the fir $\ell$ word or fentence is declared to be the conseQUence of, or to proceed from, the oljea exprefled by the fecond. It is therefore a matter of perfect indifference to the fenfe, whether we fay fickne/s of bunger, or ficknefs for bunger; The man, of be fpeaks little, is zuife, or the man is wife, for be fpeaks little. By means of the prepofition OF, we declare fickinefs to be the conseQuence proceeding from hunger, and wifdom to be the consequence we infer from the man's Speaking little; by means of for we declare hunger to he the cause of ficknefs, and the circumftance of /peaking little to be the cause from which we infer the man's zuifdom. In the one fentence, of is to be confidered as a noun in appofition to ficlinefs; in the other, as a noun in appofition to the man is wife taken alfradly as a noun. In the one fentence, for (i. e. cause) is to be conlidered as a noun in appofition to bunger, in the other, as the fanve noun in appofition to he Jocalis little, taken abjfraally as a noun.
109. In the forggoing ufe of prepofitions, we have Prepoinfeen how they are applied by way of juxia-pyfition; tions comthat is to fay, where they are prefixed to a word with. pounded out becoming a part of it. But they are ufed alfo $b y$ with sualy of compofition; that is, they are prefixed to other words, words fo as to become real parts of them. Thus in Greek we have trisiacyse in Latin, intelligere; and in Englif, underfand. So alfo, to foretcl, to oresad, to undervalue, to outgo, \&c.; and in Greck and Latin other inftances innumerable. In this cafe the prepofitions commonly transfufe fomething of their own meaning into the word with which they are compounded. For example, if we fuppofe fome given fpace, E and Ex
 SUB, under it. Hence E and PER, in compofition, aupment; if their Enornis fore own neanEnorniss is fomething not limply big, but big in excels; itg into fomething got out of the rule, and beyoud the menfure. whore Dico, "to fpeak;" Edico, "to Speak out ;" whence edieium "an edict," fomething fo effectually fpoken as all are fuppofed to hear and all to obey. On the contrary, in and sus diminifh and leffen. Inyufus. iniquus, " v vjuft, inequitable:" fomething that lies within julliee and equity, that reaches not fo far, that falls Jort of them. Susnicer, " blackih ;" surralicundus, "reddifh :" tending to black, and tending to red; but yet under the ftandard, and bclow pertuction.
110. Before we difmifs this part of our fubject, we Their real Thall make the fame general remark on profofitions that imy o thow we formerly made on conjuncious; wiz. that the pricife to be difoimport of each can with certainty be known only by vered. tracing it to its fource in fome word of known and determinate meaning, either in the language where the prepofition itfelf has place, or in fome parcnt or cognate tongue. And it maj be laid down as an infallible rule, that where different languages ufe the fame or a fimilar particie, that language ought to be conliderad as its legitimate parent, in which the true meaning of the word can be found, and where its ufe is as common and familiar as that of any other verbs and fubM
flantives.
(c) Junius derives for from the Greek $\boldsymbol{\pi}_{\beta}$; Skinner, from the Latin pro; but I bclieve, fays Horne Tooke, that it is no other than the Gothic fubllantive farrina, "caufe." He imagines alfo that or (in the Gothic and Anglo-Saxon af) is a fragment of the Gothic and Anglo-Saxon words afara and afora, poficritas, proks, \&c. In a woid, he confiders FOR and $O F$ as nouns or fubftantives; the former always meaning caufe, the latter always meaning corfiguence, offspring, fucceffor, follower, \&c. If this account of thefe words be jult. and we have no doubt of it, the prepofitions for and of are in fyntax to be confidered as noturif in afpefition with other nouns, or with fentences taken ablraely as nouns.
ftantives. When prepontions can be traced to fwech fources as thefe, no roons can be left ior difputes concerning their meaning. In carrying on this etymological purfuit, we ind advantages in the nature of frepofitions which conjundions do not afford us. Wıтн and without, from and to, with many other words belonging to this clafs, have meanings directly oppofite and contradictory to each other. If, then, by the total or partial extinction of an original language, the root of any one prepolition be loft, whilft that of its oppofite remains, the philofopher ought to be fatisfed with reafoning from contrariely; as nothing is more evident, than that the meaning of a word is known when we know with preciion the meaning of its oppolite. When we meet, however, with a lucklefs prepolition of which no root is left to be dug up, and which has itfelf no direct oppofite in the language, nothing remains but that we inquire for what purpofe it is ufed by the belt writers both ancient and modern; and if we can fix upon one meaning which will apply, however aukwardly, to all the places where it oceurs, or to the greater part of them, the probability is, that we have difcovered the trose and original ( $H$ ) meaning of the preputition; and by keeping that meaning conflantly in view, we fhall ourfelves be enabled to ufe the word with perfpicuity and precilion.

## Sect. IIf. Of Interjections.

I34
The ister. jection not properly any part of fueech.
111. Befides the above parts of fpeech, there is another acknowledged in all the languages of Europe, called the interjection; a word which cannot be compreliended under any of the foregoing claffes. The geunine interjeaions are very few in number, and of very little importance, as they are thrown into a fentence without altering its form either in Jynax or in fignifuation. In the words of Horme Tookic, the brutilh inariculate interjection has nothing to do with fpeech, and is only the miferable refuge of the fpeechlefs. The dominion of speech, according to the fame author, is erected on the downfal of interjeciions. Without the artful contrivances of language, mankind would have nothing but interjeảions with which to communicate orally any of their feelings. "The neighing of a horie, the lowing of a cow, the barking of a dog, the purring of a cat, incezing, coughing, groaning, fhrieking, and every other involuntary conculion with oral found, have almoll as good a title to be called parts of fpeech as interjations. In the intercourfe of language, interjecions are employed only when the fuddennefs or vehemence of fome affection or paffion returns men to their natural flate, and makes them for a moment forget the ufe of feech; or when, from fome circumtance, the Gortnefs of time will not permit them to exercife it." The genuine interjection, which is always exprefive of fome very ftrong fenfation, fuch as As! when we feel pain, does not owe its characteritti-
cal expreffion to the arbitrary form of articulation, but derives its whole force from the tone of voice and modification of countenance and gellure. Of confequence, thefe tones and geftures exprefs the fame meaning, without any relation to the articulation which they may aftume; and are therefore univerfally underfood by all mankind. Voluntary interjections are ufed in books only for embellifhment, and to mark forcibly a Atrong emotion. But where fpeech can be employed, they are totally ufelefs; and are always infufficient for the purpofe of communicating thought. DrBeattie ranks flrange, prodigious, amazing, zoonderful, 0 dear, dear me, \&c. whenuled alone, and without apparent grammatical fyntax, among the interjefions: but he might with as much propriety have conlidered bardly, truly, really, and even many Latin verbs, as interjeations; for thefe too are often ufed alone to fupply the place of cubole fentences. The truth is, that all men, when fuddenly and violently agitated, have a frong tendency to fhorten their difcourfe by employing a fingle word to exprefs a fentiment. In fuch cafes, the word employed, whether noun, adjective, or verl, would be the princifal word of the fentence, if that fentence were completed; and the agritztion of the fpeaker is fuch, and the caufe of it fo obvious, that the hearer is in no danger of miltaking the fenfe, and can himfelf fupply the words that are wanting. Thus if a perfon, after liftening to a romantic narrative, were to exclain, flange! would any man of common fenfe fuppofe, that the word frange, becaufe uttered alone, had loft the power of an adjegive and becume an interjecion? No, furely: Every one fees, that the exclamation is equivalent to, That is strange, or That is a strange fory. Real interjections are never employed to convey truth of any kind. They are not to be found amonglt lazus, in books of civil inflitutions, it bilory, or in any treatife of nfeful arts or fiemees; but in ribetoric and poetry, in nowels, plays, and romances, where in Englifh, fo far from giving patbos to the ityle, they have generally an effect that is difgulting or ridiculous.

Having now analyfed every part of feeech which can be neceflary for the communication of thought, or which is acknowledged in any language with which we are acquainted; we fhall difinifs the article of Grammar, after annexing a Table, which may prefent at one view the feveral claffes and fibulivijons of zoords. Of the different modes of dividing the parts of fpeech, as well as of the little importance of Jy/tematic clafljfis-. tions, we have already declared our decided opinion: but for the fake of thofe who may think differently from us, we thall in the annexed Table adopt Mr Harris's claffification as far as it is intelligible; after informing our readers that Mr Horne Tooke admits only three parts of fpeech, the article, the noun, and the verb, and confiders all other words as corruptions or abbreviations of the two latt of thefe.

A GRAM-
(H) For inftance, let us luppofe that Horne Tooke's derivation of for, from the Gothic fubllantive fairina, is fanciful and ill-founded; yet there can be little doube but cause is its true and original meaning, when it is found, that of fixicen examples brought by Greenwood, and forty-fix by 7 Fobnfon, ef different fignificacions of the word For, there is not one where the nour cause may not be fubftituted inftead of the prepofion for; fometimes indeed ankwardly enough, but always wilhout injury to the fenfi. Even where ror leems to be loco altorius, which Lowulb aflerts to be its primary fenfe, it will be found to be cause, and nothing elfc: Thus, He male congfuterable progrefs in the pudy of the la:u before he quitted that prefeflion for this of poetry; i. e. before be guisted that profefion, tios of poctry being the cause of his guitting it.

ramma rian

GRAMMARIAN, one that is $\mathbb{k}$ illed in or teaches grammar.

Anciently the name grammarian was a title of honour, literature, and erudition, being given to perfons accounted learned in any art or faculty whatever. But it is otherwife now, being frequently ufed as a term of reproach, to fignify a dry plodding perfon, employed about words and phrafes, but inattentive to the true heauties of expreflion and delicacy of Centiment. The ancient grammarians, called alfo philologers, mult not be confounded with the grammatifts, whofe fole bufinefs was to teach children the firft ele. ments of language. Varro, Cicero, Meffala, and even Julius Cæar, thought it no dimonour to be ranked grammarians, who had many privileges granted to them by the Roman emperors.

GRAMMONT, a town of France, in the Limo. fine, remarkable for its abbey, which is the chief of the order. E. Long. 133 . N. Lat. $45 \cdot 56$.

GRAMPIAN-hills; a chain of high mountains in Scotland, which run from eaft to welt almoft the whole breadth of the kingdom. See (Scottif) Alps and Scotland.-They take their name from only a fingle hill, the Mons Grampins of 'I'acitus, where Galgacus waited the approach of Agricola, and where the battle was fought io fatal to the brave Caledonians.

GRAMPOUND, a town of Cornwall in England, feated on the river Valle, over which there is here a bridge. W. Long. 5. 25. N. Lat. 50. 20. The inhabitants have a confiderable manufacture of gloves; and the town fends two members to parliament. Some think that this town is the Voluba of the ancients, becaufe it flands on the fame river; and that on the building of the bridge, the name was changed into Giandpont. It was made a borough in the reign of Edward IIL, by whofe charter it was endowed with large privileges, particularly freedom from toll throurh all Cornwall, a market on Saturday, and three fairs in the year; which the burgeffes hold of the duchy of Cornwall in fee-farm, at the rent of about 12 guineas. Its privileges were confimed by King Henry VIII. but it did not fend members to parliament till the reign of Edward VI. It is a corporation with a mayor, 8 magiftrates, a recorder, and town-clerk. The mayor is chofen annually the Tuefday before Miclatelmas, and the members by the majority of the magiftrates and freemen, who are fuch of the inhabitants as pay feot and lot. There is a chapel of eale in the town to the parim-church, which is at Creed, about a quarter of a mile off.

GRAMPUS, in ichthyology; a fpecies of del. phinus. See Delphinus.

GRANADA, a province of Spain, which for a long time was a kingdom diftinct from the relt of that country. See the article Spain.-It made a part of the ancient Brtica; and was inhabited by the Ba. Atuli, the Sexitani, \&ce. At prefent it is fometimes called Upper Andalufia. It is bounded to the fouth and eall by the Mediterranean, to the weft and north by Lower Andalulia, and to the north-ealt by Murcia. Its extent from well to eall is two hundred and ten miles; but its greatelt breadth exceeds not eighty. The air here is temperate and healthy ; and though there are many mountains in the province, and fome of them very high, yet they are almot every where
covered with vines and fruit-trees, together with lau-
Granada. rel, myrtle, fwett-bafil, thyme, lavender, marjoram, and other aromatic herbs, which give an exquifite talte to the fleth of their fheep and cattle. A great deal of filk and fugar, flax and hemp, honey and wax, is alfo produced here; befides dates and acorns, fuperior to the finelt nuts; goud Aune for building; feveral forts of gems; fumach, ufed in drefting goat.fkins; and galls, of which a dye is made for leather. The valleys, with which the mountains are interiperfed, are extremely beautiful and fertile. The inhabitants of fome of the lighefl mountains are faid to be defeendants of the Moors; and, though they are become Ro-man-cacholics, retain, in a great meafure, their ancient cultoms, manners, and language. The principal rivers in the province are the Genil, or Xenil, and Gauda. lantin, befides which there are many leffer Areams. Abundance of falt is made in this province; which, though neither fo populous nor fo well cultivated as when fubject to the Moors, yet is as much fo as any in Spain. It was the laft of the kingdoms poffefled by the Moors, and was not reduced and annexed to the crown of Caftile until 1492.

Granada, the capital of the above province, is fituated at the foot of the Sierra Nevada, or the Snowy Mountain, in a wholefome air and fruitful country, an hundred and eighty miles fouth of Madrid, in W. Long. 2. 30. N. Lat. 36. 56. It ftands upon two hills feparated by the Darro. The Genil runs under the walls, and thefe two rivers are formed from the melting of the fnow with which the mountain is conflantly covered. The Darro is faid to carry with it fmall particles of gold ; and its name, derived from dat aurum, may be alleged as a proof of this: the Genil, in like manner, rolls with its Itream little pieces of filver. When Charles V. came to Granada, in 1526 , with the emprefs I fabella, the city prefented him with a crown made of gold gathered from the Darro. The city is large and magnificent, containing a great number of very handfome public and private buildings. Its walls, which are adorned with many towers at equal diltances, are faid to be ten miles in compafs. Here are two caftles; the one builc by the Moors, and the other by Charles V. and Philip II. They both command a very fine profpect ; and the firit is fo large, that it looks like a city by itfelf, and, it is faid, has room enough to accommodate forty thoufand people, exclufive of the royal palace, and the convent of St Francis. Here is alfo a court of inquifition; a royal tribunal ; and an univerfity, founded in $153^{1}$; with the fee of an archbifhop, who has a revenue of furty thoufand ducats per annum. A great many noblemen, clergymen, and wealthy citizens, relide in this ci$t y$, of which the filk trade and manufacture is vers great, and the arfenal is faid to be the beft furnithed of any in Spain. The inhabitante, who are partly defcended of the Noors, are well fupplied with water. There are feveral fine fquares, particularly that called the Bivaramba or Plaça Mayor, where the bull-fights are held; and without the city is a large plain, full of towns and villages, called La Vega de Granada.

The Moors are faid to regret nothing but Granada, amongit all the loffes they have fultained in Spain; they mention it in all their evening prayers, and fupplicate

Granada. heaven to refore it to their poffeffion. The laft Mcorith ambaffador who came into Spain obtained permiffior of the king to fee Granada; he fhed tears on entering the Alhambra, and could not refrain from exclaiming, that the folly of his anceftors had deprived them and their pufterity of that delightful country.

Granada had formerly twenty gates: the firt, that of Elvira, which flill remains; the fezond, that of Bi balmazar, or of conference, becaufe, with the Moors, it was a kind of place of refort where they converfed on affairs; the third, Vivarambla, fo called from its leading to a grand quare which tlill beats the fame name : the fourth, Bib Racha, or of provifions; the fifth, Bitataubin, or the gate of the hermits, which led to different folitudes, the abodes of dervifes; the fixth, Bibmitie, or Biblacha, the firtt gate; the feventh, the mill gate ; the eighth, that of the fun, becaufe it opened to the eall: the ninth, the gate of the Alhambra, called by the Muors Bib Luxar; the tenth, Bid Adam, or the gate of the bones of Adam; the twelfeh, Bib Ciedra, the gate of the nobles; the Moors kept this gate fhut for a long time, becaufe it had been predicted that the enemies which fhould one day take the city, would enter by that gate; the thirteenth, is that of Faxalauza, or of the hill of almond trees; the fourteenth, the hon gate, in Arabie, Bib Elecei; the fif. teenth, the coaft gate, called by the Moors Alacabar ; the fixteenth, Bib Albinut, or the gate of the Banners, at prefent the magdalen gate ; the feventeenth, that of the Darro ; the eighteenth, that of the Mofayca; the ninetcenth, that called the gate of Ecce Homo; the twentieth, that by the fide of the Alhambra.

The Moors have left more monuments in Granada than in any other city in Spain. From the great number of inferiptions in and about the city, and the fine edifices of the Allambra and the Generalif, it might be fuppofed thefe people intended to make Granada the great deptitory of their religion, manners, cuftoms, and magnificence. There is not a wall which does not bear lome marks of their power ; but, notwithllanding this abundance of monuments, the reign of the Moors in Spain is ftill buried in confufion and obfcurity. The ignorance of the Spaniards, their fuperfition, and the hatred they bore the Moors, have much contributed to this darknefs; they have either deflroyed, or fuffered to be effaced by time, every thing which bore the mark of manometanifm, intead of preferving the monuments of antiquity, which dt the fame time were thofe of their own glory; and it may be faid, that chance alone, and the folidity of their conitraction, much more than curiofity or a love of the arts, has preferved thofe which fill exilt, altho' caily going to ruin.

An account of the Alhambra has been already given under its name in the order of the alphabet. From the hall of Comares there mentioned, there is a modern litule Itair-cafe; the old one, which correfponded to the beanty of the edilice, having been deftroyed. At the top of the itaircafe is a gallery, a part of which is inchofed with an iron railing : this kind of cage is called the prifon of the queen. It was here the wifc of the laft king of Granada was imprifoned. The Gomels and Legris, two families of diftinction, bore falie witnefs againft her virtue, and occafioned the defruction of the greateft part of the $A$ bencerrages, another
powerful and numerous family of Granada of whom they were jealous. The hitlory of this event is given as follows.

In the year 1491, Abdali, furnamed the Little, fill reigned in Granada; but this city was upon the brink of ruin, for the principa! families were divided againft cach other. The Moors had carried their arms againft Jaen, and had been bravely repulfed. Abdali was confoling himfelf in one of his pleafure houfes for the ill fuccefs of his enterprife, when the Zegris, who long had been the fecret enemies of the Abencerrages, took the opportunity of this defeat to reprefent them to the king as rebellious fubjects, who employed their immenfe riches to gain the favour of the people and dethrone their fovereign. They accufed Albin Hamet, the moot rich and powerful among them, of having an adulterons commerce with the queen, and produced witneffes who afferted they had on a certain fethival feen, at Generalif, under a bower of rofe trees, Abbin Hamet in the arms of that princcfs. The fury of Abdali may eafily be imagined; he fwore the deAtruction of the Abencerrages. But the Zegris, too prudent to let his anger break forth, advifed him to diffimulate, and not to fuffer it to be known to that nu:nerous and powerful family that he was informed of their perfidy. It will be better, faid they, to entice them into the fuare, and, before they can unite and put themfelves into a flate of defence, revenge upon their heads the infult offered to the crown. This advice was followed: Abdali went to the Alhambra, having ordered thirty of his guards to anm themfelves, and the executioner to attend. The Abencerrages were fent for one by one, and beheaded ac foun as they entered the hall of the lions, where there is thill a large vale of alabatter, which was quickly filled with blood and the heads of expiring bodies. Thirty-five heads had already been ftruck off, and all the Abencerrages would have died in the fame manner, had not a page, who had followed his mafter, and remained unperceived in the hurry of the execution, taken an opportunity of withdrawing and giving information to the reit of the unhappy family of what had paffed. Thefe immediately affembled their friends in arms, crying out through the city of Granada, "Treaton! treaion! Let the king die! he unjufly puts to death the Abencerrages!" The people, with whom they were favourites, did not hefitate in affilting them: fomsteen thoufand men were foon found in arms, and immediately proceeded towards the Alhambra, houting all the way, Let the king die! Abdali, furprifed his fecet flould have been fo foon difcoucred, and feverely repenting of having followed the pernicions counfels he had received, ordered the calle gates to be thut; but they were prefently fet on firc. Muley Hacen, who had been forced to abdicate the throne in favour of his fon, hearing the tumult of the people, had one gate opened, and prefented himfelf to appeafe the rage of the citizens; but he no forner appeared, than he was lifted up by the multitude nearett the gate, who cried out, " Behold our king, we will have no other, loug live Muley Hacen;" and leaving him furrounded by a flrong guard, the Abencerrages, and other nobles, entured the catle, accompanied by upwards of an hundred foldiers. But they found the queen only, with her women, and in the utmoft conflernation at the fudden

## $G R \quad A \quad[101] \quad G \quad R A$

anàa fudden revolution, of which the knew not the caufe. They afked for the king; and being informed he was in the hall of the lions, entered it furiounly, and found him defended by the Zegris and the Gomels, and in lefs than two hours killed upwards of two hundred of them. Abdali had the good fortune to efcape. The bodies of the beheaded Abencerrages were laid upon black cloth, and carried to the city. Muza, brother to Abdali, and who by his great actions had gained the favour of the people, feeing the Abencerrages were revenged. found means to appeafe them; and having learned that the king had taken refuge in a mofque near the mountain now called Saint Helena, went and brought him back to the caftle of the Alhambra. For feveral days nothing but fighs and groans were throughout the city. Abdali fhut himfelf up in the caftle, and refufed to fee the queen. Thofe who had accured her of adultery, however, perfifted in their falfe accufation, and faid, they would maintain, with arms in their liands, againft all who fhould contradict them, that the queen was guilty. The unhappy princefs was imprifoned, and the day arriving on which the was to perifh by the hands of the executioner, when none among the Moors offering to defend her, the was advifed to commit her caufe to fome Chriftian knights, who prefented themfelves at the time appointed, and conquered her falfe acculers, fo that he was immediately fet at liberty. The taking of Granada foon followed this combat; Muza and the Abencerrages having, it is faid, facilitated the conqueft of it by Ferdinand and Ifabella.

From the Alhambra you enter the Generalif by a low gate, which favoured the efcape of Abdali when Ferdinand took Granada. Generalif is Said to figni$\mathrm{fy}_{\mathrm{y}}$, in A rabic, the houfe of love, of dance, and pleafure. It was built hy a prince of the name of Omar, who was fo fond of mulic, that he rctired to this palace, entirely to give himfelf up to that amufement. The Generalif is the inofl pleafing fituation in the environs of Granada. It is built upon a very high mountain whence waters rufh from every fide, which efcape in torrents, and fall in beautiful calcades in the courts, gardens, and halls of that ancient palace. The gardens form an amphitheatre, and are full of trees, venerable from their antiquity. Two cypreffes in partictrlar are noted, called the Cypreffes of the queen, becaufe it was near them the peridious Gomel impeach$\epsilon d$ the virtue of that princefs and the honour of the Abencerrages. Of this place, travellers obferve, that the writers of romances have never imagined a fcene equal to it.

Granada was formerly called Illiberia, and founded, if we will believe fome writers, by Liberia, a great grand-daughter of Hercules, daughter of Hifpan, and wife to Hefperus, a Grecian prince, and brother to Atalanta. Others, who fupport their affertions by proofs to the full as fatisfactory, maintain that it was founded by Iberus, grandfon of l'ubal, and that it took the name of Granada, or Garnata, from Nata the daughter of Liberia; this word being compofed of Gar (which in the language of the time fignified grotto) and Nata; that is, "the grotto of Nata," becaufe that princefs ftudied aflrology and natural hiltory, and delighted in the country. It is certain that fuch a perfon as Nata, or Natayde, exifted in the firf agcs of
the fomndation of Granada; and that in the place Grana! 1 where the Alhambra now ftands, there was a temple dedicated to Nativala. The date of the frundation of Granada is faid to be 2808 years before Chriit. We know that in the time of the Romans it was a municipal colony.-A defcription in Latin of Granada, fuch as it was, in 1560 , written by a merchant at Antwerp, named George Hofnahel, who travelled into Spain, is to be found in the work, intitled Civitates orbis terrarum, printed at Cologne in 1576 . This book alfo contains a good plan of the city of Granada.

Granaida, or Grenada, one of the Caribbee illands. See Grenada.

GRANADA, a town of America, in the province of Nicaragua, and in the audience of Guatimala, feated on the lake Nicaragua, 70 miles from the S. Sea. It was taken twice by the French buccaneers, and pillaged. The inhabitants carry on a great trade by means of the lake, which communicates with the N. Sea. W. Long. 85.10 . N. Lat. 11. 8.

GRANADA, New, a province of South America, in Terra Firma, about 75 miles in length, and as much in breadth. It is bounded on the north by Carthagena and St. Martha, on the eal by Venezuela, on the fouth by Popayan, and on the weft by Daricn. It contains mines of gold, copper, and iron ; horfes, mules, good paftures, corn, and fruits. It helongs to the Spaniards, and Santa-Fe-de-Bagota is the capital town.

GRANADILLOES, the name of tome ifands of the Caribbees, in America, having St Vincent to. the north and Granada to the fouth. They are fo inconfiderable that they are quite neglected; but were ceded to England by the treaty of peace in $:_{7} 6_{3}$.

GRANADIER, a foldier armed with a fword, firelock, a bayonet, and a pouch full of hand-granddues. They wear high caps, are generally the talleft and brikefl fellows, and are always the firt upon all. attacks.

Every battalion of foot has generaily a company of granadiers belonging to it ; or elfe four or five granadiers belong to each company of the battalion, which, on occafion, are dravn out, and form a company of themfelves. Thefe always take the right of the battalion.

Gr.andio or Grenade, in the art of war, a hollow ball or fhell of iron or other metal, of about $2_{\frac{1}{5}}^{2}$. inches diameter, which being filled with fine powder, is fet on fire by means of a fmall fufe driven into the fufe-hole, made of well-feafoned beech-wood, and thrown by the grenadiers into thofe places where the men fland thick, particularly into the trenches and o. ther lodgements made by the enemy. As foon as the compofition within the fufe gets to the powder in the grenado, it burfts into many pieces, greatly to the damage of all who happen to be in its way. Granadoes were invented about the year 1594 . The author of the Military Dictionary has the following remark on the ufc of granadoes. "Grenades have unaccountably funk into difufe; but J am perfuaded there is nothing more proper than to have grenades to throw among the enemy who have jumped into the ditch. During the fiege of Caffel under the Count de La Lippe, in the campaign of $1=\mathcal{E}_{2}, a$ young engineez

Grarard, uadertook to carry one of the outworks with a much Granary. $\xrightarrow{+}$ fmaller detachinent than one which had been repulfed, and fucceeded with eafe from the ufe of grenades; which is a proof that they fhould not be neglected, either in the attack or defence of potts.' - 'The word Granado takes its rife from hence, that the fhell is filled with grains of powder, as a pomegranate is with kernels.

GRANARD, a borough, market, fair, and poit town in the county of Longford, province of LeeinAter; it gives title of earl to the family of Forbes; fituated 52 miles from Dublin, and about 16 north eaft of Longford. N. Lat. $53 \cdot 4+$. W. Long. 7. 30. Here is a remarkable hill or mount, called the Moat of Granosed, thought to be artificial, and the fite of a Danifh caftle or fort; which commands from its fummit a moft extenfive profpect into fix or feven adjoining counties. In this town have lately been given annual prizes to the beft performers on the Irifh harp. Granard has a barrack for a company of foot ; and returns two members to parliament ; patronage in the families of Macartney and Greville. F'airs held 3 d May and it October. This place takes its name from Grianard, or "the height of the fun", and was formerly the relidence of the chiefs of north Teflia. It is fometinnes written Grenard.

GRANARY, a building to lay or fore corn in, efpecially that defigned to be kept a confiderable time.

Sir Hemry Wotton advifes to make it look towards the north, becaufe that quarter is the cooleft and molt temperate. Mr Worlidge obferves, that the beft granaries are built of brick, with quarters of timber wrought in the infide, to which the boards may be nailed, with which the infide of the ganary mult be lined fo clofe to the bricks, that there may not be any room left for vermin to Thelter themfelves. There may be many ftories one above another, which thould be near the one to the other ; becaufe the fhallower the corn lies, it is the better, and more eafily turned.

The two great cautions to be obferved in the erect. ing of granaries are, to make them fufficiently ftrong, and to expole them to the moft drying winds. The ordering of the corn in many pats of singland, particularly in Fent, is thus: To feparate it from dult and other impurities after it is thralhed, they tofs it with fhovels from one end to the other of a long and large room; the lighter fubftances fall down in the middle of the room, and the corn only is carried from fide to fide, or end to end of it. After this they fereen the corn, and then bringing it into the granaries, it is fpread about half a foot thick, and turned from tine to time about $t$ wice in a week; once a week they alfo repeat the fcreening it. This fort of management they continue about two months, and after that they lay it a fout thick for two months more; and in this time they turn it once a week, or twice if the feafon be damp, and now and then fcreen it again. After about five or fix months they raife it to two feet thicknefs in the heaps, and then they turn it once or iwice in a month, and fereen it wow and then. After a year, they lay it two and a half or three fict deep, and turn it once in three wecks or a montl, and fereen it proportionably. When it has lain two years or more, they turn it once in two months, and fcrees it once a quarter; ond bow long foever it is kept, the oftener the turn.
ing and fcreening is repeated, the better the grain will Gramary be found to keep. - It is proper to leave an area of a yard wide on every fide of the heap of corn, and other empty fpaces, into which they tura and tofs the corn as often as they find occafion. In Kent they make two fquare holes at each end of the floor, and one round in the middle, by means of which they throw the corn out of the upper in to the lower rooms, and fo up again, to turn and air it the better. Their fereens are made with two partitions, to feparate the duft from the corn, which falls into a bag, and when fufficiently full this is thrown away, the pure and good corn remaining behind. Corn has by thefe means been kept in our granasies 30 years; and it is obferved, that the longer it is kept the more flour it yields in proportion to the corn, and the purer and whiter the bread is, the fuperfluous humidity only evaporating in the keeping. At Zurich in Swifferland, they keep corn 80 years, or longer, by the fame fort of methods.
'The public granaries at Dantzick are feven, eight, or nine ftories high, having a funnel ia the midt of every floor to let down the corn from one to another. They are built fo fecurely, that though every way furrounded with water the corn contracts no damp, and the veffels have the convenience of coming up to the walls for their lading. The Ruflians preferve their corn in fubterranean granaries of the figure of a fugarloaf, wide below and narrow at top: the fides are well plaftered, and the top covered with ftones. They are very careful to have the corn well dried before it is laid into thefe ftorehoufes, and often dry it by means of ovens; the fummer dry weather being too fhort to effes it fufficiently.-Dantzick is the grand fturehoufe or repofitory of all the fruitful kingdom of Poland. The wheat, barley, and rye, of a great part of the country, are there laid up in parcels of 20,30 , or 60 lafts in a chamber, according to the fize of the room ; and this they keep turning every day or two, to keep it fweet and fit for fhipping. A chunder ftorm has fometimes been of very terrible confequences to thefe fores. All the corn of the growth of former years having been found fo much altered by one night's thunder, that though over night it was dry, fit for hlipping or keeping, and proper for ufes of any fort, yet in the morning it was found clammy and fticking. In this cafe there is no remedy but the turaing of all fuch corn three or four times a day for two montlis or longer ; in which time it will fonetimes come to itfelf, though fometimes not. This effeet of thunder and lightaing is only obferved to take place in fuch corn as is wot a sear old, or bas not fweated thoroughly in the flraw before it was threfled out. The latter inconvenience is eafily peevented by a timely care; but as to the former, all that can be done is carefully to examine all ftores of the latt year's corn after every thunder florm, that if any of this have been fo affected, it may be cured in time; for a negleet of turning will certainly utterly deftroy it.

According to Vitruvius's rules, a granary fhould always be at the top of a houfe, and have its openings only to the north or eall, that the corn may not be expofed to the damp winds from the fouth and weft, which are very deffructive to it ; whereas the contrary ones are very neceffary and wholelome to it, ferving

## $G$ R A [ 103 ] G R A

ranary. to cool and dry it from all external humidity, from whatever caufe. There mult alfo be openings in the roof to be fet open in dry weather, partly to let in frefh air, and partly to let out the warm effluvia which are often emited by the corn. The covering of the roors fhould always be of tiles, becaufe in the worlt feafons, when the other openings cannot be fafe, there will always be a confiderable inlet for fref air, and a way out for the vapours by their joinings, which are never clofe. If there happen to be any windows to the fouth, great care muft be taken to fhut them up in moilt weather, and in the time of the hot fouthern winds. There mult never be a cellar, or any other damp place under a granary, nor fhould it ever be huilt over ttables; for in either of thele cafes the corn will certainly fuffer by the vapours, and be made damp in one, and ill tafted in the other.
M. Du Hamel and Dr Hales recommend various contrivances for ventilating or blowing fref air through corn laid up in granaries or hhips, in order to preferve it fweet and dry, and to prevent its being devoured by weevels or other infects. This may be done by nailing wooden bars or laths on the floor of the granary about an inch diftant from each other, when they are covered with hair-cloth only; or at the dif. tance of two or three inches, when coarfe wire-work, or bakket-work of ofier is laid under the hair-cloth, or when an iron plate full of holes is laid upon them. Thefe laths may be laid acrofs other laths, nailed at the diftance of 15 inches, and two or more deep, that there may be a free paflage for the air under them. The under laths nuft come about fix inches fhort of the wall of the granary at one end of them; on which end a board is to be fet edgeways, and fluping againt the wall: by this difpolition a large air-pipe is formed, which having an open communication with all the interftices between and under the bars, will admit the paffage of air below forcibly through a hole at the extremity of it, into all the corn in the granary, that will confequently carry off the moit exhalations of the corn. The ventilators for fupplying frefh air may be fixed againd the wall, on the inlide or outfide of the granary, or under the floor, or in the cieling; but wherever they are fixed, the handle of the lever that works them mult be out of the granary, otherwife the perfon who work st hem would be in danger of fuffocation, when the corn is fumed with burning brimillone, as is fometimes done for deftroying weevels. Small moveable ventilators will anfiwer the purpofe for ventilating corn in large bins in granaries, and may be eafily moved from one bin to another. If the granary or corn flip be very long, the main air-pipe may pafs lengthwife along the middle of it, and convey air, on both fides, under the corn. In large granaries, large double ventilators, laid on each other, may be fixed at the middle and near the top of the granary, that they may be worked by a wind-mill fixed on the roof of the building, or by a water-mill. The air is to be conveyed from the ventilators througb a large trunk or trunks, reaching down through the fereral floors to the bottom of the granary, with branching trunks to each foor, by means of which the air may be made to pafs into a large trunk along the adjoining crols walls: from thefe trunks feveral leffer trunks, about four inches wide, are to branch off, at the difance of three or
four feet from each other, which are to reach through Granary. the whole length of the granary, and their farther ends are to be clofed: feams of $\frac{1}{3}$ or in of an inch are to be left open at the four joinings of the boards, where they are nailed together, that the air may pals through them into the corn. In lome of thefe leffer trunks there may be fliding fhutters, in order to fop the paffage of the air through thofe trunks which are not covered with corn ; or to ventilate one part of the granary more brinkly than others, as there may be occafion. There mult alio be wooden flutters, lung on binges at their upper part, fo as to thut clofe of themfelves; thele mult be fixed to the openings in the walls of the granary on their outfide: by thefe means they will readily open to give a free paffage for the ventilating air, which afcends through the corn, to pafs off, but will intlantly thut when the ventilation ceales, and thereby prevent any dampnefs of the external air from entering : to prevent this, the ventilation thould be made only in the middle of dry days, unlefs the cern, when firft put in, is cold and damp.

In leffer granaries, where the ventilators mult be worked by hand, if thefe granaries ftand on ftaddles, fo as to have their lowefl foor at fome diftance from the ground, the ventilators may be fixed under the loweil flnor, between the Itaddles, fo as to be worked by men ftanding on the ground, without or within the granary. A very commodious and cheap ventilator may be made for fmall granaries, by making a ventilator of the door of the granary; which may be eafily done by making a circular fereen, of the fize of a quarter of a circle, behind the door: but in order to this, the doror mult be open, not inwards but outwards of the granary, fo that as it falls back, it may be worked to and fro in the fcreen; which muft be exa 81 y adapted to it in all parts of the circular fide of the fcreen, as well as at the top and bottom. But there mult be a ftop at about eight or ten inches diftance from the wall, to prevent the door's falling back farther; that there may be room for a valve in the fereen to Cupply it with air ; which air will be driven in by the door, through a hole made in the wall near the foor, into the main air-trunk, in which there muft be anocher valve over the hole in the wall, to prevent the return of the air.

To defroy weovils and other infats ruibl which Granarits are apt to be infigled. - The prefervation of grain from the ravages of infects may be bell effected by timely and frequent fercening, and ventilation; as little or no inconvenience will follow corn or malt lodged dry, but what evidently refults from a neglect of thefe precautions. For, whether the obvious damage arife from the weevil, the moth, or the beetle, that damage has cealed at the time the vermin make their appearance under either of thefe fpecies, they being, when in this lalt thate of exiftence, only propagators of their refpective kinds of vermiculi; which, while they continue in that form, do the mifchief.

In this lat, or infect tlate, they eat little, their principal bulinefs being to depolit their ova (eggs), which unerring inflinct prompts them to do where large collections of grain furnifh food for their fucceffors while in a vermicular fate. It is therefore the bufineds of induftry to prevent future generations of thefe ravagers, by deftroying the eggs previous to their hatching; and

Granary. this is bet accomplimed by trequent fereening, and ex-
$\square$ poture to Mrauglats of whe or frell air. By frequent ly hitime the grain, the collefon of their ova is brohen, and the nidus of thofe minute worms is deftroyed, which on hatching collect together, and fpin or weave numarous nells of a cobweb like fubtance for their fe. curisy. 'To thefe netts they attach, by an infinity of finell threads, many grains of corn together. find for their protection, and then for their food When their habrations are broken and feparated by the foreen, they fall throughits fmall interttices, and may be cafily semoved from the granary with the dult. Trofe that efcape an early fcreening will be dellroyed by fubfe. quent ones, while the grain is but little injured; and the corn will acquire thereby a fuperior purity. But by inattention to this, and fometimes by receiving grain already infected into the granary, thefe vermin, particularly the weevil, will in a fhort time fpread themfelves in that ftate every where upon its furface, and darken even the walls by their number. Under fuch circum. ftances a hen or hens, with new hatched chickens, if turned on the heap, will traverfe, without feeding (or very faringly fo) on the corn, wherever they fpread ; and are feemingly infatiable in the purfuit of thefe infeets. When the numbers are reduced within reach, a hen will fly up againft the walls, and brum them down with her wings, while her chickens leize them with the greatelt avidity. This being repeated as often as they wait food, the whole fpecies will in a day or two be deftroyed. Of the phaliena (moth), and the fmall beetle, they Seemequally voracious: on which account they may be deemed the molt ufeful inftruments in wature for eradicating thefe noxious and deftructive vermin.

GRANATE, or Garnet : a genus of foffils ranked among the filiceons earths; but, according to M. Magellan, analogous to gems, all of them being compoled of the tiliceous, argillaceons and calcareous earths, with a greater or lefs proportion of iron. The opaque and black garnets contain about a fifth part of iron; but the diaphanous ones only $\frac{1}{5}$ th, according to Bergman. The garnets, properly fo called, contain a crireater quantity of filiceous earth than the mirls, and buth are now jufly ranked with the filiceous earths, Tle general properties of the garmet, according to Cronlledt, are as follow: 1. lt is more fufible as it contains lefs metallic matter, and is more tranfparent or dally in its texture. 2. Mixed with falt of kelp, it inay, on a picce of charcoal, be converted into glafs by the blow-pipe, which cannot be done with flint. 3. 'Ibe mof tranfparent garnet may, without any adCition, be brought to a black opaque flag by the fame means. f. It is never, as far as is hitherto known, found pure, or withont fome mixture of metal, efpecially iron, which may be extracted by the common methods. 5. The garnet matter, during the cryftallization, has either been formed in fmall detached quantities, or clfe has had the power of thooting into cryflals, though clufly conlined in different fubftances: fince gamets are geserally found difperfed in other folid ftones, and oftentimes in the harder ones, fuch as quartz and chert. Fabroni informs us, that the garnet is eatily melted by means of borax or the vegetable alkali. Its fpecific gravity is greater than that of the precious fones; viz. from 3600 , and even from 4400
to 500c. According to Brunich, molt of the garnets Arike fire with fteel.

Cronftedt obferves, that the metallic calces, when mixed with other earthy fubitances, make great alteration in their fulibility ; iron, for inflance, in the argillaceous and micaceous earths, renders them fufible, tho' otherwife they are not fo. Hence there may be fome reafons for confidering the garnet as a quartz impregnated with iron; yet on the whole he thinks it will be better to call the garnet a llone of a different order, until we have experiments fufficient to warrant us to reduce the number of earths. The garnet earth is never found but in an indurated Itate; and is divided into the garnet properly fo called, and thirl or cockle; though this perliaps is owing more to the figure of their cryttals than any thing elfe. The fpecies are,

1. The granatus, or coarfe-grained garnet; a heavy hard tone, cryttallizing in form of polygonal balls, mottly of a red or reddifh brown colour. It is found of a reddith brown and whitith or pale yellow, in different parts of Sweden.
2. The granatus cryftallizatus, or cryltallized gar. net, is reckoned among the precious flones, but varying in its colour and form of its cryftal more than any of them. Sometimes it is of a deep and dark red colour; fometimes yellowifh or purplifi; fometimes brown, black, or opaque. It is inferior both in luftre and hardnefs to the other gems, yielding to the file, although it will Arike fire with fteel. The cryitals are fometimes irregular, but \{requently affume rhomboidal, tetradecahedral, and almoft all other regular forms.

Wallerius makes the fpecific gravity of the garnet from 3600 to 3800 , and even 4400 ; Driffen makes it 4100 ; and Cotes lays that the garnets of Bohemia are 4360 , thofe of Sweden being 3978. The molt efteemed is the Syrian garnet ; which is of a fine red, inclining to purple, very tranfparent, but lefs beautiful than the oriental anthylt. 'This, according to Masellan, is the amethylizontas of Pliny ; and is found in Syria, Calcutta, Cananor, Camboya, and Ethiopia. The foranus of the ancients was another kind of garnet of a red colour inclining to yellow, called vermeille by the French, and giocinto guarnacino by the Italians: the former having the name of rulino di rocca among the latt mentioned people. The name Soranus comes from Sorian or Suritn, a town of Pegu, from whence thefe gems are brought.

Sometimes the garnets have a yellow colour, in which cafe they obtain the name of byacinhs. Like other gems, they are divided into oriental and occidental ; but this means in fact no more than more or lefs valuable; the fineit ftones being always called oriental, wherever they come from. Some very fine ones are found in Bohemia; they are allo met with in Hungary, at Pyria in Silefia, S. Sapho in the canton of Berne in Switzerland, in Spain, and in Norway. Their colour is fuppofed to proceed from iron ; and, according to M. Sauflure, even the fueft oriental garnets attract the magnetic needle at a fmall diftance. In the focus of a good burning-glafs the garnet melts into a brown mals, which is attracted by the magnet; which fhows that iron enters into its compulition in a confiderable proportion. Some garnets, however, contain a little gold ; and fome, called by the Germans zingraufen, contain tin. M. Magellan is of opinion, that
the lapis alabandicus of Pliny, and another gem which he mentions of a deep purple, were both true garnets.
3. The cockle or thirl. See Cockle.

The garnets abound fo much with iron that they are fometimes worked with profit as ores of that metal; in which cafe no notice is taken of the natural character of the tone, in the fame manner as is done with clays and jafpers that contain iron; for in thefe the quantity of metal is gradually augmented, until at laft they acquire the appearance of iron itfelf. The greatelt part of this genus, however, contain only from fix to twelve per cent. of iron, which is too poor to be worked any where with advantage as an ore of that metal. When any of the garnet kind are to be tried for the metal they contain, the iron ought to be melted out of them by the common procefs; and if the garnet at the fame time contains tin or lead, thefe will likewife be included in the iron. They may be extracted out of it, however, by a heat gradually augmented; the lead and tin fweating out in form of drops, though al. ways fomewhat mixed with iron. None of the garnet kind have yet been found in the form of an earth properly fo called; though at Swappawari in Lapland, there is found a bole which has the fame figure with the garnet ; and the horneblende of the Swedes, which is fomewhat harder than this bole, has often the appearance of a cockle.
Grinatr-Pafle. See Garnet.
GRAND, a term rather French than Englifh, tho' ufed on many occations in our language. It has the fame import with great, being formed of the Latin grandis. In this fenfe we fay, the grand matter of an order, the grand maller of Malta, of the free mafons, \&c. So alio the grand-fignor, the grand-vifir, \&c. grand-father, grand-mother, \&c.

In the French polity and cuitoms there are feveral officers thus denominated, which we frequently retain in Englih; as grand almoner, grand ecuyer, grand chambellan, grand voyer, Sc.

## Grand-Alifze. See Assise.

Grand Diflrefs (dijlriatio magna), in Englih law, a writ of diftreis, Io called on account of its extent, which reaches to all the goods and chattels of the party within the county. This writ lies in two cafes: either when the tenant or defendant is attached and appears not, but makes default; or where the tellant or defendant bath once appeared, and after makes default. On fuch occations, this writ hes by common law, in lieu of a petit cape.

Grand Gufo, among painters, a term ufed to exprefs that thiere is fomething in the picture very great and extraordinary, calculated to furprife, pleafe, and inftruet. - Where this is found, they fay, the painter was a man of grand gufor; and they ufe the words fublime and narvellous, when they fpeak of a picture, in much the fame fente.

Grand Ÿury. larceny, ferjeanty, \&e. See Jury, \&e.
GKANDEE, is undertood of a lord of the firt rank or prime quality.

In Spain, the term grandees is ufed abfolutely to denote the prime lords of the court, to whom the king has once given leave to be covered in his prefence: there are fome grandees for life only; made by the king's faying fimply, Be covered. Others are grandees - Vol. VIII. PartI.
by defcent ; made by the king's faying, Be covered for Grandeur thyfelf and heirs. Thefe latt are reputed far above and the former.

There are fome who have three or four grandeethips in their family.

GRANDEUR and SUblimitr. Thefe terms Doubere fis. have a double fignification: they commonly fignify the nificaien. fig. quality or circumitance in objects by which the emotions of grandeur and fublimity are produced; fometimes the emotions themfelves.

In handling the prefent fubject, it is neceffary that the impreflion made on the mind by the magnitude of an object, abitracting from its other qualities, thould be afcertained. And becaufe ab!trattion is a mental operation of fome difficulty, the fafetl method for judging is, to choofe a plain object that is neither beautiful nor deformed, if luch a one can be found. The plaineit that occurs, is a huge mafs of rubbif, the ruins perlaps of cume extenfive building; or a large heap of ftuaes, fuch as are collected together for keeping in memory a battle or other remarkable event. Such an object, which in miniature would be perfectly indifferent, makes an impreffion by its magnitude, and appears agreeable. And fuppoling it fo large as to fill the eye, and to prevent the attention from wandering upon other objects, the impreffion it makes will be fo much the deeper. Sce Artention.

But thougha plain object of that kind be agreeathle, it is not termed srand: it is not intitled to that claracter, unlefs, together with its fize, it be poffeffed of other qualities that contribute to beauty, fuch as regularity, proportion, order, or colour: and according to the number of fuch qualities combined with magnitude, it is more or lefs grand. Thus St Peter's church at Rome, the great pyramid of ligypt, the Alps towering above the clouds, a great arm of the fea, and above all a clear and ferene fiyy, are grand; becaufe, befide their fize, they are beautiful in an eminent degree. On the other hand, an overgrown whale, having a difagreeable appearance, is not grand. A large building agreeable by its regularity and proportions, is grand; and yet a much larger building dettitute of regularity, has not the leaft tincture of grandeur. A fingle regiment in battle-airay, makes a grand appearance; which the furrounding crowd does not, though perhaps ten for one in number. And a regiment where the men are all in one livery, and the horfes of one colour, makes a grander appearance, and confequeutly trikes more terrur, than where there is confution of colour and drefs. Gran'e ${ }^{2}$ Thus greatneis or magnitude is the circumftance that dran', enguifh. diltinguifhes grandeur from beauty: agreeablenefs is $e 1$ from the genus, of which beauty and grandeur are fpecies. beauty.
The emotion of grandeur, duly examined, will be found an additional proof of the foregoing doctrine. That this emotion is pleafant in a high degree, requires no other evidence but once to have feen a grand object: and if an emotion of grandeur be pleafant, its caufe or object, as obferved above, muft infallibly be agreeable in proportion.

The qualities of grandeur and beauty are not more diftinct, than the emotions are which thefequalities produce in a fpectator. It is obferved in the article Beauty, that all the various emotions of beauty have one common character, that of fweetnefs and gaiety. The emotion of grandeur has a different cha-

N
racter:

Gran'ear ras: : = '.urge object that is arrecable, occupics the and uhbe attertion, and fivelis the heat into a vivid cmoSubmiry tion wheh, hough extremedy plealant, is rather ferious than gay. And this allords a good reaton for dutinguifing in lansuage thefe different emotions. The emotions raifed by colour, by regulanity, by propotion, and by order, have fuch a refemblance to each other, as readily to come under one general term, viz. the emorion of becuty; but the emotion of grandeur is fo different from thefe mentioned, as to merit a peen-
liar name.
Though regularity, proportion, order, and colour, contribute to grameur as well as to beauty, yet thefe qualities are not by far fo effential to the former as to the latter. To make out that propufition. fone preliminaries are requilite. In the firlt place, the mind, not heing toially occupied with a fmall object, ean give its attention at the fame time to every minute part ; but in a great or extenlive object, the mind, being totally occupied with the capital and friking parts, has no attention left for thofe that are little or indifferent. In the next place, two fimilar objects appear not fimilar when viewed at different diltances: the fimilar parts of a very large object, cannot be feen but at different diItauces; and for that reafon, its regularity, and the proportion of its parts, are in fome meafure loft to the eye; neither are the irregularities of a very large object fo confpicuous as of one that is fmall. Hence it is, that a large object is not fo agreeable by its regularity, as a fmall object; nor fo difagrecable by its irregularities.

Thefe confiderations make it evident, that grandeur is fatisfied with a lefs degree of regularity, and of the other qualities mentioned, than is requifte for beauIy; which may be illuftrated by the following experiment. Approaching to a fmall conical hill, we take an accurate furvey of every part, and are fenfible of the nlighteft deviation from regularity and proportion. Suppofing the litl to be confiderably enlarged, fo as to
make us lefs fenfible of its regularity, it will upon that account appear lefs beautirul. It will not, however, arpear lefs agreeable, becaufe fome flight emotion of grandeur comes in place of what is loft in beatif: And at laft, when the hill is enlarged to a great mountain. the fmall degree of beanty that is If fr, is fonk in its granderr. Hence it is, that a mowring hill is delightful, if it have but the flighteft refembiance of a cone; and a chain of mountains not I.fs fo, though delicient in the accuracy of order and proportion. We require a fmall furface to be fmooth; hut in an extenfave plain, confiderable inequalities are overlooked. In a word, regularity, proportion, order, and colour, contribute to grandeur as well as to beauiy; but with a remarkable difference, that in paffing from fmall to great, they are not required in the fame r!-gree of perfection. This remark ferwes to explain the extreme delight we have in viewing the face of nature, when fufficiently enriched and diverfitied with objeck. The bulk of the objects in a natural landicape ase boutibu, and fome of them grand: a flowing rirer. a fpreaditig, oak, a round hill, an extended plain, ore delightful; and even a rugged rock, or barren heath, though in themfelves difagreeable, contribute by contran :o the beaty of the whole; juining to thefe the verdure of the fulds, the mixture of lightand thade,
and the fublime canopy fpread over all; it will not appear wonderful, that fo extenfive a group of fplendid objects thould lwell the heart to its utmoft bounds, and raife the fto onget emotion of grandeur. The fpectator is confcious of an enthufiafm which cannot bear confinement, nor the flrictnefs of regularity and order: he loves to range at large; and is fo enchanted with magnificent objects, as to overlook night beauties or deformiries.

The fame obfervation is applicable in fome meafure Sublini to works of art. In a fmall building, the fighteft irregularity is difagreeable: but in a magnificent palace, or a large Gothic chureh, irregularities are lefs regarded. In an epic poem, we pardon many negligences that would not be permitted in a Connet or epigram. Notwithitanding fuch exceptions, it may be jufly laid down for a rule, That in works of art, order and regularity ought to be governing principles; and hence the obfervation of Longinus, "In works of art we " have regard to exact proportion; in thofe of nature, " to grandeur and magnificence."

The fame reflections are in a good meafure applicable to fublimity : particularly that, like grandeur, it is a fpecies of agreeablenefs; that a beautiful object placed high, appearing more agreeable than formerly, produces in the fpectator a new emotion, termed the emotion of fullimity; and that the perfection of order, regularity, and proportion, is lefs required in objects plaeed ligh, or at a ditanee, than at hand.

The pleafant emotion raifed by large objects, has not efcaped the poets:

The poets have allo made good ufe of the emotion produced by the elevated fituation of an object :

The defcription of Paradife in the fourth book of

Peur Paradife L.of, is a fine illuftration of the impreffion made by elevated objects :
So on he fares, and to the barder comcs
Of Eden, where delicious Paradite,
Nuw nearer, crowns with her inchfure green, As with a rural mound, the champaint head With a feep wildernef; whofe hairy fides Of thicket overgrown, grotefque and wild, Accefideny'd; and over head up grew Infuperable height of loftieft hade, Cedar, and piuc, and fir, and branching paln,
A fyivan fecne; and as the ranks afiend, Shade aloove fhade, a noody theatre Of flatelieft vicw. Yet higher than their tops The verd'rour wall of Paradife up fprung ; Which to our general fire gave profpect large Jnto his nether emy ire, neighb'ing round. Aud higher than that wall a circlug row Of goodlieft erces, tuaden with faireft fruit, Blofloms and fruits at ouce of koiden hue, Appear'd, with gay cnamell'd culours mia'd. 2. 13 r.
Though a grand object is agreeable, we mult not intfer that a little object is difagreeable; which would be unhappy for man, confidering that he is furrounded with fo many objects of that kind. The fame holds with refpect to place: a body placed high is agreeable; but the fame body placed low, is not by that circumflance rendered difagreeable. Littlenefs and lownefs of place are precifely fimilar in the following particular, that they neither give pleafure nor pain. And in this may vilibly be difcovered peculiar attention in fitting the internal conlitution of man to his external circumflances. Were littlenefs and lownefs of place agreeable, greatnefs and elevation could nut be fu: were littlenefs and lownefs of place difagreeable, they would occafion uninterrupted uneafinefs.

The difference between great and little with refpect to agreeablencfs, is remarkably felt in a feries when we pafs gradually from the one extreme to the other. A mental progrefs from the capital to the kingdom, from that to Europe一to the whole earth-to the planetary fyttem-to the univerfe, is extremely pleafant: the heart fwells, and the mind is dilated at every flep. The returning in an oppofite direction is not pofitively painful, though our pleafure leffens at cvery flep, till it vanifh into indifference: fuch a progrefs may fometimes produce pleafure of a different fort, which arifes from taking a narrower and narrower infpection. The fame obfervation lulds in a progrefs upward and downward. Afcent is pleafant becaufe it elevates us; but defeent is never painful: it is for the molt part pleafant from a different caufe, that it is according to the order of nature. The fall of a tone from any height, is extremely agreeable by its accelerated motion. We feel it pleafant to defcend from a mountain, becaufe the defcent is natural and cafy. Neither is looking downward painful; on the contrary, to look down upon objects, makes part of the pleafure of elevation: looking down becomes then only painful when the object is fo far below as to create dizzinefs; and even when that is the cafe. we feel a fort of pleafure mixed witb the pain: witnefs Shakefpeare's defeription of Dover cliffs:

[^2]The Gillermen that walk upon the beach
Appear like mice; and yontall anchormes bark
Diminaf'd to her cock; her cock, a broy

\text { King Lesr, act + fc. } 6
$$

A remark is made above, that the emotions of grandeur and fublimity are nearly allied. And hence it is, that the one term is frequently put for the other: an increafing feries of numbers, for example, producing an emotion fimilar to that of mounting upward, is commonly termed an afcending ferics: a feries of numbers gradually decreating, producing an emotion fimilar to that of going downward, is commony termed a defcending feries: we talk familiarly of going up to the capital, and of going dozon to the country: from a leffer kingdons we talk of going up to a greater; whence the cmabrifs in the Greek language, when one travels from Greece to Perfia. We difoover the fame way of fpeaking in the lanquage even of Japan ; and its univerfality proves it the offopring of a natural feeling.

The foregoing oblervation leads us to confider Grandeur grandear and fublimity in a figurative fente, and as and fut iapplicable to the fine arts. Hitherto the fe terms mify ${ }_{\text {figa }}$ arive have been taken in their proper fenfe as applicable to fonfe. objcets of fight only: and it was of importance to befow fome pains upon that article; becaufe, generally〔paking, the figurative fenfe of a word is derived from its pioper fenfe, which bolds remarkably at prefent. Beauty, in its original lignification, io confined to objects of fight ; but as many other objects, intellectual as well as moral, raife eunotions refembling that of beauty, the refemblance of the effects promptsus to extend the te:m beauty to thele objects. This equally accounts for the terms grandeur and fublimity taken in a figurative fenfe. Evcry emotioth, from whatever caufe proceeding, that refembles an emution of gra:deur or elevation, is called by the fame name : the: generolity is faid to be an elevated emotion, as well as great courage; and that lirmnefs of foul which is fuperior to misfortunes obtains the peculiar name of magnanimity. On the other hand, evtry emotion that contracts the mind, and fixeth it npon things trivial or of no importance, is termed lorv, by its refemblance to an emotion produced by a little or low object of right: thus an appetite for trilling amufements is called a lowe tafle. The fame terms are applied to characters and actions: we talk familiarly of an elverated genius, of a grat man, and equally fo of fitlonefs of mind: fome actions are great and elevated, and others are lithe and groveling. Sentiments, and even exprefions, are The i...bcharacterifed in the lame manner: an expection or hane in fentiment that raifes the mind is denominated seat or 1 oetry. elevated; and hence the SUBLIME in poerry. In fuch figurative terms, we lofe the diftinctio: between great and elovated in their proper fenie; for the refemblance is not fo entire as to preferve thefe terms diflinct in their figurative applicatiou. We carry this figure Atill farther. Elevation, in its proper fenfe, inporta fuperiority of place; and lownefs, inferiority of place: and heace a man of fuperior talents, of fuperior rank : of inferior parts, of infcrior tafte, and fuch like. The veneration wc have for our anceftors, and for the ancieyts in general, being fimilar to the emotion produced by ant

Frandeu: clerated object of fight, jultifies the figurative expreflion and

Real and
figurative fratuetur intimatcy sunnected. of the ancients being raijed above us, or polfening a futcrior place. The notes of the gamut, proceeding regularly fro n the blunter or graffer founds to the more acute and piencing, produce in the hearer a feeling fonmenat fimilar to what is produced by mounting upwart; and this gives occafion to the figurative expreffrons a bight mete, a lua nole.

Such is the refemblance in feeling between real and figurative grandeur, that among the nations on the eat coall of Afric, who are diredted purcly by nature, the officers of thate are, with refpect to rank, ditinguifhed by the length of the batoon each carries in his hand; and in Japan, princes and great lords fhow thear rank by the length and fize of their fedanpoles. Again, it is a rile in painting. that fogures of a fmall fize are proper for grotefque pieces; but that an hiftorical futject, grand and impostant, requires tigurs as great as the life. The refemblance of thefe feelings is in reality fo ftrong, that elevation in a figurative fonfe is obferved to have the fame effect, cven externa!ly, with real elevation:

## K.. Heny. This day is calid the featt of Cribipan.

 Fie thate nutlives $t^{1}$ is das, and comes fate home, Vill hand a $i_{j}$ toe when this day is nam'd, Aud roufe hini at the name of Crifpan$$

$$

The refemblance in fecling between real and figurative grandeur is humorounty illutlrated by Addifon in criticiling upon Englifh tragedy*. "I'he ordinary method of making an hero is to clap a luge plume of feathers upon his head, which rifes fo high, that there is often a greater length from his chin to the top of his head than to the fole of his foot. One would believe, that we thought a great man and a tall man the fame thing. As thefe fuperfluous onaments upon the lead make a great man, a princefs generally receives fer grandeur from thofe additional incumbrances that fall into her tail: I mean the broad fweeping train that follows her in all her motions, and finds conllant employment for a boy who ftands behind her to open and fpread it to advantage." The Scythians, impreffed with the fame of Alexander, were aftonifhed when they found him a litule man.

A gradual progrefs from fmall to great is not lef3 remarkable in firrurative than in real grandenr or elevation. Every one mult have oblerved the delightful effect of a number of thoughts or fentiments, artfully difpofed like an afcending feries, and making impreffions ietper and deeper: fuch difpofition of members in a period is termed a climax.

Within certain limits grandeur and fublimity produce their ftrongelt effects, which leffen by excefs as well as hy defect. This is remarkable in grandeur and fublimity taken in theis proper fenfe: the grandeft emotiun that can be raifed by a vifible object is where the object can be taken in at one view; if fo immenfe as not to be comprehended but in parts, it
tends rather to diftrast than fatisfy the mind $(A):$ in like manner, the ftrongeft emotion prodnced by ele. vation is where the object is feen diftinctly; a greater elevation leffens in appearance the object, till it vanifh out of fight with its pleafant emotions. The fame is equally remarkable in figurative grandeur and Figuraı elevation; which fhall be handled together, becaufe, as grande obferved above, they are fearce diftinguimable. Sentiments may be fo thrained as to become obfeure, or to timents may be fo trained as to become obfeure, or to
exceed the capacity of the human mind : againt fuch licence of imagination, evory good writer will be upon
his guard. And therefore it is of greater importance licence of imagination, evcry good writer will be upon
his guard. And the refore it is of greater importance to obferve, that even the ture fullime may be carritd beyond that pitch which produces the highelt enterthinment. We are undoubtedly fufceprible of a greater elcuation than can be infpired by human actions the molt heroic and margnanimous; witnefs what we feel from Milton's defcription of fupcrior beings: yet every man mult be fenfible of a more conttant and fweet elevation when the hiftory of his own fpecies is the fubject: he enjuys an elevation equal to that of the greatell hero, of an Alexander or a Cafar, of a Brutus or an Epaminondas: he accompanies thefe hebrutus or an epaminondas: he accompantes thete he-
roes in their fublimett fontiments and mot hazardons exploits, with a magnanimity equal to theirs; and finds it no flretch to preferve the fame tone of mind for hours together without finking. The cafe is not the fame in deforibing the actions or qualities of fuperior beings: the reader's imagination cannot keep pace with that of the poet; the mind, unable to fupport itfelf in a frained clevation, falls as from a height; and felf in a itrained eleration, falls as from a height; and
the fall is immoderate like the elevation: where that effect is not felt, it muft be prevented by fome abfeurity in the conception, which frequently attends the deferiptions of unknown objects. Hence the St Francifes, St Dominics, and other tutelary faints among the Roman Catholics. A mind unable to raife itfelf to the Supreme Being felf-exiltent and eternal, or to fupport itfelf in a ftrained elevation, finds itfelf more at port itfelf in a frained elevation, finds itfelf more at
eafe in ufing the interceflion of fome faint whofe piety and penances while on earth are fuppofed to have made him a favourite in heaven.

A flrained elevation is attended with another inconvenience, that the author is apt to fall fuddenly as well as the reader ; becaufe it is not a little difficult to defcend, fweetly and eafily, from fuch elevation to the ordinary tone of the fubject. The following paffage is a good illuftration of that obfervation:

> Sxpe ctiam immenfum colo venit agmen aquarum,
> kt fefum glomerant tempeftatem imbribus atris Conlectix ex aloo nubes. Ruit arduus ether, Et pluvia isgenis lata leta bounque labire, Diluit. (a) It is juftly obferved by Addifon, that perhaps a man would have been more aftonifhed with the majectic air that appeared in one of Lyfippus's ftatues of Alexander, though no bigger than the life, than he might have been with Mount Athos, liad it been cut into the figure of the hero, according to the propofal of Phidias, with a river in one hand and a city iat the other. Spectator, $\mathrm{N}^{2} 415$.

## G R A [ 109$] \quad G \quad R \quad A$

andeur In the defcription of a form, to fgure Jupiter throwing down huge mountains with his thunderbolts, is hyperbolically fublime, if we may ufe the expreflion: the tone of mind produced by that image is fo diftant from the tone produced by a thick fhower of rain, that the fudden tranfition mult be unpleafant.

Objects of fight that are not remarkably great nor high, fcarce raife any emotion of grandeur or of finblimity: and the fame holds in other objects; fur we often find the mind roufed and animated, without being carried to that beight. This difference may be difcerned in many forts of mufic, as well as in fome mufical influments: a kettle.dium roufes, and a hautboy is arimating; but neither of them infpires an t motion of fublimity: revenge animates the mind in a conliderable degree; but it never produceth an emotion that can be termed grand or fublime; and perhaps no difagreeable paffion ever has that effect.

No defire is more univerfal than to be exalted and honoured; and upon that account, chiefly, are we ambitious of power, riches, titles, fame, which would fuddenly lofe their relifh did they not raife us above others, and command fubmiffion and deference : and it may be thought, that our attachment to things grand and lofty, proceeds from their connection with our favourite paffion. This conuection has undoubtedly an eficct ; but that the preference given to things grand and lofty mull have a deeper root in human nature, will appear from confidering, that many beflow their time upon low and trifing amufements, without having the leaft tincture of this favourite paffion : yet thefe very perfons talk the fame language with the reft of mankind; and prefer the more elevated pleafures: they acknowledge a more refined tafte, and are afhamed of their own as low and groveling. This fentiment, conflant and univerfal, muft be the work of nature; and it plainly indicates an original attachment in human nature to every object that elevates the mind: fome men may lave a greater relifh for an object not of the higheft rank; but they are confcious of the preference given by mankind in general to things grand and fublime, and they are ferifible that their peculiar talte ought to yield to the general talle.

What is faid above fuggefts a capital rule for reaching the fublime in fuch works of art as are fufceptible of it; and that is, to prefent thofe parts or circumftances only which make the greateft figure, keeping out of view every thing low or trivial; for the mind, elevated by an important ubject, cannot, without relnctance, be forced down to betlow any Thare of its attention upon trifles. Such judicious felection of capital circumfances, is by an eminent arts is there fo great foope for that rule as in poetry; which, by that means, enjoys a remarkable power of beflowing upon objects and events an air of grandeur: when we are fpectators, every minute object prefents itfelf in its order ; but in defcribing at fecond hand, thefe are laid afide, and the capital objects are breught clofe together. A judicious talle in thus fe. lecting the moft interefting incidents, to give them an united force, accounts for a fact that may appear furprifing; which is, that we are more moved by fpirited
narra:ive at fecond hand, than ly being fpenators of Grandeur the event itfelf, in all its circumitances.

Longinus $\dagger$ exemplifies the furegoing rule by a com. Sullimity. parifon of two paffages.
$+C b a p .8$.

Ye pow'rs, what mainef! hnow on finips fo frall
(Tremencous th ught!) ean thoush:lefs mortals fiil?
For ftormy feas they quit the pleafing plain,
Plant woods i:l waves, and dweal ammate the mai:.
Far u'er the deep (a trackiefs path) they go, And wander oceane ill purfurt of wo.
No eafe their hearts, no sent therr eyev con find, On heaven their tonks, and o:1 the waves therr mind; Sunk arc their firits, while chear arnm the) rear, Aud gods are wearied with their fouthefo prayer:

Buint as a wave that from the cloud inpends, An! fwell'd with tentpetts on the finip defcends. White are the decks with foam: the windualoud H wifo'er the mafte, and fing throughevery fhroud. Pale, trembling, tir's, the fallors frceze with fuars, And iattant death on every wave appears. Homer.

In the latter paffage, the mof friking circumftances are felected to fill the mind with terror and allonifhment. The former is a collection of minute and low circuinflances, which fcatter the thought, and make no impreflion: it is at the fame time full of verbal antithefes and low conceit, extremely improper in a feene of diltrefs.

The following defcription of a battle is remarkably fublime, by collecting together, in the fewen words, thofe circumftances which make the greateft figure.
"Like antumn's dark florms pouring from two echoing hills, toward each other approached the heroes; as two dark flreams from high rocks meet and roar on the plain, loud, rough, and dark in battle, meet Lochlin and Inisfail. Chief mixes his Arokes with chief, and man with man: fteel founds on fteel, and helmets are cleft on high: blood burlts and fmokes around: ftrings murinur on the polifh'd yew : darts ruh alung the fly: fpears fall like fparks of flame that gild the formy face of night.
"As the noire of the troubled ocean when roll the waves on high, as the laft peal of thundering heaven, fuch is the noife of battle. Though Cormac's hundied bards were there, feeble were the voice of a huidred bards to fend the deaths to future times; for many were the deaths of the heroes, and wide poured the blood of the valiant.". Fingal.

The following paffage in the th $^{\text {th }}$ hook of the Iliad is a defeription of a battle wonderfully ardent. "When now gathered on either fide, the hots plunged together in fight; hield is harfhly laid to thetd; fpears crah on the brazen corflets; bofly buckler with buckler meets; loud tumult rages over all ; groans ase mixed with boalts of men; the flain and flayer join in moife; the earth is floating round with blood. As when two ruhing ftreams from two mountains come roaring down, and throw together their rapid waters below, they roar along the gulphy vale; the flartled fhepherd hears the fonud as he ftalks o'er the diftant hiills: fo, as they mixed in fight, from buth armies clamour with loud terror arofe." But fuch general defcriptions are not frequent in Homer. Even his. fingle combats are rare. The fifth book is the longeft account of a batile that is in the Iliad; and yet contains nothing but a long catalogue of chiefs killing

Grandeur and Sublinity.
chiefs, not in fingle combat neither, but at a dittance with an arrow or a javelin; and thefe chiefs named for the firt time and the laft. The fame fcene is continued through a great part of the lixth book. There is at the fame time a minute defeription of every wound, which for accuracy may do honour to an anatomit, but in an epic poem is tirefome and fatiguing. There is no relief from horrid languor but the beautiful Greek language and melody of Homer's vertification.

In the twenty. firf book of the Odyfles, there is a paffage which deviates widely from the rule above laid down: it concerns that part of the hiltory of Penelope and her fuitors, in which the is made to declare in favour of him who fhould prove the molt dexterous in thooting with the bow of Ulyfles:
N sw gently winding up the fair afecnt,
By many an eafy ftep the matron went:
Then o'er the favement glides with grace divine
(With phin'd oak the level pavemel is fhine).
The folding ga'es a dazzling light diff lay'd,
With iomp of varous archierave o'crlaid.
"lhe but, obedtent to the filken aring,
10nfore the fraple as the pulls the mos;
The wird-aprondent to the key turn'd rand;
The! so sa! kack: the thong volven refound.
Lud as a buld nakes hil and valley ring,
the mover majefte the ush the weathy room,
Where treafurdgarmerte cafi a rech perfume:
There, fr om the column where alont it hung,
Reachit, in its fplendutcafe, the bow unfirung.

Virgil fometimes errs againft this rule: in the following paffages minute circumftances are brought into full view; and what is ftill worfe, they are defcribed with all the pomp of poctical diction, Encid, L. i. 1. 214 , to 219 . L. vi. 1. 176 , to 182 . L. vi. 1. 212 , to $23^{1}$ : and the lalt, which defcribes a funeral, is the lefs excufaole, as the man whofe funeral it is makes no figure in the poem.

The fpeech of Clytemuetra, defcending from her chariot, in the Iphigenia of Euripides*, is tuffed with a number of conmon and trivial circumblances.

But of all writers, Lucan in this article is the moll injudicius: the fea-fight between the Romans and Aiafilians $\dagger$, is deferibed fo much in detail, without exhibiting any grand or total view, that the reader is fatigued with endlefs circumflances, without over fecling any degree of elevation; and yet there are fome fine incidents, thofe, for example, of the wo brothers, and of the old man and his fon, which, taken feparately, would affeet us greatly. But Lucan, once engaged in a defcription, knows no end. Sce other paflages of the fame kind, L. iv. l. 292, to 337. L. iv. 1. 750 , to 765. The epifode of the forcerefs Erictho, cand of book fixth, is intolerably minute and prolix.

This rule is alfo applicable to other fine arts. In painting it is eftablifhed, that the principal figure mult be put in the flrongell light; that the beauty of attitude confifts in placing the nobler parts moll in view, and in fupprefing the fmaller parts as much as poffible ; that the folds of the drapery mutt be fiw and large ; that forethortenings a e bad, becaule they make the parts appear little; and that the mufcles ought to be kept as entire as poffible, without being divided into fmall fectione. Every one at prefent fubfuribes to that rule as applied to gardening, in oppofition to
parterrea fpit into a thoufand fmall parts in the fiffett regularity of hyure. The mot eminent arehitects have governd themflves by the fatme rule in all their works.

Another rule chiefly regards the fublime, though it General is applicable to evtry fort of literary performance in- termsougt: tended for amuiement ; and that is, to avoid as much to be avoic as puffible abtract and general teims. Such terms fimilar to mathematical figns, are contrived to exprofs our thoughts in a concife manner; but images, which are the life of poetry, cannot be raifed in any perfection but by introducing particular objects. General terms, that compretiend a number of individuals, muft be excepted from that rule: our kindred, our clan, our country, and words of the like import, though they fearce raife any image, have, however, a wonderful power over the pafions: the greatnefs of the complex object overbalances the obfcurity of the image.

Grandeur, being an extreme vivid emotion, is not readily produced in perfection but by reiterated impreflions. The effect of a dingle impreffion can be but mumentary; and if one feel fuddenly fomewhat like a fwelling or exaltation of mind, the emotion vanifheth as foon as felt. Single thoughts or fentiments are often citcd as examples of the lublime; but their ©ffect is far inferior to that of a grand fubject difplayed in its capital parts. We thall give a few examples, that the reader may judge for himfelf. In the famous action of Thermopyla, where Leonidas the Spartan king $_{2}$ with his chofen band, fighting for their country, were cut off to the laft man, a faying is reported of Dieneces, one of the band, which, expreffing cheerful and unditurbed bravery, is well intitled to the firt place in examples of that kind: talking of the number of their enemies, it was ubferved, that the arrows fhot by fuch a multitude would intercept the light of the fun; "So much the betier (fays he"), for we thall then light in the Thade."
Soncifet. Ala! Warwick, Warwick, wert thou as we are, We mught recover ail our lef again.
The Quen froar Fiance hath bruught a puilfaut power.
Ev'naw we heard the nows. Ah! cuuld'it thou fy!
Hicuracik. Why, then 1 would not fly.
Third purt, Henry V'I. act \& [c. 3 .
Such a fentiment from a man expiring of his wounds, is truly heroic; and mult clevate the mind to the greateft height that can be done by a fingle expreflion: it will not fuffer in a comparifon with the famous fentiment 2 u'il mourut of Corneille: the latter is a fentiment of indignation mercly, the former of firm and cheerful courage.

To cite in oppofition many a fublime pafige, enriched with the fineit images, and dreffed in the moft nervous exprefions, would fcarce be fair. We flall produce but une intlance, from Shakefpeare, which fits a few objects before the eye, without much pomp of language: it operates its effect by reprefenting thefe objects in a climax, raifing the mind higher and higher till it feel the emotion of grandeur in perfection:

> The cloud-capt tow's, the gorgeous palaces,
> The fo!em: enpies, the great g'obe itfe'f,
> Iea, ail which w inhernt, Thall diflolve, \&ec.

Tbe cloud-capt tacu'rs produce an elevating emotion, heightened by the gorzeons palaces; and the mind is carried till higher and higher by the images that fol-
andeur low. Suecefive images, making thus Rronger and
ftronger impreffons, mull thevate more than any fiugle image can do.

As, on the one hand, no means directly applied have mole influence to raife the mind than grandeur and fublimity ; fo, on the other, no means indirectly applied have more influence to firk and deprefs it: for in a flate of elevation, the artful introduction of an humbling object, makes the fall great in proportion to the devation. Of this obfervation Shakefpeare gives a beautiful example in the paffage lat quoted:
The cloud capt tow'rs, the geryeous $/$ a!acer,
"J he folmma temp'c., the getar plohestelî́,
lea, all whi he inhe it, nall wifl lve,
And like the bufelefo fabric of a vifion
Leave not a wieck behend - - Tempef, act + Pc. 4

The elevation of the mind in the farmer part of this beautiful paffage, makes the fall great in proportion, when the moft humbling of all images is introduced, that of an utter diffolution of the earth and its inhabitants. The mind, when warmed, is more fufeeptible of impreffions than in a cool flate; and a depreffing or melancholy object liftened to, makes the frongeft impreflion when it reaches the mind in its highef flate of elevation or cheerfulnefs.

But a hunubling image is not always neecflary to produce that effect : a remark is made above, that in deferibing fuperior beings, the reader's imagination, unable to fupport itfelf in a flrained elevation, falls eften as from a height, and funks even below its ordinary tone. The following inflance comes luckily in vien; for a better cannot be given: "God faid, Let there be light, and there was light." Longinus quotes this paffage from Mofes as a fhining example of the fullime; and it is fcarce poffible, in fewer words, to conver fo elear an image of the infinite poucr of the Deity: but then it belongs to the prefent fubject to remark, that the emotion of fublimity raifed by this image is but momentary; and that the mind, unable to fupport itfelf in an elevation fo mueh above nature, immediatcly finks down into hunaility and veneration for a lieing fo far exalted above groveling mortals. Every one is aequainted with a difpute about that paffage between two French crities *, the one pofitively affirming it to be fublime, the other as pofitively denying. What bas been remarked, fhows, that both of them have reached the truth, but neither of them the whole truth : the primaly effect of the paffage is undoubtedly an emotion of grandeur; which fo far juftifies Boileas: but then every one mult be fenfible, that the emotion is merely a flafh, which, vanifling inflantaneoulf, gives way to humility and vereration. That indirect effect of fublimity juftifies Huet, on the other hand, who being a man of true piety, and probably not much carried by imagination, felt the humbling paffions more fenfibly than his antagonift did. And laying afide difference of charater, Huct's opinon may perhaps be defended as the more folid; becaufe, in fuch images, the deprefting emotions are the more fenlibly felt, and have the longer endurance.

The flraining an elevated fubject beyond due bounds, and beyond the reach of an ordinary conception, is not a vice fo frequent as to require the correction of criticifm. But falfe fublime is a rock that writers of
more fire than judgment commonly fplit on ; and Grandeur therefore a collection of examples may be of ufe as a and beacon to future adventurers. One fpecies of falfe fu- Sublimity. blime, known by the name of lombaf, is common among writers of a mean genius: it is a ferious endeavour, by ftrained defeription, to raife a low or familiar fubject above its rank; which, inftead of being fublime, lails not to be ridiculous. The mind, indeed, is extremely prone, in fome animating paffions, to magnify its objucts beyond natural bounds: but fuch hyperbolical defeription has its limits; and when carried beyond the inpulfe of the propenfity, it degenerates inta burlefque. Take the following examples:

```
    Sejanus.——————eat and hi_h
The word knows only two, thar's Rume and \(t\).
My roff fectives me not: "tis air ltitad,
And at each ficp I frel my advanc'd head
Knock ,ut a flar it heavin. S.jonus, Bon fobnen, af j.
```

A writer who has no natural elevation of mind deviates readily into bombalt: he ftrains above his natural puwers; and the violent effort carries him beyond the bounds of propriety.
G.ifford. Give way, and let the gunaing torrent come;

B ho'd the tears we bring to fwell the deluge,
Till the for drife upen the guilty world, And nake the ruin common.
Lady foame Grey, acg , weur the end

Another fpecies of falfe fublime is fill more faulty than bombaft: and that is, to force elevation by introducing imaginary beings without preferving any propriety in their actions; as if it were lawful to aferibe every extravagance and inconfifence to beings of the poet's creation. No writers are more licentious in that article than Johnfon and Dryden:

Methirks) fee Death and the Furies wating
What we will in, and all the t caven at leifure
For the great fpectacle. $D$ ww then our fwords:
And if cur defliny ef vy cur virtue
The honour f the day: yet lee us care
Tofell ou felven at fuch a price, as may
Undo the world to buy u-, and make Fate,
While the etmpto our, to fear her own trate Catiline, aft 5.
————The Furies fond no lills
(vireling the place, and uterubled to fee men
Du more timathey: whin Picty lett the field,
Cricv'd fir :hat fide, that in fo bad a coufe
They krew not what a crime their valuor wa:
The Sun too. 1 dill, and was, belind the clond
The battle made, feen fweating to drive up
His frighed horfe, whina fall the noife drove hackwatd.
Jbe.t. ac7 5
Ojmpn. Whi'e we indule nur eommon happint fs,
He is forgot by whom we all poffef,
The hrave Alminazor, to whole arms we owe
All that we did, and all that we flall do;
Who like a :empent that outrides the wind, Mate a juf battle ere the bocie join'l. AldAli'a. His vickories we fearce could kecp in view, Or polifh 'cm fo faft as he rough drew. Abuemelech. Fate after him below with pain did move, And V:cीory could farce keep pacc aboye. Death ril at length fo many flain forget, And loft the tale, and took 'cm by the great. Congueft of Graraciu, ald 2. at beginning
An actor on the ftage may be guily of bomball as well as an author in his clofet: a ceitain manner of acting, which is grand when fupported by dignity in the fentiment and force in the expieffion, is ridiculous where the fentiment is mean and the expreffion flat.

GAIND-

Grandgor GRANDGOR is ufed in Scotland for the pox. In have a proclamation of king James IV. of Scot-
land, ordering all who had this difiafe, or who had attended others under it, furthwith to repair to an illand in the Fith of Forth. If the grandgor was the pox, and this diftemper came into Europe at the fiege of Naples in 1495, it mutt have made a very quick progrefs to caufe fuch an alarm at Edinburgh in $1+97$.

GRANGE, an ancient term for a barn or place wherein to lay up and threfh corn. The word is formed of the Latin granea; or of gramur, " grain, corn," \&c. Hence alfo granger or grangier," a grangekeeper or farmer."

Grange is alfo ufed, in a more extenfive fenfe, for a whole farm, with all the appendages of flables for horfes, ftalls for catte, \&c. and for an imn.

GRANI, in our ancient Writers, muftachoes or whifkers of a beard. The word feems formed from the ancient Britifh or Irifh greann, "a beard." It is given for a reafon why the cup is refufed to the laity, Quia barbaii, ※ prolixos babent aranns, dum pocuhum inter equlas fumunt, prius liquore pilos inficiunt, quam ori infundunt.

GRANICUS, a fmall river near the Hillefpont in Leffer Afia, remarkable for the firft victory gained by Alexander the Great over the armies of Darius.Authors difagree very much ahout the number of the Perfians, though all agree that they were vaftly more numerous than the Greeks. Jultin and Orolius tell us, that the Perlian army confifted of 600,000 foot and 20,000 horfe; Arrian makes the foot amount to 200,000; but Diodorus tells us, that they were not more than 100,000 foot and 10,000 horfe. The Macedonian army did not exceed 30,000 foot and 5000 horfe. The Perfian cavalry lined the banks of the Granicus, in order to oppofe Alexander wherever he fhould attempt a paffage; and the foot were pofted behind the cavalry on an eafy afcent. Parmenio would have had Alexander to allow his troops fome time to refresh themfelves; but he replied, that, after having croffed the Hellefpont, it would be a difgrace to him and his troops to be fopped by a rivulet. Accordingly a proper place for crofing the river was no fooner found, than he commanded a flrong detachment of horfe to enter; he himfelf followed with the right wing, which he commanded in perfon ; the trumpets in the mean timc fonnding, and loud fhouts of joy being heard through the whole army. The Perfians let fly fuch fhowers of arrows againft the detachnent of Macedonian horfe, as caufed fome confufion ; feveral of their horfes being killed or wounded. As they drew near the bank a moft hloody engagement eufued ; the Macedonians attempting to land, and the Perfians pufthing them back into the river. Alexander, who obferved the confufion they were in, took the com. mand of them himfelf; and landing in fpite of all oppofition, obliged the Perfian cavalry, after an obftinate refiftance, to give ground. However, Spithrobates, governor of Ionia, and fon-in-law to Darius, It ill maintained his ground, and did all that lay in his power to bring them back to the clarge. Alexander advanced full gallop to engage him; neither did he decline the combat, and both were nightly wounded at $\mathrm{N}^{2} 143$.

## 12 J <br> G $R$ A

the firlt encounter. Spitlirobates having thrown his javelin without effect, advanced fword in hand to meet his antagonift, who ran him through with his pike as he raifed his arm to difcharge a blow with his fcymitar. But Rofaces, brother to Spithrobates, at the fame time gave Nlexander fuch a furious hlow on the head with his battle-ax, that he beat off his plume, and nighty wounded him through the helmet. As he was ready to repeat the blow, Clitus with one ftroke of his fcymitar cut off Rolaces's head, and thus in all probability faved the life of his fovereign. The Macedonians then, animated by the example of their king, attacked the Petfians with new vigour, who foon after betook themfelves to fight. Alexander did not purfue them; but immediately charged the enemy's foot with all his forces, who had now palfed the river. The Perfians, difheartened at the defeat of their cavalry, made no great refiftance. The Greek mercenaries retired in good order to a neighbouring hill, whence they fent deputies to Alexander defiring leave to march off unmolefted. But he, inflead of coming to a parley with them, ruthed furioully into the middle of this fmall body; where his horfe was killed under him, and he himfelf in great danger of being cut in pieces. The Greeks defended themfelves with incredible valour for a long time, but were at laft almoft entirely cut off. In this battle the Perfians are faid to have loft 20, 000 foot and 2500 horfe, and the Macedonians only 55 foot and 60 horfe.

GRANITE, in natural hiftory, a diftinct genus of ttones, compofed of feparate and very large concretions rudtly compacted together; of great hardnefs, giving fire with fteel, not fermenting with acids, and flowly and imperfectly calcinable in a great fire.

Of this genus there are three fpecies: i. The hard white granite, with black fpots, commonly called moorftone. This is a very valuable kind, confifting of a beautiful congerics of very variouly conftructed and differently coloured particles, not diffufed among or running into one another, but each pure and diftinct, though firmly adhering to whichever of the othe:s it comes in contact with, and forming a very firm mafs. It is much ufed in London for the fteps of public buildings, and on other occafions where great Itrength and liardnefs are requited. 2. The hard red granite variegated with black and white, and common in Egypt and Arabia. 3. The pale whitilh granite, variegated with black and yellow. This is fometimes found in Arata, but more frequently in loofe nodules, and is ufed for paving the freets.

Some of thefe kinds of flones are found in almoft cvery country, and in many places they are found of immenfe bignefs. The larget mafs of this kind in the known world, lying as an unconnected ftone, is found near the Cape of Good Hope in Africa, and of which we have the following defcriftion in the Plilofoph. Tranfact. val. 68 p. 102, given by Mr Anderfon in a letter to Sir John Pringle. "The flone is fo remarkable, that it is called by the people here the Tower of Babch, and by fome the Perrl Diamond. It either takes the laft name from a place near which it is fituated, or it gives name to the tract of cultivated land called the P'earl. It lies upon the top of a ridge of low Lills, beyoud a barge plain, at the

## $\begin{array}{lllll}G & R & 113 & 1 & G\end{array}$

ranic. the diffance of about thirty miles from the Cape Town; beyond which, at a little difanee, is a range of hills of a much greater height. It is of an oblong fhape, nnd lies north and fouth. The louth end is highett; the eaft and weit lides are fleep and high; but the top is rounded, and fopes away gracually to the north end, fo that you can afcend it by that way, and enjoy a molt extenfive profpect of the whole country. I could not precifely determine its circumference, but it took us above half an hour to walk round it; and by making every allowance for the rugged way, and flopping a little, I think the molt moderate computation maft make it exceed half a mile. The famedifficulty occured with refpect to knowing its height: but I think, that, at the fouth end, it is nearly cqual to lalf its length: or, were I to compare it to an objcct you are acquainted with, I mould fay it cqualled the dome of St Paul's churel.
"I am uncertain whether it ought to be confidered as the top of the hill, or a detach ed flone, becaufe there is no ponitive proof of cither, unlefs we were to dig about its lafe; but it would certainly imprefs every beholder, at firft fight, with the idea of its being one flone, fot only from its figure, but becaufe it is realIy one folid uniform mafs from top to bottom, without any interruption ; which is contrary to the gencral character of the high hills of this country, they being commonly divided, or compofed of diflerent Itrata, at leaft if we may judge from the rows of plants or thrubs which grow on the fides of the ftcepell, and, ns I fuppofe, are produced from the fimall quantity of earth interpofed between them. It has indeed a few fiffures, or rather impreffions, which do not reach deeper than four or five feet; and near its north end a flratum of a more compact llone runs acrofs, which is not above twelve or fourteen iaclues thick, with its furface divided into little \{quares, or oblongs, difpofed obliquely. This ttratum is perpendicular; but whether it cuts the other to its bate, or is fuperficial, I cannot determine. Its furface is alfo fo fimooth, that it does not appear to have formerly been joined to, or feparated from, any other part by violence, as is the cafc with many other large fragments; but enjoys the exace fituation where it was originally placed, and Las undergone little change from being expofed for fo many fucceffive ages to the calcining power of a very hot climate." $-\Lambda$ part of this ftone being examined by Sir William Hamilton, he determined it to be a granite, and of the fanc nature with the tops of fome of the $A \mathrm{p}$; ; and fuppoics both of them to have been elevated by volcanic explofions.

Granite, a genus of itones of the order of petre, belonging to the clafs of faxa. The principal contithent parts of this fone ane felt-fpar or rhombic quartz, mica, and quatr. Thefe ingredients conflitute the hardell fort of granite, and that moft anciently known. That into whicli fchoent enters is more febject to decompofition. They never have any particular texture or regular form, but confift of enormious fhapelefs malkis extremely hard. In the finer granites the quart\% is tranfparent; in others generally white or grey, violet or brown. The felt-fpar is gencrally the molt copious ingredient, and of a white, yellow, red, black, or brown colour. The mica is alfo grcy, brown, yellow, green, red, violet, or black; and commonly the lealt
Voz. VIII. Part 1.
copious. The thoerl is generally black, and abounds in the granites that contain it. Hence the colour of the granites depends principally on that of the fpar or fchocrl. The red granites confift commonly of white quartz, red felt-fpar, and grey mica; the grey ones of white quartz, grey or violct felt-\{par, and black mica. The black grarites commonly contain fchoerl inftend of felt-fpar; and the green whally contain green quartz.

On expefing granite to the flame of a blow-pipe, the component ingredients feparate from one another. Mr Gerhard having anelted fome in a crucible, fourd the felt-fpar run into a tranfparent glaf; ; blow it the mica lay in form of a black llag, the quartz. remaining unaltered. It melted fonewhat better when all the three were powdered and mixed together; though even then the quartz was fill difecrnible by a magnifying glafs. Hence we may explain the rearon why grains of a white colour are fometimes found in volcanic lavas. The mixture of mica prevents the file: or quartz from fplitting or cracki:rg ; and hence its in. fuliblity and ufe in funace-building.

Granites are feldom flaty or laminated. In thiofe which are of a clofe texture, the quarto and fehoerl predominate. They take a good polith; for which reafon the Egyptians formerly, and the Italians flill work them into lage picces of ornamental architceture, for which they are extremely fit, as not being liable to decay in theair. Farber, in his letters from Italy, mentions a kind of thone naned granitone, compofed of felt-fpar and mica: a fubttance of this kind, which monlders in the air, is found in Finland; which is faie! to contain falt-petre, and fometimes common falt. In that country it is cailed rapalivi. Wallerius deferibes 18 fpecies of granites, befides many others akin to this genas. Thofe defcribed by Cronltedt are, 1. Loote or friable, which comes from France, and is ufed at the brafs works for cafting that metal in. $=$. Hard or conspact, of which there are two varieties, red and grey. The former is met with of two kinds; viz. fine-grained from Swappari in Lapland, or coarfe-grained from the province of Dalarne in Sweden. 'The grey, wirh other colours, is met with on the coalt round Stockholm and Norland in Sweden.

GRANITELLO, a gents of ftones of the order of petre, belonging to the clafs of faxa. There are two pecies, 1. That compofed of diflinct particles, found in feveral of the mountainous parts of Sweden. In fome of thefe there is a predominance of quartzofe particles, in others of micaceous; in which latt cafe the ftone is Aaty, and cafly fplit. 2. Granitello, compufed of convoluted particles. This is met with of disferent colours, as whitih grey, greenifh, and reddifh.

Both thefe kinds of ftone are tefed in building furnaces, on account of the powerful refiftance they make to the fire; but the latter is preferable to the other, on account of its containing a little of a refractory clayith fubtance. It is likewife of great ufe in mills, vihere the fellow is a coarfe fand-ftone.

GRANIVOROUS, an appellation given to animals which feed on corn or feeds. Thefe are principelly of the tird kind.

GRANT, in law, a conveyance in writing of fuch things as cannot pafs or be conveyed by word only; fuch are rents, reverfions, fervices, \&c.

Grant (Francis), Lord Cullen, an eminent law0 yer
( R A [ 114 ] G R A

Grant. ger and julge in Scotland, was defended from a younger liranch of the family of the Grants of Grant in that king rom, and was bow about the year $\mathbf{x}$ Goo. When he commerce advocate, he made a dillinguilhed figure at the revolution, by oppofing the opinion of the old lawyers, who warmly argued on the inabihey of the convention of elates to make any difpo. Cation of the crown. The abilities he flow in favour of the revolution recommended him to an extenfue practice ; in which he acquired for much honour, that when the union between the twi, kingdoms was in agitation, queen Anne unexpectedly, and without application, created lima baronet, with a view of fecuring his interest in that meafure; and upon the fame principle, the from after created him a judge, or one If the lords of feffon. From this time, according to the atom of Scotland, he was styled, from the name of his eftate, Lord Cullen; and the fane good cu:atities that recommended him to this honourable office, were very conspicuous in the difuarge of it; Which he continued for so years with the highest reputation, when a period was put to his lift by in illiefs which lated but three days. He expired vithurt any agony on March 16 th 1720. -His charaster is drawn to great advantage in the EiograThin ithannea; where it is offered, among other remarks to his honour, "That as an advocate he was indefatigable in the management of bufinefs; but at the fame time that he feared no pains, le would t. fe no craft. He had fo high an idea of the dignity of his profeftion, that he held it equally criminal to neglect any homed moans of coming at justice, or 10 make fe of any ants to elude it. In refpeet to fortune, thought he was morita and frugal, ane had a large practice, yet he was far from being avaricious. His private charities we re very confiderable, and gee in the fame proportion with his profits. He was, befines, very ferupulous in many points; he would not Goffer a gait cafe to be left throng h a client's want of money. He was fuck an enemy to oppreffion, that he weer denied his afitanae to foch as laboured under it; and with refpeci to the clergy of all profefinons (inscothed), his confcience obliged him to ferne them without a fee. When his merit had raifed him to the bench, he thought himfelf accountable to God and man for lis conduct in that hishofice; and that deep fonfe of his chute, at the fane thane that it kept hin Hasty to it, encouraged and fupported him in the perRomance. Whenever he fat as lord ordinary ; the paper ci cafes was remarkably full, for his reputation Tais: equally eltathithed for knowledge and intofrilly, thee were none, who had a good opinion of their cow pretemfons, but were defrous of binging them before him, and rot many who did not fit down fat: If ed with his decifion. This prevailed more effiesally after it was found that fop of his fentences were reveifed: and when they were, it was commonly owing to himfie: for if, upon mature retketion, or upon new reaforisolited at the rehearing, he fay any jeff ground for altering his judgment, he made no feruple of deCaring it ; being perfuaded, that it was me e manly, as well as more gull, to follow truth, than to fupport opsion: and his conduct in this refer had a right effect; for intend of ! ffening, it riffed his reputation. Ste would not, howct:r, with all this grot hock of know.
ledge, experience, and probity, run limfelf in matters of blood, or venture to decide in criminal cafes on the lives of his fellow-creatures; which was the reafon that, though often folicited, he could never be prevailed upon to accept of a feat in the judiciary court. In his private character he was as amiable as he was respectable in his public. He was charitable without oftentation, difinterefud in his friendships, and beneficent to all who had any thing to do with him. He was not only licitly jut ; but fo frow from any feces of avarice, that his indy, who was a woman of great prudence and diferetion, finding him more intent on the bufinefs committer to him by others than on his own, took upon horfolf the care of pacing out his moneg; and w prevent his poftponing, as he was apt to do, foch lind of affairs, when fecurities offered, file canfed the circumblances of them to be fated in the form of cafes, and fo procured his opinion upon his own concerns as if they had been thole of a client. He was fo true a lover of learning, and was fo much addieted to his ladies, that, notwithanding the multiplicity of his balinefs while at the bar, and his great attention to his chare when a judge, he nevertheless found tine $t$, write various treatifes on very different and important fut jas: : Some political, which were remarkably well timed, and highly firviceable to the government : others of a moll extenfive nature, foch as his flays on law, religion, and education, which were dedicated to George II. when prince of Wales; by whole command, his then fecretary, Mr Samuel MoIyneans, wrote him a letter of thanks, in which were many gracious capections, as well in relation to the piece as to its author. He composed, befides the fe, many difoourfes on literary fubjecte, for the exercife of his own thoughts, and for the better difoovery of truth; which went no farther than his own elofet, and from a principle of modelly were not communicated cen to his mort intimate friends."

GRANMLAAM, a town of Liacolnflite, $t$ to miles from London. It is a neat populous town, witlabundnance of very good inns of great report, on the north road, and hinted on the diver Within. It is foppoled to trave been a Roman town by the remains of a cattle which have been formerly dug up here. It is governed by an alderman and 12 justices of the peace, a recorder, a coroner, an cfachior, 12 fecund twelve men, who are of the common comet, and 12 camillabis to attend the court. Here is a fine large church with a fore fire, one of the loftier in England, being 288 feet high, and, by the deception of the tight, feeds to tad awry, which, by the church being ituanted fo low, appears to a very grate difadvautage. Here is a good lice fehool, where Sir lac Newton received his fin eduction, betide two clarityfehouls. On the nighboming cowrie are frequent horse races.

GRANVILIE (George), lord Lanfdonne, was defended form a very ancient family, derived from Rollo the faint duke of Normandy. At eleven years of age he was font to Trinity College in Cambridge, where he remained five years: but at the age of 13 was admitted to the degree of matter of arts; hawing, before he was 12, Spoken a copy of renes of his own composition to the duchess of York at his college, when the paid a vilit to the Univerfity of

Cain.
ramulated Cambridge．In 16 gh，his comedy called the shegal－ II Iants was acted at the theatre royal in Lincolas iun－ fiels，as his tragedy called Heroic Love was in the year 1699．In 1702 he trannated into Englin the fecond Olynthion of Demoflerres．He was menter for the conaty of Cornwall in the parliamert which met in 1710；was afterwards fecretary of war，comptrolier of the houfehold，then treafurer，and fworn one of the prixy－comncil．＇lhe year following，he was created taron Landdowne．On the acceffion of kiny Georte I． in 1714 ，he was remored from his treafarer＇s place； and the next year entered his proteft açaint the bill＇s for attainting lord Bolingbroke and the duke of Ornord．He ent．red deeply into the felteme fur raiting an infurrection in the wed of Eingland；and being feized as a fufpected perfon，was commitred to the Tower．where he con：inuld twa years．In 1719 ， he made a fopech in the houfe of Lords，againtt the bill to prevent occafional conformity．In $172=$ ，he withdees to France，and contirued abroad alnof ten years．At his return in 1732，he publified a tine edition of his works in 2 vols quarto．He died in 1735，leavine no male iffue．

Gransille，a fea－port town of France，in Lower Normandy，partly feated on a rock and partly on a plain．It gave title to an Englifh carl，now extinct． W．Long．1． 32 N．Lat． 48.58.

GRANULATED，fonuelhing that has undergone gramuation．See the next article．

GRANULATION，in chemiltry，an operation by which metallic fubltances are reduecd into finall grains， or roundifh particles；the vie of which is，to facilitate their combination with other fub！taces．－This opera－ tion is very fimple；it confits only in pouring a melted metal nowly into a veffel filled with water， which is in the mean time to be anitated with a broom．With melted copper，however，which is apt to explode with great violence on the contact of water， fome precautions are to he obferved，of which an ac－ count is given under the article Chemistry，na 1148. Lead or tin may be granulated by pouring them when melted into a box ；the internal furface of which is to be rubbed＂ith powdered chalk，and the bo：Itrongly Thaken till the lead has become folid．Metals are granulated，becaufe their ductility renders thein inca－ pable of being pounded，and becaufe filing is long and tedious，and might render the metal impure by an admixture of iron from the file．

GRAPE，the fruit of the sine．Sce Vine and Wine．See alfo Currant and Ratsin．

Grape－Shot，in artillery，is a combination of fmall Shot，put into a thick canvas bag，and corded ftrongly together，fo as to forma kind of cylinder，whofe dia－ meter is equal to that of the ball adapted to the can－ non．The number of fhot in a grape varies accozding to the fervice or fize of the guns：in fea．fervice nine is always the number；but by land it is increafed to any number or fize，from an ounce and a quarter in ＊eight to three or four pounds．In fea－fervice the bottoms and pins are made of iron，whereas thofe ufed by land are of wood．

Grapes，in the manege，a term ufed to fignify the arrefls or mangy tumours that happen in the horfe＇s legs．
GRAPHOMETER，a mathematical inftrument，
otherwife called a Senizirche；the wie of which is to oblerve any augle whofe vertex is at the centre of the intrument in any plane（though it is molt commenly horizontal，or nearly fo），and to find how many de－ grees it．contrins．Sec Geometry，p．67t，prop．xi．太心．

GRAPNLLL，or Grappling，a fort of tmallan－ chor，fitted with four or live flukes or claws，and com－ monly afod to ride a butt or other finall velf：1．

Firc－Grappoivs，an in trament neanly refembing the forncr，but differing ta the comatacion of its nakes，waich are farailhed witl ttrons barbs on their points．Thiefe machines are ufuahy lixed on the yard－arms of a thip，in order to grapple any adver－ fary whom the intents to board．They are，however， more particularly ufful i．t FiRE Shiss for the purpufes dexcibed in that article．
GRASS，ia botany，is defined to be a plant havia， fimple leaves，a tem generally joined and tulular，a hufiy caly：（called shime ），and the feed fingla．Henc： wheat，oats，barley，\＆c．are properly gralfes，accord－ ing to the definition given；while clover and fome o． ther fimilar plants are not graffes，th ough fo frequert－ ly called by that name．－Of grafs，the leaves are foo 1 for catcte，the imall feecis for hirds，and the larger grain chietly forman．And it is clffersable，that nature has fo provided，that castle（in grazing）foldon eat the A wer irserded to produce fecd，unlets compulted by hunger．

Culniferous grafes might be diviled into two ge． neral clafes for the purpofes of the farmer，that it miglit be of ufe for him to attend to：viz．It，Thofe which，like the common annual kinds of corn，run chicfly to feed－ftalks；the leaves gradually decaying as thefe adva：nee towards perfection，and beconing to－ tally withered or falling off ertirely when the feeds are 1ipe．Rye－grats belongs to this clats in the ftrictelt fenfe．To it likewife may be affigned the vernal－ grafs，dogs－tail．grafs，and that bent－grafs．zaly，Thafo whofe leaves cuartinue to advance eren after the feed－ llalks are formed，and retain their verdute and fuccu－ lence duriog the whole feafon，as is the cafe with the fefeue and poa tribes of graftes，whofe leaves are as green and fucculeat when the fecds are ripe and the flower－1talks fading，as at any other time．
＂It is wonderful，Mr Stillingteet $\dagger$ remarl：s，to fee how long mankind has nerlected to make a proper ad．lating to vantage of plants of fuch importance，and which，in iot．$M, \begin{aligned} & \text { ．}\end{aligned}$ almolt every country，are the chicf food of castle．\＆c． The farmer，for want of diRinguilhing and felecting grafies for feed，fills his paftures either with weeds or bad or impreper gralies；when，by making a right choice，after fome trials，he might be fure of the beth grafs，and in the greatelt abundance that his la：d ad－ mits of．At prefeat，if a farmer wants to lay down his land to grafs，what does he do？he either takes his feeds indiferiminately from his own foul thay－rick， or fends to this next neighbour for a fupply．By this means，befides a certain mixture of all torts of rubbih， which mult neceffarily lappen，if he chances to have a large proportion of good feeds，it is net unlikely bat that what he intends for dry land may come from moill，

Grarnt？ Gr．．fs cras
where it grew naturally, and the contrary. This is Such a tlovenly mithod of proceching, as one wond think could not puffinly preval tiniverfally: yet this is the eafe as to all grafles except the darmel-grafi, and What is known in funce few connties by the name of the Suffolkogrofs; and this latect intiance is owing, I beliere, mone to the foil than any care of the hubandnuan. Now, would the farmer be at the pains of feparating once in his life half a pint or a piat of the different kinds of grafs feeds, and take care to fow them feparaty, in a very little time he would have wherewithal to llock his farm properly, according to the nature of each foil, and misht at the fame time foreal thefe feets feparately over the nation, by fupplying the feed-thops. The number of grafies tit for the lumer is, I believe, fmail, perhaps lhaif a duzen or hali a feure are all he need to cultivate; and how fma'l the trouble would be of fuch a takk, and how great the benctit, muft be obvious to every one at firft fight. Would not any one be looked on as wild who foould fow wheat, barley, vats, rye, peale, beans, vetches, buck wheat, turnips, and weeds of all forts together? Yet how is it much lefs abfurd to do what is equivalent in relation to grafles? Does it not import the farmer to have good hisy and grats in plenty? and will cathe thrive equally on all forts of food? We kiow the contrary. Horfes will fearcely eat hay that will do well enough for oxen and cows. Sheep ate particularly fond of one fort of grafs, and fatten upon it falter than any wher, in Sweden, if we may give credit to Linnzus. And may they not do the fume in Britain? How hall we know till we have tried?"

As the generality of farmers know farce any of the grafles by name, and as without fuch knowledge little improvenent can be made in this branch of hufoudry, we have on Plate CCXNIII. given figures of thofe forts which have been recommended as the moll prohta. ble, viz.

1. Hordeuma murimem, Rye-Grass rulg̀. [Ryegrais protric is the secute villofom. Purcmial darnel, bllent furme, is alfo, in fomi counties of England, improperly cal!ed megra/s.] See Agriculture, nu 179.
2. Fefucaruba, Purple Fescue-grass. See dgriculture, mo 5 t
3. Fyfan o im, Shfers ditto. Sze AgriculTURE, $n$, $6-5 \%$. 'This is pultaps the moft valuable grafs of all. It is obferved to grow and thrive on lands of all quiatities and in ali fituations, from the ditelt upland pathures to the very meit pats of meadows. It does not part with its feeds till fome time after they are ripe, and even quite dry. It makes the thickelt and clolett pile of any of them, and fends up but fow flower-l!alks in proportion to its leaves. It fowers in June, and is ripe in July.
4. Holcus linates, Creepine Soer-crass. Sce Agriculture, io 59.
5. Alopicur bis billefies, Bulbous Foxtall-grass, is recomnended by Dr Anderfon $\dagger$, as promifing on rome occahons to afford a valuable patture-grafs. It feens clieby, he oblerves, to delight in a mail foil, and therefure promifes to be only fit for a meado.v pafture gra?s. The quality that firlt recommended it to bis notice, was the unulual fammed that is: enowed
roots gave to the fupface of the ground, naturatly foft that it misht be of ufe upon fuch foils, chisgr in preventing then from bein 5 mach poached by the feet of catte which nigirt pature upon them. Mory foils efpecially are fo much hmt by porehing, that any thing that promifes io be of wie in preventing it defurwes to be nttended to.
6. Poa pralenge, Greit Meadow griss, feems to approach in many refpects to the nature of the purplefefeue; only that its leaves are bruader, and not near fo long; being only about a fout or 16 inches at their greateit length. Like it, it produces few leed-Ralks and many leaves, and is an abiding plant. It affects chielly the dry parts of meadows, though it is to be found on moll good paidures. It is very cetentive of its feeds, and may thercfore be fufferd to remain till the flalks are quite diy. It bloffoms the beginning of June, and its fecds are ripe in July.
7. Poz comprifu, Creeping Meadow-grass, according to Dr Auderfun, fecins to be the moft valuable grafs of any of this grenus. Its leaves are firm and fucculent, of a dark Saxon.grecon colvur; and grow fo clofe upon one another, as to form the richett pile of palture-grafs. The hlower it.illss, if fuffered to grow, appear in fufficient quantities; but the growth of thefe does not prevent the growth of the leases, bot? advancing together during the whole fummer; and when the falks fade, the leaves continue as green as befure. Its leaves are much larger and more abundant than the common meadow-grafs, poatrivialis; and therefure it better deferves to be cultivated.
8. Anthosinhtum odoratum, Vernal. Grass, grows very commonly on dry hills, and likewife on found rich meadow-land. It is one of the earliett graftes we have; and from its being found on luch kinds of paftures as theep are fond of, and from whence excelleme mutton cones, it is mofl likely to be a good grafs for Recep-pallures. It gives a grateful odour to hay. In one relpeet, it is very ealy to gather, as it theds its feeds upon the lealt rubbing. A correfpondent of the Bath Society, however, mentions a difficulty that oce curs in collecting then, owing to its being furrounded with taller grafies at the time of its ripening, and being almol hid ameng them. If it be not carefully watched when nearly sife, he cbecwes, and gathered within a few days after it comes to maturity, great part of the feed will be loft. 'The twitted claltic asnen which adhere to the feed, lift them out of their receptacles with the lat motion from the wind, even whito the itraw and ear remain quite erect. It is found moftly in the moill parts of meadows; very little of it on diy pathures. It howers about the beriming of May, and is ripe about the middle of June.
9. Cynofurus crighas, Celestey Dog's-tail Graes. Mr Stillingfleet imagines this grals to be proper for parks, from his having known one, where it abounds, that is fameus for excellent renifon. He recommend; it allo, Prom experience, as good for theep; the beit mutton he cver talted, next to that which comes from hills where the purple and feeps fefoue, the dine bent, and the filver hair grates abound, haviag been frons fheep fed with it. He adds, that it makes a very line ture upon dry fandy or clalky foils: but unlefs fwept, ore: with the foythe, iss Howering ltems will loota

## $G R \quad A$

brown; which is the eafe of all graftes which are not fed on by variety of animals. Fur that fome animals will eat the fovering ftems is evident by commons, where feareely any paits of graikes appear but the radical leaves. This grafs is faid to be the ealieit of the whole groupe to collect a quantity of feed from. It flowers in June, and is ripe in July.
10. Stía penmata, Cockos-tail or Festher Grass.
11. Asrofis capillaris, Fine Bent, is recommended by Mr stillingtteet, from his having always found it in great plenty on the bel theep pallures, in the difierent counties of England that are remahable for good mutow. This grais Rowers and ripors its feed the latelt of them all. It leeres to be kitk the former part of the yeat, but vegtate, iaxurianty towards the autumn. It appears to be fovel ol moill ground. It retains its feed till full ripe ; fowers the latter end of July, and is ripe the latter end of Auguth.
12. Aveira fexuofu, Mouetan Fhas.
13.- caryophillen, Sisuir Hiar.

The fame may be faid of thefe two grates as of the preceding one.
14. Feflica fiuitans, Flote Fescue. In a piece publithed in the Amcenitates Academicx, yol. 3. intitled Plante Fferlonta, we are informed, that "the fecds of this grafs are gathered yearly in Poland, and from thenee carricd into Germany, and fometimes into Sweden, and fold under the ame of mana feeds. Thefe are mench ofed at the tables of the great, on account of their nourilhing quality and agrecable tatte. It is wonderful (ades the author), that amongh us thefe feeds have hitherto been negleeted, fance they are fo eafily collected and cleanfed." There is a clamminefs on the car of the Rote-fffure, when the feeds are ripe, that talles like honey; and for this reafon perhaps they are called manns fectls.

Linnæus (Flor. Scul. art. 95.) fays that the bran of this giafs will cure horles trsubled with botts, if kept from drinking for fome hours.

Concerning this grafs we have the following information by Mr Stillingfleet. "Mr Dean, a very fenfible farmer at Rufcomb, Berkfire, affured me that a field, always lying under water, of about four aeres, that was cceupied by his father when he was a boy, was covered with a kind of grafs, that maintained five farm horfes in good heart from April to the end of harvel, without giving thein any other kind of tood, and that it yielded more than they conld eat. He, at my defire, brought me fome of the grafs, which proved to be the flote. fefuce with a mixture of the marihbent; whether this laft contributes much towads fursuifhing fo good pature for horfes, I eannot fay. They both throw out roots at the joints of the thalks, and therefore are likely to grow to a great length. In the index of dubious plants at the end of Ray's Synoplis, there is mention made of a grafs uader the name of gramen caninum fiopinuan lonigifimum, growing not far from Salifury, 24 fect lones. This mult by its length be a grafs with a creeping llalk; and that there is a grafs in Wilt lhire growing in watery meadows, fo valuable, that an acre of it lets from 10 to 12 pounds, I have been informed by feveral perfons. Thefe circumfances incliae me think it muit be the fote-fefcue;
but whatever grafs it be, it certainly muld deferve to be inquired after."

Gras.
15. Aibpecurus praienfor, Meadow Foxtail. Linnxus fays that this is a proper grafs to tow ongrounds that have been drained.-Mr Stilling fleet was informed, that the beit hay which eomes to London is from the meadows where thi; grafs abounds. It is fearee in may parts of Eugland, particularly Hesefordmire, Berkfllite, aind Norfolk. It inight te gathered at al. molt any time of the year from hay. ricks, as it does not flued its feeds without rubbing, which is the eafe of but few gratez. It is amonglt the moit grateful of all graffes to cattle. It is ripe about the latter end of Jane.
16. Poounnuz, Asxual Meadow Grass. "This grafs (fays Mr stillingficet) makes the linelt of turfs. It grows every where by way lides, and on rich found conmons. It is called in fume parts the Sufole grafs. I have fan whole helds of it in High suffoik without any mistive of other graffes; and as fome of the belt falt-butter we have in London eomes from that county, it is mo!l likely to be the beft gralis for the dairy. I have feen a whole park in Suffolk covered with this grafs; but whether it affords good venifon, I cannot tell, having neser talfed of any from it. I fhould rather think not, and that the belt patture for theep is alfo the beil for deer. However, this wants trial. I remarked on Malvern--lill fomething particular in relation to this grafs. A walk that was made there for the convenie:ice of the water-drinkers, in lefs than a year was covered in many places with it, though I could not find one lingle plant of it befides in any part of the hill. This was no doubt owing to the frequent treading, which above all things makes this grafs flourih; and therefore it is evident that rolling muft be very ferviceable to it. It has been objected, that this grafs is not free from lents, by which word is meant the flowering. Aems. I anfwer, that this is mot certainly true, and that there is no grafs wittout them But the flowers and flems do nut grow fo foon brown as thofe of other graffes; and being much thorter, they do not cover the radical leaves fo much; and therefore this grafs affords a more agreeable turf without mowing, than any other whatever that I know of." - Ihe feeds of this fpecies drop off before they are dry, and, to appearance, before they are ripe. The utmolt care is therefore neceflary in gathering the blades, without which, very few of the feeds will be faved. It ripens from the middle of April, to lo late, it is believed, as the end of Octover; but modlly difappears in the middle of the furmer. It grows in any foil and lituation, but rather affects the hade.
17. A new grafs from America (named Agrofl's cornucopis) was fome time ago much advertifed and extolled, as poffefing the moll wonderful qualities, and the feeds of it were fold at the enormous rate of L. 68 the buhel. But we have not heard that it has at all anfwered expectation. On the contrary, we are informed by Dr A nderfon in his new publication $\dagger$, that $T$ the $\Gamma_{0}$, " it has upon trial been found to be good for no- vol. 1 loz 2 . thing. Of the feeds fown, few of them ever germinated: but enow of plants made their appearance, to afcertain, that the grafs, in refpect of quality, is among the puorelt of the tribe; and that it is an 1 nnmad plant, and altogether unprofitable to the farmer."

## $G R$ A [i8 ] G R A

Ge iss.lW"lks are made, fur the mont part, not by fowing grafs feeds, but by laying turf; : and indeed the ture from a fise common or down are much preferabie t. Sowagrafs: but if walks or plats are to be made by fowing, the bet way is to procure the feed from thole patures where the grads is naturally fine and clear; or clie the tronble of keeping it from feiry or benty grats will be very great, and it will foarce ever loo's landrome.

In order to fow grafs walks, the ground mut be firit Cug; and when it has been dreffed and laideven, it matl be very carefuly raked over, and all the elodsant Atones taken off. and then covered over an inch thick with gord moukd.
'I'his being done, the feed is to be fown pretty thick, that it may come up clufe and hort; it munt then be raked over again, to cover the feed, that if the weather thould happen to be windy, it may not be blown away. It unght alfo to be obterved, that where grals is ium in gadens, cither for lawns or walks, there thenh always be a good quantity of the white trefoil or' Dach choser fown with it ; for this will make a tine turt much fooner than any cther fown grafs, and will contione a beiter verdure than any other of the gratstribe.

Iu order to keep grafs plats or walks handfome, and in groud order, you may fow in autumn frefh feed over any places that are not well billed, or where the grafs is elend: but nothing improres grafs fo much as mowing and contant rolling.

When turf is laid in gardens, it is a general praefice to cover the furface of the ground under the turf, either with fand or very poor earth: the delign of this is to kecp the grafs the, by preventing its growing two rank. This is proper enough for very rich grumd : but it is not fo for fuch land as is mid ding, or but poor: for when this is practifed in fueth places, the grafs will foon wear out and decay in patches.

When turf is taken from a common or down, fuch onghe to be chofen as is free from weeds: and when it is defigned to remain for years without renewing, a drefling thould be laid upon it every other year, cither of very rotten dung, athes, or, where it can be eanly procured, very rotten tan; but thefe dreflings fhonld be laid on early in the winter, that the rain nay wath them into the ground, otherwife they will oceation the grais to burn, when the warmeth of the fummer begins.

When grafs is to dreffed, and well rolled and mowed, it may le kept very beantiful for many years; but where it is not drefled, or fed with theep, it will rarely continue handfome more than eight or ten years.

GKASSHOPPER, in zoulogy, a fpecies of gryllus. See Gryezus.

GRATAROLUS (William), a learned phyfacian in the 16 h century, was born at Bergamo in ltaly; and taught phylie with reputation at Padna: but having embraced the Protellant religion, he retired to Switerland, where he "as made profffor of phyfie. He died at Balil in 1568 , aged 52. He wrute feveral curious works in I atin; amonglt ahichare, i. The manner of pelerving and inpreving the memory. 2. Of preferving in health travellers, men of letters, magiflrates, and tludious perfons, \&e.

GRATES for Fires, are compofed of ribs of iron
placed at fmall difanees from one another, fo that the air may have luffecient acedis to the fuel, and the aceuinulation of the ahes, which would choke the fire, may be prevented. - Grates leem peculiarly adapted to the ble of pit-coal, which requires a greater quantity of air to make it burn frecly than other kinds of fuel. The liearths of the Britons feem to have been fixed in the eantre of that halio, as is yet practifed in lome pats of Scotland, where the fire is uearly in the middle of the houfe, and the family fit all around it. Their fire place was pelarps nothing more than a large flone, depreffed a little below the level of the ground, and thereby adapted to receive the afhes. About a century ag', it was only the flow of the room, with the addition of a bauk or hoo of clay. But it was now changed amonis tlee gentlemen for a purtable direpan, raifed upon low Supporters, and titted with a cireular grating of hars. Such were in wfe among the Gauls in the hat century, and among the Welm in the tonth.
(;RATIAN, the fon of Valentimian I. by his Erit wife, was deelared Auguttus by his father at the eity of Amions in 365 , and fucceeded him in 367 ; a prince equal.; extolled for lis wit, cloquence, modely, chathity, and zoal againt heotics. He allociated Theodolius with lim in the empire, and advanced the poet Aufonits to the confulate. He made a great flaughter of the Germans at Straburg *, and hence was furnamed Alemannivis. He was the firt emperor who dora. refuled the title of Pontifex Maxisuses, upon the feore of its being a P'agan dignity. He was aftalfinated by Andragnthins in 375 , in the $2+4$ hit year of his age.

Gratian, a famus Benedictine monk, in the 2 th century, was bon at Chiofi, and employed near twenty lour years in compuling a work, intitled, Decretum, or Concordantics Difordantium Cononum, becauie he there endeayoured to reconcile the canons which feemed contradictory to each other. This work he publithed in :15 . As he is frequently miltaken, in taking one canon of one council, or one paflage of one faller, for another, and has often cited falfe decretals, foceral authors have endeavoured to correct his faults; and chictly Anthony Augultine, in las excellent work, iutided, De emendatione Gratiani. To the decretals of Cratian, the popes principally owed the great authority they excrcifed in the thirtcenth and follow. ing centuries.

GRATINGS, in a hip, are fmall edges of fawed plank, framed one into another like a lattice or prifon grate, lying on the upper deck, between the main-malt and fore-math, lerving for a defence in a elofe fight, and alfo for the coolnefs, light, and conveniency of the thip's company.

CRAT'loLed, hedgehyssop: A genus of the monogynia onder, belonging to the diandria clafs of plants. The corolla is irregular ; there are two barrcu Itamioa; the capfule is bilocular; the calyx has feven laves, with the two exterior ones patulons. There are four fpecies; the molt remarkable of which is the ufticinalis, or common hedge-hyffop. This grows naturally on the Alps and uther mometainous parts of Europe. It lath a thick, flefhy, nibrous, creeping root, which propagates very much, when planted in a proper foil and lituation. From this arife feveral upright fquare flalks, gamihed with
narrow fpear-fhaped leaves, placed oppofite. The flowers are produced on the fide of the tlalks at cach joint : they are flaped like thofe of the fox glove, but are fmall, and of a pale yellowifh colour.-This herb has an emetic and purgative virthe ; to anfwer which intentions, it was furnerly ufed by the common people in England, but was never nuich preferibed by the phyficians, and at latt fell totally into difofe. Of late, fowever, it has been the fu!'ject of a differtation by Dr Jamcs Kollracwki of Warfaw, in Poland; who gives fome remarkable accounts of its effe:1s in mania and obltinate venereal cafes. It was given in powder, or in cxtract, to the quantity of half a drachn of the firft, and a whole drachm of the fecont, at cach dofe. From the cafes related ia bis dilicrtation, the author daws the following conclufions: 1. The gratiola may be given with fifecty both to male and female paticnts. 2. In all diforders procecding from a fuperabundance of ferum in the nuids, it anpperz to be a moft cfictual remedy. 3. La confequerice of this, it is has reconrfe to with very great advantage in melancloly and mania arifing from that flate of the fyflem. 4. It powcrfully promates purging, vomiting, fiweat, and urine; and is thercfore nuch fuperior to any of the ufial ceacuating medicines, moot of which prove only attive in promoting one of thefe difcharges at once. 5. The mont wiblinate cafes of gonort licea, fluor albus, and venereal ulecers, are cured by the porder. - In fonce inflancess it has induced falivation; but whether or not it can always be maded to produce that cifect, is not as yet altogether certain. 6. The powder of gratiola prepared froin the extract, and cxlibited with fugar, does not in 'uce wowiting; and, on the contrays, the powder of the root always promotes that evacuation.
GRATTHDE, in cthics, a virtue difpofing the mind to an inward fenfe and outward acknowleginent of bercfits rectived.
Examples of ingratitude, Mr Palky obferves, check and dircomage veluntary beneficence; hence the cultivation of a grateful temper is a confideration of $p u$ bici importance. A fecond reafon for cultivating in ourferves that tumper is: That the fame principle which is touched with the kindsefs of a luman benefactor, is capable of being affected by the divine guod. nefs, and of bccoring, under the influence of that affection, a furree of the purn and mofe exalted vituc. The love of God is the fublimed gratitude. It is a rifilake, therefore, to imagine, that this virtue is onitted in the Scripsures: for cecry precept. which commands us "to love God, becaufe he frrt Tovet us," prefuppofes the principl of gratitude, and dircets it to its propcr object.
It is inpofifice to particulatize the feveral exp-ef. fivons of gratitute, which vary with the character and fittation of the benefafor, and with the oppurtuasties of the perfon obliged; for this variety admits of no bounds. It may be obferved, however, that on one part gratitude can never oblige a man to do what is wrong, and what by confequence he is previouny obliged not to do: Oa the other part, it argues a total want offerery generous priuciple, as "cll as of moral probity, to take adrantage of that afcendency, which the conferring of bencfits jufly creates, to draw or drive
thofe whom
compliences.
The following pleating example of genuine gratitude is extraCted from Hackuel's Appl. 1. 14. c. 10. P. +36 . - Francis 1 Trefecobald, a Florentine merclant defeended uf a noble family in Italy, had qained a plentiful fortune, of which he was liberal laanted to all in ncceffity; which being well known to ollicrs, though conceald by himfelf, a yourg Aranger applied to him for clarity. Signior Frefcobald, feeng fonich hing in lis conntenance more than ordinary, overlooked ! is tatterced clothes; and companionating his cicumliances, afked him "What he was, and of what country:" "1 anm (anfwered the young man) a native of Eng. lawd: my name is Thomas Cromwell, and my father-inlaw is :t poor fheer-man. I left my country to feek my fortune; came with the Vrench army that were routcd al Gatyliun, whicre I was a pare to a foothan, and carried his jike and burgonet atter him." liref. colvald commiferating lis neconfities, and laving a particular oc fect for the Englith nation, clothed him genteclly; took him into his houfe till he had recovered flrength ly buter dit: ; and, at his taking leave, mounied him upon a grod horfe, with 16 ducats ef gold in his pockets. Cromwell cxprufidd lis thankfulncfo in a very fenfible mamer, and ieturned by land towards Eugland ; where, being artived, he was preferred into the fervice of Cardinal Woolfey. Aftur the Cardinal's death, he worked himfilf fo eifuctually into the favour of King Henry VIIl. that lis majety made him a baron, wifount, earl of Enix, and at laft mate lim 1 wh high chancullo: of England. In the mean time, Siguior Frefedrald, by repeated lofics at fea and lana, was reduced to porenty; and calling to mind (without ceer thinking of Crometel!), that fome Ewgl:n mocrelants were indebted to him in the fitm of 15 , coo ducats, lee came to London to procure paymont. 'Travelling in purfuit of this afair, he fortunately met with the lord chancellor as he was riding to court; who thinking hin to be the fance genteman that had cone him fuch great kindnefs in Italy, lie immodiatedy alightad, en.braced him, and with tears of joy akice thin, fif he was not Stgios Francis Frefecbald, a Florentine mecthant? "Y'ss, Sir (faid he), and your mof humble fervant." "My fervant! (fait the (hanctlor) No; you are my fpecial friend, that ellieved me in m:z wants, had the foumdation of my greatuefs, and, as fuch, I receive yon; and, fince the affains of my fovercign will not now permite a honger comference, I bey you will oblige me this day wilh your company at my houfe to daner with me." Signior Frefcobald was furprifcd and altorifined with admination who this great man fhould be that acknowledged fuch obligations, and fo paffionately ex. Froffid a kindnefs for lim: but contcrapl tinisg a white his woice, his mien, and carriage, he concludes it to be Cromwell, whon he had relieved at Florenct; and therefore not a little overijoyed, gocs to his houfe, and attended his coming. His lordhip came foon after; and immediately taking his friend by the land, turns to the lord high admial and other noblemen in lis company, faying, " Don't your Lurdmips wornder that I am fo glad to fee this gentleman ? This is he who firft contributed to my advancement." He:
then

C-atioute then told them the whole flory; and, holding hina ftill 6-a by the hand, led him into the dining room, and phacid him next limflf it table. Thac company being grone, the Chancellor made ufe of this opportunity to know what aftair had brought him into England. Fieferbald in few wond gave him the true flate of his circumftances: 'To which Cromwell replicd, "I am forry for your misfortures, and I will make them as eafy to you as I can; but, becaufe men ought to be jufl before they are kind, it is fir I houkd repay the debt I owe yon." Then lauding him into his clofet, he lockcd the door; and opening a coffer, firt took out 16 ducats, delivering them to Frefoohald, and faid, "My friend, hele is the money you lent me at Florence, with ten pieces you laid out for my apparel, and ten more you paid for my horfe; but, conffidening you are a merchant, and might liave made fome advantage by this money in the way of trade, take thefe four bags, in every one of which is 400 ducats, and enjuy them as the free gift of your friend." Thefe the inodefty of lirefeobald would have refufed, bat the other forced them upon him. He next caufed him to give lim the mames of all his debtors, and the fums they owed: which account he tranfmited to one of his fervants, with a charge to find out the men, and oblige them to pay him in 15 days under the penalty of his difpleafure ; and the fersant fo well difcharged his duiy, that in a hort time the entire fum was paid. All this time Signior Frefeobald lodged in the Chancellor's houfe, where he was entertained according to his merits, with repeated perfuafions for his continuance in Lugland, and an offer of the loan of 60,000 ducats for four years if he would trade here: but he defired to return to Florence, which he did, with extraordinary Savours from the Lord Cromwell.

There is a pecies of grateful remorfe, which fometimes has been known to operate forcibly on the minds of the mof harlened in impudence. Of this Mr Andrews, who makes the remark, gives an inftance in the following ancedote, faid to have been a favourite one with the tate Dr Campbell. "Towards the beginning of this century, an actor, celebrated for mimicry, was to have been employed by a conic author, to take off the perfon, the manner, and the fingularly ankward delivery of the cekbrated Dr Woodward, who was intended to be introduced on the flage in a laughable character, (viz. in that of Dr Fobill, in Three Hours after Marriage). The mimic drelfed himiflf as a country man, and waited on the Doctor with a long catalogue of ailments, which he faid attended on his wife. The phyfician heard with amazement difcafes and pains of the molt oppofite nature, repeated and redoubled on the wretclied patient. For, lince the actur's greatef wifh was to kcep Dr Woodward in his company as lung as puffible, that lie night make the more offervations on his getures, he loaded his poor imaginary fooufe with every innirmity which had any protable chance of prolonging the intervicw. At length, being becone completely mafler of his errand, he drew from his purfe a guinea, and, with a frrape, made an meouth offer of it. 'Put up thy money, poor fellow' (cried the Doctor); 'thou hatt need of all thy cafh and all thy patience too, with fuch a bundle of difeafes tied to thy back.' The actor returned to his employer, and recounted the whole converfation: No 143.
with fuch true fecling of the plyfician's charaker, that the author fcreamed with approbation. His raptures were foon chacked; for the minic told him, with the emphatis of fentitihey, that he would fooner dic than prollitute his talente to the rendering fuch gemuine humaniy a public laughing. liock. 'The player's name was Griffur."

GRATZ, a handfome fluong town of Gurmany, and capital of Styria, with a calle feated on a rock, and an univerfity. The Jefuits have a college bere; and there are a great number of handfome palaces, and a fine arfenal. Thie cafte ftands on a very lofty hill, and communicates with the river by means of a decp well. The emprefs-dowager was obliged to retire lither during the war of $17+1$ and 1742 . It is feated on the river Muer, in E. Long. 16. 25. N. Lat. 47.4.

GRATIUS, a Latin poet, cotemporary with Ovid, the author of a poem intitled $C_{y n}$ acreciion, or the MImerer of bunting witif dogs ; the bett edition of which is that of Leyden, 12 mo , with the learned notes of Janus Ulitius.

GRAVE, in grammar, a fpecics of accent oppofite to acute. The grave accent is expreffed thus ('); and fhows, that the voice is to be depreffed, and the fyltable over which it is placed pronounced in a low deep tone.

Grave, in mufic, is applied to a found which is in a low or deep tone. The thicker the chord or Aring, the more grave the tone or note, and the fmaller the acuter. Notes are fuppofed to be the more grave, in proportion as the vibrations of the chord are lefs quick.

Grave, in the Italian mufic, ferves to denote the flowell movement.

Grave is alfo ufed for a tomb, wherein a perfon defunct is interred.

Graves, among the Jews, were generally out of the city, thongh we meet with inftances of their interring the dead in towns. Irequent mention is made of graves upon mountains, in highways, in gardens, and private houles. So that nuthing on this head feems to have been determined. The fame may be obferred with refpect to the Greeks. The Thetuans had a law that every perfon who built an houfe fhould provide a burial-ground. Men who had diftinguihed themfelves were frequently buried in the public forum. The mont general cuttom was, however, to bury out of the city; chietly by the highway fide. The Romans were forbidden by the law of the 12 tables to bury or burn the dead in the city; but fome we find liad their $f_{e}$ pulchres in Rome, though they paid a fine for the indulgence.

Grave, a very frong town of the Netherlands, in Dutch Brabant, feated on the river Maefe, beyond which there is a fort. L. Long. 5. 4 i. N. Lat. 5 t. 46.

GRAVEL, in natural hittory and gardening, a congeries of pebbles, which, mixcd wieh a filf loam, makes lalling and elegant gravel-walks; an ornarment peculiar to our gardens, and which gives them an advantage over thofe of other nations.

Gravel, in medicine. See the Index fubjoined to that article; and fee Alkali, $11^{\circ} 17$.

Gramet-Halks. Tu make thefe properly, the bottom fhould be laid with lime-rubbilh, large flint-lones,
or any other hard matter, for eight or ten inches thick, to keep weeds from growing through, and over this the gravel is to be laid fix or eight incles thick. This fhould be laid sounding up in the middle, by wlich means the larger Nones will run off to the lides, and may be raked away; for the gravel thould never be freened before it is laid on. It is a common miftake to lay thefe walks tno round, which not only nakes them uneafy to walk upon, but takes off from their apparent brealth. One inch in five feet is a fufficient proportion for the rife in the middle; fo that a walk of 20 feet wide fhould be four inehes higher at the middle than a: the edges, and fo in proportion. As foon as the gravel is laid, it thould be raked, and the large llones thrown back again: then the whole fhould be rolice both lengthwife and croffwife; and the perfon who draws the roller fhould wear thoes with that lieels, that he may make no holes; becaufe holes make in a new walk are not eafly remedied. The walks foculd always be rolled three or four times in very hard thoxers, after which they will hind more firmly than otherwife they could ever be made to do.

Gravel, with fone loam among it, binds more firmly than the rawer kinds; and when gravel is naturally wery harfh and harp, it is proper to add a mixture of loam to it. The befl gravel for walks is fuch as abounds with fmooth round pebbles, which, being mixed with a litile loam, are bound fo firmly together, that they are never afterwards injured either by wet or dry weather. 'Thefe are not fo liable to be turned up by the feet in walking, as the more irregularly flaped pebbles, and remain much more firmly in their places atter rolling.

GRAVELINES, a very flrong fa-port town of the Netherlands in French Flanders, with a calle and harbour. It was ceded to France by the treaty of the Pyrenecs, and is feated in a marfly country on the river Aa, near the fea, in E. Lonf. 2.13. N. Lat. 50.59 .

GRAVELLY Iavd, or so:l, that abouncing with gravel or fand, which ealily admi's of heat and moiKure; and the more fiony fuch lands are, the more barren they prove.

GRAVENAC, a town of Germany, in the cirche of Surbia, and eapital of a county of the fame name. E. Lent. 8. 15. N. Lat. 48.22.

GRAVER, in the art of engraving, a tool by which all the lines, feratches, and thaces, are cut in copoer, \&e. See Esgraving.

GRAVESANDE (W゙illiam James), was born of an ancient and honourable fam:ly at Deift in Holland, in 688 . He fudied the civil haw at Leyden, but maticmatical kearning was his favourite amufement. When he had taken his doctor's degree in 1707, he fetted at the Hague, and practifed at the bar, in which fitmation he cultivated an acquaintance with learned men; with a fociety of whom, he pullihhed a periodical review intited Le Ơomnal Litucraire, which was continued without interruption from the year 1713 to the year $\mathbf{1 7 2 2}$, when he died. The mont confiderable of his works are, "A treatife on perfpective; Au introduction to the Nemtonian philofophy, or a treatife on the elements of plyfics confirmed by experin.ents; A treatile on :be clements of algebra, for the Lfe of young fludents;" and "A courfe of logic and Vox.VIII. Partl.
metaphy fics." He liad intended to have prefented the Gravefond, public with a fyttens of morality, but his death pre- Gravina vented the exechtion. The minitters of the republic confulted him on all occalions whercin his talents were requifite: and his in:ill in calculation was often of fervice to them; as was his addrefs in decyphering, for detecting the fecret correfpondence of their enemies. As profeflur of mathematics and afronomy at Leyden, none cyer applied the powers of nature with more funcefs, or to more ufeful purpofes.

GRAVESEND, a town of Fient in England, $f_{i}$ tuated on the banks of the Thames. It is 23 milies from London; and has a blockhoufe well mounted with cannon, to command the fhips and river, direetly oppofite to Tilbury fort in Efex. The town was plundered and ournt by the French and Spaniards in the reign of Richard II. to compenfate which, the king, at the requeft of the abbot of St Mary-le. Giace oi Tuser hill, to whom he had granted a manor there called Parrocks, velted it and Milton with the fole priyilege of carrying paffengers by water from hence to London at 4 s. the whole fare, or 2 d . a head; which was confirmed by Henry VIII.; but now the fare is $\boldsymbol{g}$ d. a head in the tilt-huat, and 18 . in the wherry. The formar whit aus idhe in aloove 40 pafiengers, the later no more than 8. Coaches ply here at the landing of people from London, \&c. to cary them to Rochelter, at is. Gd. each. This town and Milton were incorporated by queen Elizateth by the name of the purtreco (now the mayor), jurats, and inlahitauts of Gravelend and Milton: And, as Gravefend is the place where molt paffengers through Kent from foreign parts take boat fur London, that queen, in order to fhow the grandcur of the metropulis of her kingdom, ordered the lord mayor, aldermen, and city companies, to receive all ambaffadors and cminent fraggers here in their formalities, and to attend then to London in barges if by water; or if they choofe to come by hand, they were to meet them on horfeback on Black. heath in their livery-gowns. The towns for feveral miles round are fupplied from hence with garden ituff: of which great quantities are alfo fent to London, where the afparagus of Gravefend is preferred to that of Batierfea. All outward bound hips are obliged to anchor in this road till they hare been vifited by the cuftom-houfe officers; and for this purpofe a centinel at the block -houle fires a mufeet : but the humewardbound all pafs by without notice, unlefs it be to put waiters on board, if they are not fupplied before. $\lambda_{0}$ the outward bound generally take in provifions here, the place is full of feamen, who are ail in a hurry. The whole town beiur burnt down in 1727,5000 . was granted by the parliament in 1731 for rebuilding its church, as one of the 50 new ones. In 1624, one Mr Pinnock gave 2 t dwelliug -houfes here, befides one for a matter weaver, to employ the poor; and here is a charity fchool for $2 \div$ boys, who are both tanght and cloathed. The town houfe was enected in 176 ; and in 1772 an act of parliament empowered the inhabitants to pave and light their Arects.

GRAVINA, a town of Italy, in the kingdom of Naples, and Terra di Bori, with a bifhop's fee, and the title of a duchy. E. Long. 17. N. Lat. 41 .

Graviva (John Vincent), an eminent feholar, and illuttrious lawyer of Italy, born at Roggiana in

## $G \quad R \quad A \quad\left[\begin{array}{lll}122\end{array}\right] \quad G \quad R \quad A$

Ce:vina :GC+. He was profefor of the canon lav in the"college of Sapiensi at Rome; and though many foreign raiverlitics made propofals to draw him to them, he never quitted that city, but did there in 1718. His
works are both curions and ufeful; the greateit of them is De orta et progrefly yaris Civilis. A culcetion of his works was printed in 4 to at Leipfie in 1737, with the notes of Mafcovius.

Gravixa (Pet.r), in Italiza poet, much efteemed the the great gencial Gomfalvo, and P ofper Culoma. He wrote, in a phre Roman hyle, Difeurfes on Mattera relating to the Law and to the Belles Lettres, as well as Porms. He died in 15:7.

GRAVITATION, in na:mal philofophy, is fomesincs ditin suithed from grarify. Thus Mi. Maupertuis takes gravity for that force whereby a body would fall to the eath ; but gravitation for the fame dininimed by the centrifugal force. See Nelerowlas Philofody

GRAVITY, or Gramitation (for the words are moft eummonly ufed fynonymoufly), tigniaies either the force by which bodies are preffed towards the furface of the earth. or the manifelt effect of that force; in which latt fenfe the word has the fame lignification with weight or bearine/s.

Concenning gravity in the firl fenfe of the word, or that active power ty which all bodies are impelled towards the earth, there have been great difputes. Many eminent philofopher, and among the rett sit Haac Newton himilf, have confidered it as the firlt of all fecond caufes; an incorporeal or firitual fubflance, which never can be perceived any other way than by its effects; an univerfal property of matter, \&c. Others have attempted to txplain the phenomena of gravitation by the atrion of a very fubtile ctherial fluid; and to this explanation Sir Ifaac, in the latter part of his life, feems foot to have been averfe. He hath even fiven a conjeture conecrning the matter in which this fluid might oceation thefe phenomena. But for a full account of the difeoveries of this great philofopher -oncerning the laws of gravitation, the conjectures made by him and others concerning its caule, the vasious of jections that have been made to his doct:ine, and the flate of the difpute at prefent, fee the atticles Ne, tomes Phisfoly, Astronomb, Atmospherf, Earth, Elfctruity, Fire, Light, Attraction, Repulsion, Plenum, Vacuum, \&oc.
Speiffit Graigrar, derntes the waight belonging to in equal bulk of every different fubfance. Thus the caect weight of a cubic inch of gold, compared with a eubic inch of water, tin, lead, see. is called its fpecific areafy. Sce Hydaostatics.

GRAUNI' (John), author of a curions and celebrated bosk, intithd, Nutural aial Politial Obfervazions made ufon the Bills of Mcrtality. He was a haberdaher of fmall wares; but haid down his trade, and all public employments, on account of his religion. He was educated a puritan; afterwards profeffed himSelf a Sociuian; yot in the hatter part of his life deJared himfelf of the Roman Catholic religion. Hc was a member of the royal fociety, and died in 1674.

GRAY, or Grey, a mixed colour partaking of the :wo extremes, black and white. See Black, $11^{\circ} 8$, q, 10. and Dyeing, $n \cdot y z$, and 90 .
In the manege they make feveral forts of grays;
as the branded or blackened gray, which has fyots quite black difperfed here and there. Tine dappled gray, which has fpots of a darker colour than the reft of the body. The light or tituer gray, wherein there is but a frall mistere of black hairs. The fad or irun gray, which has but a fmall mixture of white. find the brownih or fandy coloured gray, where there are bay-coloured hairs mised with the black.

Gray, a town of Irance, in the liranche Compte, and capital of the bailiwick of Amont. It is a tracting place, and feated on the river Saone, in E. Long 5.41. N Lat. 47.30 .

Gray (Lady Jme). Sce Grer.
Gray (Tho:nas), an admired IEnglifh poet, was the younget and only furviring fon of a reputathe citizen of London, and was born in Cornlull ia 17, 15. He was educated at Einn, where he contracted a friendflip with Mr Harace War.ole, and with Mr Richari Welt fon of the lerd chanecthor of Iecland. MrWeitand Mr Gray were both intendul for the bar; but the frmer died eanly in life, ant the later was diverted froan that purfuit by an invitation to accompany Mt Walpole in his travels: which he acceried without any detemined plafor ?:is Future life. Daring Mr Gray's travels, se weote a varity of letters to Mr Weat and to his parents, whichare rinted with his poems; and when he returnch, frating homifif in narow circhmllances, yet with a mind indifpofed for active emplayment, he retired to Cambricge, and devoted hinfelf to ftudy. Soon after his return, his friend Wert cied: and the melarcholy innefled oa him oy this event may be traced in his admired " Elegy witen in a country cherchyard:" which is thought to have been berun, if not finifhed, at this time: though the conclation, as it fland at prefent, is certainly different from whe it was in the fink manufeript copy. The fort impulfe of his forrow for the death of his friend gave birth to a veis tender fomet in Enylith, on the Petrarchian model; and alfo to a fublime apotrophe in hexame. ters, written in the genuine ftrain of claffical majety, with which lie intended to begin one of his books $D e$ Primatitis cositanli.

From the winter of the year $17+2$, to the tay of his death, his principal relidence was at Cambridge: from which he was feldom abfent any confudcrable time, except between the years 1759 and 1762 ; when, on tho opering of the Dritih Muteum, he took lodgings in Southampton-row, in order to have recourfe to the Harlcian and other mamicripts there depolited, from which he made fevena curious extracts, amounting in all to a tolerable fized folio, at prefent in the hands of Mr Walpole.

About the year $174 \%$, Mr Mafon, the editor of Mr Gray's poeras, was introduced to him. 'The former had written, a year or wo before, fome imitations of Milton's juvenile poems, qiz. A Monody on the death of Mr Pope, and two pieces intitled Il Bellicofo and Il Pucifico on the peace of Aix-la-Chapelle; and the latter revifed them, at the requelk of a friend. This laid the foundation of an intimacy which continucd withont interruption to the death of Mr Gray.

About the ycar :750, Mr Gray had put his laft hand to his celebrated Elegy written in a country church yard, and had communicated it to his friend Mr Walpole, whofe good talle was too much charmed
with it to fuffer him to with-lold the fight of it from his acquaintance. Accordingly it was hown about for fome time in manufcript, and received with all the applaufe it fo juftly meritcd. At latt the publifher of one of the magazines having oltained a furreptitious copy of $\mathrm{it}, \mathrm{Mr}$ Gray wrote to Mr Walpole, defiring that he would put his own manufeript into the hands of Mir loadtley, and order him to print it inmediately. This was the molt popular of all our author's publications. It ran through eleven editions in a very fhort fpace of time; was finely tranflated into Latin by by Mefirs Anfty and Roberts; and in the lame year by MrI loyd.

From July 1759 to the year 1762 , he generally refided in London, with a view, as we have already obferved, of having recourfe to the Britifh Mufcum. In July 1768, bis grace the duke of Grafton wrote him a polite letter, informing him, that his majelly had been pleafed to offer to him the profeflorthip of Modern Hittory in the univerlity of Cambridge, then vacant by the deatly of Mr Laureace Brocket. This place was valuable in itfelf, the falary being 4001 . a. rear; but what rendered it particularly acceptable to Mr Gray was its being given him withont any folicitation. He was indecd remarkably difinterelled in all his purfuits. Though his income, before this addition, was very fmall, he never read or wrote with a view of making his labours ufeful to himfelf. He may be faid to ha:e been of thofe few perfonages in the annals of literature, efpecially in the poetical clafs, who are devoid of felf intereft, and at the fame time attentive to economy; and alfo was among mankind in general me of thofe very few economits, who porfefs that talent, untinctured with the fighteft fain of avarice. When his circumftances were at the loweft, lue gave away fuch fums in private charity, as would lave done credit to an ampler purfe. But what chiefly deterred $\lim$ from fecking any advantage by his literary purfuits, was a cettain degree of pride, which led him to defpife the idea ef being thought an author by profefton.

However, it is probable, that carly in life lee lad nn intention of puldithing an edition of Strabe; for his papers contain a great number of notes and geographical difquifitions on that author, particulaly with refpect to that part of A wa which compreliends Peffia and Incia. The indefatigable pains which he took with the writings of Plato, and the quantity of critical as well as explanatory obfervations which he has left upon alnoflt every part of his works, plainly indicate, that no man in Europe was better prepared to republifh and illuntrate that philofopher than Mr Gray. Another work, on which lie beftowed uacommon labour, was the Anthologia. In an interleaved copy of that collecion of Greck epigrams, he has tranferibed foreral additional ones, which he felected in his extenfive reading; has inferted a great number of critical notes and cmondations, and fubjoincd a copious index. lhut whethes he intended this performance for the prefs or not, is uncertain. The only work which he meditated upnn with this dircet view from the beginning was a hiftory of Englilh poctry, upon a plan anetched out by Mr Popec. He has mentioned this himfelf in an adrertifement to thofe three line imitations of Norfe and Welch poctiy, which lie gave the
world in the laft edition of lis poems. But after he had made fone confiderable prefarations for the execution of this defign, and MrMafon had offered hin his affiftance, he was informed, that Mr Warton, of Trinity College, Oxford, was engaged in a work of the fame kind. The undertaking was therefore relinquifhed, by mutual confent ; and foon after, on that gentleman's defiring a fight of the plan, our author readily fent him a copy of it.

Among other fciences, Mr Gray had acquired a great knowledge of Gothic architecture. He liad fecn and accurately ftedied in his youth, while abroad, the Roman proportions on the fpot, bóth in ancient timeg, and in the works of Palladio. In his later ycars lic applied himfelf to confider thofe ftupendous, ftructure; of roore modern date that adorn our own country; which, if they have not the fame grace, lave undoubt. edly equal diguity. He endeavoured to trace this mode of building from the time it commenced through its various changes, till it arrived at its perfection in the reign of Henry VIII, and ended in that of Ellizabeth. For this purpofe, be did not fo much depend upon written accounts, as that internel evidence which the buildings themfelves give of their refpective antiquity; fince they conllantly furnith to the well informed eye, arms, ormaments, and other marks, by which their feveral ages may be afcertained. On this account he applied himfelf to the ftudy of heraldry as a preparatory fcience; and has left behind him a number of genealogical papers, more than fufficient io prove him a complete mafter of it. By thefe means he arrived at fo rery extraordinary a pitch of fagacity, as to be en. abled to pronounce, at firlt fight, on the precife time when every particular part of any of our cathedrals was erected. Dut the favourite ftudy of Mr Gray for the latt ten years of his life was natural hiftory, which he then rather refumed than began; as by the inflructions of his uncle Antrobus, he was a confiderable botanif at 15 . The marginal notes which he has left on Linnaus and other writers on the vegetable, animal, and fuffile kingdons, are very numerous: but the mont confiderable are on Hudfon's Flora Anglica, and the tenth edition of the Sylloma Nature; which latter he interleaved and filled almolt entirely. Whilc employed on zoology, he read Ariftotle's treatife on that fubject with great care, and explained many difficult paffages of that obfeure ancient by the lights he had received from modern naturalifts. In a word, excepting pure mathematics, and the fudies dependent on that fcience, therc was hardly any part of human learning in which he had not acquired a competent fkill, and in mott of them a confummate maftery. To this aecount of his literary character we may add, that lie had a fine talle in painting, prints, gardening, and mufic; and was moreover a man of good-breeding, virtue, and bumanity.

He died in 1771; and an edition of his poems, with memoirs of his life and writings, were publifhed in 4 to, in 1775, by Mr Mafon. This gentleman, howera, intlead of cmploying his own pen in drawing Mr Gray's character, hasadopted onedrawn by the Rev. Mr Temple, reitor of Mamlead in Devonthire, in a letter to Mr Bofwell; to whom the public are indebted for communicating it. "Perhaps (fays Mr Temple) be was the molt learned man in Líurope. He was equally acquainted
with the clegant and profound parts of fcience, and that not fuperficially but thoroughly. He knew every branch of hiflory, both matural and civil; had read all the origial hititorians of England, France, and Italy: and was a great antiqurian. Criticim, metaphytio, merels, pritice, made a principal part of his plan of An'y: wages and travels of all forts, were his farosmee amufement; and he lad a fine talle in painting, prints, architecture, and gardening. With fuch a sund of knowledge, his converfation mult have been equally intructing and entertaining; but he was alfo a good man, a well-bred man. a min of virtue and humanity. There is no character without fome fpeck, fome imperfection; and I think the greatell defect in his was an affectation in delicacy, or rather effeminacy, and a vifible faltidioufaef, or contempt and difdain of his inferiors in feience. He alfo had, in fome degree, that weaknefs which difguted Voltaire fo much in Mr Congreve: though he leemed to value others chicfy according to the progrefs they had made in knowledge, get he could not bear to be confidered himfelf merely as a man of letters; and though without birth, or fortune, or ftation, his delire was to be looked upon as a private independent gentleman, who read for his amufement. Perhaps it may be fait, What fignities \{o much knowledge, when it produces fo little? Is it worth taking fo much pains to leave no memorial but a few poems? But let it be corfidered, that Mr Gray was, to others, at leat innocently employ d; to himfelf, cestainly beneficially. His time pafted agreeably; he was every day making fome new acquifition in fcience; his mind was enlarged, his heart fuftened, and his virtue flrengthened; the world and mankind were hown to him without a mark; and he was tanght to conlider every thing as trifing, and unworthy the attention of a wife man, except the purfuit of knowledge, and the practice of virtue in that fate whereia God hath placed us."

GRAYLING, in ornithology, a fpecies of Salmo.
In angling for this fifl your hook mult be armed upon the fhanks with a very narrow plate of lead, which fhould be flendereft at the bent of the hook, that the bait (which is to be a large grahopper, the uppermont wing of which mult be pulled off) may come over to it the more caflly. At the point let there be a cadbait in a continual motion. The jag-tail, which is a worm of a pale flefh-colour, with a yellow tag on its tail, is an excellent bait for the grayling in March and April.

GREASE, a fwelling and gourdinefs of the legs of a horfe. Sec Farriery, § xxisvi.

GREAT, a term of comparifon, denoting a thing to have more extenfion than fome other to which it is referred. Thus we fay, a great fpace, a great dillance, a great figure, a great bady, \&c.

Grear is likewife ufed figuratively in matters of morality, \&c. to fignify ample, noble, elevated, extraordinary, important, \&c. Thus we fay, Shakefpeare was a great genins, Da Vinci a great painter, Galileo a great philofopher, Boffu a sreat critic, \&c.

Great is alfo a title or quality appropriated to certain princes and other illull rious perfonages. Thus we fay, the great Turk, the great Mogul, the grat olham of 'Tartary', the great duke of Flurence, \& a e.

Grear is alfoa furname bettowed on foreral kings
and emperors. Thas we fay, Aleszatir the atazt; Cyrus the areat; Chaties the great, or Charlenagae; Heary the yrate of France, sco.
Great is alfo applied to teveral offeers who have pre-cininence over uthers. Thas we fis, the lord great clamberlain; the gecat mathni of phand, sic.

GREAIER tonf, m maic. Sec loue.
GREAVES (Jolm), an eminent phylician and antiquary, was the eldell fom of John Greaves rettor of Celemore, mar Alrestord in Hanphire, and born in 160:. He was educated at Buliol College in Oxford, from which he removed to Merion. He was afterwards, oa the foot of his great merit, chufon geometry profufor of Greham college. His ardent thirft of kuvwledge foon carried himinto feveral parts of Europe, where he eagrerly ieized every opportunity of improving it. His next voyage was into the ealtern countries; where nothing remarkable in the heavens, earth, or even fabterrateous places, feens to have efcaped his nace oblervation. Hie, with indefatigable indully, and evon at the peril of his life, collected a confiderable number of Arabic, Perfic, and Greek, manuferipes, for archaidhop Laud. Of thefe he well knew the value, as he was a mafter of the languages in which they were writica. He allo collected for that prelate many oriental gems dad coins. He took a more accurate harey of the pyramids than any traveller who went before him. On his return from the Eafk, he vifited feveral parts of Italy a fecund tine. Daring his flay at Rome, he made a particular inquiry into the true flate of the anciens weighis and mealures. Soon afier he had linimed his fecoad royage, he was chofen Savilian prufefor of ditronomy at Uxford. He was eminently. qualitied for this protetror:hip, as the works of ancent and modern alltomomers were familiar to him. His books relating to oriental learning, his Pyramidogrushobl, or a defeription of the pyramds in Egypt, his Epoib, Culebriores, and other curious and uifful pieces, of which Mr Ward has given us a cataloguc, thow him to have beea a great man. Mhofe which loc intended to publih would thave thown hin to be a greater; but he was ftopped in has great cares by death in 16,52.

GREBE, in ornithology. Sie Colrmaus.
GRELCE, the prefert Rumelia, and in many refpects one of the mult defervedly celcbrated cunntrics in the world, was ancientiy bounced out the north by Macedonia and the river sirymon; on the well by the Ionian fea; un the fouth by the Mediserianean; on the call by the Egean fea and Archipelago. It extended from the Sirymon, by which it was parted from Thrace, to the promontory of Tenarts, the fouthmort point of the Peloponnefus, now the Morea, about 6 $20^{\prime}$ of latitude, or nearly 4 to $\operatorname{linglih}$ miles, and ia breadh from ealt to we!t about 350 riles.

The gencral names by which the inhatitants of this country were known to the ancients were thofe of Graioi, or Graiooi, from whence the name of Grece is plainly derived. Thefe rames are thought to come from Grecus, the father, or (accordang to iume) the fon, of Theflahas, who gave nane to Theflily; but fone mudern critics choofe to derive it from Ragan, the fame with Rca, the fon of Peleg, ty the tranpodition of a letter to foften the found. - Thefe names were after-
 freppofed,
$\qquad$教 .
$\qquad$
$\qquad$
fuppofed, from Acbeus, the fon of Suthus, the fon of Hellen, and father of Ion; or, accurding to the Cable, the fun of Jupiter: the other from Hellen, aboze-mentioned, the fon of Deucalion, and fathere, Dorus, from whom came the Dores, afterwards al famons mation among the Grecks. - Anosher mane by which the Greeks wite known in fome parts of the comerty, was that of Pollferi, which the Arcadians, the mont ancient people in Greece, deduced from their pretended founder Pollufys; who is faid to have got fitch fouting in Peloponacfus, that the whole peninfula from him was calld Pelofisia. But the molt ancient name of all is univerfally allowed to have been that of Iones, with the Grecks themfelves derived from Ion the fon wf Xuthus; or, as the fable hath it, of Apolio, by Cre. ufa the daughter of Erichtheus the grandion of Dencalion. Jofephus, however, affims, that their original is of much older date; and that Javan, the fon if Japhet, and grandfon of Noah, was the frit who peopled thefe countries; which Bochart Bath alfo rendered very probable. It is tute, indeed, that ainons the Grecks thenifelves, only the Athenians, and fuc: colonies as fprung from them, were called Scnes: but it is allo plain beyond execption, that whener nations gave this name to all the inhabitants of Greece.

The imhabitants of Grecce in the mitages, w:a by the confeflion of their own binorians, appcar to have been favages fearce a degree remared fre in brutes. They lived iadiferatly on every frut, herb, or :oot that came in their way; and lay cithes in the ops a fields, or at bett faeltered themfelies in dens, calses, and hollow trees; the country itfolf in the mean time remaining one continu d uncultivated detant. - The list improvenent they made in their way of heving, was the exchanging of their old food for the more shotefome acorus, building huts for themstars to fleep in, and covering their boties with the Reins of beaits. For all this, it feems, they were beholden to Pidfgius a-bove-mentioned (fuppofed by fonce to be 'i'cleg fpoken of in Scripture), and who was highly reverenced by them on that account. - This reformation in the ir way of life, however, it feems wrought none in their manners. On the contrary, they who had nothing to fight for but a hole to fleep in, began now to envy and wob one another of thefe nender acquifitions. Tlis, in procefs of time, put thein under a neceffity of joining themfelves into companies under fome head, that they might either more fafcly plunder their neighbours, or preferve what they had got. Laws they had none, except that of the fword: fo that thofe only lived in fafety who inhabited the moft barren and craggy plaecs; and hence Greece for a long time had no fotticel inhabitants, the weakef being always turned out ty the ftrongett. Thcir gigantic fize and frength, if we may believe Plutarch, added fo much to their infulence and cruelty, that they feemed to glory in committing. the greatef acts of violence and barbarity on thefe: that unhappily fell into their hands.

The next advance towards civilization, was the ir forming themfelves into regular focieties, to cultivate the lands, and build thenfelves towns and cities for their fafete: Their original barbarity and mutual violences againd each other naturally preveated the in from uniting as one nation, or even into any confiderable comnunity: and hence the great number of flates in-

\section*{| 125 | $G$ | $R$ |
| :--- | :--- | :--- |}

to which Greece was originally divided. T"، un an remarkable of thefe finall prinipalicis muativned in hifory are the follusing: In Pelupomatis licre hofe of Bicyon, Argos, and Sidfichit, Ahaia Propria, Atcadis. and Lacmia. In Grias Proplis (that
 thuf: of Attica, Negara, Bucua, Locria, Epichnemidid, Doris, Phocis, Locris, Uadia, and ABtolia. In Epinas were the NIoloffi, Amphiluhi, Cafiopari, Disepece, Chaocec, Threfpnii, Alineni, anl Acarnani. In Thellaly were thofe of Thefaliotis, Elliutis, Pelafgiotis, Minguelin, and Phehia.- Ith thefe have at one time or cther been feverally guverned by kings of their own, though we ouly find hat nanes of many of then mentioned in the haturies of the more contedrabic hinghans of Sparta, Attica, Theber, Ec.- The erection of thefe kingdoms, however, for fome time, did mot mulh alter the caic ; the imhabitants of the new kingdons phandered and delroyed othe annther without meres. Attica was the only place ia any degree free from thefe incurions, becaufe it was naturaliy cillitute of every thing that could inviee a phodenifg enemy; but thofe cities fared much woife which wete fitwated on the fea-coalts ; becaufe they were in continual danger of being plundered either by fua or land: for pirates at that time did not lefis iufat all thofe feas than robbers did the land. And this was one main caule why mult of the ancient cities of Grece were fituated at fome confiderable didance from the flore; but even in thefe, as all their fafty coulited in the refillance they conld male againt an inveder, the ir inhabitants were under a ncelffity of going conmantly armed, and being ever on their guad.
Amelher mifhicf anifug foom thefe continual pirto cies end robberics was, ihat they occafioned the far grater part of the lands to lic unculticated, fo that the perple ouly planitd and fowed as much as was ba diy weceltary for their prefent fupport; and where there wats futh an univerfal neylect of agriculture, there could be as little room for any difcoveries in o. ther tifeful ats and trades. Hence, when other ma. tions, as the Jews, Exyptiaus, Midianites, Phomicians, \&ec. had mproved themfelves to a very high degice, wit Greeks fecm to have been uter Itranecers to cury wffilat art.
Waring this period of favage babarity, the mont
 pelfurmed their exploits; which, however exargera. ted by puttic fiction, no doubt had a foundation in truth. Sime irdecd are of opinion that the Grecian hetoes are entiely fotitious, and the ir expluits derived frum thofe of the Hebrew worthies, fuch as Samfor, Gideon, \&e. Yet, confidering the extreme degree of barbarity which at that time prevailed throughcut Greece, it feems not at all inprobable that fome perfons of extravedinary ftrength and courage night unlertake the caufe of the oppreffed, and travel about like the more modern kuights errant in quelt of adventures.

The finf expedition in which we find the Greeks mited, was that againt Troy, the particulars of which are recited mider the article Tros. Their fuccefs hace (which happend atome the +13 . C.) cull then very dear; vatt mumbers of their bravelt wartions being fuia; freat aunturs ce the furvivarubing cut

Greece. $\xrightarrow{ }$
away in thir retum; and many of thofe who had the fnod luck to st back again, being foon after murderel, or driven ont of their countsy. It is probable, Howeres, that thicir having flaid for fuch a long time in Alia, might contribute to civilize the Greeks fomewhit fockice thon what the oherwife would have been; and accordingly from this time, we find their hilury fomewhat lifs obfeare, and as it were beginins to charge out of darkuefs. The continual wars, incisd, in which they were engaged among themfelves, ro doubt, for a long time, preverted them from maKing any confiderable progrefs in thofe arts in which they afterwards made fo great progrefs. Thefe wars, which indeed never ceafed as long as the Greeks preferved their liberty, rendered them brave, and Rilled in the militay att, above all other nations; but at the fanc time they effectually prevented them from making pomancut conquefts, and cenfmed them within the bounds of their own conntry; while the different flates were one way or other fo equally balaneed, that fearee whe of them was able perfectly to fubdue another. The sipartans, however, having, with great difficulty, reduced the kingdom of Meflene, and added its territories to their own, became the leading people in Grecce. Their fuperiority was long difputed by A. thens; but the Pcloponnction war at laft determined that point in farour of the Spartans, when the eity of Atheris was taken, and its walls demolihed by Lyfander the Spartan general. See Arrica, $\mathrm{n}^{\circ} 16+$ - iny the battle of Leuetra, the Spartans lof that fupetiority which they had mantained for 500 years, and which now devolved on the Thebans. After the isatio of Epaminondas, the celebrated Theban geneial, however, as no perfon was found pofleffed of his abities, the Thebans were again obliged to yield the fuecriority to the Spartans. But by this time the Grocks had become acquainted with the luxuries and degancess of life; and all the rigour of their orisinal laws could not prevent them from valuing thefe i.s highly as other people. This did not indeed abate their valour, but it heightened their mutual animofities; at the fame time that, for the fake of a more eafy and corffutable life, they became more difpofed to iubait to a mafter. The Perfians, whofe power they had long dreaded, and who were unable to refift them by furce of arms, at lalt found out (by the advice of Alcibiades) the proper method of reducing the Grecian power; namely, by aflilling them by turns, and tupplying one flate with money to fight againft another, sill they thould all be fo much reduced, that they might beeome an eafy prey. Thus the Greeks were weakened, though the Petlians did not reap any benefit from their weaknefs. Philip of Macedon entered into the fame political views; and partly by intrigue, partly by force, got himfelf deelared Generalifimo of Grecce. His fuceeffor Alexander the Great completed their fubjection; and by dellroying the city of Thebes, and exterminating its inhabitants, Aruck fuch a terror throughout Greece, that he was as fully obeged by all the ltates as by any of the relt of his fubjects. During his abfence in Perfia, however, they attempted to ?hake off the Macedonian yoke, but were quelled by his general Antipater. The news of Alexander's death was to them a matter of the utmolt joy; but their mutual animofites prevented them
frum joining in any folid plan for the recovery of their liberties, and hence they continued to be oppreffed by Alexander's fuceefors, or other tyrauts, till Aratus, an Achran, about 268 B . C. formed a defign of fetting his country free from thefe opprefors. He perfuaded a number of the frall republics to enter into a league for their own defence, which was called the Achazan laguc; and notwithtanding that the republics, taken fingly, bad very little Itrength, they not only maintaind their independency, but foon became formidable when united. This allociation continued to become daily more and more powerful; but reccived a fevere check from Cleomenes, king of Sparta, which obliged them to call in Antigonus to their affifance. This prince overeame Cleomenes at the battle of Sellatia, and aferwards made himfif mafter of Sparta. Thus he became a more formidable enemy than the one he lad conquered, and the recovery of the Grecian libeties was incomplete.
Soon after this, the Greeks began to feel the weight of a power more formidable than any which they had yet experieneed; namely, that of the Romans. That infidious and haughty republic firlt intermeduled with the Grecian affairs, under pectence of fetting them at liberty from the oppreffion of Philip of Macedon. This, by a proper union among themfelves, they might have accompliithed: but in this they afted as though they had been infatuated; receiving with the utmolt joy the decree of the Roman con(ul, who declared them free; without confidering, that he who had thes given them liberty, might take it away at his pleafure. This leflion, however, they were foon taught, by the total reduction of their country to a Roman province; yet this can fearee be called a misfortune, when we look back to their hithory, and condider their outrages upon one another: nor can we fympathife with than for the lofs of that libety which they only made whe of to fill their country with llaughter and bloodthed. After their curquert by the Romans, they made no united effort to recover tileir liberty. They continued in quiet fubjection till the beginning of the 15 th eentury. About that time, they began to fuffer under the tyranny of the Tarks, and their fufferings were completed by the taking of Conltantinople in 1453 . Since that time, they have groaned under the yoke of a moll defpotic gowemment; fo that all traces of their former valour, ingenuity, and learning, are now in a manner totally extinct.
Modern Grecee comprchends Maeedonia; Albania, now called Arnatt ; Epirus; Theffaly, now Tana; A. chaia, now Livalia; the P'cloponnefus, now Morea; together with the iflands on its coall, and in the Arehipelago. The continent of Greece is feated betwixt the 3 sth and $43^{3}$ degrees of north latitude; and between the 10 th and 27 th degrees of longitude, eald of London. To the north it is bounded, by Bulgaria and Scrvia, from which it is divided by a ridge of mountains; to the fouth, by the Mediterranean fea; to the eatt, by Romania and the Archipelago; and to the weft', by the Adriatic, or gulph of Venice. Its length is faid to be about 400 miles, and its utmolt breadth about 350 miles. The air is extremely temperate and healhy: and the foil fruitful, though badly cultivated ; yielding corn, wine, delicious fruits, and abounding with catte, fowls, and ven:fon. As to re-
rece. ligion, Chilitianity was planted in Greece foon after the death of our Saviour, and flourithed there for many ages in great purity; but fince the Greeks became fubject to the Turkith yoke, they have funk into the moll deplorable ignomanee, in confequence of the favery and thraldon ander which they groan, and their religion is now greatly carrupted. It is indeed litte better than a heap of ribiculous ceremonies and abfurdities. The head of the Greek church is the patriareh of Conttantinople; who is chofen by the neighbouring archbilhops and :nctropolitans, and contirned by the err.persor or granc vifir. He is a parfon of great dignity, being the head and director of the callern church. The other pariarchs are thofe of Jernfiem, Antioch, and Inc:candria. Mr 'Tournefort eclls us, that the patriarchates are now generally fet to fale, and bellowed t:pon thote who are the higheit bidders. The patriarchs, metroptlians, whbihose, and bithops, are always chofeaf from a anong the Caioyers or Creek monks. Before the pattiarehs receive their patents and tile caftua, which is a veit of linfey woolfey, or fome other Itati, prefented by the grand fignior in ambafudors and other perfons newly invelted wih fome confiderabic difuity, they are obliged to make large pefents to the vizir, ic. The income of the patriarch of Confantinople is fail to a:nown to no lefo than one hundred and twenty thoufan! guilders, of which he pays the one half by way of analual tribute to the Ottoman Porte, adding fix thouland guilders belides as a prefent at the feat of Bairam. The next perfon to a hiflop among the elergy is an arehinandrite, who is the director of one or mare convents, which are called mandren; then come the abbot, the arch prief, the priett, the deacon, the ander-deacon, the chanter, and the lecturer. The fecular clergy are fubjected to no rules, and never rife higher than high-prict. 'They are allowed no marry once; but it mall be with a virgin, and before they are ordained. They have aeither glebe nor tythes, but depend on the perquilites that arife from their office; and :ley feldom preach but in I, ent. The Greeks lave few nunneries ; but a great many convents of monk, who are all priell, and, 'tudents excepted, obliged to fullow fome handicraft employmeat, and lead a very autere life. The Greeks deny the fupremacy of the pepe, and ablaor the worthip of images: but have a multitude of pienures of faints in their clarches, whom they pray to as mediators. Their falls are very fcvere. They believe alfo in the doctuine of tranfubilantiation, and that the Holy Ghot does not proceed from the Son. They admit not of purgatory, fays Mr Thevenot : but yat they allow a third place, where they fay the blefled remain, in expectation of the day of judgment. At mafs they confecrate with leavened bread; and communicate under both kinds, as well laies as priet?s, and as well women and children as men. When they carry the facrament to the fick, they do not proArate themfelves before it, nor expofe it to be adured: neisher do they carry it in proceffoa, or have any particular fealt in honour of it. Baptifm is performed among them by plunging the whole body of the child thrice into water. Immediatcly after baptifin, they give it contirmation and the communioa; and feven days after that, it undergoes the cercmony of zblution. When a prical is married, among other ce-
remonies, the bridegroom and bride drink each (wi) glafies of wine; then the glafs is given to the priett, who merrily drinks ofl the rett of the wine, and break: ing the ghaf, fays, So may the bride groom break the virginity of the bride. As to the charaker of the m.sern Grecks, they are fiill to be very covetons, typocritical, theacherons, great pederats, and at the fame time revengeful to the higheft degree; but wery fuperititions. They are fo nueh defpifed by the "iurks, that theie do not value even a Greek who turas Ma. hometan. 'The Thark ane remorkable for their tasiturnity; they never ufe any unnecofiry words : but the Greeks, on the contrary, are ve:y talkative and lively. The Turks generally practife what their rehigion enjoins, but the Grecks do not; and their mifery puis them upon a thoufand mean fhifts and feandalous practices, authorized by bad example, and perpetasted from father to fon. The Grect: women have inse features and beantiful complexions: their countenances itill very much wfemble thofe of the ancien: Greck flatuen.

GRIEEK, or Greciav, any thing beionoing to anctent Gruece.

The Greck Inguare, as peferved in the exritings of the celbrated authors of antipuity, as $H$ mer, Hefiod, Demolhenes, Arikole, Dlato, Xenophon, sie. has a gevat variety of terms and expreffims, fuitable to the genius and occalions of a plite and leamed prople, who had a tatte for arts and fciences. In it, 1 roper manes are figrimative; which is the reafon that the modern language; burrow fo many terms from it. When any net invention, intrument, machime, or the like, is difcuveral, recombe is generally had to the Gacel for a mame to it ; the facility wherewith words are there componded, affurding fuch as will be expreflive of its ufe: Cach are, brometer, hyyroneter, mierofeop, tele foope, the:mometer, \&s. But of all fciences, mediune mo!k abounds with fola terms : as diaphoretic, diagnofis, diarrhed, hamorhhare, bydrophobia, phthifi=, atrophy, Ese. Befdes the copioufnefs and lignilicancy of the Greck, wherein it ex. cels moft, if not all, other languages, it has alf, three numbers, viz. a fingular, dual, and piaral: alfo abundance of tenfes in its visos, which makes a variety in difeourfe, prevents a cert:in dryners that always accompanies too great an uniformity, and renders that language peculiarly proper for all kinds of verfe. The ufe of the participles, of the aorill and preterite, toricether with the compound words already inentionel, give it a peculiar foree and brevity without taking any
thires from its perpicuity. thirg from its perpicuity.

It is no eafy matter to alfign the precife diference between the modern and anciont Greek; which confits in the terminations of the nouns, pronouns, verbs, \&e. not unike what obtains between fume of the dialcess of the Italian or Spasifh. There ate atio in the modern Greek many new worts, not to be met with in the ancient. We may therefore ditinguin three ages of the Greek concue: the fith of which ents at the time when Confaatinople became the capital of the Romas empire; the ficond lafted from that period to the taking of Conftantinople by the Twhs; and the third from that rime to tisis.

The length of greenhoufes mult be proportioned to the number of plants intended to be priferved in them， and cammot thersfore be reduced to sule：the their depth houkd ne：e：be greater lian their heirioht in the clear；whicli，in fnall or middlins huntee，nay te 10 or $t 8$ feet，but in large ones from $2-$ o 24 feet；and IN
the keneth of the windows thould reach from about one ious and a taid above the pawement，and within the fame didance，f the cieing，which will admit of a co：nicho roumd the building over the heads of the win－ dews．Thein berath carant be in proportion to their Lengil！for if in the latgelt buidings they are more than forn or f．ves feet and a half truad，they will be extrmely heavy and inconversicnt．＇The piers between the windows mult ce as namow as may be to fupport the buildines；for which reaton they thould either be of Hous w ot hare burme bricks．If the piers are made of thone，they thould be 30 itheles wide in front，and foped sathehim to about is inches，by whichmeans thre will be no curners to take off the rays of the fun． If they are of brich，they will require io be at lata theefit in fornt，but they fould be in the fane manner flued of behind．Oser tise greenhoule may be roums for drying and puderving fects，roots，Eic．and behind it at place for touls and other purpoles；and both thefe bulin：t，and the roams abuve，will bee of great ufe in ketping of the frols，fo that the wall between the ie now wot be of more than two bricks and a half in theitinter．

The fluor of the greentoufe，which thould be laid either with Bremen fquares，Pbilack llone，or Alat tiles，mut be raifed two feet ahove the furface of the adjoining ground，or if the lituation be damp，at leaft three feet；and if the whole is arched with low brick arches under the floor，they will be of great fervice in preventing damps；and under the floor，about two feet from the fiont，it will be very advidable to make a flue of enn inches wide and two feet deep；this foold be carried the whole length of the houfe，and then returnod back along the hivder part，and there be carried up iato funncls adjoining to the tool－houfe，by which the fonoke may be carried off．The dire－place may be contrived at one end of the houre，and the door at which the fuel is put in，as alio the ath－grate， may be contrived to open into the tool－houle，and the fued being laid in the fame place，the whole will be out of light．Bradley advifts，that the front of green－ houfes，in the colder parts of Eugland，be built in a fwocp or femicircle，fo that one part or other of it may rective the fun＇s rays all day．＇The ufe of fires mul， however，be very fparing in this place；and it is not one winter in three or four that will require them is any patt，only when the weather is very fevere，and the frot cannot well be kept out any other way，this is an expedicnt that is good to have in readinefs，as it may fare a wholc loufe of plats．Withinfide of the win－ dows，in front of the giemhoufe，there hould be good flronis thuiters，made with hinges，to fold back clofe to the piers，that they may not obtruct the rays of the fun．The back part of the houfe fhould be either laid orer with llucso or plathered with mortar，and whiter afhed，in order to prevent the froty air from penetrating through the walls．When the greenhoufe is wainfootted，the wal＇s fonold be plallered with lime and hair behind the wainfoot，to keep out the cold； and the wainfoot，as well as the cieling，and every part within the houfe，fhould be printed white，for the refection of the fim＇s rays．There num be a num－ het uf tedels with forms of wom！uponthem，to fup－ purt the puts of plants；the taitelt to be flaced hind－ roull thewelt within four feet of the windows：ane

## G R E

the rows of plants fhould rife gradually, fo that the heads of the fecond row fhould be entirely above the firlt; and behind them there fhoold be a fpace of at leaft five feet, for the convenience of watering the plants, and for a free circulation of air. It has been obferved, that the placing of the euphorbiums, cereufes, and other fucculent plants among orange-trees, and other common greenhoufe-plants, is always deftructive of them, by making them receive an improper fort of eflluvia, which plants of that kind imbibe very freely. They fhould therefore be placed in two wings built at each end of the greenhoufe; which, if well contrived, will be a great beauty as well as ufe to the building. Thefe wings may be mate capable of a greater warmth alfo by more flues, and may be made to contain a hot-bed of tanners bark for the railing many of the tender plants, natives of warm climates.

Whild the front of the greenhoufe is exactly fouth, one of the wings may be made to face the fouth-eat and the other the fouth-weit. By this difpofition the heat of the fun is reflected from one part of the building to the other all day, and the front of the main greenhoute is guarded from the cold winds. Thefe two wings may be fo contrived as to maintain plants of different degrees of hardinefs, which may be eafily effected by the fituation and extent of the firc-place, and the manner of conduating the flues: the wing facing the fuuth-ealt is evidently the moft proper for the warmeft fove ; this may be divided in the middle by a partition of glafs, with glafs-doors opening from one divifion to the other. In each of thefe there fhould bc a fire-place, with flues carried up againt the back-wall, through which the fmoke fhould be made to pafs as many times the length of the houfe as the height will admit of the number of flues; for the longer the fmoke is in paffing, the more heat will be given to the houfe with a lefs quantity of fuel. The other wing, facing the fouth-welt, fould be divided and furnithed with flues in the fame manner ; and thus different degrees of heat may be obtained, according to the feafons and the particular forts of plants that are to be preferved. If there are no fheds behind thefe wings, the walls fhould not be lefs than three bricks thick; and the back part, having floping ruofs, which are covered with tiles or flates, fhould be lined with reeds, \&c. under the covering. The noping glaffes of thefe houfes fhould be made to flide and take off, fo thas they may be drawn down more or lefs in warm weather to admit air to the plants; and the upright glaffes in front may be fo contrived as that every other may open as doors upon hinges, and the alternate glaffes may be divided into two: the upper part of each fhould be fo contrived as to be drawn down like fafhes, fo that either of them may be ufed to adnnit air in a greater or lefs quantity as there may be occafion.
$\therefore$ As to the management of the planta herein, Mortimer recommends the opening of the mond about them from time to time, and prinkling a little freth mould in them, and a little warm dung on that; as alfo to water them when the leaves begin to wither and curl, and not oftener, which would make them fade and be fickly; and to takc off fuch leaves as wither and grow dry.

Grean-Sicknefs (Chlurgfos). See Iudex fubjoined to Medicine.
, Vol. VIII. Part I.
$129] \quad G R E$
GrEEN: Silver, the name of an ancient cuflom within Greentand. the manor of Writtel in the county of Effex in England; which is, that every tenant whofe fore-door opens to Greenbury flaall pay an talf-penny yearly to the lord, by the name of green-fiver.

Grems. IVax, is uled where eflates are delivered to the theriffs out of the exchequer, under the feal of that court, made in green wax, to be levied in the feveral counties. This word is mentioned the 43 d dat. Ed. III. c. 9. and 7 Hen. IV. c. 4 .

GREENLAND, a general wame by which are weft ${ }^{\text { }}$ denoted the molt eafterly parts of America, Atretching Greentard towards the north pole, and likewife fome iflands to teffribed. the northward of the continent of Europe, lying is very high latitudes.

This councry is divided into Wen and Ear Green. land. - Weft Greenland is now determined by our lateft maps to be a part of the contitient of America, though upon what authority is not very clear. That part of it which the Europeans have any knowledge of is bounded on the well by Bafin's Bay, on the fou?h by Davis's Stnits, and on the eall by the northern part of the Atlantic Ocean. It is a very trountaimus country, and fume parts of it fo high that they may be difcerned 30 leagues off at fea. The inland mcuntulas, hil!s, and rocks, are covered with perpecnal fnow; but the low lands on the feadide are clothed with verdure in the fummer feafon. The coalt abounds with inlets, bays, and large rivers; and is furrounded with a vaft number of inlands of different dimenfions. In a great many places, however, on the eaflern coalt efpecially, the ihore is inaccelfible by reafon of the hoating mountains of ice. The principal river, cal!ed Baal, falls into the fea in the $\sigma_{\psi}$ th degree of latitude, where the frit Danifh lodge was built in 1721 ; and has been navigated above to miles up the country.
Weit Greenland was firft peopled by Europeans in the eighth century. At that time a company of Icelanders, headed by ore Ericke Rande, were by accident driven on the coalt. Oi his rtturn he reprefented the country in fuch of favourable light, that fome famiiies pe ont ${ }^{2}$ is again fullowed him thither, whele they foon became a colony thriving colony, and heftowed on their new habitation firm thethe name of Groenlund, or Greenland, on account of its innd. verdant appearance. This colony was converted to Chriftianity by a mifionary from Nurway, fut thither by the celcbrated Olaf, the lind Nurwegia! monarch who embraced the true religion. The Gieenland fetlement continued to increafe and thrive under his protection; and in a little time the country was provided with many towne, churches, convente, bithops, \&e. under the j:tridiction of the archbihop of Druntheim. A conliderable commerce was carried on between Gremund and Norway; and a regular intercourfe mainsaned betwon the two countries till the year ifob, when the hat biAop was fent over. From that time all correfpondence bit curre"as cut off, and all knowledge of Greenland las been firondence buried in oblivion.
This Ararge and abrupt ceffation of all trade and den y cut intercourfe bas been attributed to valious caudes; bat off. the mott probable is the following. The colony, from is firff fettlement, had been harafied by the natives, : barbarous and favaze prople; agrecing in cuftons, ga:b, and appearance, with the Efquimaux found about Hudfon's Bay. This nation, called Sclurellirgs,

Greenbed. at lençth prevailed againt the I aland fetters who inhabited the wettern ditrict, and exterminated them in the 1 the century: infonuch, that when their brethern

Colony fup joled to be cxtermim© J. of the cathern dilaiet came to their affatace, they found nothing alive but fome catte and flocks of theep tunning wide about the cosotry. Perhaps they themfelves afterwards experienced the fane fate, and were wally delleoyed by thede Schallinge, whene detend. ants ilill inhabit the witern parts of Greemland, and from tradition contim this eonjéture. 'They alfirm that the hours and villages, whole rous ftill appear, wor inhabited by a mation of hangers, whon their ancefors dethoged. 'Ithere are reafors, however, fes betheint that there may be thill fone defecadmat of the ane icnt Iedand colony remaning in the cathern ditriat, thoush they cannot be vitited by land, on ascumt of the tupendons monntina, perpetmally cowerad with fnow, which divite the two pares of (ireenland: while they have been rendered inaccettoble by fea, by the valt quantity of ice driven from Spitzoergen, or Eat Grecnland. One would imagine that there mutt have been fome confiderable alteration in the nortiern parts of the world fince the $15 \%$ century fo that the con't of Geenland is now become almett totally inaccentible, though formorif wified with very litele diffeuley. It is alio natural to abs, By what means the peoy!e of the eatter culony furmounted tle above-mentioned obtacles when they went to the allitance of their weltern fiends: how they returned in then own country; and in what manner liitorians learned the fuccels of their expedition? Concerning 5 all thit we have very little fatisfactory information. Acoint of All that can be learned from the molt authentic resactare cords is, that Greenland was divided into two diftricts, called $/ H_{e} ? B_{y}{ }^{d}$ l and Eaf Bygd: that the weltern divifion contained four parifies and 100 villages: that the eallern dialrict was itill more fourihing, as being neaver to Itel ind, fwoner fettled, and more frequented by fipping frem Norway. There are alfomany acvuruts, thoigh mot of them romancic and nightly aticelted, which render it probatic that part of the eaienu colong alll fublits, who, at fome time or other, many lave given the imperfect relation above mention4. This eolony, in ancient times, certainly comprelonled iwelve extentive parihes, one hundred and minety whages; a bithop's fee, and two monaterics. The prefent iohabitants of the weftern diftrict are entircly ignorant of this part, from which they are divided by rocks, mountains, and deferts, and thill more ellectually by their apprehention : for they believe the eallern Greenlanders to be a cruel, barbarous nation, that dettroy and cat all frangers who fall into their kands. About a century after all intercouife between Norway and Greenland had cealed, feveral mips were fent fueceffively by the kiners of Denmark in order to
rocks of loadtone at the bottom of the fea. The Greenta fame year, 1576, in which this attempt was made, has been rendered remarkable by the voyage of Captain Martin Frobifer, font upon the fame errand by Queen Elizabeth. He hikewife deferied the land; but could not reach it, and therefore retuned to England; yet not before he had iailed fixty lea yues in the itrait which ftill retain; his name, and landed on leveral if. lands, where he had fome communication with the natives. He liad likewife taleon poflefion of the country in the name of ( neen Elizabesh; and brought away lome pices of heary black thome, from which the re. tinets of Lomion extracted a certain propartion of gold.
 at the head of a fmall iqualron, equipped at the expence of the public; entered the llaits a fecond time; diforend ugen an illand a gold and filver mine; befoned names upon dillerent bays, iflands, and headlands; and hooglt away a liding of ore, together with two natives, a male and a fomale, whom the Lighlith kidnappeet.

Such was the fuccefs of this royare, that another arnament was fitted out under the aufpices of Admiral Frobifher, confiting of is fail, includag a confulemalle number of foldiers, miners, imeltors, carpenters, and bakers, to remain all the winter near the mines in a wooden fort, the different pieces of which the carried out in the tranfports. 'They met with boitterous weather, impenctrable fogs, and violent currents upon the coall of Greenland, which retarded their operations uatil the feafon was far advanced. Part of their wooder. fort was lolt at fea; and they had neither provilion nor feel fufficient for the winter. The admiral therefore determined to return with as much ore as he could procure: of this they obtained large quantities out of a new mine, to which they grave the name of the Courtefs of Sulfex. 'They likewife brilt an houfe of Stone and lime, provided with ovens; and here, with a view to conciliate the affection of the natives, they left a quantity of fmall morrice-bel!s, knives, beads, lookmyglaties, leaden pictures, and other toys, together with leveral loaves of bread. 'They buried the timber of the fort where it could be eadly found next year ; and fuwed corn, peafe, and cther grain, by way of experiment, to know what the country would produce. Having taken thele precautions, they failed from thence in the deginning of September; and ater a month's llormy pallage, arrived in England: but this noble delign was never profecuted.

Chrikian $\mathrm{IV}^{\mathrm{P}}$. king of $\mathrm{D}_{\text {s mmark, }}$ being delirous of difcovering the old Greenland fettement, fent theee thips thither, under the command of Captain Godke Lindenuw; who is faid to have reached the ealt coalt of Grecnland, where he trade. 1 with the favage inhabitants, fuch as they are llill found in the waflern diflrict, but faw no ligns of a civilized people. Had he actually landed in the caltern divifion, he mult have perceived fome remains of the ancient colony, even in the ruins of their convents and villages. Lindenow kidnapped two of the natives, who were conveyed to Copenhagen ; and the fame cruel fraud ( $A$ ) was prac-
(A) Nothing can be more inhuman and repugnant to the diftates of common jullice than this praetice of feariog away poor creatures from their country, their families, and cometions: untefs we fuppofe them alto-
mothand. tifed by other two fhips which failed inta Davis's Straits, where they difcovered divers fine harbours, and delightful meadows covered with verdure. In fome places they are faid to have found a contiderable quantity of ore, ceery hundred pounds of which yiehded twenty tix ounces of filver. The fame Admiral Lindenow made anuther royage to the coalt of Greenland in the year 1606, directing his courfe to the weftward of Cape Farewell. He coalled along the Straits of Davis; and laving made fome obfervations on the face of the country, the harhours and iflands, returned to Denmark. Carten Richards, being dctached with two mips on the fame difcovery, deferied the high land on thie eaftern fide of Greculand; but was hindered by the ice from approaching the thore.

Other expeditions of the fame nature have been planned and executed with the fame bad fuccers, under the aufpices of a Danih company of merchants. Two flips seturned from the wetlern part of Greenland loaded with a kind of yellow fand, fuppofed to contain a large proportion of gold. This being affayed by the goldraiths of Coperhagen, was condemned as ufflefs, and thown owerboard: but from a fmall quantity of this fand, which was referved as a curiolity, an expert chemin afterwards cxtracted a quantity of pure gold. The captain, who brought home this adventure, was fo chagrined at his difappointment, that he died of grief, without having left any directions concerning the place where the fand had been difonvered. In the year 1654 , Henry Moller, a rich Dane, equipped a veffel under the command of David de Nelles, who failed to the wett coall of Greenland, from which le carried off three women of the country. Other efierts have been made, under the encourdgement of the Daninh king, for the difcovery and recovery of the old Iceland culony in Greenland: but all of them mifcarried, and prople began to look upon fuch expeditions as wild and chimetical. At length the Grecnkand company at Pergen in Norway, tranfported a colery to the wetitern coalt, about the Gqth degre of latitude ; and thete Norwegians failed in the gear 1712, accompanied by the Revisend Hana Egede, to whofe care, ability, and precifion, we owe the beit and molt authentic account of modern Gicenland. This gentliman endearoured to reach the eafern diArict. hy conlling foushwards, and advanced as far as the States Promontory: bit the feafon of the year, and continual llorms, obliged him to return; and as he could not eventind the Strait of Probiher, he con-
cluded that no fuch place ever exilted. In the year Cocerian3. 1724, a thip, being equipped by the company, failed on this difeovery, with a view to land on the calt fide oppofite to Iceland; but the valt thoals of ice, which barlicadoed that part of the coalt, rendered this feneme impracticable. His Danith majelty, in the year 1728 , cauled horfes to be cranfported to Cireenland, in hops: that the fettlers might by their means travel over land to the eaftern diftriet; but the icy monntains were found impaffable. Finally, lieutenant Richards, in a hlip which had wintered near the new Danih colony, attempted, in his return to Dcumark, to land on the ealern thore; but ail his endeavours proved abortive.

Mr Egede is of opinion, that the only practicable method of reaching that part of the country, will be to coalt north-about in fmall veffels, between the great flakes of ice and the thore ; as the Greenlanders liave declared, that the currents continually rufling from the bays and inlets, and running fouth-weitwards along the hore, hinder the ice from adhering to the hand; fo that there is ahways a channel open, through which velfels of fmall burden might pafs, etpecially if lodges were built at convenient diftances on the hore, for the convenience and direction of the adventurers.

That part of the country which is now vifited and Mr Egede', fettled by the Danes and Norwegians, hies between account of the G4th and 68th degrees of north latitude; and thus the courfar it is faid the climate is temperate. In the ${ }^{\text {try }}$ fummer, which continues from the end of May to the middle of September, the weather is warm and comfortable, while the wind blows cafterly; though even at this time florms frequently happen, which rage with incredible violence; and the fa-coats are infetted with fugs that are equally difagretable and unhealthy. Near the thore, and in the bays and iulets, the low land is clothed with the moft charming verdere: but the inland mountains are perpetually covered with ice and frow. To the northward of the Geih degree of fatitule the cold is prodipioufly inteale: and towards the end of Auguat all the coatt is covered with ice, which never thaws till April or May, and fometimes not till the latier end of June. Nothing can exhibit a more dreadful, and at the farre time a nore dazzling, appearance, than thofe prodigious maffe. of ice that firround the whole coall in various forms, relesting a multitude of colours from the fun-beams, and calling to mind the enchanted feenes of romance. Such proIpects they yicld in calm weather; but when the wind $Q^{2}$
begins
gether deftitute of natural affection; and that this was not the cafe with thofe poor Greenlanders, fome of whom were brought alive to Copenhagen, appears from the whole tenor of their conduct, upon their firf capture, and during their confinement in Denmark. When firt captivated, they rent the air with their crics and lamentations: they even leaped into the fea; and, when takea on board, for fome time refufed all fuftenance. Their eyes wete continually turned towards their dear country, and their faces always bahed in tears. Evea the comntenance of his Danifh majefty, and the careffes of the court and people, could not alleviate their grief. One of them was perceived to fhed tears always when he faw an infant in the mother's arms; a circumpance from whence it was naturally concluded, that he had left his wife with a young child in Grcenland. Two of them went to foa in their litle canoes in hope of reaching Greenland; but one of them was retaken. Other two made the fame attempt; tut were driwen by a form on the coalt of Schonen, where they were apprehended by the peafants, and reconveyed to Copenhagen. One of them afterwards died of a fever, caught in fifhing pearl, ewing the winter, for the governor of Kolding. The rell lived fome years in Denmark; but at length, feeing no profpect of being able to revilit their uative country, they fuak into a kind of melancholy diouder, and expired.
the vir: Anciss of thofe pieces of ice dathing a gaind on: an ther fill the mind with horror.... Grecenland is fillom wited with thuader and lightning, but the riurow $B$ oralis is very ficquent and brightit. At the time of tew and full moon, the tide rifes and falls upon this coal about three fathoms ; and it is remarkable, that the fprings and fountains on those rife and fall with the flux and reflux of the ocean.

The foil of Greemland valies like that of all other mountamous countris. The hills are very barren, being indeed frozen throughout the whole year ; but the valleys and low ground, efpecially wear the fea, are rich and frutful. The ancitnt Norwerias chronicles inform us, that Greenland formerly produced a great number of cattle ; and that condidesable quantities of butter and chefewcreexparted to Norway; and, on account of their peculiar excellency, fet a pait for the king's ufe. The fame hillories inform us, that fome parts of the comenty yielded excellent wheat; and that lays oaks wete fotind here, which carried acorns as Hig 1 apples. Some of thefe saks thill remain in the fouthern parts, and in many places the marks of ploughed land are eafily perceived. At prefent, however, the country is deftitute of corn and cattle, though in many places it produces excellent pallure ; and, if properly cultivated, would probably yield grain alfo. MrEsrede fowed fome barley in a bay adjoining to the Danith colony. It faring up fo faft, that by the latter end of fuly it was in the full ear; but leing nipped by a night-frolt, it never arrived at matority. This feed was brought from Bergen, where the fammer is of greater heat and duration than in Greenland; but is all prubability the con which grows in the northern parts of Norway would alfo thrive here. Turnips and coleworts of an excellent talle and flavour are alfo produced here. The fides of the mountains near the hays are elothed with wild thyme, which diftufes its fragrance to a great ditance. The herb tomentil is very common in this country, and likewife many uthers not deferibed by the botanills. Among the fruits of Gremand we number miper-berries, bhe berres, bil-berries, and brambleberries.

Gicenland is thought to contain many mines of me-- al, though mone of thein are wrought. To the fouthward of the Danifin colony are fome appearances of a mine of copper. Mr Egede once reccived a lump of ore from one of the natives; and here he found cala. mine of a y ellow colour. He once fent a confiderable quantity of fand of a jellow colour, intermixed with freaks of vermilion, to the Bergen company. They probably fuund their account in this prefent; for they cofred him by a letter to procure as much of that find as poffille: but he was never able to find the Hace where he faw the firft fpecimen. It was one of the fimallet among a great number of illands; and the nath he had fet up was blown down by a violent thorm. Poffibly this might be the fame mineral of which Captain Frub fher brought fo much to England. This comnery produces rock-cryitals looth red and white, and whele mountains of the afbellos or incombuilible ilax. Arount the colony, which is known by the name of Coul Hape, they lind a kind of battard anarble of varions colours, which the natives form inte
the fertility of Greenland, however, muth be underAtood only of that part which lics beween the Goth and 65 th elegrees of latitude. The mof northern parts are totally dellitute of herbs and plants. 'l'be wretched inhabitants cannot find grafs in fufficient quantities to ftuff into their hoes to keep their feet warm, but are obliged to buy it from thofe who inhabit the more fouthern parts.

The animals which ahound moft in Grecnland are, rein-deer, foxcs, hares, dogs, and white bears. 'The hares are of a shite colom, and very fat: the foxes are of different colous, white, greyith, and bluifh; and fmaller than thofe of Denmark and Norway. The natives keep a great number of dogs, which are large, white, or fpeckled, and rough, with ears itanding upright, as is the cafe with all the dogs peculiar to cold climates. They are timorous and Itupid; and neither bay nor bark, but fometimes howl difmally. In the northern parts the natives yoke them in fledges; which, though heavy laden, they will draw on the ice at the rate of 70 miles in a thort winter's day. Thefe poor animals are very ill rewarded for their fervice; being left to provide for themfelves, except when their mallers happen to catch a great number of feals. On' thete oecalions the dogs are regaled with the blood and entrals; at other times they fublift, like wild beatts, upon mufeles and bernies. Here alio are found great nunibers of tavens, eagles of a prodigious fize, falcons, and other birds of prey ; and likewife a kind of linnet, which warbles very melodionfly. Whales, fword-filh, porpoifes, \&e abound on the coafts; alfo hulvbut, turbot, cod, haddock, sis. The more dabious animels allo, called mormbith, jea-frpens, and krakizs, faid to be found on the coall of Norway, are faid likewife to dwell in thefe feas. Mr Egcele alfures us, that, in the year $1733^{4}$, the fea ferpent was feen off the ntw Dania colony, and raifed its head mall high above the furfice of the watct. See Kraken, Mlermaid, and Sich-Serpent.

The peophe who now iulabit the whiten coall of Greenl and whe whout doult, are the defeent cenland, and whe, withont doult, are the defeen-the inh dants of the ancient Scherlines, who exterminated the tants. firt lceland colony, bear a neal relemblance to the $S$ amoicales and Lato! anders in their pertons, complexions, and way of life. They are fort, brawny, and inclined to corpulency; with broad faces, flat nofes, thick lips, black hair and eyes, and a yellowifh tanney complexion. They are for the molt part vigorous and healthy, but remarkably fhort-livel; few of them reaching the grand climacteric: and many dying in their infancy, and in the prime of youth. "1llicy are fubiect to a weaknefs in the eyes, occafioned by the piercing winds and che glare of the fnow in the wintertime. The leprofy is known among them, but is not contagious. 'Thofe that dwell in the northern parts are miferably tormented with dyfenteries, rheums, and pulmonary diforders, boils, and epilepfy. Thè fmallpox being imported among them from Copenhagen in the year 1734, made terrible havoc among thefe poor people, who are utterly deltitute of any knowledge of the medicinal art, and depend entircly for alfitance upon their argekuts or conjurers. In their difpolitions the Greenlanders are cold, phlegmatic, inciolent, and now of apprehenfion; but very quict, coderly, and

## G R E

ennand. good-ntured. They live praccably togather; and have eviry thing in common, without Atrife, cneying. or aninutfity. Thry are civil and hofpitable, but flovenly to a degree almof beyoud the Hottentots themfelves. They never wafh themfeives with water; bat lick their paws like the cat, and then rub their faces with then. 'They eat after their 'duge without wan. ing their difhes; devour the lice which devour then ; and even lick the fweat, which they ferape of fiom that faces with ticir knics. The woren waft the:sfelves with their own urine, which they imagite makes their hair grow ; and in the winter-time go ont irmediatcly ater, to ke: the liquor freeze upon their f.ia. They will often eat their vietuals of the dirty ground, witi-
 with the greateit avidity. In times of farcity they will fubtill on pieces of cld dikn, rects, fa-wetd, and a root called tuytoronet, drefled with train oil and fat. The dung of rein deer taken fion the inteltines, the entrails of partricges, and all forts of offals, are counted danties among thefe favages; and of the ferapings of feals ikins they make delicate pan-cakes. At firft they could not tafte the Danifl provilions without abhorrence; but now they are become extremely fond of bread and butter, though they Rill retain $2 n$ averfion to tobaceo and firituous liquors; in which particular they differ from almoft all favages on the face of the carth.

The Greenlanders commonly cortent themflues with one wite; who is condemnet, as among other fa. vage nations, to do all the drudgeny, and may be corrected, or even divorced, by the hufand at plafure. Heroes, however, and extraordinary pufonages, are indulged with a pharality of wives. 'Their young women are generally chatle and bafhful; but at fome of their fealls, in the midd of their jollity, a men retires with his neighbour's wife behind a curtain made of flins; and all the gucfor, thus coupled, retire in their thens. The women think themfetes happy if an angekut or prophct will thas honour them with his carefies. Thefe prople never marry within the prohibited degrees of cocfanguinity, mor is it counted decemt in a conple to mary who lave been edreated in the fane fanily.-They have a number of ridinhous and fuperfitious cuftoms; among which the two following are the mof remarkable. While a wonan is in labuar, the goffips hold a chamber-pot over her head, as a charm to hatten the delivery. When the chill is a year old, the mother licks and flabbers it all over, to reader it, as the imagines, more ftrong and hardy.

All the Greemlanders hitherto krown fpeak the fame lauguage, though different dialects prevail in difierent parts of the country. It ahounds with double confonants; and is fo guttural, that the pronunciation of many words is not to be learned exeept by thofe who lave been accuftomed to it from their infancy. The letters C, D, F, C , and X , are not known in their alphabet. Like thi North Americans, and in. babitants of Kanfchatka, they have a great number of long polyfyllables. Their words, nouns as well as yerbs, are inflected at the end by varying the terminations without the help of articles; bur their language being found cofective, they have adopted a good many words from the Norwegian Cialect. NituithRanding the cadcanours of :hc Danith mikionatics,
they lave no ereat reafon to boart of the profeletes Greenlard. they lave made at ace netives of Grecnland. The ie farages pay great dufernee and relfeet to the Danes, whom i.uded they ubey as their manters, and hear the truchs of the Chr:kian retigico expounded without doubting the veracity of their trachets; but at the fane time they hiftes with the moll mortifying in. difierence, without being in the kalt influmed by what they have heard. They believe in the imnortality of the foul, and the exiftence of a fuirit whom they call Tornawjok; but of whom they have formed the moll ridiculous notions. The Augthuts, who are huptofed to be his immediate minifers, differ concening the principles of his exitence; fone affirming that he is without form or mape; others, that he has the fhape of a bear; others, that he has a large hulman body with only one arm ; while others affim that he is no larger than a man's finger, with many other abfurdities of a fimilar kind. Ther have alfo a pecuhar kind of mytholoyy, by which they believe all the elenemts to be full of firits, from anong which every one of thicir prophats is fupplied with a familar which they mane Torngack, and who is always ready when fummoned to this affitance.

The Greculanders are empluged all the year round either in fifuing or hunting. At fea they purfue the whales, morfes, feals, fith for eating, and fea-fowl. On fhore they hunt the rein-deer in diferent parts of the country. They drive thefe animals, which feed in large herds, into a narrow circle or deffle, where they are cafly flain with arrows. Their bow is made of fir-tree, wound abcut with the twited linews of animats: the Aring is compofed of the fame fulf, or of feal $\mathrm{n}_{\mathrm{in}}$ : the arrow is a good fathom in length, pointed with a bearded iron, or a flarp lone; but thofe with which they kill bircs are thunt, that they may not tear the foth. Sea fowls they kill with tances, which they throw to a great diltance with furprifing dexterity. Tiseir manner of eatching whales is quite different from that pratifed by the Europeans. About 50 perfons, men and women, fet out in one long boat, which is called a koric-bout, from kone a "woman," becaufe it is ruwed by females only. When they liad a whate, they ftrike him with hat prons, to which are fatened with long lines fome feale akins bloan up like bladders. Thefe, by Huating on the furface, not only difover the back of the whate, but hinder him from diving under water for any length of tince. They continue to purfue him until the lofes firength, when they pierce him with fpears and latices till he expires. On this occalion they are clad int their fpring coats conifing of one picce, with glowes, boots, caps made of feal-fkin fo clofcly laced and fewed that they keep out water. Thus aceoutred, they leap into the fea; and begin to flice off the fat, even muder water, before the whale is dead. - They have many different ways of killing feals; namely, by Atriking ihem with a fmall harpoon equipped alfo with an air-bag; by watching then when they come to breathe at the air-holes in the ice, and Ariking them with fyears; by approaching them in the difguife of their own fpecies, that is, covered with a feal-fkin, creeping upon the ice, and moving the head from lide to fide as the feals are accuftomed to do. By this Aratagem the Gicenlander moves towards the unerf-

## G R E

ecentwat patine feal, and hills him with a fpear. The Grectlandens angle with lines made of whale-bonc cut wery fmall, by means of which they fueceed womerfelly. The Greenland canoe, like that ured in Now Zanlla and Hunfon's bay, is about three fathoms in longth, pointed at both ends, and thase quarters of a yad in breadth. It is compoled of thia rafis faltened together with the linews of animals. It is covered with dreffed feal-flins buth below and above, in fuch a manner that only a circular hole is left in the middle, large enough to admit the body of one man. Into this the Greculander thrults hinfolf up to the waill, and fallens the flin fo tight about him that no water can enter. Thins fecured, and armed with a paddle brond at both ends, lie will venture out to fea in the moft formy weather to eateh frals and fea-fowi; and if he is overfet, he can eadily raile himelf by means of his padale. A Greenlander in one of thefe canoes, which was brought with him to Copenhagen, outhripped a pinnace of 16 oars, manned with choice manaers.- The koneboat is made of the fame materials, but more durable; and fo large, that it will contaia 50 perfons with all their tackle, baggage, and provifinn. She is titted with a matt, which carries a triangular fail made of the nembranes and entrail; of feals, and is managed without the help of braces and bowlings. Thice kones are flat bottomed, and fometimes 60 feet in leagth. The men think it beneath them to take charge of then; and therefore they are left to the conduct of the women, who indeed are obliged to do all the drudgery, including even the building and repairing their houfes, while the men entploy themfelves wholly in preparing their hunting implements and fifling tackle.

This country is but thinly inhabited. In the winter time the people dwell in huts built of ftone or turf: on the one fide are the windows, covertd with the fkins of feals or rein-decr. Several farilies live in one of thefe houfes, polfeffing each a feparate apartment, before which is a hearth with a great lamp placed on a trevit, over which hangs their kette: above is a rack or fleef on which their wet clothes are dried. They burn tain-oil in their lamps; and inllead of wick, they ufe a kind of mofs, which fully anfwers the purpofe. Thefe fires are not only lufficient to boil their victuals; but likewife produce fuch a heat, that the whole houfe is like a bagnio. The door is very low, that as little cold air as poffible may be admitted. The boufe within is lined with old flins, and furounded with benches for the conveniency of ftrangers. In the fummertime they dwell in tents made of long poles fixed in a conical form, covered in the infide with deers fkins, and on the outfide with feals fkinz, drefled to that the rain cannot pictee tilem.

## 10 <br> Eaft Green

lund.

Eaft Greenland was for a long time confidered as a part of the continent of Wefl Greenland, but is now difcovered to be an affemblage of inlands lying between $76^{\circ} 46^{\prime}$ and $80^{\circ} 30^{\prime}$ of north latitude, and between $9^{\circ}$ and $20^{\circ}$ of ealt longitude. It was difcovered by Sir Hugh Willoughby in the 1553 , who called it Groenlund; fuppofing it to be a part of the wellem continent. In 1595 , it was again vilited by Willian Barentz and John C'ornelius, two Dutchmen, who pre-
tended to be the original difeoverers, and called the Greenlan cuantry Siazturgen, or Sharp Mountains, from the many hatp-pointed and rocky mountains with which it abound.. They alleged that the coall difonvered by Sir Inugh Willoughby was fome other country; which ascordingly the Hollanders delineated on their mapes and charts by the name of Willoughly Land; whereas in fact no fach land ever exitted; and long before the voyage of thefe Dutchmen, Stephen Barrows, an Englifh mipmater, had coated along a defolate country from N. Lat. 78 to $30^{\circ}$ ir', which was mudoubtedly Spitzbergen. The fea in the neighbourhood of the inands of Spitzbergen abounds very much with whales, and is the common refort of the whale-filhing flaps from different countries, and the country itfelf is frequently vifited by the fe hips: but till the late voyage of the Hon. Capt. Phipps, by order of his Majery, the fituation of it was erroneonfy laid down. It was imuged that the land aretched to the northward as far as $z={ }^{\circ}$ of north latinude; but Capt. Phipps found the moft northerly point of land, called Scath I/Roshs, not to exceed $80^{\circ} 30^{\prime}$ of latitude. Towards the eat he haw other lands lying at a diftance, fo that Spitabergen plainly appeared to be fruround d by water on that bde, and not joined to the continent of Alia, as former navigators had fuppofed. The noth and wett coals alio he explored, but was prevented by the ice from failing fo far to the northward as he wifhed. The coall appeared neither habitable nor accofiole. It is formed of high, barren, back rocks, without the lealt marks of vegetation; in many places bare and pointed; in others covered with frow, appearing even above the clouls. The valleys betwecn the high diffs were filled with fnow and ice. "This profpect," fays Capt. Phipps, "would have furgetad the idea of perpetval winter, had not the mildnefs of the weather, the fnooth water, bright fun-hine, and contant day-lizht, given a cheerfulnefs and novelty to the whole of this romantic fene." The current ran along this conat half a knot an hour, north. The height of one mountain feen here was found by geometrical menfuracion to be at one time $1503 \frac{1}{2}$ feet, at another 1503 年 feet. By a barometer conilructed after De Lue's methot, the height was foum to be $1588 \frac{1}{2}$ feet. On this occation Capt. Phipps has the following remarks. "I cannot account for the great difference betwen the germetrical meafure and the baromertical according to M. de Luc's ca?culation, which amonts to $8+7$ feet. I have no reafon to doubt the aceuraey of Dr lrwing's obfervations, which were made with great care. As to the geonetrical meafure, the agreement of formany triangles, exch of which mut have difovered ceren the fanleft crior, is the mult fatisfactory proof of its correctncfs. Since my retura I have tried hoth the theocolite and barometer, to diconver whether there was any fault in cilher; and fond them, upon trial, as I had always done before, very decarate."
There is good anchorage in Schmeerenourgh harbour, lying in N. Lat. $7 t^{\circ}+t^{\prime}$ E. Long. $9^{\circ} 50^{\prime}+5^{\prime \prime}$, in 13 fathom, fandy botton, not far fiom the thore, and well flatered from all wiads. Clofe to this harbour is an illand called Ainglerdin: !/hond, where the Dutch ufed formerly to boil their whate-oil; and the remains of fume conveniency erected by them for that paspofe

## 

eenland. purpofe are fill vilible. The Dutch thips Alll refort to this place for the latter feafon of the whale-ifhery. -The flone about this place is chiefly a kind of marble, which diffolves eafily in the marine acid. There were no appearances of minerals of any kind, nor any figns of ancient or moderil voleances. No infects, or any fpecies of reptiles, were feen, not even the common earth worm. There were no frpings or rivers; but great plenty of watet was produced from the fnow which melted on the mountains.

The moft remarkable views which thefe dreary regions prefent are thofe called Icebergs. They are large bodies of ice filling the valley; between the high monntains. Thaci face towarls the fea is nearly perpendicular, and of a very livily light-green colonr. One was abont 300 feet hish, with a ca!cade of water illuing from it. The black mountains on tach tide, the white frow, and greenifn coloured ise, compofed a very beautiful and romantic picture. Large pieces frequently broke off from the icebergs, and fell with great moife into the water. One picce was obferved to lave floated out into the bay, and grounded in 24 fathoms; it was 50 feet high above the furface of the water, and of the fame beautifal colour with the feebery from which it had feparated.

Thefe iflands are totally uninhabited, though it doth not appear but that human creatures coulid fubfitt on them, notwithanding their vicinity so the pole. Eight Enclinh fatiors, who were acidentlly left here by a whale-fining fhip, furvivcd tlic winter, and were brouglat home nexi fafon. The Duth then attemptid to fettle a colony on Amfterdam ifland abuve mentioned; but all the people perifhed, not through the feverity of the elimate, but of the foury, owing to the want of thofe remedies which are how happily difeovered, and which are found to be fo effectual in preventing and curing that dreadful difeare. - The late account alfo of fix Ruffan failors who flaid four years in this inhorpitable country, affords a decilive pioof, that a colony might be fettled on Laft Gretuiand, provided the duing fo could anfwer any good parpofe.

Gafenkian Company. A joint asck of 40,000 1. was by flatate to be railed by futifribers, who were incorporated for 14 years from the firlt of October $16 y 2$, and the company to uf: the trate of catching whales. \&e. into and Erom Cirtenland, and the Greenland feas; they may make bye-laws for the government of the perfons cmployed in their thips, \&c. Stat. 4 and ; W. III. can. 17. 'This company was farther encouraged by parliament in 1696 ; but partly by unkilful management, and partly by real loffes, it was under a neceffity of entirely breaking up, hefore the expiration of the term affignci to it, ending in 1707 . Dut any perfon who will adventure to Greenland for whale-fifhing, fall have all privileges granted to the Greenland company, by 1 Anne, cap. 16 . and thus the trade was again lail open. Any fubjects may import whale-fins, oil, \&e. of fifh canght in the Greenland feas, without paying any cuftoms, \&c. Atat. :o Geo. I. cap. 16. And hips employed in the Green-land-fithery are to be of fich burden, provided with boats, fo many men, fithog-lines, harping irons, \&c. and be licenfed to proceed; and on their ruturn hall be paid 20 perton bounty, for whale-fins, ise. im. ported; 6 Geo. II. cap. 33. The bounty was afterwatds increafed; but has been lately diminihed, and
fince this diminution the trade has hitreafed. See bieene Whale-Fishatry.

GREENOCK, a fea-poit town of Scotiand, and one of the ports of the city of Glafgow. It is ciftant 22 miles from that city; and was formenly called the Ray of St Laurence. The Erith of Clyde tere expands into a fine bafon four miles wids, and is landlocked on ail fides. Greenock is a bugh of barony, and the beth built town on all the coaft. It is the chicf refort of the herring fithery, and othervife a place of great trade and very populous. - The harbom was made by Sir Jolan Shaw of Greenock, whofe anceftor buik the church; and the fanily had here a cafle.

GREENIWICH, a town of the county of lient, in England, pleafantly fituated on the bank of the Thames, about five miles ent from Lomdon. Here was formerly a royal palace, buile by Humphry duke of Gloucther, entarged by Henry ViI. awd completed by Heary VIII. The later ofeen chofe his town for his place of refidence; as did alfo the queens Mary and Elizabeth, who were born in it. The fame dake Humphry began a tower on the top of the Ateep hill in the park, which was ininhed by IJenry VII, but afterwards demolihad, and a royal obferwatury ercéted in its place by Charles II. furninhed with mathem:itical inftrunents for aftonomical obfervations, zred a deep dry well for obferving the fars in the day-time. The palace being afterwards much tughected, king Charles II. (who had eularged the park, walled it about and planted it), pulleil it down, and began amo ther, of which he lived to foe the firt wing 1:"aniticontly frificd. Dut king Wiaian III. in 16y, granted it, with nine acres of ground thereto belonging, to be converted into a royal hofpital for old ath difabled feamen, the widows and children of thofe who loft their lives in the fervice, and for the tncourigement of navigation. The will, whidh coft kmer Chates 36,0001 . is now the frit wing of the hourital towards Londen. The front to the Tlames cor:fi:ls of two ranges of fone buildugs, with the rangu's looufe in the centre of the area but detached fom any part of the horpital. Thefe buildiags perfectly co:1. Spond with each other, and have their tups cromad with a itone balluttrade. The buildings which are so cing the area, corref fond with them, though in a fincr and more elegant ilyle; and have domes al the ir chdy, which are r20 feet ligh, fupportad on ceupled enlumns. Under one of thefe is the hath, which as finely painted by Sir James Thombinh, atd conta us anay royal portaits; and under the other the chapel, which by accident was dellroyed by fire. This fre broise out in the hefpital on the fecond of January $1: 79$, and totally confumed the dome at the S. E. quarier of the building, with the chapel which was the mote elc. gant in the world, the great dining hall, and eight wards containing the lodgings of near 6.0 penfioners. The dome was rebuilt about the year $178 ;$; but the reparation of the whole damage is not yet completed. On the lides of the gate which opens to thefe baildings from the park, are placed a large terreltrial and celc Aial globe, in which the fars are gilt ; and in the c ntre of the area is a flatue of George II. About 2000 old difabled feamen are maintaincd in this hofpital. Befides private benefacions, to the amount of n.ar L. 60,000 (which appear in tables hung up at the entrance of the hall), the parliament, in the year

Grsenw.ch. 1932, fettled upon it the earl of Derwentwater's eltate, - to the walue of 1.6000 fer anmun. All itrangers who fee it. pay twopence each; and this income is applied to the fupport of the mathematical fehool for the fons of failors. For the better fupport of which, every feaman in the royal navy, and in the merchant fervice, peys fixpence a month. Atopped out of eheir pay, and delivered in at the fix-penay receiver's office in 'lowerhill. On this account, a femman, who can produce an authentic certificate of his being difabled, and rendered arifit for fervice, hy defending any thip belonging to his Majefty's Britih fubject: or in taking amy thip from the enemy, may be admitted into this hofpital, and receive the fane bencfit from it as if he liad been in his Majelly's immediate fervice. Befides the feamen and widows above-mentioned, about 100 bos , the fons of Ceamen, are bred up for the fervice of the royal navy: but there are no out-penfioners as at Chellea. Each of the mariners has a wetkly allowance of feven loaves, weirthing 16 ounces each; three pounds of beef, two of mutton, a pint of peale, a pound and a quarter of cheefe, two ounces of butter, fourteen quarts of beer, and one filltins a week tobaceo-money: the tubac-co-money of the boatfonins is two hillings and tixpence a-weck each, that of their mates one fhilling and fixpence, and that of the other offiees in proportion to their rank: befides which, each common pewhoner receives once in two years, a fuit of bhe cluaths, a hat, three pair of fockings, two pair of thoes, five neekcloths, three hits, and two night-caps. Out of all that is the thilhing is allowed to the perfon that thows them ; the rett makes an excellent fund for the yearly maintenance of not lefs than 20 poor burs, who are the fors of mariners that have been either il in or difabled in the fervice of their country. 'The park is well tlucked with deer, and affirds as much variets, in proportion to its lize. as any in che kingdom; but the wiews from the Obfervatory and the One-tree hall are beautiful beyond imagination, particularly the furmer. The projection of the fe hills is fo bodd, that you do not look down upon a gradually falling fope or hat inelofures, but at once upon the tops of cuanching trees, which grow in knots and clunip out of deep hollows and imGrowned dells. T'te cattle which feed on the lawns, which appear in breaks among them, feem moving in a region of airy land. A thoufand matmal openims among the branches of the trees break upon little pieturefque views of the fwelling tarf, which, when illumined by the fin, have an effect plealing beyoud the power of fancy to paint. This is the foreground of the landicape: a little farther, the ege falls on that noble Atruture the hofpital, in the midt of an amphitheatre of wood; then the two reaches of the river make that beatiful ferpentine which forms the I le of Dozs, and prefent the floating millions of the "lhames. To the left appears a fine tract of commy, leading to the capital, which there finifhes the profpect. The pa-rith-charch of Crecewich, rebuilt by the comminioners for erectiag the $s 0$ new churches, is a very handfone fructure, ducheated to St Alphage, archbihop of Canterbury, who is faid to have been fain by the Danes in the year 1012 on the fpot where the church now Alands. There is a college at the end of the town, fronting the Thames, for the maintenance of 20 decayed ohl houlc-lecpers, 12 out of Greenwich, atd
N) 144.
cight who are tol e alternately chofen froon Snottitham
and Caltle-Rinug in Norfoik. This is called the duke of Norfolh's Coliese, though it was founded and endowed in 1013 by Henry carl of Northampton the duke of Norfolk's brother, and by him committed to the care of the Merecrs company. 'lo this college belongs a chapel, in which the edri's body is laid; which, as well as his mosument, was removed hither a few years ago from the chapel of 1 over caltle. The penfioners, befldes meat, drink, and lodging, are allowed one Milling and Gixpence a week, with a gown every year, lithen once in two years, and hats once in fous years. In 1560 , Mr Lambard, auther of the Perambulation of lient, alfo built an hofpital, called queen Elizabeth'scollege, faid tobethe firt erected by an Englith Proteftant. There are hkewife two charity-fchools in this parih. The river Thames is here very broad, and the channel detp; and at lome very high tides the water is falt. 'This is the chief harbour for the king's yachts. The town containsabout $1 ; 00$ houles; and a matket on Wednefday and Saturday waserected here in 1737, the direction of wheh is in the governors of the rogal hofpital, to which the profits arifing from it were to be apptopriated.

GREGARIOUS, among zoologifts, a term applicd to fuch animals as do not live folitary, but affociate in herds or flocks.

GREGORIAN calendar, that which fhows the new and full moon, with the time of Ealter, and the moveable feafts depending thereon, by means of epacts difoled through the feveral months of the Gregorian year. See Chronologr, $\mathrm{n}^{\prime} 2$.

Gregorifn Telffopr. See Optics, (Index.)
Gregorian Pear. Se Chronology, $\mathrm{n}^{2} 24$.
GREGORY the Great, was born at Rome, of a patrician family. He difcovered fuch abilities in the exereife of the fenatorial cmploynents, that the emperor Juftin the younger app inted him prefect of Rome. Pope Pelafgius Il. Sent him nuncio to Conltantinople, to demand fuccours agant the Lombards. Whan he thorght of enjoying a fulitary life, he was elected pope by the clergy, the fenate, and the people of Rome. bendes his learning and dilizence in inftructing the church, both by writing and preaching, he had a very happy talent in winning over princes in favour of the terrporal as well as firitual intereft of religion. He umdertook the converion of the Enghih, and fent over tome monks of his order, under the oirection of Augulin their abbot. His morality with refpect to the chantity of churchnen was very rigid, afferting thas a man who had ever known a woman ought not to be admetted to the priethood; and he always canfed the candidates for it to be examned upon that point. He likewife vigorondy exerted himfelf againit fuch as were found guity of calumny. However, he flattered the emperor Phocas, while his hands were yet recking with the blood of Mauritins, and of his three children, who had been butchered in his fight. He likewife flattored Brunehaut, a very wicked queen of Fance. He is acculed of dettroying the noble monuments of ancicnt Roman marnificence, that thofe who vifited the city might not attend more to the triumphal arehes than to holy things; and burnt a multitude of heathen books, Livy in particular. He died in 604.

Girgory of Nazianzen, firnamed the Divine, was

## G R E

one of the moft illultious ornaments of the Gieek chureh in the fourth age. He was made bilhop of Conftantinople in 379 ; but finding his election contetted by Timothevs archbiliop of Alexandria, he voluntarily retigneo his dignity about 3 siz, in the general council of Conftantinople. His works are extant, in two volumes, printed at I'atis in 1609 . His flyle is faid to be equal to that of the molt eclebrated vrators of ancient Greece.

Grigory (Theodorus), furnamed Thaumaturgus on account of his miracles, was the fcholar of Origen; and was elccted bithop of Neocefarea, the place of his birth, about the year 240 , during his ablence. He alfiltud at the council of Antioch, in 255, againft Paulus Samofetanus; and died in 270. He had the fatisfaction of leaving only feventeen idolaters in his diceefe, where there were but feventeen Chrittians when he was ordained. There is ftill extant of his, A gratulatory oration to Origen, A canonical epille, and fome other works.

Gregory, bifhop of Nyffa, one of the fathers of the chanch, and author of the Nicene creed, was born - in Cappadocia, about the year 331. He was chofen bilhop of $\mathrm{N}_{\mathrm{y}} / \mathrm{F}_{\mathrm{a}}$ in 372, and batifled by the emperor Valens for adhering to the council of Nice. He -was neverthelefs afterwards employed by the bifhops in feveral important affairs, and died in 306 . He wote, Commentaries on the Scriptures; Sermons on the myfterics; Mural difoonrfes; Dogmatical treatifes; Panegries ou the faints; fome letters on chutch difcipline; and other works. His llyle is very allegorical and aflected.

Gregory of Tours, or Georgius Florentius Gregorius, one of the moil illuftious bilhops and eckebrated writers of the fixth eentury, was defeended from a noble family in Auvergue. He was educated by his uncle Gallus, bifhop of Clermont ; and diftinguihed himfelf fo much by his learning and virtue, that in 573 he was chofen bifhup of Tours. Ile afterwards svent to Rome to vilit the tomb of the apofles, where he contracted a friendhip with Gregory the Great, and died in 595 . This author was extremely credulous with regard to miracles. He wrote, I. The hifory of France. 2. The lives of the faints; and other works. The beit edition is that publifhed by Fa. ther Rumart, 1699.

Gregory (James), one of the moft eminent mathematicians of the laft eemtury, was a fon of the Rev. Mr John Gregory minither of Drumoak in the county of Aberdeen, and was born at Aberdeen in 363 . His mother was a daughter of $\mathrm{Mr} \mathrm{David}^{\text {Anderfon of }}$ Finzaugh, a gentleman who polfeffed a finguiar turn for mathematical and mechanical knowledge. This mathematical genius was hereditary in the family of nthe Anderfons, and from them feems to have been tranfmited to their defeendants of the name of Ciregory. Alexander Anderfon, coulin german of the above-mentioned David, was profeffor of mathematics at laris in the begiuning of the 17 th century, and publifzed there in 1612 , Suppicmentum Apollonij vedivine Eic. The mother of James Gregory inherited the genius of her family; and obferving in her fon, while yet a child, a flrong propenfity to mathematics, fhe inflructed him herfelf in the elements of that fcience. He received his education in the laneuages at the
Vol. VIII. Part I.
grammar fchool of Aberdeen, and went through the Grezory. ufual comre of academical aludics in the Marifchal college.

At the age of $2+$ he publined his treatile, intitled

 Libens, London 1663 : a work of great genius, in which he gave the world an invention of his own, and one of the mont valuable of the modera difcoveries, the conflruction of the refecting telefeope. 'This difouvery immediately atracted the attention of the mathematicians, both of our own and of foreign countrics, who were foon convinced of its great importance to the fciences of optics and aftronomy. The manner of placing the two fpecula upon the fame axis appedring to Sir Iface Newton to be attended with the difadrantage of lofing the central tajs of the larger fpeculum, he propoted an improverent on the indrument, by giving an whl:que polition to the fmaller fpeculum, and placing the eye-glafs in the fide of the tube. But it is woth remarking, that the Newtonian conitruction of that intrument was long abandoned for the original or Gregorian, which is at this day univerfally employed where the inltrument is of a moderate fize; though Mr Herichel has preferred the Newtomian form for the conflruation of thofe inmenfe telefcopes, which of late years he has fo fuecefffully employed in oblerving the heavens.

The univerfity of Padua being at that time in high reputation for mathematical fudies, James Gregory went thither foon after the pubilication of his firit work; and fixing his refidence there for fome years, he publithed, in 1667, Veru Circuli et Hyperbsles quadruthre; in which he propounded another difcovery of his own, the invention of an infinitely converging isrics for the areas of the eirele and hyperbule. To this treatife, when republifhed in 1668 , he added a new work, intitied, Geometris purs univerfalis, inferciens quantititum curvarum traryinutationi at menfurs; in which he is allowed to have fhown, for the firt time, a method fur the tranfmutation of curves. Thefe works engaged the notice, and procured Mr Gregory the correfpondence, of the greateft mathematicians of the age, Newton, Huygens, Halley, and Wallis; and their anthor being foon after chofen a fchow of the royal foeiety of London, contribused to cnrich the Philofophical Tranfactions at that time by many excellent papers. Through this channel, in particular, he earried on a difpute with Mr Huygens, upon the oceafion of bis treatife on the quadrature of the circle and hyperbole, to which that able mathematician had Rarted fone objections. Of this controverfy, ic is unneceffary to enter into particulars. It is fulficient to fay, that, in the opinion of Leibnite, who allows Mr Gregory the higheft merit for his genius and difcoveries, Mr Huygens has puinted out, thourh not errors, fome conliderable deficienctes in the treatife above mentioned, and forwn a much fimpler mechod of attaining the end in view.

In 1668, Mr James Gregory publifhed at London another work, intited, Exercitationes Geomethira, which contributed fill to extend his reputation. About this time be was elected profefor of mathematics in the univerfity of St Andrew's; an office which he hecld for R

Gis years. Dumb hisa elidene there, he mamied, in abg. Mary, the dathether of gorge famefon the eelebrated painter, whom Mr Waproic has termed the Tandyise of Scothand, and who was fellow-difeiple with that great artifit in the ferool of Rubens at Ant vit: $]$.

In a 0 -, , he was called to Edinhurgh, to fill the chair of mathematics in that univertity. "Ih place he had held for little more than a year, when, in OCtober 1695 , being employed in thowing the Satelites of Juviter through a telefore to fome of his pupils, he was fudeneng itruck with total blimdnefs, and died a few days after, at the early arge of 37.

He was a man of an acute and penetrating gemius. His temper beems to have been warm, as appears from the condact of his difpute with Mr Huygens; and, confious perhaps of his own merits as a difcoverer, he feems to lave been jealous of loting any portion of his reputation by the improvements of others upon his incentions.

Gregorz (David), Savilian profefor of attronomy at Oxford, whom Dr Smith has teroned fubilifimi ingsnit matlematicies, was the eldelt fon of Mi Gregory of Kinnairdy, brotlier of the above mentioned Mr James Gregry. He was born at Aberdeen in 1661 , and received the eavier parts of his education in that city. He completed his thudies at Ediaburgh; and, being poffefed of the mathematical papers of his uncle, foon diltinguithed himelf likewife as the heir of his genius. In the $23 d$ year of his age, he was elected profeflor of mathematics in the univerfity of Edinhurgh; and publithed, in the fame ycar, Exercitatio Geometrica de dimerfone fisurarum, five fpecimon methodi generdlis dimetiendi quaforis fisuras, Edinburgh, 168 , 4to. He faw very carly the excellence of the Newtonian philofophy; and lad the merit of being the firlt who introduced it into the fehools by his public lectures at Edinburgh. "He had (fays Mr Whifton*) already caufed feveral of his Fcholars to keep acts, as we call them, upon feveral branches of the Newtonian philofophy; while we at Cambridye, poor wretches, were ignominioufly ladying the hititious hypothefes of the Cartelian."

In 1691, on the report of Dr Bernard's intention of refigning the Savilian prefefforhip of aftronomy at Oxford, David Gregory went to London; and being patronifed by Sir IFaac Newton, and warmly befriended by Mr Irlanitead the aftronomer royal, he obtained the vacant profefforfaip, for which Dr Halley was a competitor. This rivalhip, however, inttead of animofity, laid the foundation of friendhip between thefe eminent n en ; and Halley foon after became the colleague of Gregory, by obtaining the profeflorfhip of geometry in the fame univerfity. Soon after his arrival in Lendon, Mr Gregory had been elected a fellow of the royal fociety; and, previouny to his election in.
to the Javilizn profeftorfhip, had the degice of dontor Gegor of phyide conferred on him by the univerfity of Oxford ( 1 ).

In 1693 , he publinhed in the Plilofophical Tranfactions a refolution of the Florentine problen de Tefudiae weliformi quadribils; and he continued to commubicate to the public, from time to time, many ingenious mathematical papers by the fame chanmel. In 16055, he printed at Oxford Catopirice et Dioparica Spherice litincona; a work which, as !e informs us in his preface, contains the fubftance of fome of his public lefiures read, eleven yeats before, at Edinburgh. This valuable treatife was republifhed tirt with additions by Dr William Brown, with the recommendation of Mr Jones and I)r Defaguliers; and afterwardy by the latter of thefe gentlemen, with an appendix containing an account of the Gregorian and Newtonian telefcopes, together with Mr Hadley's tables for the conll ruction of both thofe intruments. It is not uaworthy of temats, that, in the end of this treatife, there is an obfermaion which hows, that what is generally believed to be a difoovery of a much later date, the conftuction of achromatic telefcopes, which has been carried to great perfection by Mr Dollond and Mr Ramiden, had frygetted itfelt to the mind of David Gregory, from tae reflection on the adinirabie contrivance of nature in combining the different humours of the eye. 'The paffage is as follows: "Qund fi ob difficultates phyficas in fpeculis idoneis torno elaborandis et poliendis, etiamnum lentibus nti oporteat, fortafis media diverfx dentitatis ad lentem objectivam componendam adhibere utile foret, ut a natura factuna oblervamus in oculi fabrica, ubi criftallinus hunor (fere ejuldem cum vitro virtutis ad radios lueis refrimgendos) aqueo et vitreo (aquæ quoad refractionen haud ablimilibus) conjungitur, ad imaginem quam diftincte fieri poterit, a natura ninil frultra moliente, in oculi fundo depingendam." Catopt. et Diopt. Sphaer. Elem. Oxon. 1695 , p. $9^{\text {B. }}$

In 1702 our author publinted ai Oxford, Afronomie Pbyfice ot Geometrice Eltmenta; a work which is accounted his mafter-piece. It is founded on the Newtonian doctrines, and was efteemed by Sir Iface Newton himfelf as a moit excellent explanation and defence of his philofophy. In the following year he gave to the world an edition in folio of the works of Euclid in Greek and Latin; in profecution of a deingn of his predecelfor Dr Bernard, of puinting the works of all the ancient mathematicions. In this work, alhoough it contains all the tteatifes attributed to Enelid, Dr Gregory has been careful to point out fuch as lie found reafon, from internal evidence, to believe to be the productions of fome inferior geometrician. In profecution of Dr Bermard's plan, Dr Gregory engaged, foon after, with his colleague Halley,
(a) On obtaining the above profuforhip, he was fucceeded in the mathematical chair at Edinburgh by his brother James, likewife an eminent mathernatician; who held that office for thirty-three years, and retiring in 1725 was fucceeded by the celebrated Maclanria. A daughter of this profeffor James Gregory, a young lady of great beaut $y$ and accompluhments, was the victim of an unfortunate attachment, which furnifhed the fubject of Mallet's well known ballad of Williman and Margaret.

Another brother, Charles, was created profeffor of mathematics at St Andrew's by queen Anne in 1707. This office he held with reputation and ability for thirty-two years; and, refigning in $\mathbf{1} 739$, was fucceeded by. kis fon, who eminently inherited the talents of his family, and died in 1763 .
ory. in the publication of the Conics of Apollonius; but he had proceceled but a little way in this undertaking when lie dieck, in the 4 th y year of his age, et Maidenhead in Perkflime, A.D. 1710 . To the genius and abilities of Davill Giegory, the molt celebrated mathenaticians of the age, Sir Ifaac Newton, Dr Halley, and Dr heill, have given anple telimonies. Befides thefe works publifhed in his lifctime, he left in manuicript, A Sbert Treatife of tive Niaure and Strillmetcic of Loogaritinns, which is printed at whe end of Dr Keill's tranilation of Commandine's Euclid; and a Treatife of Praeical Grometry, which was afterwards trasflated, and fublifhed in 1745, by Mr Maclaurin.

Dr David Gregory married, in 1695, Elifabeth, the danghter of Mr Oliphant of Langtown in Scotland. By this ledy he had four fons, of whom, the eldeft, David, was appointed regius profeffor of modern hiltory at Oxford by king George I. and died in $176_{7}$, in an advanced age, after enjoying for many years the digni$t y$ of dean of Chrill church in that univerfity.

Gregory (Dr John), profeflor of medicine in the univerfity of Edinburgh, was the Con of Dr James Gregory profeffor of medicine in King's college Aberdeen, and grandfon of James the inventor of the Gregorian telefcope. His fathor was funt married to Catharine Foubes, daughter of Sir Jolu Forbes of Monynuik; by whom he had fix chitdren, not of whom died in infancy. He married afterwards Anne Chalmers, only daughter of the Rev. Mir George Chalmers principal of King's college, by whom he had two fons and a daughter. John, the youngef of the three, wasborn at Aberdeen, June 3. $172+$. Lofing his father when only in the 7 th year of his age, the care of his education devolved on his grandfather Principal Chalmers, and on his elder brother Dr James Gregury, who, upon the refiguation of their father a fhort time before his death, had been appointed to fucceed him in the profellorhip of medicine in King's college. He likewife owed much in his intant ycars, and during the wholc courfe of his Aludiea, to the care and attention of his coufin, the celebrated Dr Reid, now of the uni. verfity of Glafgow. The rudiments of our author's clafical education he received at the grammar-feinool of Aberdeen; and, under the eye of his grandfather, he completd, in King's college, his tudies in the Latin and Greck languages, and in the fciences of ethics, mathematics, and ratural philofophy. His mater in philofophy aind in mathematics was Mr Thomas Gordon, the prefent philofopliy prefeflor of King's college, who has ably filled an academical chair for above half a century.

In 1742, Mr Gregory went to Edinburgla, where the fehool of medicine was then rifing to that celebrity which has fince fo remarkably dittiuguifhed it. Here he attended the anatomical lectures of the elder Dr Monro, of Dr Sinclair on the theory of medicine, and of Dr Rutherford on the practice. He heard Hkewife the prelections of Dr Alton on the materia medica and butany, and of Dr Plummer on chemilltry. The medical fociety of Edinburgh, inflituted for the free difcuffion of ail quattions relative to medicine ard philofophy had begun to meet in 1737 . Of this fociety we find Mr Gregory a member in ${ }^{1772}$, at the time when Dr Mark Akenfide, his fellow Rudent, and
R. G R
intimate companion, was a member of the fume infi- cragoy. tution.

In the year $1-5+5$ our author went to Leyden, and attended the lectures of thofe celebrated profeffors Gaubius. Albinus, and Van Royen. White at this place lie had the honour of receiving from the laing's college of Aberdeen, his almamater, who regarded him as a favourite fon, an unfolicited degree of doctor of necuicine; and foon aftor, un his weurn thither from Hollanc, he was elected profeffor of philuefophy in the fame univerfity. In this capacity he sead lectures du. ring the years 1747,1748 , and 1749 , on mathem. tics, on experimental philufophy, and on moral philo. fuphy. In the end of 17 fo, however, he chote to refign his profeflormip of philofophy, his views being turned chiefly to the practice of phyfic, with which he apprehended the duties of this profeflurthip, occupying a great portion of his time, too much interfered. Previoufly, however, to his fettling as a phytician at Aberdeen, he went for a few months to the Continent ; a tou of which the chief motive was probably amulement, though, to a mind like his, certainly not without its profit in the enlargement of ideas, and an increafed knowledge of mankind.

Some ume after his return to Scotland, Dr Gregory married, in 1752, Elifabeth daughter of William Lord Forbes; a young lady who, to the exterior endowments of great beauty and engaging manaers, joined a very fuperior undertanding, and an uncommon hare of wit. With her he rectived a handfome addition of fortune; and during the whole period of their union, which was but for the fpace of nine gears, onjoyed the highelt portion of domettic happinefs. Of her character it is enough to fay, that her hufbond, in that admired little work, A Fatber's Legacy to bis daughters, the laft proof of his affection for them, declares, that, " wifle he endeavours to point out what they fhonld be, he draws but a very faint and inperfect piture of what their mother was." The field of medical practice at Aberdeen being at that time in a great meafure pre-occupied by his elder brother Dr James Gregory, and others of fome note in their prefefion, our author determined to try his fortune in london. Thither accordingly he went in 1754 ; and being already known by reputation as a man of genius, he found an eafy inhoduction to many perfons of dillinction borth in the literary and polite world. The late George Lord Lyttleton was his friend and patron. An attachment, which was founded on a friking fimilarity of manners, of tattes, and of difpofitions, grew up into a firm and permanent friendfhip; and to that nobleman, to whom Dr Gregory was wont to communicate all his literary productions, the world is indebted for the pultication of the Comparative Vicew of the State and Faudlies of Mon, which made him firlt known as an author. Dr Gregury likewife enjoyed the friendhip of the late Edward Montague, Efq; and of his lady, the celebraten champion of the Fame of Shakefpeare againt the cavils and calumnies of Voleaine. At her affemblies, or converfazione, the refort of tafte and genius, ourauthor had an opportunity of cultivating an acquaintance with many of the moft diftinguihed literery characters of the prefent times.

In $\mathrm{t} 75+\mathrm{Dr}$ Gregory was chofen fellow of the roy-

## $\mathrm{G} R \mathrm{E} \quad[$ i40 ] G R E

Geesory. al fociety of Londou; and, daily advancing in the public cllem, it is not to be duubeed, that, had he continued his refideuce in that metropolis, his profeffional talents would have found their reward in a very extenfise practice. But the death of his brother, Dr James Gregory, in November :755, occafoning a vacancy in the profeforthip of phytic in King's college, Aberdeen, which he was folicited to fill, he returned to Lis mative country in the beginaing of the following year, and took upon him the duties of that office to which he had been clected in lis ablence.

Here our author remained till the end of the year 1-ki, when. mrged by a very laudable ambition, and prefuming on the reputation he had acquired as affording a reafomable profyeci of fuccefs in a more extendel fish of gractice, he changed his place of refi. dence for Elinburgh. His friends in that metropolis had reprefented to thim the fituation of the college of medicine as favourable to his views of tilling a proferforial chair in that univerfity; which accordingly he oltained in 1766 , on the refignation of Dr Rutherfurd profefor of the practice of phyfic. In the fane year he had the honour of beingappointed firlt phyfician to his majelty for Scotland on the death of Dr Whytt.

On his firlt eflathiment in the univerlity of Edin. burgh, Dr Gregory gave lecturcs on the practice of plytic during the years 1767, 1768, and 1769. Af terwards, by agreement with Dr Cullen, profeffor of the theory of phytie, thefetwo eminent men gave al teraate courfes of the theory and of the practice.-As a publ'c jpeaker, Dr Gregory's manner was fimple, natural, and animated. Wichont the graces of orazory, which the fubject he lad to treat in a great degree precluded, he expreffed his ideas with uncommon perfpicity, and in a thyle happily attempered between the fomality of fludied compotition and the eafe of converfation. It was his culton to premeditate, for a fhort time before entering the college, the fubject of his lecture, confulting thofe authors to whom he had occalion to refer, and marking in fhort notes the arrangement of his intended difcourfe : then fully maHer of his fubject, and confident of his own powers, he trulles to his natural facility of expreffion to convey thofe upinions which he had maturely deliberated The only lectures which he committed fully to writing, were thole introdactory difcourfes which he read at the beginning of his annual courle, and which are publifhcal in thefe volumes under the title of Leabres on the Duties and ©ualifications of a Phyfian. Of thefe, which were witten with no view to publication, many copies were taken by his pupils, and fome from the original manufript, which he freely lent for their perufal. On hearing that a copy thad been offered for fale to a bookfeller, it became necellary to auticipate a fraudulent, and perhaps a mutilated pullication, by 'authorifing an impreffion from a corrected copy, of which he gave the profits to a favourite pupil. 'Thefe lectures were firt publifled in 1770 , and afterwards in an enlarged and more perfect form in 1792.

In the fame year, 1772, Dr Gregory rublifhed Whoments of the Pracice of Phayic, for the afe of Sudents; a work intended folety for his own pupils, and to be ufed by himfelf as a text-book to be commented upon in his courfe of lecturce, In an advertifiment prefixed
to this work, he fignified his intention of comprehending in it the whole feries of difcafes of which he treated in lis leeturco on the Practice of Phylic; but this intention le did not live to accomplifh, having brought down the work no further than to the enld of the clafs of Fitbrile Dileafes,--In his academical lcctures. Dr Gregory never attemped to minead the ladent by flattering xiews of the perfection of the feience; Out was, un the conrary, anxions to point out its defects; wifely judging, that a thorough fenfe of the imperfection of an art or fcience is the firlt thep towards its improvement. In this vicw he was careful to expofe the fallacoufnefs of the feveral theories and hypothefes which bave had the mot exterfive currency, and perpetually inculcated the danger of fyltematizing with limited experience, on an imperfect kiowledge of facts. Yet in the work laft mentioned it will appear, from the order in which he las treated of the feveral difeafes, that he did nut entirely negleet. the fyltematic arrangements of other authors. Thefe, however, he warned his pupils, that he had not adupted from any conviction of the rectitude of thofe theories to which they referred, but ouly as affording that degree of methonf, and regularity of plan, which is found to be the belt help to the ftudy of any feience. Conlidering a rational theory of phytic to be as yet a duflderatum, it was his object to communicate to his. pupuls the greateft portion of practical knowledge, as the only batis on which fuch a theory could ever be reared. His method, in tieating of the feveral difeafes, was firlt to mention thole fymptoms which are underltood among phyficians to characterife or define a difeafe; pruceding from the general to the more particular feries of fymptoms and their occafional varieties; to point out accurately the dingnofic fymptoms, or thofe by which onc difeafe is edfentially diftinguin:ed from others that refemble it, and to mark likewile the prognoflics by which a plyylician is enabled to conjecture of the probable event of a difeafe, whether favourable or otherwife. He then proceeded to fpecify the various caufes, predifpoting, oceational, and proximate; accounting, as far as he thought could be done on juft principles, for the appearance of the feveral fymptoms; and, finally, he pointed out the general plan of cure, the particular remedies to be emploged, and the cautions requifite in the adminilatation of them. Thus defirous of eftablihing the fcience of medicine upon the folid foundation of practice and experience ; and knowing that many things afferted as faits by medical writers have been allumed on a very carelefs obfervation, while confirning a favourite theo$1 y$; and that, on the other hand, mayy real and important facts have, from the fame fipint of fyttem, been explained away and diferedited; he conitantly endeavoured, both by his precept and cxample, to intculcate to his pupils the necelity of extreme caution either in admitting or in denying medical facts, or what are commonly given as fuch. 'To the defire of enforcing this neceflary caution is owing that multitude of queries refpecting matters of fact, as well as matters of opiuion, whicls oceurs in the Elenents of the Pralice of Pbyfo.

Dr Giegory, foon after the death of his wife, and. as he himelf fays, "for the anufencut of his folitar heurs.".

Inours," employed himfelf in the compofition of that admirable tract, intitled, $A$ Father's Legacy on his Danyhters; a work which, though certainly never iatended by its author for the public eye, it would have been an unwarrantable diminution of his fame, and a capricous refufal of a general benchit to mankind, to have limited to the fole purpofe for which it was originally defigned. It was, therefore, with great propricty, puiblifhed after the author's death hy his eldelt fion. This work is a moft amiable difplay of the piety and goodnefs of his heart, and his confummate knowledge of human nature and of the world. It manifells fuch follicitude for their welfare, as ftrougly recommends the advice which he gives. He fpeaks of the female fex in the moll horourable terms, and tabours to increafe its eatimation, whilt the plainly, yet genteelly and tenderiy, puints out the eirors into which young ladies are prone to fail. It is particulatly obfervable, in what ligh and honourable terms he fecaks of the Holy Scriptures, of Chillian worthip, and faithfut minifers; how warmly he recommends to his daughters the ferious and devout worthip of God in public and private. He dwells largely on that temper and bchaviour, which were particularly fuited to their education, rank, and circumitances; and recommends that gentlenefs, benevolence, and modetty, which adorn the character of the ladies, and do particular honour to their fex. His advicts, with regard to love, courthip, and marriage, are peculiarly wife, and interelling to them. Thcy fhow what careful obfervation he had inade on female comeltic conduct, and on the different effeets of polfefing or wanting the virtues and qualities wheh he recommends. 'I here is fomething peculiarly curious, animated, and ufeful, in his directions to them, how to judge of, and manifeft an honourable paffion in, and towards the other fex, and in the very accurate and ufful dillinetion which he makes between true and falfe delicacy. Nothing ean be more Atriking and affecting, nothing more likely to give his paternal advices their defired effect, than the refpectful and affectionate manner in which he mentions his lady their mother, and the irreparable lofs which be and they fittained by her cally death. In thort, in this tract, the profellur thines with peculiar lultre as a hufband and father, and it is admirably adapted to promote domeltic thappinefs.

Thefe letters to his daughters were evidently written under the impreffion of an early death, which Dr Gregory had reafon to apprehend from a conftitution fubject to the gout, which had begun to thow itfelf at irregular intervals even from the 18 th year of his arge. His mother, from whom he inherited that difeafe, died Suddenly in 1770, while fitting at table. Dr Gregory had proguofticated for himelf a fimilar death; an event of which, among his friends, he often talked, but had no apprehention of the nearnefs of its approach. In the beginning of the year 1773, in converfation with his fon the prefent Dr James Giegory, the latter remarking, that having for the three preceding years had no sturn of a tit, he might make his account with a pretty levere attack at that feafon; he received the obfervation with fome degree of anger, as he felt himfelf then in lis ufual flate of health. The prediction, however, was too true; for having gone to bed on the gth of Fcbruary 1773 , with no
apparent dibrder, he was found dead in the morning. His death had been initantaneous, and probably in his ficep; for there was not the fmalleft difcompofure of limb or of feature, -a perfect Euthanafia.
Dr Gregory, in perfon, was conliderably above the middle fize. His frame of body was compacted with fynmetry, but not with elegance. His limbs were nut active; he thooped fomewhat in his gait; and his countenance, from a fuilnefs of feature and a heavineis of eye, gave no external indication of fuperior power of mind or abilities. It was otherwife when engaged in converfation. His features then became animated, and his eye molt expreffive. He had a warmh of tone and of getlure which gave a pleafing intereft to every thing which he uttered: But, united with this anination, there was in him a gentlenefs and finplicity of manner, which, with little attention to the exterior and regulated forms of politenefs, was more engaging thon the mod linithed addrefs. His converfation Howed with eafe; and, when in company with literary men, without affecting a difplay of knowledge, he was libsral of the thores of his mind. He poffolled a large flare of the focial and benevolent affections, which, in the exercife of profeflion, manitetted themfelves in many namelefs, but important, attentions to thofe under his care; attentions which, proceeding in him from an extended principle of humanity, were not fquared to the cireumitances or rank of the patient, but ever beflowed moil liberally where they were molt requifite. In the care of his pupits, he was not fatistied with a faithful difcharge of his public duties. To many of the fe, Arangers in the country, and far removed from all who had a natural intereft in their concerns, it was matter of no fmall importance to enjoy the acquaintance and countenance of one fo univerially refpected and efteemed. Through him they found an eafy introduction to an enlarged and elegant fociety; and, what to them was !lill more valuable, they experienced in him a friend who was ever eafy of accefis, and ready to alfilt them to the ntmolt with his counfel and patronage. - The fame firit of philanthropy endeared him in a particular manner to his intimate friends; among whom may be ranked mott of the Scottifh literati of his time. - Some time after his death, the profefforhip of the Theory of Medicine was beflowed upon his eldelt fon the prefent Dr James Gregory; who has fince fucceeded to the Practical Chair, lately tilled by that other moft eminent profeffor Dr Cullen.

GRE-hound. See Cants.-Among a litter of gre-hound puppies, the belt are always thofe which are lighteft. Thefe will make the nimbleft dogs as they grow up. The gre-hound is beft for open countries where there is little covert. In thefe places there will fumetimes be a courfe after a bare of two or three miles or more, and both the logs and the game in light all the white. It is generally fuppofed that the grehound bitcla will beat the dog in running: but this feems to be an crior; for the dog is both longer made, and confiderably flronger, than the bitch of the fame kind. In the brecding thefe dogs the bitch is principally to be regarded; for it is found by experience, that the bett dog and a bad bitch will not get fo good puppies as an indifferert dog with a good bitch. The dog and bitch fhould be as nearly as may be of the
frame

Gregory,
Gre
hound.

## GRE[ If: ] G R E

fime age: and for the brecding of hine and peoteet account of the game with which it abounded. In tojo, doge, they foukd nue be mare than four yeats ol.1. An uld bith may be ufed with a young dop, but the \} uppie; of a young titch and an cld doy will never be gool for any thing.

The general food for a gre-hound ought to be chippings or rafpinge of bread, with foft bones and grities; and thofe chippings onght always to be foaked in betf or mutton broth.

The proper exercife for a gre-hound is courfing him ibrec times a-week, and rewarding him with blood; which will animate him in the highelt degree, and encourage him to profecute his game. But the hare alfo morld ever have fair play. She mould lave the law, as it is called; that is, have leave to run about twelve foore yands before the dog is nipped at her, that lie may have fome difficulty in the course, and not pick up the game too tally. If he kills the hare, fie mult never be fuffered to t, ar her ; but the muit be taken from him, his mouth cleaned of the wool, and the liser and lights given him by way of encouragement. Then he is to beled home, and his feet wafhed with bntter and beer, and about an hour after he is to be fed.

When the dog is to be taken out to courfe, he thould have nothing in the moming but a toalt and butter, and then be is to be kennelled till taken out to the field. The kennelling there dogs is of great ufe, always giving them fpirit and nimblenefo when they are let loofe: and the beft way of managing a line gre hound is, never to let him flir out of the kennel, except at the times of feeding, walking, or courfing.

GRENADA, one of the Caribbee iflands, lying in W. Long. 61. 40. N. Lat. 12. O. It is the latt of the Windward Caribbees; and lies 30 leagues north of new Andalufid, on the continent. According to fome, it is $2+$ leagues in compafs; according to others, only 22 ; and it is faid to be 30 miles in length, and in fome places 15 in breadth. 'The chief port, formerly called I ouis, now St George's, ftands on the weft fide of the ifland, in the middle of a large bay, with a fandy bottom. It is pretended that to00 barks, from 300 to 400 tons, may ride fecure from Itorms; and that 1 colhips , of toco tons cach, may be moored in the harbour. A large ronnd bafon, which is parted from it by a bank of fand, would contain a confiderable number of fhips, if the bank was cut through : but by reafon of it the large Mips are obliged to pals within 80 paces of one of the mountains lying at the month of the harbour ; the other mountain lying about half a mile diltant. The illand abounds with wild game and fifh; it produces alfo very fine timber, but the cocoa-trec is ublerved not to thrive here fo well as in the other iflands. A lake on a high mountain, about the middle of the illand, fupplies it with frefh.water ftreams. Several bays and harbours lie round the ifland, fome of which might be fortified to great advantage: fo that it is very convenient for Chipping, not being fubject to hurricanes. The foil is eapable of producing tobacco, fugar, indigo, peafe, and millet.

In $163^{8}$, M. Poincy, a Frenchman, attempted to make a fettlement in Grenada; but was driven off by the Caribbeans, who reforted to this illand in greater aumbers than to the neighbouring ones, probably en

Monf. Parquet, governur of Martinico, carried over from that illand 200 men, furuifhed with prefents to reconcile the favares to them; bnt wiih arins to fubdue them, in cale they fhould prove intractable. The favages are faid to have been frightened into fubmiffion by the number of the Ficnehmen: but, according to fome French writers, the chief not only welcomed the new-comers; but, in confideration of fome kuives, latchets, feiflars, and other toys, yielded to Parquet the furectignty of the illand, relerving to themfelves their own habitations. The Abbé Raynal informs us, that thefe firt French colonits, imagining they had purchaled the ifland by thefe trifles, allumed the foverignty, and foon acted as tyrants. The Caribs, unable to contend with them by force, took their afual method of murdering all thofe whom they found in a defencelefs Hate. This produced a war; and the Firench fettlers having received a reinforcement of 300 men from Martinico, forced the fapages to retire to a mountain; from whence, after exhaulting all their arrows, they rolled down great logs of wood on their enemies. Here they were joined by other favages from the neighbouring illands, and again attacked the French, but were defeated anew: and were at lat driven tu fueh defperation, that 40 of them, who had efca. ped fiom the flaughter, jumped from a precipice into the fea, where they all perifhed, rather than fall into the hands of their implacable enemies. From thence the rock was called le morne des fateurs, or "the bill of the leapers;" which name it ftill retains. The French then deftroyed the habitations and all the provifions of the favages; but freft Cupplies of Caribbeans arriving, the war was renewed with great vigour, and great numbers of the French were killed. Upon this they refolved totally to exterminate the natives: and having accordingly attacked the favages unawares, they inhumanly put to death the women and children, as well as the men; burning all their boats and canoes, to cut off alfo communication between the few furvivors and the neighbouring illands. Notwithllanding all thele barbarous precautions, however, the Caribbees proved the irreconcileable enemies of the French; and their frequent infurrections at lait obliged Parquet to fell all his property in the ifland to the Count de Cerillac in 1657. The new proprietor, who purchafed Parquet's property for 30,000 crouns, fent thither a perfon of brutal manners to govern the ifland. He behaved with fuch infupportable tyranny, that molt of the colonitts retired to Martinico; and the few who remained condemed him to death after a formal trial. In the whole court of juftice that tried this mifcreant, there was only one man (called Archangeli) who conld write. A farrier was the perfon who impeached: and he, inttead of the fignatures, fealed with a horfe-thoe; and Archangeli, who performed the office of clerk, wrote ronnd it thefe words in French, "Mank of Mr de la Brie, counfel for the court."

It was apprehended tbat the court of France would not ratify a fentonce paffed with fuch unufual formalities; and therefore moll of the judges of the governor's crimes, and witnefles of hisexecution, difappeared. Only thofe remained whofe obfcurity fereened them from the purfuit of the laws. By an eftimate,
renada. taken in 1700 , there were at Grcnada no more than 25 white people, 53 fiec favages or mulattoes, and 525 flaves. The ufeful animals were reduced to 64 horfes and 569 head of horned catle. The whole cul. ture conlifted of 3 plantations of fugar and 52 of indigo. - The illand had been fold in 1664 to the French Weft India company for 100,000 livres.

This unfavourable flate of the affairs of Grenlada was changed in 1714. The change was owing to the flourifing g condition of Martinico. The richeft of the fhips from that ifland were fent to the Spanifh coalts, and in their way touched at Grenada to take in refreflments. The trading privateers, who undertook this navigation, taught the people of that illand the value of their foil, which only required cultivation. Some traders furnifhed the inhabitans with flaves and utenfils to erect fugar plantations. An open account was eflablifhed between the two colonies. Grenada was clearing its debts gradually by its rich proluce; and the balance was on the point of being clofed, when the war in 1744 interrupted the communication between the two illands, and at the fame time fopped the progrefs of the fugar-plantations. This lofs was fupplied by the culture of coffee, which was purfued during the hoftilitics with all the activity and eagernefs that indultry could infpire. - The peace of $17+8$ revived all the labours, and opened all the former fources of wealth. In 753 the population of Grenada coulifed of 1262 white people, 175 fiee negroes, and 11,991 flaves. The cattle amounted to 22198 horfes or mules, 2456 head of horned catte, 3273 fleep. 902 goats, and $33^{1}$ hogs. The culcivation rofe to 83 fugar-plantations, $2,725,600$ coffee-trces, 150,300 cocoa-trees, and 800 cutton plants. The provifions confifted of $5,740,450$ trenches of caffada, 933,596 banana trees, and 143 fquares of potatoes and yams. The colony made a rapid progrefs, in proportion to the excellence of its foil; but in the courfe of the laft war but one the ifland was taken by the Britifh. At this tume one of the mountains at the fide of St George's harbour was Atrengly fortified, and might have made a good defence, bit furrendered without firing a gun ; and by the treaty concluded in 1763 the inland was ceded to Britain. On this ceffion, and the management of the colony after that event, the isbe Raynal has the following remarks.-"This long train of evils [the ambition and nifmanagement of his countrymen] has thrown Grenada into the hands of the Englifh, who are in poffeffion of this conqueft by the treaty of ${ }^{1763}$. Fut how long will they keep this colony? Or, will it never again be reftored to France? -England has not made a fortunate beginning. In the firt enthufiafm raifed by an scquifition, of which the higheft opinion had been previoufly formed, every one was eager to purchafe eftates there. They fold for much more than their real value. This caprice, by expelling old colonits who were inured to the climate, has fent about $L$. $1,5,53,000$ out of the mothercountry. This imprudence has been followed by another. The new proprietors, mined, no doubt, by national pride, have fubftituted new methods to thofe of their predeceffors. They have attempted to alter the mode of living among their flares. The negroes, who from their very ignorance are more attached to their cuftoms than other men, have revolted. It bath been
found neceffary to fend out troops, and to thed bluod. The whole colony was filled with fufpicions. The matlers who had laid themfelves under a neceffity of ufing violent mathods, were afraid of being burnt or maffacred in their own plantations. The labours have declined, or been totally interrupted. Tranquillity has at length been reftored. The number of llaves lias been increafed as far as 40,000 , and the produce has been raifed to the treble of what it was under the French government. 'The plantations will ftill be improved by the neighbourhood of a dozen of illand., called the Grenadines or Grenadilloes, that are depencient on the colony. They are from three to eight leagues in circumference, but do not afford a fingle fpring of water. The air is wholefome. The ground, covered only with thin bufhes, has nat been fereened from the fun. It exhales none of thofe noxious vapours which are fatal to the humandman. Cariacou, the only one of the Grenadines which the French have occupied, was at firf frequented by turtle fithermen: who, in the leifure afforded them by fo eafy an occuIntion, employed themflves in cleating the ground. In procels of time, their finall number was increafed by the accellion of fome of the inbabitants of Guadaloupe; who, finding that their plantations were deflroyed by a particular fort of ants, removed to Cariacou. 'The inand flourithed from the liberty that was enjoyed therc. The inhabitants collected about 1200 llaves, by whofe labours they made themfelves a revenue of near 20,000 a-year in cotton - The other Grenadines do not afford a profpect of the fame advantages, though the plantation of fugar is begun thete. It has fuc. cceded remarkably well at Becouya, the largell and moit fertile of thefe inands, which is no more than two leagues diftant from St Vincent."

In the year 1779 the conqueft of this inland was accomplifhed by D'Ettaign the French admiral, who had been preverted from attempting it before by his enterprife againit St Vincent. Immediately after his conquett of St Lucia, however, being reinforced by a fquadron under M. de la Motte, he fet fail for Grenada with a fleet of 26 fail of the line and 12 frigates, baving on board 10,000 land forces. Here he arrived on the fecond of July; and landed 3000 troops, chiefly Irifh, being part of the brigade compofed of natives of Ireland in the fervice of France. Thefe were conduced by Count Dillon, who difpofed them in fuch a manner as to furround the hill that overlooks and commands George's 'Town, togcther with the fort and harbour. To oppofe thefe, Lord M'Cartncy, the governor, had only about 150 regulars, and 300 or 400 armed inhabitants; but though all refiftance was evidently vain, he determined neverthelefs to make an honourable and gallant defence. The preparations lie madc were fuch as induced I)'Eftaign himfelf to be prefent at the attack; and, even with lis vall Cuperiority of force, the tirft attack on the entrencliments proved unfuccefsful. The fecond continued two hours; when the garrifon were obliged to yield to the immenfe difparity of numbers who affaulted them, after having killed or wounded 300 of their antagonifts. Having thus made themfelves mafters of the intrenchments on the hill, the French turned the cannon of them towards the fort which lay under it ; on which the governor demanded a capitulation. The terms, however,

## Grenala.

 were fo extraordinary and unprecedented, that both the governor and inhabitants agreed in rejecting them; and determined rather to furrender without any conditions at all than upon thofe which appeared fo es. travagant. On this occafion D'Eftaign is faid to have behaved in a very haughty and fevere manner; indulging his foldiers alfo in the moft unwarrantable liberties, and in which they would have proceeded much farther had they not been reflrained by the Irith troops in the French fervice.In the mean time admiral Byron, who lad been convoying the homeward-bound Well India leet, hafened to St Vincent, in hopes of recovering it ; but being informed, by the way, that a defcent had been made at Gienada, he changed his courle, hoping that Lord M'Cartney would be able to hold out till his arrival. On the dixth of July he came in fight of the French fleet; and, without regarding D'Eitaign's fuperiority of fix thips of the line and as many frigates, determined if pollible to force him to a clofe engagement. The Fiench commander, however, was not fo confident of his own prowefs as to run the rilk; of an encounter of this kind; and having already atchicucd his conquelt, had no other view than to preferve it. His deligns were facilitated by the good condition of his flect; which being more lately cone ont of port than that of the Britill, failed faller, fo that he was thus emabled to keep at what dilance he pleated. The engagement began about eight in the morning, when admiral Barrington with his own and two other fhips got up to the van of the enemy, which they attacked with the greatefl fpirit. As the other hips of his divifion, however, were not able to get up to his affitance, thefe three mips were neceffarily obliged to encounter a valt fuperiority, and of confequence fuffered exceedingly. The battle was carried on from beginning to end in the fame unequal mamner; nor were the Britifh commanders, though they ufed their utmolt eflorts for this purpofe, able to bring the French to a clofe engragement. Thus captains Collingwood, Edwards, and Cornwallis, flond the fire of the whole French fleet for fome time. Captain Fanhaw of the Monmouth, a $6+$ gun thip, threw himfelf fingly in the way of the cnemy's van; and admiral Rowley and captain Butchart fought at the fame difadvantage: fo that finding it inmponible to continue the engagement with any probability of fuccefs, a general ceflation of fring took place about noon. It recommenced in the fame manner about two in the afternoun; and lafted, with different interruptions, till the evening. During :his action fome of the Britilh fhips had forced their way into St George's Larbour, not imagining that the enemy were already in polfefion of the illand. They were foon undeceived, however, by perceivity the French colours Aying athore, and the guns and batteries liring at them. This difcosery put an end to the defign which had brought on the engagement; and as it was now high time to think of providing for the fafety of the Britifh tranfports, which were in danger from the number of the enemy's frigrates, the engagement was finally difcontimet. During this action fome of admiral Byron's hlips had fuffered extremely. The Lion of 64 guns, captain Cornwallis, was found incapable of rejoining the fleet which were plying to nindward; and was therefore obliged to bear away $\mathrm{N}^{2} 84+0$
alone before the wind. Two other thips las far attern in a very difirefted fituation; but no attempt was made to capture them, nor did the French admiral fhow the leall inclimation to rene w the engagement.

Grewada was refored to Great Briain by the late treaty of peace.-George's tosn, or St Gcorge's, is the refidence of the governor; and the prelent governor, general Matthew, made a prefent to the citizens of a clock and bells laft fring (1790). The garrifon conilled at that time of artillery, two regimenis of Europeans, and one of blacks. As there ane feveral finall illands fulject to the laws enaited in Grenada, they each elect a perfon to reprefent them in the general allembly, which is always held in St George's, As none of the Grenadines have a habour fit for large veffels, the produce of them is converied in fmall veffich to St George's, from whence it is exported to the different places of Europe, Africa, America, \&c. From the number of veffels that arrive there yearly from dif. ferent places, and from its being the feat of the legiflature, it has become fo populous, that two news papers are publifhed in it. On occafion of the lave proSpect of a war with Spain, an act was palted here iri Tebruary 1792 , obliging every gentleman to give in apon oath the value of his ettate, and the number of blacks upon it, in order that the general affembly might afcertain the number of flaves each fhould fend to work upon the fortifications on Richmond-hill, near St George's.

GRENADINES, or Grenadillos. See the preceding article.-It is there mentioned that the Grenadines do not afford a lingle drop of freth water. A fmall fpring however has been lately difcovered in the principal inand Cariacou, by digging; but being of great value, it is kept locked by the proprietor Mr Mayes. The capital of that illand is called Hillborough, in which there is a fmall church.

GRENAILLE, a name given by the French writers to a preparation of copper, which the Chinefe ufe as a red colour in fome of their finett china, particularly for that colour which is called oil-rad, or ret in oil. The china-ware coloured with this is very dear. The manner in which they procure the preparation is thus: they have in China no fuch thing as filver-coined money, but they ule in commerce bars or mafles of filver; thefe they pay and receive in large bargains; and among a nation fo full of fraud as the Chinefe, it is no wonder that thefe are too often adulterated with too great an alloy of copper. They pafs, however, in this fate in the common payments. There are fome occalions, however, fuch as the paying the taxes and comributions, on which they mutt have their filver pure and line: on this occation they have recourle to ccrtain people, whofe fole butine fs it is to refine the filver, and leparate it from the copper and the lead it contains. "1'his they do in furnaces mate for the purpole, and with very convenient veflels. While the copper is infufion, they take a fmall brufh, and dip the end of it into water; then flriking the handle of the brufh, they fprinkle the water by degrees upon the melted copper; a fort of pellicle forms itfelf by this means on the furface of the matter, which they take oll while hot with pincers of iron, and immediately throwing it into a large veffel of cold water, it forms that red ponder which is called the granalle; they re2

Giena-
dines

peat the operation every time they in this manncr feparate the copper; and this furnifhes them with as much of the grenaille as they have occafion for in their china works.

GRENOBLE, a large, populous, and ancient town of Dauphiny in France, with a bifhop's fee. It contains a great number of handfome ftructures, particularly the clurches and convents. The leather and gloves that are made here are highly efteemed. It is feated on the river Ifere, over which there are two bridges to pafs into that part called Perriere, a large flreet on the other fide of the river. E. Long. 5.49. N. Lat. 45.12.

GRESHAM (Sir Thomas), an opulent merchant of London, defcended from an ancient and honourable family of Norfolk, was burn in 1519. He was, as his father had been before him, appointed king's agent at Antwerp, for taking up money of the merclants; and in 1551, he removed to that city with his family. This employment was fufpended on the acceffion of queen Mary: but on proper reprefentations, was reftored to him again. Queen Elizabeth conferred the honour of knighithood upon him, and made him her agent in foreign parts. It was at this time he thought proper to provide himfelf with a manfion-boufe in the city, fuitable to his flation and dignity; with which intention he built a large houfe on the weft fide of Bifhopfgate-ftreet, afterwards known by the name of Grefluam.college. His father had propofed building a houfe or exchange for the merchants to meet in, inftead of walking in the open flreet; but this defign remained for the fon to accomplifh. Sir Thomas went beyond his father: he offered, if the citizens would provide a proper piece of ground, to build a houfe at his own expence; which being accepted, he fulfilled his promife after the plan of the exchange at Antwerp. When the new edifice was opened, the queen (Jan. 29. 1570) came and dined with the fourder; and caufed a herald with a trumpet to proclaim it by the name of the Royal Exchange. In purfuance alfo of a promife to endow a college for the profeflion of the feven liberal fciences, he made a teitamentary difpofition of his houfe in London for that pupofe; leaving one moiety of the royal exchange to the corporation of Loudon, and the other to the mercers company, for the falaries of feven lecturers in divinity, law, phyfic, aftronomy, geometry, mufic, and shetoric, at 501 . each per annum. He left feveral other confiderable benefactions, and died in 1579. As to the college, it las been pulled down within thefe 14 or 15 years, in confequence of an application to parliament from the city, and the excife-office erected in its place. The lectures are read, or rather hurried through, in a chamber over the Royal Exchange.'Thofe who have drawn Sir Thomas's charakter obrerve, that he had the happinefs of a mind every way fuited to his fortune, generous and benign; ready to perform any gond actions, and encourage them in others. He was a great friend and patron of our celibrated mattyrologift John Fox. He was well ac. quainted with the ancient and feveral modern languages; he had a very comprehonive knowledge of all affairs relating to commerce, whether foreign or domeftic; and his fuccefs was not lefs, being in his time efteemed the higheft commoner in England. He
Vol. VIII. Part I
tranfacted queen Elizabeth's mercantile affairs fo con- Greeille. ftantly, that he was called the rayal merchant; and his houfe was fometimes appointed for the reception of foreign princes upon their firft arsival at London.

GREVIILLE (Fulke), lord Brook, of Beauchamp's Court in Warwickthire, a poet and mifcellaneous writer, was born in the year 1554, and defcended from the noble families of Beauchamps of Powick and Willoughby de Brook. In company with his coufin Sir Philip Sidney, he began his education at a fehool in Shrewßury: thence he went to Oxford, where he remained for fume time a gentleman commoner, and then removed to Trinity-College in Cambridge. Having left the univerfity; he vifited foreign courts, and thus added to his knowledge of the ancient language a perfeet knowledge of the modern. On his return to England he was introduced to queen Elizabeth by his uncle Robert Greville, at that time in her majefty's fervice ; and by means of Sir Henry Sidney, lord prefident of Wales, was nominated to fome lucrative employments in that principality.
In the year 1581, when the French commiffioners who came to treat about the queen's marriage with the duke of Anjou were fumptuoufly entertained with tilts and tournaments, Mr Greville, who was one of the challengers, fo fignalized himfelf, as to "win the reputation of a moft valiant knight." He continued a conftant attendant at court, and a favourite with the queen to the end of her reign; during which he obtained the office of treafurer of marinc canfes, alfo a grant of the manor of Wedgnock, and likewife the honour of knighthood. In this reign he was feveral times elected member for the county of Warwick; and from the journals of the houfe fecms to have been a man of bufinefs, as his name frequently appears in committees.

On the acceffion of king James I. he was inftalled kniglit of the Bath; and foon after obtained a grant of the ruinous caftles of Warwick, which he repaired at a confiderable expence, and where he probably refided during the former part of this rcign : but in the year 1614, the twelfth of James I. he was made un-der-treafurer, and chancellor of the exchequer, one of the privy council, and gentleman of the bed-chamber; and in the 1620 , was raifed to the dignity of a baron by the title of lord Brook of Beauchamp's Court. He was allo prive-counfellor to King Charles I. in the beginning of whofe reign he founded a hiftorylecture in Cambridge.

Having thus attained the age of 74 , through a life of continued profperity, univerfally almired as a gentleman and a fcholar, he fell by the hand of an affafin, one of his own domeftics, who immediately ftabbed himfelf with the fame weapon with uhich he had murdered his matter. This fcllow's name was Haywood; and the caufe is faid to have been a fevere reprimand for his prefumption in upbraiding his mafter for not providing for him aftes his death. It feems he had been witnefs to lord Brook's will, and knew the contents. Some fay he flabbed lim with a knife in the back, others with a fword. This affair happened at Brook houfe in Holborne.-Lord Brook was buric with great pomp in St Mary's church at Warwick, in his own vault, over which he had erected a monument of black and white marble, ordering at his death

GREIV (Nekmiah), a leamed Enslifh writer, in the 1 th century, had a cundiderahe practice as a plyyfocian in Lendion, and fueceeded Mr Oldenburch in the offece of contury to the royal focicty. In this cepacity, purduat io an order of council, he drex up a cotalngue of the natural and artilicial rarities be longing to the focietr, under the title of Muraton: Re galis Societatis, \&ec. 1681 . Hie alfo wrote, behds le icral pieces in the Phitorytical Terafactimen, 1. The Comparative Anatomy of the Evorachand Guta, folio. 2. The Anatomy of ilants, folio. 2. Trontous
 or a Difonafe of the Unverfe os it is tle Creature and Kingdom of Gud, folio. He aind fucdonly in 1721.

GREWTA, in botany: A renus of the rolyandia onder, buonving to the gynandia clafs of pemts: and in the natural method anking under the $3-$ th order, Colmmifica. 'The calys is pentaphyhoms; there are fine petals. each sith a metaiforous fore at the bafe; the bery is quadriocular.

Buechs. 1. The uccidentalis, with oval crenated leaves, 1 as long been preferved in many curiontagar. dens both in Fentanal and Holland. It is a native of the Cape of Good Hope, and grows to the he isht of so or 12 feet. The them and branches greatly ufemble thofe of the falll leavel elm, the bark beine finooth, and of the fane columer with that whan youns. "Ihe leaves are alfs very like thofe of the elm, and fall off in autumn. Tree flowers are prodnced fincoly aloner the young branclies fiem the wings of the laves, and atce of a bright purpe colour. 2. The Africana, with oval fpear flatured fermated laves, is a mative of Senegal in Africa, from whance its feeds were brourthe by ATr Adanfon. In this contry it rifes with a throbby Aalk five or fix feet high, fonding ont many laterd handiee, with a brown lairy bark, and garmibed "ith frear-fraped fermatco leaves; but the plants have not flowered in Britain.

Culture and ufes. The fint fort, though a native of a warm climate, will beat the open air in this conn119: only requiring to be thettered in a green-houle during the minter-time. It may be proparated by
 carcl. The fecond fort is tender, and mull be kept conflantly in a wam bark-flove. In fummer, they renuise a large thare of the free air to be admitted to them, and Ahomb have water three or four times aweck in warm weather: but in the winter they mout lef faningly watered.-The negrocs of Soneqal highty value a decosion of the lark of this lat ipection, and ofe it as a never-faling remedy againt vencreal complains.

CREEY, or Gray colom: See Gray.
Gefy (Lady Jane), a mold iblultrous amed unfortwate lady, defemed of the hood-rovil of Wioland lev both pancate, was the chett danstater of Heury

 of 1 oulis XII king of France, who was the youngeit dathtor of Ileny V'll. king of Diditand. She was horn in the vear 1537, at Ponadzate, her fathen's feat in Leionterthire. she difrorered an early propenfly to all kinds of grond literatare: and having a fine Gerius, improwed mader the thition of Mr Elaner, the made a noll furprifing proguf in time lancuages, arte, and feiences. She underfond perfectly buahkinds of philofophy", and could seprefs herfelf very properly at leafin the Latin and Greck tongues: and we are informed by Sir 'Thomas Chalener (ins.repe's Memonrials, Vol. 1I1. p. y3.), that the wats wril verfel in Itcorsw. Chaldec. Arabic, French, and htalian; "and (he adds) the played well on isflommont mufic, writ a curious hand, and was excellent at the needle." Chabomer alfo tells ns, that the acombmaned her mufical inthoments with a woice expuifitely freet in itfelf, anthud by all the grates that art combld botow.

In the sear 1553 , the dukes of Suftolk and Northandorant, who were now, after the fall of Somere fet, amised at the heigh of power. began, on the decline of the king"s hoaleh, to think how to prowent that revelfe of foltme wheh, as hames then Hond, they forfaw muth hapen upon Edwari's death. 'Po obtain this ent, no other remedy was judged fuffecient but a change in the focecffon of the crown, and tranfering it int., thcir own familice, by rendering Laly Jane ducen. 'Thole motl exalient ame amiable quatities which had rendece her clesr to all who had the happine to know her, joined to ber near affonty to the king, fubjected ber to become the chef tool of an amhition fonombonf not her own. Upan this very account the was married to lond Guitend Dudky, fourth for of the duke of Northumberland, without difeswans to her the real dugho of the mateh; which was cethatud with great pump in the later end of May, formuch to the kinge"s Satisfation, that he concributed bounteonly to the expence of it from the royal wararome The young kiner EnwadVI. died in Julv following; and our fain felnolar, with infinite reluctance, owerpowered by the folicitations of lier ambitious friends, allowed bofell to let prowdimed queen of Engiand, on the Itrengets of a decal of fetternent extanted from that prine by hor father-inlaw the duke of Noothumberland, which fe: adide the fuccefion of quen Mary, queen Elizabeth, and Mary quecn of $8 .$. t. Her regal pageantry continued but a few day i. Queta Mary's nomubted right prevailed; and the uniortunate Laciy Jane Ciry and her hafband were commited to the fower, and on the 13 th of November arraigned and found ruity of high ticafon. On the sath of Febrway following they were buth beheadeat on Tower-lith. Her magnanimity in this dieadral cataflrophe was athonifning. Im. mediately before her ex:cution, the adcheffed hetfelf to the weeping maltionde with anazing compofure and comencocy: bre acknowledued the juftice of the law, and dided in charity whith that wetchod world which the had fo mach reafon to exceste. Thus did

## G R I [ 147 ] G R I

did the pious Mary begin her reign with the murder of an irnocent young creature of 18; who for fimplicity of manners, purity of heart, and extenfive learning, was hardly ever cqualled in any age or country. But, alas! Jane was an obftinate heretic.-A few days before her execation, Fleckenham, the queen's chaplain, with a pious intention to refcue her poor foul from eternal mifery, paid her frequent vifits in the Tower, and ufed every argument in his power to convert her to the Popifh religion: but he found her fo much his fuperior in argument, that he gave up the conteft ; refigning her body to the block, and her foul to the devil.

Her writings are, 1. Four Latin Epifles; three to Bullenger, and one to her filter lady Carharine. The lafl was written, the night before her execution, in a blank leaf of a Greek Teftament. Printed in a book intitled Epifola Helvetica Reformatoribus, cel ad cos foripta, \&c. Tiguri, 1742, 8vo. 2. Her Conference with Fleckenham. (Ballard). 3. A letter to Dr Harding, her father's chaplain. Printed in the Phenix, vol. ii. p. 28. 4. A Prayer for her own ufe during her confmement. In Fox's acts and monuments. 5. Four Latin verfes; written in prifon with a pin. They are as follows:

> Non aliena putes, hemini qua obtingere poftunt: Sors hodierna mihi, tuuc erit illa tibi. Deo juvan:e, nil nocet livor malus: Et non juvarte, nul juvac labor gravis. Pun tenebras fero turen.
6. Her Speech on the Scaffold. (Ballard). It began thus: "My Lords, and you good Chritian people who come to fee me die; I am under a law, and by that law, as a never-erring judge, I am condemned to die : not for any thing I have offended the queen's majelly; for I will wafh my hands guildcfs thereof, and deliver to my God a foul as pure from fuch trefpafs as innocence from iajultice; but only for that I confented to the thing I was enforced unto, conftraint making the law believe I did that which I never underftood," \&c.-Hollinhthed, Sir Richard Baker, Bale, and Fox, tell us that the wrote feveral other things, but do not mention where they are to be found.

## Grer-IHound. See Gre-Hound.

GRIAS, in botany: A genus of the monogynia order, belonging to the polyandria clafs of plants; and in the natural method ranking with thofe of which the order is doubtful. The corolla is tetrapetalous; the calyx quadrifid; the Atigma feffile and cruciform; the fruit is a plum with an cight-furrowed kernel. There is but one fpecies, the caulifora or anchovypear, a native of Jamaica. The leaves are nearly oval, and about three feet long. It has a llraight ftem, upon the upper part of which come forth the flowers. The fruit is large, and containa a flone with eight furrows. Thefe fruits are eaten by the inhahitants.

GRIBALI)US (Mathew'), a learned civilian of Padua, left Italy in the 1 Gth century, ia order to make a fublic profeflion of the Proteflant religion. After having been for fome time profeffor of the civil law at Tubingen, he was obliged to make his efeape to avoid the pumifhment he would have incurred had he teen conviqed of diffring from Calvin with refpeet to
the doctrinc of the Trinity: but he was feized at Berne, where he would have met with very fevere treatment had he not pretended to renounce his opinions; but as he relapled again, he would certainly have been put to death, had he not died of the plague in $16 \sigma_{+}$. He wrote De metloads ac ratione fudiadi in juri cirifl; and feveral other works which are efleemed.

GRIBNER (Michact Henry), a learned civilizn of Germany, was born at Leipfic in 1682. After wrising fome time in the journal of Leipfic, he was made profeffor of law at Wittemberg: whence he paffed to Drefden, and was at laft recalled to Leiptic to fucceed M. Mencke. He died in 1734 . Defides feveral acsdemical differtations, he wrote, 1. Principia proceffus ju: diciarii; 2. Principia jurifprudentio naturalis, à (mall work much eftecmed; 3. Opufula juris publici et prirati.

GRIEF, or Sobrow. The influence of this palfion on the body is very great. Its effects refemble in feveral inflances thofe of fear, with, however, fome variations, owing perhaps to its being in general of longer duration. Grief diminithes the bodily ftrength in general, and particularly the force of the heart and circulation; as appears by the frequent fighs and deep refpirations which attend it, which feem to be neevefary exertions, in order to promote the paflage of the blood throngh the lungs. It diminifhes perfpiration, obfructs the menttrual difcharge, produces palenefs of the $\ell$ in, and cedematous complaints, and firirhus of the glandular parts. It aggravates the fcurvy, and the malignity of putrid and contagious diftempers, and renders people more apt to receive the infection of them. When it comes on fuddenly, and in a great degrec, it caufes a palpitation of the heart, and renders the pulfe irregular. Blindnefs, gangrene, and fudden death, have followed the excefs of this fenfation. Its effects of changing the coluur of the hair are well known. Opiates, if not given in large dofes, are good cordials in this cafe.

GRIELUM, in botany: A genus of the pentagynia order, belonging to the decandria clafs of plants. The calyx is quinquefid; there are five petals; the filaments peifilling; and there are five mono!permous feed-cafes.

GRIERSON (Conftantia), born of poor parents in the county of Kilkenny in 1 reland, was one of the moft learned women on record, though the died at the age of 27, in 1733 . She was an excellent Greck and Latin fcholar; and undertood hiltory, divinity, philofuphy, and mathematics. She proved her hill in Latin by her dedication of the Dublin edition of Tacitus to lord Carteret, and by that of Terence to his fon; to whom the alfo addreffid a Greek epigram. She wrote many elegant Englihh poems, feverai of which were inferted by Mrs larber amoug her own. When lord Carteret was lord lieutenant of Ircland, he obtained a patent for Mr Grierfon to be the king's printer ; and to reward the uncommon merit of his wife, caufed her life to be included in it.

GRIFFON (Gryphus, 2nvi,), in the natural hiAtory of the ancients, the name of an imaginary bird of prey, of the eagle kind. They reprefented it with four legs, wings, and a beak; the upper part reprefenting an eagle, and the lower a lion: they fuppofed it to watch over gold mines, hidden treafures, \&c.

II Griffor.

## G R I <br> $14^{9}$ <br> G R I

Lintlea, The animal nas confecrated to the fun; and the ancient painters reprefented the chariot of the fon as drawn by griffons. M. Spanheim obferves the fame of
thofe of Jupiter and Nemelis.

The griffon in Scripture is that fpecies of the eagle called in Latin olffraga, the "ofprey;" and ras, of the verb one paras, "to break"

The griff in is frequently feen on ancient medals; and is ftill horne in coat-armour. Guillim blazons it rampant; alieging, that any very fierce animal may Le fo blazoned as well as the lion. Sylvefter, Morgan, and others, ufe the terms fortiont inftead of ranfant.

This is alfo an ornament of arehiecture in conflant afe among the Greeks, and was copied fion them, with the other elegancies of architectural enrichments, by the Komans. See Sprynx.

GRIFLEA, in botany: A genus of the monogynia order, betonging to the octandria clafs of plants; and in the natural method ranking under the 17 th order, Culyounthema. The calyx is quadrifid; and there are four petals, one from each incifure of it. The fila ments are very long, afcending or turning upwards; the capfute is globofe, fuperior, unilocular, and polyfpernous.

GRIMAIDI (Francifo), an eminent painter, generally known hy the appellation of Bologrefa, was born at Bologna in 1606 , where he lecame a difciple of Annibal Caracei, and proved an honour to that illuftrious mafter. From the fchool of Annibal he went to complete his Audies at Rome, and improved himfelf daily, by copying the works of thofe artilts in which he obferved the greateft excellence, until his fuperior talents seeommended him to the favour of fmocent X. who afforded him immediate opportunities of exerting his genius in the gallery of his palace at Monte Cavallo, and alfo in the Vatican. The merit of his performances very foon engaged the attention and applaule of the public, and increafed the number of his admirers and friends; among whom were the prince P'dmphilio, and many of the prineipal nobility of Rome. His reputation reacher cardinal Mazarine at Paris, who fent for him, fettled a large penfion on him, and em. ployed him for three years in embellifhing his palace and the Lourre, by the order of Louis XIII. The troubles of the tate, and the clamours raifed againt the eardinal, whofe party he warmly efpoufed, put him fo much in danger, that his friends advifed him to retire among the Jefuits. He did fo, and was of ufe to them ; for he painted them a decoration for the expofition of the facrament during the lioty days, according to the cuftom of Rome. This piece was mightuly relifh--d at Paris: the king honoured it with two vifits, and commanded him to paint fuch another for his chapel at the I.onve. Grimaldi after that returned to laly; and at his arrival at Rome found his great patron Innosent X. dead: hut his :wo fucceffurs Alexandcr VII. and Clement IX. honoured him equally with their friend $/ \mathrm{hip}$, and found him variety of employment. Grimaldi was amiable in his manners, as well as Akilful in his profeffion: he was generous without profufion, pefpectful to the great without meannefs, and charitable to the poor. The following intance of his bencvolence may ferve to characterife the man. A Sieilian gentleman, who had retired from Meflina with his
daugher during the troubles of that country, was re-
duced to the mifcry of wanting bread. As he lived over-againk him, Grimaldi was loon informed of it; and in the dulk of the evenind, knocking at the Sicilian's dour, without making himble known, tofted in money and retired. The thing happening more than once, raifed the Sicilian's curiofity to know his bencfactor; whofinding him out, by hiding himfelt behind the doar, fell down on his knees to thank the loand that had relieved him. Grimaldi remained confufed, offered him his houfe, and continued his friend till his death. He died of a droply at Rome in 1080 , and left a confiderable fortune anong dix children. The genius of Grimaldi directed him chiefly to landfcape, which he executed molt happily. His colouring is ftrong; his touch light and delicate; his fituations are uncommonty pleafing; and the leating of his trees is ad. mirable. Sometimes, indeed, his colouring appears rather too green: but thofe landfeapes. which he painted in the manner of the Caracci, may ferse as models for all thufe who admire the dyle of that fchool; and he defigned his figures in an elegant talle. The pictures of this mafter are very unfrequent, efpecialiy thofe of his beft time ; and whenter they are to be purchafed, they afford large prices. Of his children above mentioned, the youngett, named Alexander, proved a good painter, in the fame Ityle and tatte with his father, though very far inferior to him: fome of the pictures of Alexander, however, are either artfully, or injudicioully, afcribed to Francifco.

GRIMSBY, a large fea-port town of Lincolnfhire in England, 109 miles from London; and faid to be the fecond, if not the firt, corporation in England. It had anciently three convents and a caltle. It is governed by a mayor, high-tleward, recorder, twelve aldermen, twelve common-council men, two bailifs, two coroners, a town clerk, and three ferjeants at mace. The mayor holds a court here on Tuefday, and the bailiffs on Friday. Here are feveral Atreets of good houfes, and a church that looks like a cathedral. It was a place of great trade before its harbour was choaked up; yet the road before it is a good ftation for Ships that wait for a wind to get out to fea. Its chief trade is in coals and falt brought by the Humber.

GRINDING, or Trituration, the act of ireaking or comminuting a folid body, and reducing it into powder. Sce Pulverisation and Livigation,

The painters colours are grinded on a marble or porplyyry, eitherwith oil or gum-water.

Grinding is alfo ufed for rubbing or wearing off the irregular parts of the furface of a body, and reducing it to the deftined figure, whether that be flat, concave, or the like.

The grindiag and polifhing of glafs is a confiderable art ; for which fee Gliss Grinding. For the grinding of optical glaftes, fee Oprics, the Mechanical Part.

GkINSTED, EAst and West; two towns near Salifury in Wilthire.

Grinsten, Eaf, a town 29 miles from London, feated on a hill, near the borders of Surry, near Athdown foreft. It has a handfome church, which was rebuilt after being burnt down 1883 . On November 12,1785 , the beautiful tower having lately fallen to decay, fell down, and part lighting on the church very confiderably damaged it. An hofpital in the reign of

## G R I［ 149 ］G R I

riilfed king James I．for ${ }^{1}$ r poor people of this town was built and endowed with $33=1$ ．a－gear．It is a bo－ rough by prefeription，governed by a bailifi and his brethren；has fent burgcffes to parliament ever fince the firft of Edward II．who are elected by about 35 burgage holders；had a charter for a monthly market from Henry VII．and is generally the place for the aflizes．The returning office；here is the bailiff，who is chofen by a jury of burgazchoders．Its market is on Thurfday，and its fairs，which are well frequented，are July 13 and December 11 ；which lafl is a great one for Welih runts，that are brought up bere hy the Kentifh and Suffex farmers and for fats hogs and o． ther cattle．

Gxinsted，Wef，in Suffex，a town above 10 miles to the fouth－wefl of Eall．Grinfted．

GRIPES，in medicine，a fort of cholic or painful diforder of the lower belly，occafioned by fome flarp pungent matters vellitating the parts，or by wind pent op in the intellines．See Indx fubjoined to Medt－ cief．

GRIPSWAID，a frong and confiderable town of Pomerania in Germany ；formenly imperial，but now Subject to the Swedes，with a good harbour and uni－ verlity．E．Long．13．53．N．Lat．54． 12.

GRISGRIS，a fupcrlition greally in vogue among the negroes in the interior parts of Afica．The grif－ gris，according to Le Maire，are certain Arabic cha－ raters mixed with magical figures drawn by the Ma－ rabuts or priefts upon paper．Labat affirms，that they are nothing elfe than feraps of the alcoran in Ara－ bie；but this is denied by Barbot，who brought over one of thefe grifgit to Europe，and Thowed it to a number of perfons deeply killed in oriental learning． None of thefe could find the leaft trace of any charac－ ter they underflood．Yet，after all，this might be owing to the badnefs of the hand writing；and the words are probably of the Mandingo language，though the characters are an attempt to imitate the A rabic． The pooreft negro never goes to war without his grif－ gris，as a charm agaialt wounds；and if it proves in－ effectual，the prieft transfers the blame on the immo－ rality of his conduft．Thefe priefts invent grifgris a－ gainit all kinds of dangers，and in farour of all defires and appetites：by virtue of which the poffeffors may obtain or avoid whatever they like or diflike．They defend them from florms，enemies，difeafes，pains，and misfortunes；and preferve health，long life，wealth， bonour，and merit，according to the Marabuts．No clergy in the world are more honoured and revered by the people than thefe impoftors are by the negroes； nor are any people in the world more impoverifhed by their priefts than thefe negroes are，a grifgris being frcquently fold at three flaves and foar or five oxen． The grifgris intended for the head is made in the form of a crofs，reaching from the forehead to the neek behind，and from ear to ear；nor are the arms and thoulders neglected．Sometimes they are plan：－ ed in their bonnets in the form of horns；at other times，they are made like ferpents，lizards，or fome other animals，cut out of a kind of pafteboard，\＆e． There are not wanting Europeans，and otherwife in－ telligent feamen and merchante，who are in fome degree infeted with this weaknefs of the country，and believe that the negro foreerers have an actual communication
with the devil，and that they are filled with the ma－ lignant influence of that evil fpirit，when they fee them didort their fcatures and mufcles，make horris grimaces，and at laft imitate all the appearance of cpi－ leptics．

GRISONS，a people fituated among the Alps，and allies of the Swifs．I lucir country is bounded on the north by the countics of Surgans and Bludenz，the canton of Glaris，and the prineipality of Lichtentem： on the fouth by the canton＇s Italian bailiwics，the county of Chavenne，and the Valtcline；on the eat by the territories of Venice and Milan；and on the well by fome of the Italian bailiwics，and the canton of Uri．It is divided into three leagnes，riz．the Grifon or grey league，the kague of the bonfe of Gad，and thit of the ten jurijazaions ；which unite and form one republic．The two firlt lie towards the fonth，and the thind towards the noth．The length of the whole is above 70 miles，and the breadth about 60 ．The inhaoi－ tants are fail to have lad the name of Grifons from the grey coats they wore in former times．This country， lying among the Alps，is very mountainous；but the mountains yield good patture for cattle，theep，and goats，with fome rye and barley：in the valleys there is plenty of grain，palfe，fruits，and wine．This coun－ try alfo abounds with hoys and wild fowl ；but there is a fearcity of finh and falt，and their horfes are mottly purchafed of foreigners．The principal rivers are the Rhine，the Inn，and the Adda．Here are alfo feveral lakes，mold of which lie on the tops of the hills．The language of the Grifons is either a corrupt Italian or the German．Each of the leagues is fubdivided into feveral leffer communities，which are fo many demo－ cracies；every male above 16 having a fhare in the go－ vernment of the community，and a vote in the election of magitrates．Deputies from the feveral commun：－ ties conflitute the general diet of the Grifon leagues， which mects annually，and alternately at the capital of each league；but they can conclude nothing without the confent of their contituents．This country was anciently a part of Rhetia．After the extinction of the Roman empire in the welt，it was fome tine fub－ jert to its own dukes，or thofe of Swabia．＇Then the bifhop of Coire，and other petty princes，depeudent on the emperors of Germany，became mafters of great part of it：at laft，by the extinction of lome，pli－ chafe，voluntary grants，and force，it got rid of all its lords，and ereEted it felf into three dittinct republics， each of which，as we obferved already，is fildividu＇ into a certain number of communities，which are a fert of republics，exercifing every branch of fovereignty， except that of making peace or war，fending cmbaffits， concluding alliances，and enacting laws relating to the whole country，which belong to the provincial dicts of the feveral leagues．The commenities may be compa－ red to the cities of Holland，and the diets of the feve． ral leagues to the prowincial tates．The particular diets－ are compofed of a deputy fron each community；and both in them and the communities every thing is deter－ mined by a majority of votes．In the communities， every male above to has a rote．Befites the annua？ provincial diets for chooding the chiefs and other offi－ ecrs，and deliberating on the afficirs of the refpective leagues，there are general diets for what concerns all the thrce leagues or whole body．In both thefe，the
reprefntatives can do nothing of themfelves, but are tied down to the inllustions of their principals Thare is a general foal for all the three learues; and each particular kague has a feparate fial Belides the Hated times of meeting, extraordinary dicts ale fometimes fummoned, when either the dometic affairs of the thate or any fereign minither require it. In the general diets, the Grey League has 28 votes; that of the Houfe of God, 23 ; and that of the Ten Jurifdictions, 15. Thefe leagues, at different times, have entered into dofe alliances with the neighouring cantoms and their affociates. The builiwies belonging in common to the three leagues are thofe of the Valteline, Chieas.ne, Bormio, Mesenfeld, Malans, and Jennins; the officers of which are nominated fucceffereiy by the feverai commonitics cerry two years. The yearly revenue ariting to the Grifons from their bailiwics is laid to amome to abent 1350 florins. The public revenues altogether are but fmall, thouch there are many private perfons in the country that are rich. However, in cafe of any extraordinary emergency, they tdx themfelves in proportion to the necelfity of the forvice and the people's abilities. They have no regular troops, but a well-difciplined militia; and upon occalion, it is faid, can bring a body of 30,000 lighting men into the field: but their chief lecurity arifes from the narrow paffes and ligh mountains by which they are furrounded.

Of the jurifprudance, religion, \&c. of the Grifons, the following account is given by Mr Coxe in his travels in Sxitzerland. Throughout the three leagues the Roman law prevails, modified by the mumicipal culoms. The courts of jattice in each community are compofed of the chief magifirate, who pretides, and a cutain number of jurgmen, chofen by the peopls: they have no regular filaries, but receive for their attendance a Imall fum, ariting in fome communities from the expences of the procefs, which are defrayed by the criminals; in others from a thare of the fines. They ening the power of pardoning or diminithing the penalty, and of receiving a compolition in muney. This mode of proceeding fuppofes what is as alfurd in theory as is is concrary to experience, that jndes will incline to mercy when it is their intewat to conviet; or will impantally infict punifment, even When inguriuns to their nan private adwantasc.- The prifuncrs are cxamined in priatate; frequentiy tontured for the purpofe of furcing contimen, whon the judges cither divide the fines, or remit the panallment for a compofition. In Come difticts a criminal trial is a kind of feltival to the judges, for whom a good repalt is provided at the expence of the prifoner if convicted; and thus the following alluion, in Garth's Difpenfary, applied with more wit than truch to our courts of juftice, is literally fulfilled:-

- And writches hang, that jurymen may dine

Capital punifhments, however, are extremely rare; a civeruntance arifing not from a want of feverity in the penal ftatutes, or from a propeofity to mercy in the judges: but becaufe the latter draw more indantages from timing than executivg an offender. In a word, to ufe the expreflion of Burvet, which is as true at prefent as it was in his time, "Many erinces go unpunined, if the perfons who commit them have either great credit or much moncy." It is romarkable, that
torture is more frequenty applied, and for fmalier delinquencics, in thefe independent republica, than in the

Grifore
fubject provinces. The indition of it depends eatirely upon the abitrary will of the jutges; a majority of whom may order it for an offence which is hut crpital, nor even puaimble by corporat penatios. Thus it is not uncommon, in thofe commanities where fines are divided amoner the judges, to torture women of lovie conduct, for the papofe of compcling them to confels with whom they have been comnected; for as fuch offences are punithible by lives, the more perfons are convitited, he larger flare of money is diatributed among the judges for the trouble of their, attendance. Len in the diltriets where the fines are paid to the community, torture is orten no lefs wantonly inficted, becaule, when the prifoner is not found guity, the expences of the proeffs fall upon the public, and the judges receive little emolument. Even in the civil comits molt caufes are deciued by bribing the judges; and appeads in thoie communities, wherein they are admitect, fearcely ferve any other cnd than to endarge the folure of corroption: Coire, and a few other phees, are excepted from this general reflection.
The religion of the Grifons is divided into catholic and reformed. The doctrines of the reformation were mit preached about the year 1524 , and received at Fhath a fmall village in the Teu Jurifaditions upon the contines of Sargans; from thence they were extended to Mayenfeld and Malantz, and foon afterwards through the whole valley of Pretigau. The new opinions fpread with fuch celerity, that before the end of the 16 th century they were embraced by the whole league of the Ten Jurifdictions (excepting part of the community of Alsenew), the greatell part of the Houfe of God, and a few communities in the Grey Lcague. The difference of religion nearly excited a civil war between the two fects, as well at the firlt introduction of the retormation as at the beginning of the troubles in the Valctine. In the lazer intance, the two parties rofe in atms; but the Catholics being overpowered by* the Irotellants, matters were amicably adjuled. Since that period all religious concerns have been regulated with perfect cordiality. According to the general confent of the three leagues, cach community being abfulute within its linte terriony, has the power of appointing its own paticular worthip, and the intabitants are free to follow cither the Catholic or Reformed pufation. In the adnanilation of civil affais religiun has no imerference: the deputies of the genetal dit may be mentors of cither commanion, as chofen by the communitics which thay reprefont. By this moderate and tolerating pinciple, all religious dif. fealions have been fuppreffed as much as pofitble; and the mot perfect amity fubtith how weon the two ferts.

In fpiritual concerns, the Cathories for the mont part are under the jurifdiction of the bilhop of Coire. For the affairs of the Reformed churchos, each league is divided into a cortzin number of dilhicts, the miniders whereof aflemble twice enety year: thefe affenthics are called collogniz. Each colloquium"las its prefident, and each league a fuperintendint catled a dechn. The fupreme authority in: firitual concerns is wefled in the fynot, which is compofed of the three deans, and the clergy of cach hague; the Grood aftembles every year alsenately in cach of the thice leagucs. Candidates

## G R O

for holy orders ase examined before the fynod. The neceflary qualifications for admithon into the chirech ought to be the knowledge of Hebrew, Greck, and Latin: but this rale is not Arictly adhered to; nany being ordained withon: the Iratt acquan? nace with cither of thofe han wages. Fonnerly 1 atin was foldy uled, as wedl in the debates of the fynonl as for the purpofe of examining the candidates; but at prefent that iongue grows more and more ino difufe, and German is employed in its flead.

The number of reformed parifhes in the whole three leagues amounts to 135 , in the following proportion: -In the Giey League 1 $^{\circ}$, in that of God's Honfe 53, and in the League of TenJurifdictions 36. The minillers of thete churches enjoy but very fmall falaris. The richell benefices do mot perhays yield more than I. 20, or at moll L. 25 fer annum, and the poorett fornctimes fearedy L. 6. This fanty income is attended with many inconvenierces. It obliges the elergy who have farihes to follow fome branch of tralfic, to the neglect of thetir eccleliallical Iludies, and to the degradation of the profeffonal character. Annther inconvenience is fuperaded to the narrownefs of their income. In mont communities the minitena, though confirmat by the fyod, are clofen be the people of the parim. and are folels dependent on their bounty. Fur thefe reafons, the candidates for ho: orders are gencral?y extremely ignoran. Ihley can not fupport that expence which is requifite to purfue their fudies: they are not animased with the expec tation of a decent comperence; and, from the dependent mode of their clection, are not encouraged to deferve their promotion by a contittent dignity os cha. racter.

GRIST, in comotry affairs, denotes corn gronnd. or ready for grinding.

GRIT (argilaceons), agenns of argillacens earths. Its texture is more or lefs porous, equable, and rengh to the touch. It does not give tine with test, nor effervefce with aciés. When fiest broken and bicathed upon, it exhales an earthy fruell. N1 Kirwan men. tions two kinds: one from Hollingenn near l': xeter, of a yeliowih or whtith grey, and about the fercilic gravity of 2283 . Another, from Kneaerly in Staffordflire, is of the fpecific gravity of 2565 : and to unfufible as to be ufed for nire lones. According to Fabroni the grit-lione is of greater or leis hardnefs, moflly of a grey, and fometimes cif a yellowith colour, compofed of a iticeous and micaccous fand, but rarely of a fparry kind; with greater or fmaller particles clofely compacted by an argillaceous cement. It gives fome Sparks with lteel, is indiffoluble for the moll part in acids, and vitritiable in a ftrong fire. It is uled for milltones and whetfones; and fometimes for filter. ing fenes and for luaiding.

GROA'I', an Englih money of account, equal to four pence. Other nations, as the Duteh, Polanders, Saxons, Bohemans. Frencli, \&ic. have likewife their groats, groots, gruches. gros, \&ec. In the Saxen times, no filver coin bigger than a penny was fruck in England, nor after the conquet, !ill Edward IIl. whe, about the year 1351, coined grofles. i. e. groars, or great pieces, which went for 4 d. a-piece: and io the matter flood till the reign of Henry VIII. who, in $155^{4}$, firft colned fillings.
$15 \mathrm{I}] \quad \mathrm{G} \quad \mathrm{R} \quad \mathrm{O}$
Groats, in country affairs, oats after the hul's are olf. rrercat oat-meal.

GROCERS, anciently were fuch perfons as enfroned all meetrandize that was vendible; but now they are inentporated, and matre bie if the compares of he city of London, which inato in sutar, freign Sruita, fpices. Eve.

GROENLAND, or Spitzerfgev. SecGrfenLañ.
(;ROGRAM, a kind of fuff mace of filk and molair.

GROIA, the part of the belly next the thigh.In the Philofophical Tranfacions we have an aceonnt of a remarkatle cafe, where a pey of wood was extracted from the groin of a young woman of 21 , after it had remained it years in the domath and intellimes, having been accidentally fwallowed when the was about five years of agre. Vrile Vol. 1.XV1I. p. 459 .

Grons, among builders, is the angular curve made by the interfection of two femi-cylinders or arches; and is either regular os irregular. - A reatar groin is when the interfecting arclees, whethor femicircular or femieliptical, are of the fame diameters and heights. An irregular groin is where one of the arches is femicircular and the other femieliptical.

GRUNIWEI.I, in botany. Sce ImthosperMUM.

GRONINGEN. the mot northerly of the Seven l'nited Provinces, is bounded on the north by the German ocean: on the fouth, by the county of Drenthe; on the ank, by the bimopric of DInder, and the prin. cipality of batt-Friefland; and on the well by the pruvince of Friefeland, from whet. : is parted by the river Lawers. Its greatell length from foutheralt to noth-weit is about +7 miles: but its breadth is wery ancepual, the greate being about 33 miles. Here are i:ch pa turs, lurge herds of great and fmall cattle, plenty of lea and river tifh, and of turf, with frome forells and combland. There are leveral rivers in the provine, of which the principal is ine Hunfe; and a great number of canals and dykes. 'lhe dates contit of the cispletics of the town of Croniagen, and the Ommeland, or circurgacent counery; and hold their athemblies ahways in the town of Groningen. The province had ancienly governors, under the tizle of 1 heremess: hut their power briar linited, the penpicenjoyd great privileces. Afterwarss it became fubject to the batnop of Utrecht: bus thook ofl his yoke at laft, and recowered its liberty. In 1,36 it fubonitied to Charles V. and in $15: 9$ aceeded to the union of [trecht. The colleges are much the fame hereas in the other provinces, siz. the proviticial thates, conncil of flate, provincial trib,nal, and chamber of accounts. Six deputies are fent from hence to the Hates-gencral. Of the eftablifed clergy there are 100 minikers, which form feren claftes, whofe anmal Cynd is held, by turns, at Groningen and Appingedan.

Growngev, the capital of the province of that name, is lituaied about 12 miles from the neared fhore of the German ocean, at the conflux of feveral rivulets, which form the Hunfe and Fivel. Ships of confiderable busden can come up to the city, in conlequence of which it enjoys a pretty good trade. It was formerly very ftrong, but its fortilications ate now muct, neglested.

Gronovia The univerfity here was founded in 1615 , and is well endowed out of the revenues of the ancient monattenies. The tomn, which was formerly one of the Hanfe, and has fill great privileges, is large and populons, being the feat of the laigh colleges, and containing three $\mathrm{f}_{\text {pacious maket-places, and } 27 \text { Areets, }}$ in which are many line houfes, belides churches and other public ftructures. By the river Fivel and the Eenns, it has a communication with Wetlphalia. In $16_{72}$ it made fuch a gallant refiftance againg the biflop of Munter, that he is faid to have lolt 10,000 mea before it. Rodolphus Agricola and Vefelius, two of the moft learned men of the age in which they lived, were born here. Under the jurifdiction of this city is a confiderable diftrict, called the Gorecht. E. Long. 6.25.N. Lat. 53.10.

GRONOVIA, in botany: A genus of the monogymia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the $3+h_{1}$ order, Cucurbitacea. There are five petals and ftamina inferted into a campanulated calyx ; the berry is dry, monofpermous, and inferior.

GRONOVIUS (John Frederic), a very learned critic, was born at Hamburgh in 1613; and having travelled through Germany, Italy, and France, was made profefor of polite learning at Deventer, and afteruards at Leyden, where he died in 167 I . He publifhed, 1. Diatribe in Statii, \&c. 2. De fefertiis. 3. Correct editions of Seneca, Statius, 'T. Livy, Pliny's Natural Hiftory, Tacitus, Aulus Gellius, Phædrus's Fables, \&c. with notes; and other works.

Gronovius (James), fon of the preceding, and a very learned man, was educated firft at Leyden, then went over to Eugland, where he vifited the univerfities, confulted the curious MSS. and formed an acquaintance with feveral learned men. He was chofen by the grand duke to be profeffor at Pifa, with a confiderable flipend. He returned into Holland, after he had refided two years in Tufcany, and confulted the MSS. in the Medicean library. In 5679 , he was inwited by the curators of the univerfity to a profeflorthip; and his inaugural difertation was fo highly approved of, that the curators added 400 florins to his Ripencel, and this augmentation continued to his death in 1716. He refufed feveral honourable and advantagcous offers. His principal works are, The treafure of Gretk antiquities, in 13 vols. folio ; and a great uumber of differtations, and editions of ancient authors. He was compared to Schioppus for the virulence of his fyle; and the feverity with which he treated other great men who differed from him, expafed him to jutt cenfure.

GROOM, a name particularly applied to feveral fuperiar officers belonging to the king's houlchold, as groom of the chamber, gruom of the itole. See Stole, and Wardrobe.

Groon is more particularly ufed for a fervant appointed to attend on horfes in the fable.-The word is formed from the Flenifh grom, "a boy."

GROOVE, among miners, is the fhaft or pit funk into the earth, fometimes in the vein, and fometimes nut.

Groove, among joiners, the channel made by their plough in the edge of a moulding, fyle, or rail, to put their pannels in, in wainfcotting.
$\mathrm{N}^{2}{ }^{144}$.

GROSS, a foreign money, in divers countries, anfwering to our groat.

Gross is ufed among us for the quantity of twelve dozen.
Gross zeeight, is the weight of merchandizes and goods, with their dutt and drofs, as alfo of the bag, cafk, cheft, \&c. wherein they are contained; out of which grofs weight, allowance is to be made of tare and tret.

GROSS, or Grossus, in our ancient law writers. denote a thing abfolute, and not depending on another. Thus, villain in grofs, villanus in grofo, was a fervant, who did not belong to the land, but immediately to the perfon of the lord; or a fervile perfon not appendant or annexed to the land or manor, and to go along with the tenures as apputtenant to it ; but like other perfonal goods and chattels of his lord, at his lord's pleafure and difpofal.
Gross, advoufon in. See Adrowson.
Gross-bean, in zoology, a name by which we

## G R O

den in a mountain or rock. The word is Italian, grotha, formed, according to Menage, zec. from the Latin crypta. Du Cange ohferves, that groifa was ufed in the fame fenfe in the corrupt Latin.

The ancient anchorites retired into dens and grottos, to apply themfelves the more attentively to medi. tation.

Okey-hole, Elden-hole, Peake's hole, and Pool's hole, are famous among the natural caverns ur grottos of our country.

The entrance to Okey-hole, on the fonth fide of Mendip-hills, is in the fall of thofe lills, which is befet all about with rocks, and has nee: it a precipitate defcent of near twelve fathoms decp, at the hottom of which there continually iffucs from the rocks a conliderable current of water. The naked rocks above the entrance frow themfelves about 30 fathoms high, and the whole afcent of the hill above is about a mile, and is very fteep. As you pafs into this vault, you go at firll mpon a level, but advaning farther. the way is found to be rocky and uneven, fometimes afcending, ars 4 fometimes defcending. The 10 of of this cavera, iathe lighelt part, is about eight fathoms from the ground, but in many particular places it is fo low, that a ma: nult foop to get along. The breadth is not lefs various than the height, for in fonne places it is fave or fix fathoms wide, and in others not more than one or two. It extends itfelf in length about two hundred yards. leople talk much of certain flones in it, refembling men and women, and other things; but there is little matter of curiofity in thefe, being only flapeiefs lumps of a common fpar. Al the farthelt part of the cavern there is a good Atream of water, large enough to dri:s a mill, which pafies all along one fide of the caven, and at length fides down about fix or eight fathom; among the rocks, and then prefling through the elefts of them, difcharges iffelf into the valley. The river within the cavern is well fored with ecls, and has fome tronts in ic; and thele cannot have come from with. out, there being fo great a fall near the ertrance. In diy fummers, a great number of frogs are feen all atong this cavern, cyen to the fatthelt part of it; and on the roofof it, at certain places, hang val numbers of hats, as they do in almot all caveras, the enirance of which is either level, or but fighty afcending or defeending; and ceen in the more perpendic lar ones they are fometimes found, provided they are not ton marrow, an a are fufficiently high. The catile that feed in the paneme; through which this river runs, have lecen known to die fuddenly fometimes after a flood; this is probally owing to the waters having been inpregna:ed, eiber naturally or accidentally, with 1 :ad ore.

Ehen-lone is a luge profound perpendicular chafm, three miles from Buxton, ranked amons ilse nathal wonders of the Pak. Ita depih is unkrown, and is pretended to be unfathomable. Cuiton tu!ls wa lee fonnded 88+yards; yet the phomemt thll drew. But he might eatily be deccived, undefs his plummet was very heavy; the weight of a rope of that Ingeth miglst well make the landing of the plummst fiarce perceivable.

Pealis-hole, and Pool's hoie, calied alfo the Dea','s $A-f e$, are two remarkabie borizonta! Springz under mountains; the one near Caflicton, the other juat by Baxton. They feem to have owed their origin to the $\mathrm{T} \quad \mathrm{f}_{\mathrm{g}}$ ings

Gro:to. fprings which have their current through them; when the water houl forced its way throush the horizontal Foffures of the $\mathfrak{A}$ rata, and had carried the loofe earth away with it, the loofe ftones muft fall down of courfe: and where the frata had few or no fiffures, they remained entire ; and fo formed thefe very irrcgular arches, which are now fo much wondered at. The water which paffes through Pool's hole is impregnated with particles of lime-ftone, and has incrufted the whole cavern in fuch a manner that it appears as one folid rock.

In grottos are frequently found cryftals of the rock, falactites, and other natural conglaciations, and thofe often of an amazing beauty. M. Homberg conjec1 ures, from feveral circumitances, that the marble pillars in the grotto of Antiparo vegetate or grow. That anthor looks on this grotto as a garden, whereof the pieces of marble are the plants; and endeavours to fhow, that they conld only be produced by fome ve. getative principle. See Antiparos.
At Foligno in Italy is another grotio, confifting of pillars and orders of architecture of marble, with their ornaments, \&c. fcarcely inferior to thofe of art; bat they all grow downwards : fo that if this too be a garden, the plants are turned upfide down.

Grotro del Cani, a little cavern near Pozzuoli, four leagues from Naples, the fteams whereof are of a mephitical or noxious quality ; whence alfo it is called bocia venenofa, the poifonous mouth. See Mephitis.
"Two miles from Naples (fays Dr Mead), juft by the Lagode Agnano, isa celebrated mofeta, commonly called ha Grotta del Cani, and equally deftructive to all within the reach of its vapours. It is a fmall grotto about eight feet high, twelve long, and fix broad; from the ground arifes a thin, fubtile, warm fume, vifible enough to a difcerning eye, which does not fpring up in little parcels here and there, but in one continued flream, covering the whole furface of the bottom of the cave: having this remarkable difference from common vapours, that it does not like fmoke difperfe itfelf into the air, but quickly after its rife falls back again, and returns to the earth; the colour of the fides of the yrotio being the mcafure of its afcent : for fo far it is of a darkifh-green, but higher only common eath. Iud as I myfelf found no inconveniency by flanding in it. fo no animal, if its head be above this mark, is the lealt injured. But when, as the manner is, a dog, or any other creature, is forcibly kept below it ; or, by reafon of its fmallnefs, cannot hold its head above it, it prefently lofes all motion, falls down as dead, or in a tivoon; the limbs convulfed and trembling, till at laft no more figns of life appear than a very weak and almoft infentible beating of the heart and arteries; which, if the animal be left a little longer, quickly ceafes too, and then the cafe is irrccoverable; but if it be fnatched ont, and laid in the open air, it foon comes to life again, and fooner if thrown into the adjacent lake." The funcs of the grotto, the fame author argues, are no real poifon, but act chiefly by their gravity; elfe the creatures could not recover fo foon, or if they did, fome fymptums, as faintnefs, \&c. would be the confequence of it. He adds, "that in creatures killed therewith, when diffected, no marks of infection appear; and that the attack proceeds from a want of air, by
which the circulation tends to an entire floppage ; and this fo much the more, as the animal infpites a fluid of a quite difierent nature from the air, and fo in no refpect fit to fupply its place. Taking the animal out, while yet alive, and dirowing it into the neighbouring lake, it recovers: this is owing to the coldnefs of the water, which promotes the contraction of the fibres, and fo affifts the retarded circulation ; the fmall portion of air which remains in the veficule, after every expiration, may be fufficient to drive out the noxious fluid. After the fame manner, cold water acts in a delizuium animi : the lake of Agnano has no greater virtue in it than others."
The tteam arifing in this grotto was for a long time reckoned to be of a poifonous nature, and thought to fuffocate the animals which breathed it. Dr Hales imagined that it deftroyed the elafticity of the air, caufed the veficles of the lungs to collapfe, and thus occafioned fudden death.-It is now, however, found that this fleam is nothing elfe than fixed air, which from time immemorial hath iffued out of the earth in that place in very great quantity, the caufes of which cannot yet be inveltigated from any of the modern difcoveries concerning that fpecies of air. It proves pernicious when breathed in too great quantity, by rarefying the blood too much; and hence the beft method of recovering perfons apparently killed by fixed air, is to apply a great degree of cold all over their bodies, in order to condenfe the blood as much as poffible. This is the reafon why the dogs recover when thrown into the lake Agnano, as above mentioned. See the articles Bloon and Damps.

Grotta del Serpi, is a fubterraneous cavern near the village of Saffa, eight miles from the city of Braccano in Italy, defcribed by Kircher thus: "The grotta del firpi is big enough to hold two perfons. It is perforated with feveral fittular apertures, fomewhat in manner of a fieve; out of which, at the beginaing of the fpring feafon, iflues a numerous brood of young fnakes of divers colours, but all free from any particular poifonous quality. In this cave they expofe their lepers, paralytics, arthritics, and elephantiac patients, quite naked; where, the warmth of the fubterraneous feams refolving them into a fweat, and the ferpents clinging varioufly all around, lisking and fucking them, they become fo thoroughly freed of ail their vitious humours, that, upon repeating the operation for fome time, they become perfectly reftored."

This cave Kircher vifited himfelf; and found it warm, and every way agreeable to the defcription given of it. He faw the holes, and heard a murmuring hiffing noife in them. Though he miffed feeing the ferpents, it not being the feafon of their creeping out; yet be faw a great number of their exuvise, or floughs, and an elm growing hard by laden with them.
The difcovery of this cave was by the cure of a Mufrem leper going from Rome to fome baths near this place. Wormo Lofing his way, and being benighted, he happened upon this cave. Finding it very warm, he pulled of his clothes; and being weary and fleepy, had the good fortune not to feel the ferpents about him till they had wrought his cure.

Mifily Grotto, Crypta Latlea, a mile diftant from
rotto, the ancient village of Bethlehem, is faid to have been rove. thus denominated on occafion of the bleffed Virgin,
who let fall fome drope of milk in giving fuck to Jefus in this grotto. And hence it has been commonly fuppofed, that the earth of this cavern has the virtue of refloring milk to women that are grown dry, and even of curing fevers. Accordingly, they are always digging in it, and the earth is fold at a good rate to fuch as have faith enough to give credit to the fable. An altar has been built on the place, and a church juft by it.

Grotro is alfo ufed for a little artificial edifice made in a garden, in imitation of a natural grotto. The outfides of thefe grottos are ufually adorned with ruftic architecture, and their infide with thell-work, fomls, \&c. finifhed likewife with jets d'eaus or fountains, \&c.

A cement for artificial grottos may be made thus : Take two parts of white refin, melt it clear, and add to it four parts of bees wax; when melted together, add two or three parts of the powder of the tone you defign to cement, or fo much as will give the cement the colour of the ftonc; to this add one part of fower of fulphur: incorporate all together over a gentle fire, and afterwards knead them with your hands in warm water. With this cement the fones, Thells, \&c. after being well dried before the fire, may be cemented.

Artificial red coral branches, for the embellifhment of grottos, may be made in the following manner: Take clear rofin, diffolve it in a brafs-pan; to every ounce of which add two drams of the fineft vermilion: when you have llirred them well together, and have chofen your twigs and branches, peelcd and dried, take a pencil and paint the branches all over whillt the compolition is warm; afterwards fhape them in imitation of natural coral. This done, hold the branches over a gentle coal fire, till all is fmooth and even as if polifhed. In the fame manner white coral may be prepared with white lead, and black coral with lampblack.

A grotto may be built with little expence, of glafs, cinders, pebbles, pieces of large flint, fhells, mofs, ftones, counterfeit coral, pieces of chalk, \&c. all bound or cemented together with the above defcribed cement.

GROVE, in gardening, a fmall wood impervious to the rays of the fun.

Groves have been in all ages held in great veneration. The profeucha, and high-places of the Jews, whither they reforted for the purpofes of devotion, were probably fituated in groves: See Johuah xxiv. 26. The profeuchre in Alexandria, mentioned by Philo, had groves about them, hecaufe he complains that the Alexandrians, in a tumult againit the Jews, cut down the trees of their profeuche.

The ancient Romans had a fort of groves near feveral of their temples, which were confecrated to fome god, and called luci, by Antiphrafis, a non lucculd, as. being thady and dark. The veneration which the ancient druids had for groves is well known.

Modern gioves are not only grtat ornaments to gardens; but are alfo the greateli relief againft the violent heats of the fun, affording fhade to walk under in the hotteft parts of the day, when the other parts
of the garden are ufclefs; fo that every garden is defective which bas not made.
Groves are of two forts, viz. either open or clofe. Open groves are fuch as have large thady trees, which ftand at fuch diftances, as that their branches approach fo near to each other as to prevent the rays of the fun from penetrating through them.

Clofe groves have frequently large trees ftanding in them; but the ground under thefe are filled with fhrubs or underwood: fo that the walks which are in them are private, and fcreened from wrinds; by which means they are rendered agreeable for walking, at thofe times when the air is either too hot or too cold in the more expofed parts of the garden. Thefe are often contrived fo as to bound the open groves, and frequently to hide the walls or other inclofures of the garden: and when they are properly laid out, with dry walks winding through them, and on the fides of thefe fweet-fmelling thrubs and flowers irregularly planted, they have a charming effect.

Grove (Henry), a learned and ingenious Prefoyterian divine, was born at Taunton in Somerfethire, in 1683. Having obtained a fufficient ftock of elaffical literature, he went through a courfe of academical learning, under the reverend Mr Warren of Taunton, who had a flouriihing academy. He then removed to London, and ftudied fome time under the reverend Mr Rowe, to whom he was nearly related. Here he contracted a friendhip with feveral perfons of merit, and particularly with Dr Watts, which continued till his death, though they were of different opinions in feveral points warmly controverted among divines. After two years fpent under Mr Rowe, he returned into the country, and began to preach with great reputation; when an exact judgment, a lively imagination, and a rational and amiable reprefentation of Chritianity, delivered in a fweet and well governed voice, rendered him generally admired; and the fpirit of devotion which prevailed in his fermons procured him the efteem and friendhip of Mrs Singer, afterwards Mrs Row, which fhe exprefled in a fine ode on death, addreffed to Mr Grove. Soon after his beginuing to preach, he married; and on the death of Mr Warren, was chofen to fucceed him in the academy at Taunton. This obliging him to refide thare, he preached for 18 years to two fmall congregations in the neigh. bourhood; and though his falary from both was lef; than twenty pounds a-gear, and le had a growing, family, he went through it cheerfully. In 1708, he publithed a piece, intitled, The Reysalution of Diverfions, drawn up for the ufe of his pupils. About the fame time, he entered into a private dififute by letter with Dr Samuel Clarke: but they not being able to convince each other, the debatc was dropped with expreffions of great mutual efteem. He nest whote feveral papers prinied in the Spectator, viz. Numbers 588. 651.626.635. The latt was republified, by the direcion of Dr Gibfon bifhop of London, in the Evidences of the Chritian Religion, by Jofeph Addifon, Efq. In ${ }^{1725}$, Mr James, his partner in the academy, dying, he fucceeded himin his pattnral charge at Fulwood, near Taunten, and engaged his nephew to undertake the other parts of Mr James's work as tutor; and in this fituation Mr Grove continued till his death, which happened in 1738 . His great con-
cern with his pupils, was to infpire and cherifh in them a presiling love of trath, virtue, liberty, and genuine religion, without violent at:achments or piejurticts in favour of any party of Chriltians. He reprocencel tmith and wirtac in a moft engaging light; and thongt his income, both as a tutor and a miniller, was indifacent to fupport his family, winout breaking in:o his fatemal elate, he knew not how to refufe the cal of darity. befides the above pieces, he wrote, 1. An lifay towarils a bemonatration of the Soul's Immortality. 2. An lillay on the terme of Chrillian Commanion. 2. The Evilunce of our Saviour's Refurrection confidered. 4. Sume Thoughto concerning the Proof of a luture State fom Reafon. 5 A Dif. confe conceminut the Nature and Dedign of the Lord's supper. 6. Withom the tirl fpring of Action in the Deity. 7. A Ibifenufe on Saving Faith. 8. Mifetlanis in profe and verfe. o. Many Sermons, \&c. After his heceafe, his pothumous works were publifhed by fubfription, in four volumes octavo, with the nanes of near 700 fubferibers, among whom were fome of the bett judges of merit in the eftablifhed church.

GROUND, in painting, the furface upon which the figures and other objects are reprefented.

The ground is properly undertood of fuch parts of the piece, as lave nothing painted on them, but retain the original colvor upon which the other colours are applied to make the reprefentations.

A building is faid to furve as a ground to a figure when the figure is painted on the building.

The ground beliond a pieture in miniature, is commonly blue or crimfon, imitating a curtain of fattin or velvet.

Ground, in etehing, denotes a gummous compofition fimeared over the furface of the metal to be etched, io prevent the aquafortis from eating, except in fuch places where this ground is cut through with the point of a meedle. Ste the article Etching.
G.owno-fughers, lithing under water without a float, coly with a plumb of lead, or a bullet, placed about rine inclies from the hook; which is better, becaule it will roll on the ground. This method of filhing is mut proper ial cold weather, when the fin fwim vay law.

The morning and evening are the chisf feafons for the ground line in hibing for trout; but if the day prowe chon's, or the water muldy, you may fith at gromad ail day.

Grecon-Takte, a mip's anchors, cables, \&e. and in general whatever is necefary to make her ride fafe at anchor.
Ground-Fy, in botany. See Glechoma.
Ground-Pime, in botany. Sue Teuckium.
GROUNDSEL. See Spretio.
GROUP, in painting and fculpture, is an affmWage of two or more ligures of neca, bealts, frints, or the like, which have fome apparcut relation to each other. See Painring.-The word is formed of the Italian groppo, a Rnot.

The Grours, a chifter of iflands hately difenvered in the South Sea. They lie in abont S. Lat. 18. 12. and W. Long. Tot2.42. They are long narrow flips of land, ranging in all directions, fome of them tul anks or upwards in letegth, but not more than a cimar.
ter of a mile broad. They abcund in trees, patticularly thofe of the cocoa-nut. They are inlabited by well-made people, of a brown complexion. Mot of them carried in their hands a foricer prie atrout it feet in length, pointed like a feear; they had likevife foncthing thaped like a paddle, alout four fect long. Their canoes were of different fizes, carrying from three tulix or feven people, and fome of them hoitted a fail.

GROUSE, or Growse. See Tetrao.
GROUIHEAD, or Greathid (Robert), alearned and famons bithop of Livicoln, was born at Stow in Lincolnfaine, or (according to others) at Stradbrook in Suffolk, in the latter part of the twelich century. His parents were fo porr, that when a boy he was reduced to do the meanett offices, and ven to beg his bread; till the mayor of Lincoln, thuck with his appearance and the quickuefs of his anfwers to certain quettions, took him into his family, and put him to fichol. Here his ardent love of larning, and admirable capacity for acquaing it, foon appeared, and procured him many patron:, by whofe affitance he was enabled to profecute his fludies, lirlt at Cambridge, afterwards at Oxfurd, and at lat at Paris. In thefe three famons feats of learning, he fpent many years in the moft indefatigable purfiuit of knowledge, and became one of the beft and mot univerfal fcholars of the age. He was a great malter not only of the French and Latin, but alfo of the Greek and Hebrew languages, which was a very rare accomplifhment in thofe times. We are afured by Roger Bacon, who was intimately acquainted with him, that he fipent much of his time for almoit forty years in the fludy of geometry, altronomy, optics, and other branches of mathematical karning, in all which he very much excelled. Theology was his favourite ftudy, in which he read lectures at Oxfor with great applaufe. In the mean time, the obtained feveral preferments in the church, and was at kength elected and confecrated bifhop of Lincolt, A. D. 1235. In this tlation he foon became very famous, by the purity of his maners, the populanity of his preachugg, the vigour of his difcipline, and the boldoefs with which he reproved the viees and oppofed the abbitrary mandates of the court of Rome; of this laft it may be proper to give one example. Pope Innocent IV. had granted to one of his own nephews named Fredrick, who was but a child, a provition to the tirt canon's place in the church of Lineoln that fhould become vacant; and fent a bull to the archbihop of Canterbury, and In:ocent, then papal legate in England, commanding there to fee the provifion made effectual ; which they tranfmitted to the bihop of Linceln. But that brave and virtuous prelate boldly refuled to obey this unreafonable mandate, and fent an aniwer to the papal bull containing the following fevcre reproaches againlt his holinefs for aboling his power: "If we escept the fins of Lucifer and Antichrift, there neither is nor can be a greater crime, nor any thing more contrary to the doetrine of the gofped, or mare odious and abominable in the light of Jefus Chriit, than to ruin and deftroy the fuuls of men, by depriving then of the firitual aid and minillty of their paftors. This crime is committed by thofe who command the beafices intended for the fupport of able patore, to be befowed on thofe who are iacapable of

## G R O

athead, performing the duties of the paftoral office. It is impoffible therefore that the holy apofolic fee, which received its authority from the Lord Jeflus Chrilt, for tdification, and not for deflruction, can be guilty of fuch a crime, or any thing approaching to fuch a crime, fo hateful to God and to hurtful to men. For this would be a moft manifet corruprion and abufe of its authority, which would forfcit ail is ghory, and plunge it into the pains of hell." Upon hearing this letter, his holinefs became frantic with rage, poured forth a torrent of abure againft the good bihop, and threatened to make him an orject of terror and aftonlifhment to the whole wonld. "How dare (faid he) this old, deaf, doating foul, difobey my commands? Is not his mailer the king of England my fubject, or tather my tlave? Cannot he calt him into prifon, and crufh hin in a moment?" But the cardinals by degrees brought the pope to think mort calmly, and to take so notice of this letter. "Let us not (faid they) raife a tumult in the church without neceffity, and precipitate that revolt and feparation from us, which we know mult one day take place." Remarkable words, when we refect when and by whom they were fpoken! The bifhop did not long furvive this noble fand againft the grofs corruptions and tyranny of the church of Rome: for he fell fick at his caftle of Bugden that fame year; and when he became fenfible that his death was drawing near, he called his clergy into his apartment, and made a long difcourfe to them, to prove that the reigning pope Innocent IV. was Antichrift. With this exertion his ftrength and fpirita were fo much exhauted, that he expired foon after, Ottober 9. 125\%. A comemporary hitorian, who was perfectly well acquainted with him, harh drawn his clarafter in the following manner. "He was a free and bold reprimander of the pope and the king; an admonither of the prelates; a corrector of the monks; an influctor of the clergy ; a fupporter of the ithdious; a cenfures of the incontinent ; a fconrge and terror to the court of Rome; a diligent feacher of the feriptures; and a frequent preacher to the people. At his tatule he was hofpitable, pulite, and cheerim. In the church he was conerite, devout, and folemn; and in performing all the duties of his ollice the was - nerahle, açive, and iedefatigable. The illultrious Roger Bacon, who was molt capable, and lhad the belt epportunities of forming a true judgnons of the cxtent of his leanding, by peraing his works, and by friquently conve ling with him, hath given this horonrable teftimony in his favour. "Robert Grouthead bifhop of Lincoln, and his friend friar Adan de Marifco, are the two moll karned men in the wolld, and excel all the reft of mankind both in divine and human hnowldge." This moil excellent and learned prelate was a very voluminous writer, and compord a prodigious number of treatifes on a great varisty of fubjects in phitufopl:y and divinity, a catalogue of which is given by Dale.

GROWTH, the gradual increafe of bulk and ftature that takes place in animals or vegetables, to a certain period. - The increafe of bulk in fuch budies as have no life, owing to fermentations excited in their fub. ftance, or to other caufes, is called Expansion, Swelhing, \&ic.

The growth of animal, nay even of the human fpe-

## $157] \quad \mathrm{G} \quad \mathrm{R} \quad \mathrm{O}$

cies, is fubject to great variations. A remarkable in. Growh. flance in the laft was ubferved in France in the year - . 1729. At this time the Academy of Sciences examined a boy who was then only feven years old, and who meafured four fee: eight inches and four lines high without his fhoes. His mother obferved the figns of puberty on lim at two years old, which continued to increafe very quick, and foon arrived at the ufual ftandard. At four years old he was able to lift and tofs the common bundles of hay in ttables into the horfes racks; and at fix years old could lift as much as a flurdy fellow of twenty. But thoust he thus increafed in bodily ftrength, his underltating was no greater than is ufual with childien of his age, and their playthings were alfo his favourite annferncits.

Another boy, a native of the hamlet of bowzanquet, in the diocefe of Alais, though of a frong con.. flitution, appeared to be knit and ؛liff in his $j$ mints till he was about four years and a hali uld. Inuing chin time nothing farther was remarkable of him than an extraordinary appetite, which was fatistied no otherwife than by giving him flenty of the common aliments of the inhabitauts of the country, confilting of rye-bread, chefnuts, bacon, and water; but his limbs foon becoming fupple and pliatle, and his body beginning to expand itfelf, he grew up in fore extrasrdinary a manner, that at the age of live years he meafured four fect three inches; fome months after, he was four feet eleven inches; and at fix, five feet, and bulky in proportion. His growth was fo rapid, that one might fancy he faw him grow: every month, his cloaths required to be made lunger and wider; and what was till very extraordinary in his growh, it was not preceded by any lickuefs, nor accompanied with any pain in the groin or eliewhere. At the age of five years his roice changed, his beard began to appear, and a: fix he had as much as a man of thirty ; in thort, all the unquettionable marks of puberty were vifible in him. It was not doubecd in the country but this child was, at five years old, or five and a half, in a condition of begeting other childen; which induced the rector of the farih to reconament to his mother that he would keep hi:n foom too familiar a converfation with chilhth of the ohter fex. Though his wit was riper than is commozly ubfervable at the age of five or fix years, yet its progeths was not in proportion to that of his body. His air and manner flill retained fomcthing childif, doogh by his bulk and tature he refomblica a complete man, whinh at inft fight produced a viry lingular contra!!. His voice was itrong and maniy, and his EMat itrength rendered him already fit for the labours of the country. At the age of tive years, be coild carry to a goud diHtance three meafures of rwe, wighing it pounds ; when turned of hix, he could life up ealily on his homders and carry loads of 150 pounds weight a g ex way off; and thefe exercifes were exhibited by him as often as the curions engaged him thereto by fome liberality. Such begianings made people think that he would foon thoot up into a giant. A mountebank was alredad foliciting lis pareries for $1: i m$, and flatering them with hopes of patting him in a way of making a great fortune. But all thefe hopes ful. denly vanified. His legs became crooked, his budy thruak, bis Arcrget diminifhed, his voice grew fori-

## $G R \quad[158] \quad G \quad R \quad Y$

Grus fibly weaker, and he at laft funk into a total imbecillity.

In the Paris Memoirs alfo there is an account of a girl who had lier menfes at three months of age. When four years old, fhe was four feet fix incles in height, and had her limbs well proportioned to that height, her breafs large and plump, and the parts of generation like thofe of a girl of eighteen; fo that there is no doubt but that the was marriageable at that time, and capable of being a mother of children. Thefe things are more fingular and marvellous in the northern than in the fouthern climates, where the f males come fooner to maturity. In fome places of the Eaft Indies, the girls have children at niue years of age.

Many other inflances of extraordinary growth might be brought, but the particulars are not remarkably different from thofe already related.-It is at firt fight aftonifling that children of fuch earls and prodigious growth do not become giants: but when we confider, that the figns of puberty appear fo much fooner than they ought, it feems evident that the whole is only a more than ufually rapid expanfion of the parts, as in hot climates; and accurdingly it is obferved, that fuch children, inflead of becoming giants, always decay and die apparently of old age, long before the natural term of human life.

GRUB, in zoology, the Englif name of the hexapode worms, produced from the eggs of beetles, and which at length are transformed into winged infeets of the fame fpecies with their parents.

GRUBBING, in agriculture, the digging or pulling up of the flubs and raots of trees.

When the roots are large, this is a very troublefome and laborious talk; but Mr Mortimer hath fhown how it may be accomplifled in fuch a manner as to fave great expence by a very fimple and eafy method. He propofes a ftrong iron hook to be made about two feet four inches long, with a large ironring fattened to the upper part of it. This hook mult be put into a hole in the fide of the root, to which it mult be faftened; and a lever being put into the ring, three men, by means of this lever, may wring out the root, and twith the fap-roots afunder. Stubs of trees may alfo be taken up with the fame hook, in which work it will fave a great deal of labour, though not fo much as in the other; becaufe the tubs mult be firft cleft with wedges, before the hook can enter the fides of them, to wrench them out by pieces.

GRUBENIIAGEN, a town and calle of the duchy of Brunfwic, in Lower Saxony, remarkable for its mines of filver, copper, iron, and lead. E. Long. 9. 36. N.Lat. 51. 45.

GRUINALES (from grus, "a crane"), the name of the fourteenth order in Linnæus's Fragments of a Natural Method, confifing of geranium, and a few other genera which the author confiders as allied to it in their habit and external flructure.

GRUME, in medicine, denotes a concreted clot of blood, milk, or other fubitance. Hence grumous blood is that which approaches to the nature of grume, and by its vifcidity and flagrating in the capillary veffels produces feveral diforders.

GRUP1'O, or Turned Suste, a mufical grace, de-
fined hy Playford to confit in the alternate piolation of two tones in juxtapolition to each other, with a clofe on the note immediately beneath the lower of them. See Share.

GRUS, in antiquity, a dance performed yearly by the young Athenians around the temple of Apollo, on the day of the Delia. The motions and ligures of this dance were very intricate, and varioully interwoven; fome of them being intended to exprefs the windings of the labyrinth wherein the minotaur was killed by Thefeus.

Grus, in aftronomy, a fouthern conftellation, not vifible in our latitude. The number of flars in this conitellation, according to Mr Sharp's Catalogue, is 13 .

Grus, in ornithology. See Ardea.
GRUTER (James), a learned philologer, and one of the molt laborious writers of his time, was born at Artwerp in 560 . He was but a child when his father and mother, being perfecuted for the Proteftant religion by the duchefs Parma, governefs of the Netherlands, carried him into England. He imbibed the elements of learning from his mother, who was one of the moft learned women of the age, and befides French, Italian, and Englih, was a complete miltrefs of Latin, and well fkilled in Greek. He fpent fome years in the univerfity of Cambridge; after which he went to that of Leyden to Audy the civil law ; but at latt applied himfelf wholly to polite literature. After travelling much, he became profeffor in the univerfity of Heidelburgh; near which city he died, in 1627 . He wrote many works; the moft confiderable of which are, I. A large collection of ancient inferiptions. 2. Thefaurus criticus. 3. Delicie portarum Gallorum, Italorum, E' Belgarum, foc.

GRUYERS, a town of Swifferland, in the canton of Friburgh, with a pretty good caltle. It is famous for its cheefe, which is all its riches. E. Long. 7. 23. N. Lat. 4 6. 35 .

GRY, a meafure containing one tenth of a line.
A line is one-tenth of a digit, and a digit one-tenth of a foot, and a philofophical foot one-third of a pendulum, whofe diadromes, or vibrations, in the latitude of 45 degrees, are each equal to one-fecond of time, or one-fixtieth of a minute.

GRYLLUS, in zoology, the name of the cricket and locult kinds, which, toget her with the grafshoppers, make only one genus of infects, belonging to the order of hemiptera. The general characters of the genus are thefe: The head is inflected, armed with jaws, and furnifhed with palpi: The antennæ in fome of the fpecies are fetaceous, in others filiform: The wings are deffected towards and wrapped round the fides of the body; the under ones are folded up, fo as to be concealed under the elytra. All the feet are armed with two nails; and the hind ones are formed for leaping. The gentis is fubdivided into five different fections, or fumilies, as follows:
I. The Acriden, Truxalides of Fabricius, or Cricker family properly fo called; of which the characturs are: "buir he.d is of a conical form, and ionger than the thoras: and their antentax ate enfiform, or fword-haper. Of this tanily there dee cight fpecies, none of them frond ia Bataia.
II. The Bullit, or Aloydia of Fabricius: 'Thefe

## G R Y

are diftinguithed by a kind of creft or elevation on the thorax; their antennæe are thorter than the thurax, and filiform ; and their palpi are equal.-The gryllus bulla-bipunctatus is of a dark-brown colour; fometimes berpinkled with fpots of a lighter hue. But the chief and molt obvious diltinction of this fpecies is the form of its thorax, which is prolonged, covering the whole body, and decrcaics to the extremity of the abdomen. This prolongation of the thorax ftands inftead of elytra, of which this infect is deftitute. It has only wings under this projection of the thorax. Linnæus mentions a foot in the thorax ; which, however, is often wanting. This fpecies is every where to be met with, in the fields, in woods, \&e. There are to or it other fpecies, inhabitants of Europe and America.
III. The third family, called Acheta, are ditinguifhed by two briltles, fituated above the extremity of their abdomen ; by having three Itemmata; and by the tarfi heing compofed of three articulations. This family is in many places called Cricket, on account of the found which the infect makes. There are 28 fpecies enumerated in the new edition of the $S_{y j l e m a}$ Nature; of which the molt remarkable are,

1. The gryllus domelicus, or the domeficus and campeflis, the domeltic and the field gryllus being one and the fame fpecies; only tbat the former is paler and has more of the yellow ealt, and the latter more of a brown. The anteune are as nender as a thread, and nearly equal to the body in length. The head is large, and round, with twn large eyes, and three fmaller ones of a light yellow colour, placed higher on the edge of the depreffion, from the centre of which originate the antenne: The thorax is broad and hort. In the males, the elytra are longer than the body, veined, as it were rumpled on the upper part, eroffed one over the other, and enfolding part of the abdomen, with a projecting angle on the lides: They have alfo at their bafe a palecoloured band. In the females, the elytra leave one-third of the abdomen uncovered, and feareely crols each other; and they are all over of one colnur, reined and not rumpled; nor do they wrap round fo much of the abdomen underneath. The female, moreover, carries at the extremity of its body a hard fpine, almoft as long as the abdomen, thicker at the end, compoled of two theaths, which encompafs two lami. næ: This implemert ferves the infect to fink and depofit its eggs in the ground. Both the male and female have two pointed foft appendices at the extremity of the abdomen. Their hinder feet are much larger and longer than the rell, and ferve them for leaping.

Towards funfet is the time the field grylhus, or cricket as it often called, likes belt to appear out of its fubterraneous habitation. In White's Natural Hiflory 8.46. of Sclbourne $t$, a very plealing account is given of the manners and economy of thele infects; which, how. ever, are fo thy and cautious, he oblerves, that it is no eafy matter to get a fight of them ; for, feeling a perfon's footfleps as he advances, they ftop fhort in the midt of their fong, and retire backward nimbly into their hurrows, where they lurk till all fufpicion of danger is over. At firt it was attempted to dig them out with a fpade, but without any great fuccefs; for either the bottom of the hole was inacceffible from its terminating under a great fone; or elfe, in breaking
up the ground, the poor infect was inadvertently fquee. zed to death. Out of one fo bruifed a mulcitude of egges were taken, which were loug and narrow, of a yellow c.alour, and covered with a very tough lin. More gentle means were then uled, and iproved fuccefsful: " a pliant thalk of grafs, gently influmated into the caverns, will probe their windings to the bottom, and quickly bring out the inhabitant; and thus the humane inquirer may gratify his curiofity without injuring the object of it. It is remarkabie, that though thefe infects are furnifhed with long legs behind, and brawny thughs for leaping, like grafshoppers; yet when driven from their holes they fhow no activity, hut crawl along in a fhiftefs manner, fo as eafily to be taken: and again, tho' provided with a curinus apparatus of wings, yet they never exert them when there feems to be the greatelt oceafion. 'The males only make that fhrilling noife perhaps out of rivalry and emulation, as is the cafe with many animals which exert fome fpightly note during their breeding time : it is raifed by a brifis friction of one wing againtt the other. They are folitary beirgs, living fingly male or female, each as it may happen; but there mult be a time when the lexes have fome intercourfe, and then the wings may be ufeful perhaps during the hours of night. When the males meet they will fight fiercely, as our author found by fome which he put into the erevices of a dry flone wall, where he wanted to have made them fettle. For tho; they feemed diftreffed by being taken out of their knowledge, yet the firlt that got poffeffion of the chinks would feize on any that were obtruded upon them with a valt row of ferrated fangs. With their Atrong jaws, toothed like the fhears of a lobiter's claws, they perforate and round their curious regular cells, having no fore-claws to dig, like the mole cricket. When taken in the hand, they never effered to defend themfelves, though armed with fuch formidable weapons. Of fuch herbs as grow before the mouchs of their burrows they eat indiferiminately; and on a little platform, which they make jult by, they drop their dung; and never, in the day time, feem to fir more than two or three inches from home. Sitting in the entrance of their caverns they chirp atl night as well as day from the middle of the month of May to the midule of July: in hot weatber, when they are moft vigorous, tbey make the hills echo; and in the tiller hours of darknefs, may be heard to a confiderable dillance. In the beginning of the feafon their notes are more faint and inward; but become louder as the fummer advances, and fo die away again by degrees.-Sounds do not always give us pleafure according to their fiveetnefs. and melody; nor do harfh founds always difpleafe. We are more apt to be captivated or difgulted with. the aflociations which tbey promote, than with the notes themfelves. Thus the firilling of the field-criclet, though harp and Aridulous, yet marvelloully delishts fome learers, filling their minds with a train of fummer ideas of every thing that is rural, verdurous, and joyous. About the tenth of March the crickets appear at the mouths of their cells, which they then open and hore, and fhape very elegantly. All that ever I have feen at that feafon were in their pupa fate, and had only the rudiments of wings, lying under a ikio or coat, which mult be eaft before the infect can arrive at its perfect flate; from whence I flould fuppole that the

[^10]

$\qquad$

$\qquad$

   ,

$\qquad$
$\qquad$

old ones of laft year do not aluays furvive the winter. In Augutt their boles begin to te obliterated, and the infects are fien no more till fpring.-Not many fummersago I endeavoured to tranfplant a colony to the terrace in my garden, by boring deep holes in the nojing turt. The new inhabitants flaid fome time, and fed and fung; but wandered away by degrees, and were heard at a farther diltance every morning; fo that it appears that on this emergency they made ufe of their wings in attempting to return to the foot from which they were taken-One of thefe crickets, when confined in a paper cage and fet in the fun, and fopplied with plants moittened with water, will feed and thrive, and beeome fo merry and loud as to be irkfome in the fame room where a perion is fitting: if the phats are not wetted, it will die."

The comelta srylhus, or hearth-cricket, as it is called, dues nut require it to be fought after abroad for cxamination, nor is lhy like the other fort: it refides altogether within our dwellings, intruding itfelf upon our notice whether we will or no. It delights in new built houfes; being, like the fpider, pleafed with the moifure of the walls; and befides, the foftnels of the mortar enabies them to burrow and mine between the juints of the bricks or llones, and to open conmunications from one room to another. They are particularly fond of kitehens and bakers ovenc, on account of their perpetual warmth. "Tender infects that live abroad either enjoy only the flort period of one fummer, or elfe doze away the codd unconsurtable months in profound llumbers; but thefe (our author oberves), refiding as it were in a torrid zone, are always alert and merry : a good Chrillmas fire is to them like the heats of the dog-days. Though they are frequently heard by day, yet is their natural time of motion only in the night. As foon as it grows duak, the chirping increafes, and they come running forth, and are from the fize of a llea to that of their full itature. As one fhould fuppofe, from the burning atmofphere which they inhatit, they are a thirtty race, and how a great propenfity for liquids, being found frequently drowned in pans of water, milk, broth, or the like. Whatever is moit they affect: and therefore often gnaw holes in wet woollen flockings and aprens that are hung to the fire. Thefe crickets are not only very thirlty, but very voracious; for they will eat the fcommings of pots; yeath, falt, and crumbs of bread; and any kitchen ofial or fweepings. In the funmer we have obferved them to fly, when it became dolk, ont of the windows, and over the neighbouring roofs. This feat of ateivity accounts for the fudden manner in which they often leave their hamn:, as it does for the method by which they come to houfes where they were not known before. It is rema-kabie, that many forts of infects feem never to ufe their wings but when they have a mind to hifit their quarters a:ad fate new colonits. When in the air they move "roblatu undofo," in waves or curves, like wood-peckers, opering and hatting their wings at every ftroke, and fo are always rifing or finking. - When they inereafe to a great degree, as they did once in the house where 1 am now writing, they become noifome pefts, flyir into the candes, and dahhing into people's faces; but may be blatled by gunpowde difutharged into their crevices and crannies. In families, at fuch times, they are, like N 144.

P'saranh's plague of frogs, -' in their bedchambers, Gryllus. and upon their bects, and in their ovens, and in their kneading-troughs.' 'Their flhrilling noife is occafioned by a brif attrition of their wings. Cats catch hearth. crickets, and playing with them as they do with mice, devour them. Crickets may be deflowed, like wafps, by phials half filled with beer, or any liquid, and fet in their haunts; for being always eager to drink, they will crowd in till the bottles are full." A popular prejudice, however, frequently prevents their being driven away and delfroyed: the common prople imagine that their prefence briags a kind of lurk to the honfe while they arc in it, and think it would be hazardous to deAtroy them.
2. Gryilus gryilitalpa, or mole cricket, is of a very unpleafant form. Its liead, in proportion to the fire of its body, is frail and oblong, with four long thick palpi, and wo long antenne as hender as threads. Behind the antenne are lituated the eyes, and between thofe two eyes are feen three flemata or lefice eyes, amounting to five in all, fet in one bine trafveritly. The thorax forms a hind of cuirala, oblung, a'moft cylindrical, which appears as it were velvetty. The clytra, which are hort, reach but to the middle of the ablomen, are crolled ore over the other, and have large black or brown nervous fibre:. The wingsterminate in a point, longer not only than the clytra, but even than the abdomen. This latter is foft, and ends in two points or append:ces of fome length. But what conflitutes the chief fingularity of this infect are its fore-feet, that are very large and flat, with broad leg, ending outwardly in four large ferrated claws, and in wardly in two only; between which claws is fituated, and often concealed, the tarfus. The whole animal is of a brown dutky colour. It haunts moilt meadows, and frequents the fides of ponds and banks of ftreams, performing all its functions in a fwampy wet foil. Wit! a pair of fore-feet curiouly adapted to the purpofe, it burows and works under ground like the mole, raifing a ridge as it proceeds, but feidom throwing up hillocks. As mole crickets often infelt gardens by the fides of canats, they are unwtione guefts to the gardener, raifing up ridges in their fobterraneous progrefa, and rendering the walks unfighty. If they take to the kitchen quarters, they occalion great damage among the plants and roots, by dettroying whote beds of cabbages, young legumes, and fowere. When dug ont they feem rery how and helplefe, and make no nie of their wings by day; but at nigin tirey come atron!, and make long excurlions. In fine weather, ahont the middle of April, and jult at the clofe of day, they begin to folace themfelves wis! a low, dull, jaring note, continued for a long time wehour interruption, and not walike the chatcring of the fermoxh, or groatfacker. but nore inwa:d. Abcut the beginning of Mar they tay their egus, as Mr White informs t:s, who was once an ege-witacts: " for a gardener at an houfe where le was on a viit, happening to be mowing, on the Gth of that month, by the fide of a canal, liis fegthe llack ton deep, pared off a large piece of turf, and laid apen to view a curious lecne of domeltac economy:

[^12]There

Hes. There were many caverns and winding paffages leading to a kind of chamber, neatly fmoothed and rounded, and about the fize of a moderate fnuff-box. Within this fecret muffery were depolited near 100 eggs of a dirty yellow colour, and enveloped in a tough Nim, but too lately excluded to contain any rudiments of young, being full of a vifcous fublance. 'lhe eggs lay but fhallow, and within the influence of the fun, juft under a little heap of freth-mowed mould. like that which is raifed by ants. - When mole-cricketsfly, they move "curfu undofo," rifing and falling in curves, like the other fpecies mentioned before. In different parts of this kingdom people call them fon-erthkets. clurrworms, and e.e churrs, all very appolite names."
IV. "The Tetrigosia, Grasshoppers, or Locuffs armed at the tail: The females of this family are diainguifhed by a tubular dart at the extremity of their abdomen: in both fxes the antenne are fetaceous, and longer than the abdomen; and the taiti compofed of four articulations. Of thefe infects there are on fpecies enumerated in the Sylemad Nofurx. They lap by the help of their hinder legs, which are ftrung and much lonecer than the fore ones. Their walk is heary, but they fly tolerably well. Their females depolit their cggs in the ground, by means of the appendices which they carry in their tail, which confit of two laminx, and pencirate the pround. 'lhey lay a great number of eggs at a time ; and thofe eggs, nnited in a thin membrane, form a kind of group. 'The little larva that fpring from them are wholly like the perfect infects, excepting in lize, and their having nether wings nor elytra, but only a kind of knobs, four in rumber, which contain both, but undifplayed. The unfolling of them only takes place at the time of the metamorphofis, when the infect has attained its full growth. In thefe infects, when examined internally, belides the gullet, we difcover a fmall ftomach; and behind that, a very large one, wrinkled and furrowed within-fide. Lower down, there is Aill a third : fo that it is thourgt, and with fome probubility, that all the animals of this genus chew the cud, as they fo much refemble ruminant animals in their internal conformation.
V. Locuste (the Grylli of Fabricius), or Loculs -unarmed at the tail. This family is dilinguifhed by having the tail purple. without the fotie of the Achete, or the tube of the Teffigonis: their antenne are filiform, and halt florter than the abdonea: they lave three fternmata, and three joins to the tarli. To part of this deferiprion, however, there is an excepsion in the gryllus loculla groflus, the antenne of which are of a cylindrical form. According to Mr Barbutt, " few fpecies vary fo much in lize and colours. Sone of thefe infects are twice as long as others; the anten $n x$ in molt are filiform, but in this particular fpecies cylindrical, compofed of about $2+$ articulations, and but one fourth of the length of the body. As to colour, the liadi individuals are nearly quite red fotted with black, with the under part of the body only of a greenifh yellow. The larger fubjects are all over of a greenifh hue, the under part being of a deeper yellow; only the infice of the hinder thik is red. Dut what characterifes this fpecies is, the form of the thorax, which has, above, a longitudinal elevation, attended by one une each lide, the middle whereof drawing migh

Vol. VIII. Part 1.
to the firf, forms a kind of X. Moreover, between the claws that terminate the feet there are fmall fpunges, but larger in this species than the reft. Whis fpecies is to be met with every where in the comery. The larve or caterpillars vely inuch refemble the per. fet infects, and commonly dwell under groume." ()f this trike, 118 other fpecios are enmmerated in the SyRema Nature, natives of diferent parts of the globe; befides a confiderable number noted as unafcertained with regard to their being dittinct fpeces or only fynonymes or varieties of fome of the others.

All the Gryblt, except the fird family which feed upon onlier infects, live upon planta; the achede chichy upon the roots, the tenigonix and lorefor upon the leaves.

The dillinction of lacef/s into tamilies (IV V.), as above characterifed, is extremely proper: and the difference of organifation upon which it is founded has been obferved to be adapted to the monte and the places in which the infect lay their eggr. But by taking the wings intoconlideration, there might have been f rined thee tribes or divifions, infted of two. upon the fane natural foundation. Thus, accorbing to the ohforvations of the Abhe Pouet + , those which have their absumen + Gourn. fo
 their eggs in a Alif fort of earth which that inllrument ${ }^{\mathrm{p}}$ ur $\mathbf{5} 7 \mathrm{z} \%$ perforates. During the operation, the dart opens; Apr. and, being hollow and groored on each lide withon, the egg flides down along the prowes, and is depulitel in the hole. Of thofe which luve the tail fimple, i. $e$. which have no dart, fome have long wings, and fome very fhort. The lonc-winged fort lay their ezes on the bare ground, and lave wo wie for a perforating inftrument ; but they cover them with a glutinuus fubHance, which fixes them to the foil, and prevents their being iujured either by wind or wernefs. Thofe, again, which have thort wings depofit their eggs in the fand: and to make the holes for this purpule, they have the power of clongating and reeracting their abdominal rings, and can turn their body as on a pivot; in which operation long wings would have been a material impediment.

The annals of moft of the warm countries are filled with accounts of the devaltations produced by Iocufts, who fometimes make their appearance in clouds of valt extent They foldom vifit Europe in fuch fwarms as formerly; yet in the warmer parts of it are Atll formidable. - Thofe which have at uncertain intervals vifted Europe in our memory, are fuppofed to have come from Africa: they are a large fecies about. three inches long. The head and horns are of a brownifh colour; it is blue about the mouth, as alfo on the infide of the larger legs. The fhield which covers the back is areenith; and the upper lide of the body brown, fpotted black, and the under lide purple. The upper wings are brown, with fmall dufly fpots, and one larger fpot at the tips. The under wings are more tranfparent, and of a lighe trown tinctured with green, but there is a dark clond of fpots near the tips. -Thefe infects are bred in the warm parts of Aita and Africa, from whence thes have oftentaken their flight into Europe, where they committed terrible devatlations. They multiply fatler than any other animal io the creation, and are truly terrible in the countries where they breed. Some of then were feen in differeut

## G R Y [ 162 ] G R Y

cofllus. rato of Batain in the year 1749 , and great mifo chiefs were apprechended: but hapinly fur us, the cohlrefo of our climate, and the hanidity of our foil, are wery unfavourable to their production; fo that, as they are only animals of a year's continuance, they all perith without leasing a young geneation to fucced them.

When the locults take the fich, it is faid they have a leader at thein head, whofe fight thev obferve, and pay a fhict regard to all his notions. They appear at a dillance like a black cloud, which, as it approaches, gathers upon the horizon, and almoil hides the light of day. It often happens, that the hutbandman ters this imminent cadanity pafs away without doing him any mifchief; and the whole fwan proceeds onward to fettle upon fome lefs fortunate country. In thofe places, however, where hey alight, they deftroy every green thing, Iripping the trees of their leaves, as we.l as devouring the con and grafs. In the tropical climates they are not fo pernicipus as in the more fouthern parts of Furope. In the firt, the power of vegetation is fo Itrong, that an interval of three or four days repairs the darnage ; but in Europe this eannot be dune till next year. Befides, in their long flights to this part of the world, they are famined by the length of their journey, and are therfore more voracious whereever they happen to fettle. But as much damage is o ocationed by what they dettroy, as by what they dewour. Thitir bite is thought to contaminate the plant, and either to detlroy or greatly to weaken its vegtiation. To ufe the expaffion of the hurbindinen, they burn wherever they touch, and leave the marks of their devallation for there or four years enfuing. When dead, they infect the air in fuch a manner that the tench is infupportable.-Onolius tulls us, that in the year of the world 3800 , Africa was infefted with a multitude of loculls. After having eaten up every thing that was green, they flew off and were drowned in the fea; where they caufed fuch a fench as could not have been equalied by the putrefying carcafes of 100,000 uren.

In the year 1650 , a cloud of locults was feen to enur Ruffia in three different places; and from thence they epread themfelves over Poland and Lithania in Suchatonifnng multitedes, that the air was darkened and the earth coveled with their numbers. In fome places they were feen lying dead, heaped upon each uther in the depth of four feet; in athers, they eovered the furfacel'ke a black cioth; the trees bent with thicir weight, and the damage which the country futainedexceeded compuation.

In Pasbars, their numbers are formidable ; and Dr Shaw was a uitnefs of their devallations there in 1724. Their tirt appearance was in the latter end of Marcl, whan the wind bad been fontherly for fome time. In the beriuning of April, their numbers were fo vafty increafed, that, in the heat of the day, they formed themfelves intolarge fwarms that appeared like clouds, and darhened the fon. In the midule of May they began to difappear, retiring into the plains to depofit their efibs. In June the young brood began to make their appearance, forming many compaet bodies of feveral hatnhed yards fquare; which atterwards marching forward. Climbed the trees, walls, and houfes, eating every thing that was green in their way. The in-
habitants, to ftop their proigrefs, laid tenches a!! over Gryll their lichls and gariens, which they filied with water. Some placed large guantities of heath, nubble, and fuch like combultible matter, in rows, and fet them on fire on the approach of the locults. But all this was to no purpofe; for the trenches were quickly filled up, and the fires put out by the great numbers of fwarms that fucceeded cach other. A day or two after one of thefe was in mution, others that were jull latched came to glean after them, gnawing of the young branches, and the very bark of the trees. Having lived near a month in this manner, they arrived at this full growth, and thesw of their worm-like fate, by catting their nkios. To propare themfelves for this change, they fixed their hinder part to fome bufh or twit, or corner of a Atone, when immediatsly, by an unduating motion ufed on this oceafon, their heals wronld firt appear, and foon after the rell of their bodics. The whole transformation was performed in fewn or eight minutes time, aifur which they remained for a little white in a lanyrnilhing condition; but as foon as the fun and air bint hardond their wings, and dried up the moinare that remained after calling off the ir former floughs, they returned to their former greedinefs, with an addition both of flrength and agility. Bat they did not long contime in this flate before they were entirely difperfed. After laying their egga, they direted theit courfe northward, and probably perimed in the fea.- In that country, however, the amazing fertility of the foil and warmands of the climate generally render the depredations of thefe infects of little confequence ; betides that many circum $\begin{aligned} & \text { anees concur to di- }\end{aligned}$ minin their number. Though naturally herbivorous, they often fight with each other, and the vitar devours the vanquined. They are the prey, too, of ferpents, lizards, frogs, and the carnivorous birds. They have been found in the flomachs of the eagle and different kinds of owis. They ate alfo uled as food by the Moors; who go to hunt them, fry them in oil or butter, and fell them publicly at Tunis and other places.

Jn 1754, 1755, 1756, and 175:, great devaftations were commaited in spain ty a fpecies of locults, of which we have the following defeription by Don Guillermo Buwles, publifned in Dillan's Travels thro' that country. "The locults are continually feen in the fouthern parts of Spain, particularly in the paftures and remote uncultivated ditricts of Eltramadua, but in yeneral ate not taken notice of, if not very numerous, as they commonly feed upon wild herbs, wishout preying upon gardens and cultivated lands, or making their way into heufes. The peafants look at them with indiffermee while they are friking about in the field, nespecting any meafure to defroy them till the danger is inmediate and the favoarable moment to remedy the evil is elapicd. Their yearly number is not very confiderable, as the males are far mure numerous than the females. If an equal proportion were allowed only for ten years, their numbers would be fo great as to deftroy the whole vegetative fyllem. Bealts and birds woold tharve for want of fubfittence, and even mankind would become a prey to their ravenous appetites. In 1754, their increafe was fo great from the multitude of females, that all La Manclia and Portugal were covered with them and totally ravaged. The horrors of famine were firead even farther, and affailed
the fruitful provinces of Andalufa, Murcia, and Va . lencia.
"The amours of thefe creatures are objects of furprife and aftonithment, and their union is fuch that it is dithcult to feparate them. When this feparation is voluntary, after having lafted fome hours, they are fo exhauled, that the inale retires inmediately to the water for refrefliment, where, lofing the ufe of his limbs, he foon perifhes, and becomes an eafy prey to the fill: having given life to his offspring at the expence of his own. The femalt, difembarrafled, tho' not without violent Atruggles, fpends the remainder of her days in fome folitary place, bufy in forming a recreat under ground, where fhe can fecure her egys, of which the generdly lays about to, fereening them by her fagacity from the intemperature of the air, as well as the more inmediate dancer of the plough or the fpade, one fatal blow of which would deftroy all the hopes of a rifing generation.
"The manner of her building this cell is equally furprifing. In the hinder part of her body, nature has provided her with a round fmooth in? rument, eight lines in length, which at its head is as big as a writing quiil, dimintifhing to a hard fharp point, hollow within like the tooth of a viper, but only to be feen with a lens. At the root of this velhick there is a cavity, with a kind of bladder, containing a glutinous matter, of the fame colour, but without the conlitency or tenacity of that of the filk-worm, as I found by an experiment, made for the pu:pofe, by an infution in vinegar, for fereral days, without any effect. The orifice of the bladder correfponds exafily with the infrument which Serves to eject the glutinous matter. It is hid under the flin of the belly, and its interior furface is united to the moveable parts of the belly, and can partake of its motions, forming the mon ajmirable eontexture for every fart of its operations, as fhe can difpofe of this ingredient at pleafure, and eject the fluid, which has three very effential properties: firt, being indiffoluble in water, it prevents its young from being drowned; nest, it reifs the heat of the fun, otherwife the fruc. ture would give way and defroy its inhabitants; laftly, it is proof againt the froft of winter, fo as to preferice a neceflary warmith within. For greater fecurity, this retreat is always contrived in a folitary place: for tho' a miilion of lucults were to light upon a cultivated field, not one would depofit her eggs there; but wherever they meet a barren and lontfome lituation, there they are fure to repair and lay their eggs.
"Thefe locults feem to devour, not fo mich from a ravenous appetite, as from a rage of deltroying every tbing that comes in their way. It is not furprifin, ${ }^{\text {r }}$, that they fhould be fond of the mont juicy plants and fruits, fuch as melons, and all manner of garden fruits and herbs, and feed allo upon aromatic plants, fuch as hevender, thyme, rofonary, \&c. which are fo common in Spain, that they ferve to heat ovens: but it is very fongular, that they equally eat muftard feed, onions, and garlic; nay even hemlock, and the mont rank and poifonous plants, fuch as the thorn apple and deadly night-fhate. They will even prey upon crowfoct, whofe caulticity burns the very hides of bealts; ard fuch is their univerfal tafte that they do not pafor the innocent mallow to the binter furze, or rue to wam wood, contuming all anke. wht prediletion or favour, with this remarkalle ciocitulave, that during
the four gears they commi ted fuch havoc in Eftrema- G.ghue. dura, the love-apple, or fyroperficon folunum of Linnaus, was the only plant that efcaped their rapacious tooth, and claimed a refpeet to its rant, leaves, fowers, and fruit. Naturalids may \{earch for their motives which I am at a lofs to difcover; the more as If faw militions of them light on a field near ilmaden, and devour the woollen and linen garments of the peafants, which were lying to dry on the ground. The curate of the village, a man of veracity, at whofe houfe I was, affered nee, that a tremendous body of them entered the church, and devoured the filk garments that adorned the images of the faints, not fparing even the varnifi on the altas. The better to difeover the nature of fuch a phenonie. noti, I examined the fomach of the locuft, but miny fund one thin and foft membrane, with which, an 1 the liquor it contains, it deftroys and diffolves all kind of fubtances, equally with the mof caulic and venomous plants; extracing from them a fufficient and falutary nourifliment.
" Out of cariofity to know the nature of fo formidable a creature, 1 was urged to examine all its pats with the utmott exactnefs: its head is of the fire of a pea, though longer, its forchead pointing downwarl's like the handfome Andalutian horfe, its mouth large and open, its eyes black and rolling, added to a timis afpect not unlike a hare. With fuch a daftardly countenance who wonld imagise this creature to be the fcourge of mankind! In its two jaws it has four incifive tecth, whofe tharp points iraverfe each other like feiffars, their mechanifm being fuch as to gripe or to cut. Thus armed, what can refilt a legion of fuch enemies? After devouring the vegetable kingdom, were they, in proportion to their firength and numbers, to become carnivorous like wafps, they would be able to deftroy whole flocks of heep, even to the dogs and fhepherds ; j:ff as we are told of ants in America, that will overcome the fiercell ferpents.
"The locult fpends the months of A pril, May, and June, in the place of its birth: at the end of June its wings have a fine rofe colour, and its body is Atrong. Being then in their prime, they affemble for the lalt time, and burn with a defirc to propagate their fpecies: this is abferved by their motions, which are unequal in the two fexes. The male is reftlefs and folicitous, the female is cor, and eager after food, flying the ap. proaches of the male, fo that the morning is fpent in the courthip of the one and the retreat of the other. About ten o'dick. when the warmth of the fun has cleared their wings from the dampnefs of the night, the females feem uneafy at the forwardnefs of the males, whocontinuing their purfuit, they rife together $; 00$ feet high, forming a black cloud that darkens the rays of the fun. The clear atmofphere of Spain becomes gloomr, and the fineft fummer day of Etlremadura more difmal than the winter of Holland. The rutting of fo many millions of wings in the air, feems like the trees of a forelt agitated by the wind. The firll direction of this formidable column is always againt the wind, which if not too ftrong, the column will extend about a couple of leagues. The loculs then make a halt, when the mot dreadful havoc begins; thers fenfe of frell being fo delicate, they can find at that diltance a corn field or a garden, and after demolifing at, rife again in purfuit of another: this may be faid to be donc in an inflant. Each feems to have, as it were,

Gryllug
four arms and two feet: the males climb up the plants, as failors do the fhrouds of a thip, and nip off the tendereth buds, which fail to the females below.
"Many uld people aflured me, when fo much mif. chief was done in 1754 , it was the third time in their remembance. and that they always ate found in the falue gromds of Ehranadura, from whence they ppread into the otber provinces of Spain. They are cortainly indigenous, being of a diflerent hape from thuef of the North or the Levant, as is evident in comparing them with fuch in the cabinets of natural hitauy. The locult of Sipain is the only one that has rofecoloured wings: brides, it is impoffible they can come from any other pait. From the north it is clear they do not, by the obleryation of fo many ares; from the fouth they cannot, without crofling the fea, which is handly pumbie by the thortacis of their flight : and tike birds of paflage, they would be known. I once faw a cloud of them pafs over Malaza, and move towards the fea, and go over it, for about a quarter of a league, to the great juy of the inhabitants, who concluded they would fuon be drowned; but, to their difappointment, they fuddenly veered about towards the coalt, and pitched upon an uncultivated fpace furrounded with vineyards, which they foon after quitted. When once they appear, let the number demolifhed be ever fogreat, the proportion remaining is fill too confiderable: therefore, the only way to put an end to fuch a calamity, is to atteck them beforehand, and defroy their eags, by which means they might be totally extirpated." See Plate CCXXI.

GRYNEUS (Simon), fento a peafant of Suabia, born in 1493 , was Creek profeflor at Heidelberg, in 1523. He took a tour into England, and received great civility from the lord chancellor Sir Thomas More, to whum Erafinus had recommended him. He was a learned and laborious man, and did great fervice to the commonwealth of letters. He was the firtt who publifhed the Almagell of I'tolemy in Greek. He alfo publihed a Greek Euclid, and Plato's works, with fome comsaentaries of Pioclus.

GRYPIIUS (Scbatian), a celebrated printer of Lyons in France, was a German, and born at Suabia near Auglourg in 1494. He reflored the art of printing at Lyons, which was before exceedingly corrupted; and the great number of bouks printed by him are -alued by the comoifeurs. He printed many books in Hebrew, Greek, and Latin, with new and very beautiful types; and his cditions are no lefs accurate than beautiful. The reafon is, that he was a very learned man, and pertectly verfed in the languages of fuch broks as he undertook to print. Thus a certain epigrammatift has obferved. tbat Robert Stephens was a very grood corrector, Colinzus a very good printer, but that Gryphius was both an able printer and corrector. This is the epigram:

> "Sner to nownt hioros qui culere, tres fust
> "Jifines: languat astera tupbal fiamu
> "C.afigitl tphonms, lcoffit tolenvis, utrimgue
> "Grypbius eifoids ments manerge fatit."

He ried $155^{6}$, in his Ged year: and his trade was carried honourably in the fame city by his fon, Anthony Coyphius. One of the mult beautiful books of sebattian Gryphius is a Latin Bible: it was printed 1550 ,
$16+1$ G U A
with the largef types that had then been feen, in 2 vols Gryphites folio.

GRYPHITES, in natural hiftory, in Englift Guadaup crow's stowl, an oblong foffile thell, very narrow at the head, and occoming gradually wider to the extremity, where it ends in a circuiar limb; the head or beak or this is very hooked or bent inward.

They are firquently found in our gravel or clay-pits in many countics. There are three or four diftinct fpecics of them; forne are extremely rounded and convex on the back, others lefs fo; and the plates of which they ase compoled, are in fome fmaller and thinner, in others thicker and larger, in feecimens of the fame hignefs.

GuAdalajara, or Guadalayara, a toma of Spain, in New Cattle, and dillrict of Alcala, feated on the river Herares. W. Long. 2. 45. N. Lat. $4^{0 .} 3^{6}$

Guadalajara, a confiderable town of Noth America, and capital of a rich and fertile province of the fame name, with a bifhop's fce. W. Long. 114. 59. N. Lat. 20. 20.

GUADAL IVIAR, a river of Spain, which rifes on the cunfines of Arragon and New Callile, and, running by Turvel in Arragon, croffes the kingdom of Valencia, paffes by the town of the fame name, and foon after falls into the Mediterranean fea, a little below Valencia.

GUADALQUIVER, one of the mot famous rivers of Spain, riles in Andalufia, near the confines of Granala, and rumning quite through Andalufia, by the towns of Baiza, Andaxar, Cordova, seville, and St Lucar, fallsat laft into the Bay of Cadiz.

GUADALUPL, a haudfome town in Spain, in Eflamadura, with a celebrated convent, whofe fructure is magnificent, nod is immenfely rich. It is feated: on a rivulet of that fame name. E. Long. 3. 50. N. Lat. 39. 15.

Geabalupe, one of the Caribbee iflands, belonging to the French, the midule of which is feated in about N. Lat. 16. 30. W. Lnng. 61. 20.

This inand, which is of an irregular fggure, may be about 80 leagnes in circumference. It is divided intotwo parts by a finall arm of the fea, which is notahove two leagues long, and from 15 to 40 fathoms broad. This canal, known by the name of the Salt. Rivir, is navigable, but wiil only carry veffels of 50 . tons burden.

That part of the ifland which gives its name to the whole colony is, towards the centre, full of craggy rocks, where the cold is fo intenfe, that nothing will grow upon them but fern, and forme ufelefs thrubs covered with mofs. On the top of thefe rocks, a mountain called la Souphriere, or the Brimfone Mountain, riSes to an immenfe height. It exhates, through various. openings, a thick black fmoke, intermixed with fparks, that are vilible by night. From all the fe hills flow numberlefs fprings, which fertilize the plains below, and moderate the burning heat of the climate by a refrefhing fircam, fo celebrated, that the galleons which formerly ufed to tonch at the Windward Mlands, had orders to renew their provifion with this pure and falubrious water. Such is that part of the illand properly calted Guadilupe. That which is commonly called

## G U A

dnee. Grand Terre, has not been fo mucl favoured by nature. It is indeed lefs rugged; but it wants fprings and rivers. The foil is nut fo fertilc, or the climate fo wholefome or fo pleafant.

No European nation had yet taken poffifion of this iland, when 550 Frenchmen, led no by two gentlemen Hamed hoilicic and Duplefrs, arrived there from Dieppe on the 28 ih of June i635. Thicy had been very inprodent in their preparations. Their provifions were fo ill chofen, that they were foited in the paffige, and they had mipped fo few, that they were exhauthed in two months. They were fupplied wihl more from the mother commery. St Chriliopher's, whether from fearcity or delign, refufed to fuare them any; and the lirt attempts in huflandry they made in the country, could not as yet afford any thing. No refource was left for the culony buy from the favages; bu: the fupernuixies of a people, who cultivate but litele, and therctore lad never laid up any thores, could not be very contiderable. The new comers, not content with what the favages might freely and voluntarily bring, came to a refohution to plunder them; and hollities commenced on the 1 6th of January 163 K.

The Caribs, not thinking thenfelves in a condition openly to relift an enemy who had fo mach the advat. tage from the fuperionity of their arms, deflroyed their own provifions and plantalions, and retired to Grand Terre, or to the neighbowing illands. From thence the mott defperase came over to the inand from which they had been driven, and concealed theneflves in the thicke? parts of the furefls. In the day time, they thot with their poifuned arrows, or knocked down with their clubs, all the Frenchmen who wete fcatered about for hunting or firting. In the night, they burned the houfes and deflroyed the plantations of their unjuft fpoilers.

A dreadful famine was the confequence of this kind of war. The colonifts were reduced to graze in the fiells, to eat their oun excrements, and to dig up dead bodies for their fubfill ence. Many who had been flaves at Algiers, held in abhorrence the hands that had broken their fetters; and all of them cusfed their exithence. It was in this manner that they atoned for the crime of their invafion, till the government of Aubert brought a peace with the favages at the end of the year 1640. The remembrance, however, of thardihips elldured in an invaded ifland, proved a powerful incitement to the cultivation of all articles of immediate neceffity; which afeerwards induced an attention to the fe of luxury confumed in the mother-country. The fow inhabitants who had efcaped the calamities they had drawn upon themfelves, were foon joined by fonie difcontented colonitts from St Chrifopher's, by Europeans fond of novelty, by failors tired of navigation, and by fome feacaptains, whil prodently chofe to commit to the care of a grateful foil the treafures they had faved from the dangers of the fea. But till the profperity of Guadalupe was ftopped or impeded by obltacles ar:fing from its fitmation.

The facility with which the pirates from the neighbouring inands could carry off their cattle, their flaves, their very clops, frequendy brought them into a cefperate fituation. Intelline broils, arifing from jealonfies of authority, often dillurbed the quiet of the planters. The adventurces who went over to the windward iflands,

1651 G U A
diftaining a land that was fiter for agriculture than Gnadapefor naval expeditions, were eafily drawn to Martinico by the convericnt roads it abounds with. The protiction of thofe intrepid pirates brought to that ifland all the traders who flatered themfelves that they might buy up the fails of the enemy at a low price, and all the planeres who thoughe they might fafely give themfelves up to peaceful labours. This quick population colld not fail of introducing the civil and military government of the Caribbee inands into Blartinico. From that time the French minitry attended more feriouny to this than to the other colonies, which were not fo imnediately under their direstion; and hearing chiefly of this inand, they turned all their catouragements that way.

It was in confuquence of this preference, that in 1700 the number of inhalitants in Gaudalupe anounied only to $3^{82} 5$ winte people, 325 favages, free negroes, mulattoes, an! ( 1725 naves, many of whom were Caribs. Het cultures were reduced to 60 fmall plantations of fugar, 65 of indigu, a little cocoa. and a comiderable quanticy of cotem. The cattle amounted to 1622 hortes and males, and 3 Kyg head of horned cattle. This was the fruit of 60 ycars labour. But her fiture progrefs was as rapid as her firft atter.:pts had been flow.

At the end of the year 1755, the colony was pec. pled with $9^{5}+3$ whites, $41,1+0$ llaves of all ages and of both fexes. Here faleable commodities were the produce of $33+$ fugar-plantations, 15 plots of indigo, 4, $\mathrm{C}, \mathrm{to}$ thems of cocoa, 11,7Co of tobaceo, 2,257,725 of coffee, $12,7+8,4+7$ of cotton. For her provifions the had 29 fquares of rice or maize, and 1219 of potatocs or yams, 2,028520 banalla trees, and 32,577,950 trenches of caflava. The cattle of Gua. dalupe confilled of $49+6$ horfes, $292+$ mules, 125 affes, 13,7:6 head of horned cattle, 11,162 heep or goats, $24+4$ hogs. Such was the flate of Guadialure when it was conquered by the Britifh in the monsh of April 1759.

France lamented this lofs; tut the colony had reafon to confort themfelves for this difgrace. During a fiege of three months, they had feen their plantations deftroyed, the buildings that ferved to carry on their works burnt down, and fome of their flaves carried off. Had the enemy been forced to retreat after all thefe devattations, the illand was ruined. Deprived of all aflutance from the inother-country, which was not able to fend her any fuccours; and expecting nothing from the Dutch (who, on account of their neutrahty, came into her roads), becaufe the had nothing to offer them in exchange; the could anever have fublifted till the enfuing harvent.

The conquerors delivered them from thefe apprehenfions. The Britih, indeed, are no merchants ia their colonies. The propictors of lands, whon molly relide in Europe, fend to theiriepreithatives whatever they want, and diaw the whole produce of the etlate by the return of their hip. An asent fettled in forae fia port of Great Britain is intrulted with the furnifling the plantation and receiving the produce. 'Ihis was impraćicable ai Guadalupé; and the conquerors in this refpect were obliged to adopt the chflom of the conquired. The Britilh, infurmed of the advantage the fiench made of their trade with the
con?! 1 pe colonies. haftened, in imitation of then, to fend their CNatian $\rightarrow \downarrow=$ Phips to the conquered illand; and fo muttiplied their espedtion:, that they overkocked the market, and fuak the price of all European commoditics. The colonith bought them at a very low price; and, in confequence of this plenty, obtained long delays for the payment.
To this credit, which was necellary, was foon added another ariling foom fpeculation, v, hich enabled the culony to fulfii its cngayenents. A great number of argroes were carried thither, to balen the growth and enfance the value of the plantations It has been faid in varinu-memorials, all copied from each other, that the Englith had atocked Guatalupe with 30000 during the four years and three months that ticy remained malkers of the ithand. The regitters of the cultomhonfes, which may be depended on, as there could be no indrement for an impofition, attef that the num1, was no more than $18,72 \mathrm{I}$. This was fuflicient to give the nation well-grounded hopes of reaping great advantages from their uew conqued. But their hopes were fruftrated; and the colony, with its dependencies, was refored to its former poffofors by the treaty of peace in July 1703.
lis the furvey taken in 1767 , this ifland, including the fmaller illands, Defeada, St Bartholomew, Mariwhante, and the Saints, dependent upou it, contains 11,853 white people of all ages and of both fexes, 752 free blacks and mulattoes, $72,-71$ flaves; which makes in all a population of 85,376 fouls. The cattle confills of 5660 horfes, $485+$ mules, 111 affes, $17,3,8$ head of homed eattle, 14,895 theep or guats, and 2669 hogs. The provifion is $30,476,218$ trenches of caffava, $2,819,262$ banana trees, 2118 fquares of land planted with yams and potatoes. The plantations contain 72 arnotto trees, 327 of caffa, 13,292 of cocoa, $5,831,1,76$ of coffee, $12,156,769$ of cotton, 21,774 fquares of land planted with fugar-canes. The woods occupy 22,097 fquares of land. There are $20,2+7$ in meadows, and 6405 are uncultivated or forfaken. Oaly 1582 plantations grow cotton, coffee, and provifirns. Sugar is made but in qor. Thefe fugar works employ 140 water-mills, $26_{3}$ turned by oxen, and 11 wind mills.

The produse of Guadalupe, including what is poured in from the fmall illands under her dominion, ought to be very confidstable. But in 1768 it yielded to the mother-country no more than $1+0,418$ quintals of fine fugar, 23,603 quintals of raw fugar, 34,205 yuintals of coffee, 11,955 quintals of cotton, 456 quintals of cocoa, 1884 quintals of ginger, 2529 quintals of logwood, ' 24 chells of fweetmeats, 165 chefls of liquors, 34 caks of rum, and 1202 undreffed fkins. All theife commodities were fold in the colony only for $310,7921.18 \mathrm{~s}$. 3 d . and the merchandife it has received from France hascoll but 197,9191. 18 s .6 d.

GUADIANA, a large river of Spain, having its fource in New Caftile, and, paffing crufs the high montains, falls down to the lakes called Ojos of Guadiana; from whence it runs to Calatrava, Dledelin, Merida, and Badajox in Ettremadura of Spain; and after having run for fome tine in Alentejo in Portuged, it paffes on to feparate the kingdom of Algarve from

Andainia, and fills into the bay or gulph of Cadiz between Callro Marino and Agramonte.

GUADIX, a town of Spain, in the kingdom of Gramada, with a bihop's fee. It was taken from the Moors in 1253. who afterwands retook it, but the Spaniards aytin got poffefion of it in $17^{8} 9$. It is feated in a futile country, in W. Long. 2. 12. N. Lat. 37.5 .

GUAJACUM, Lignum Vite, or Pockwood: A genus of the mongynia order, belonging to the de. candria elafs of plants; and in the natural method ranking under the $1_{\boldsymbol{q}^{\text {th }}}$ th order, Gruinales. The calyx is quinquetd and unequal; the petals five, and inferted into the caly $x$; the capfule is angulated, and trilocular or quinquelocular.

Species. 1. The uffacinale or common lignum vite ufed in medicine, is a native of the Wreat India Iflands and the wamer parts of America. There it becomes a large tree, laving a hard, brittle, brownifh bark, not very thick. 'Tle wood is firm, folid, ponderous, very refinous, of a blackin yellow colour in the middle, and of a hot aromatic talle. The fmaller branches lave an afh-coloured bark, and are garnifhed with leaves divided by pairs of a tright green colour. The flowers are probluced in cluters at the end of the branches, and are compofed of oval concave petals of a finc blue colour. 2. The fanctum, with many pairs of obtufe lobes, hath many finall lobes placed along the mid rib by pairs of a darker gretn colour than thofe of the foregoing fort. Thie flowers are produced in loofe bunches towards the end of the branches, and are of a fine blue colour, with petals fringed on the edges. This fpecies is alfo a native of the Weft India illands, where it is called lafiard lignum vilu. 3.The A frum, with many bluntpointed leaves, is a native of the Cape of Good Hope. The plants retain their leaves all the year, but have never yet flowered in this country.

Culture. The firll fpecies can only be propagated by feeds, which mult be procured from the countries where it naturally grows. They mult be fown freth in pots, and pluaged into a good hot bed, where they will come up in fix or cight weeks. While young, they may be kept in a hot-bed of tan-bark under a frame during the fummer; but in autumn they muft be removed into the bark-fove, where they fhould confantly remain. The fecond fort may be propagated the fame way; but the third is to be propagated by layers, and will live all the winter in a good greenhoure.

Ufes. The wood of the firf fpecies is of very confiderable ufe both in medicine and in the mechanical arts. It is fo compact and heavy as to fink in water. The outer patt is ofeen of a pale yellowifh colour; but the leeart is blacker, or of a deep brown. Sometimes it is marbled with different colours. It is fo hard as to break the tools which are employed in felling it; and is therefore fildom ufed as firewood, but is of great ufe to the fugar-planters for making wheels and cogs to the fugar-mill. It is alfo froquently wrought into bowls, mortars, and other utenfils. It is brought over hither in large pieces of four or five hundred weight each; and from its bardnefs and beauty is in gitat demand for varions articles of turnery ware.
'The wood, gum, bark, fruit, and even the flowers

.

.

 ?

$\qquad$

of this tree, lave been found to ponfers medicinal vir. tues; but it is only the three firt, and more particularly the wood and refin, which are now in gencral ufe in Europe. The wood has little or no frell, except when heated, or while rafping, and then a flight aromatic one is perceived. When chewed, it impaffes a mild acrimony, biting the palate and fances. Its pungency relides in its refinows matter, which it gives it out in fome degrie to water by boiling, but Cpirit extract: it wholly.
Of the burk there are two kinds; one finooth, the other unequal on the furface: they are both of them weaker than the wood; though, while in a recent flate, they are frungly cathartie.
The gum, or rather gummy refin, is obtained by wounding the bark in different parts of the body of the tree, or by what has been callcedjagtivg. It exfudes copionfly from the wounds, thourh gradually; and when a quantity is found accumulated upon the feecral wounded trees, hardened by expoliure to the fun, it is gathered and packed in fraall kegs for exportation. This refin is of a friable texture, of a deep greemith colour, and fometimes of a reddifh hue; it has a pungent acrid tafte but litule or no fmell, unlefs heated. The tree aifo yiclds a fpontaneous exfudation from the bark, which is called the nusive grom, and is hrought to us in fimall irregular pieces, of a bright femipellucid appearance, and differs from the former in being truch purer.

In the choice of the woot, that which is the frefhert, mot ponderous, and of the darkeft colour, is the beth; the larger pieces are to be preferced toa; and the beft method is to rafp thicm as wantec, fur the fiace parts are apt to exhale when the ralpings or clips are kept a while.
In choofing the refin, prefer thofe pieces which have lips of the bark adhering to them, and thast eafly feparate therefrom by a quick blow. The retin is fometimes fophiticated by the negroes with the gum of the manchincal trie ; but this is cality detceted by difiving a litete in fpirit of wine or ram. The true guim imparts a whitith or milky tinge, but the manchineal gives a greenifh calf. Möuch advifes a fecy drops of /pirit. nitri dulc. to be added to the fipirituons folution, and then to be diluted with water, by which the gum is to be precipitated in a blue powder; hu: the adulteration will appear floating in white frixe, x́c.

Guaiacum was firll introductd into Europe as a remedy for the vencreal difeafe; and appears to have been ufed in Spain fo early as $\mathbf{1 5 0 8}$. The great fuccefs attending its adminititration before the proper ufe of mercury was known, brought it into fuch repute, that it is faid to have been fold for feven old crowns a.pound. It did not, however, continue to maintain its reputation; but was found generally to fail where the diretre was deep.rnoted, and was at length fuperfeded by mercury, to which it now only freves occationally as ain adjuvant in the decolium IEgnorum, of which guaiacum is the chicf ingredient.
The general virtues of guaiacum are thofe of a warm flimulating medicine; ftrengthening the fonach and other vifcera, and remarkably promoting the urinary and cuticular difcharges: hence, in cutaneous defeda. tions, and other diforders proceeding from obftructions of the excretory glands, and where Augg: fh ferous hu-

## 167 ] G U A

mours abound, they are eminently ufeful; rheumaicicurisum, and other pains have often been relieved by them. Guacur. They are alfo laxative. The refu is the molt astive of -rthere druts, and the efficacy of the others depends upoa the quantity of this part contained in them. The rehin is extracted from the wood in part by watery liquors, but much more perfectly' by fpinituous ones. 'Ih's watery extract of this word, kept in the fhops, prows not only le fs in quantity, but contiderably weaker than one made with fpirit. 'This laft extract is of the fame quality with the native refin, and differs from that brought to us only in being purer. The gum or extracts are given from a few grains so a foruple or half a dram, which lalt dole proves for the moll part confiderably purgative. The officinal preparations of guaiacum are, an extract of the wood, a folution of the arm in rectified fpirit of wine and a folution in volatile fpirit, and an empyremmatic oil diltilled from the wood. The relin diffulved in rum, or combined with water, by means of mucilage or the rolk of egg, or in form of the volatile tincture or elixir, is much employed in gout and chronic rheumatim. The tincture or elixir has been given to the extent of half an ounce twice a-day, and is functimes uffully combined with ladanum.

GUALEOR, Gualior, or Goriatier, a large town of Indoflan in Alia, and capital of a province of the fame name, with an ancient and cllibrated fortrefs of great flrength. It is fituated in the very heart of Hindoftan Proper, being ahout 80 miks to the fouth of Agra, the enzeicnt capital of the empirie, ant 150 fronn the nearett part of the Gaages. From Caleulta it is, by the neareth rout, upwards of 800 mils, ard 9 to by the ordinary one; and about 280 from the Britifh fromticrs. Its iatitude is $\mathbf{2 6}$. 14 . and longitude $; 8.26$. from Greenwich.
In the ancient divifion of the empire it is claffed in the Soubah of Agra, and is offen mentioned in hitory. In the year 1008 , and during the two following cencuries, it was thrice reduced by faminu. It is probable that it mall in all ages have been deemed a milltary port of utmoit confequence, both from its firtuation in refpect to the capital, and from the peculiaritw of its fite, which was generally deemed impregnable. With refpeer to its relacive pofition, it mull be contidered that it Itands on the principal road leading fron: Agra to Malwa, Guzerat, and the Decan ; and that too near the place where it enters the hilly trast which adrances fiom Bundscicund, Malwa, and Agimere, to a parallel with the river Jumnah, throughout the greateft part of its courfe. And from all thefe circumilances of general and particular fituation, together with its natural and acquired advantages as a fortreff, the poffeffion of it was deemed as neceffary to the ruling emperors of Hindoflain as Dover callle might have been to the Saxon and Norman kingz of England, Ihs paiace was ufed as a fate prifon as early as 1317 , and continuted to be fuch until the downfal of the em-pire.-On the linal difmemberment of the empire, Gualeor appears to have fallen to the lot of a rajah of the Jat tribe; who allumed the government of the diflrict in which it is immediately fituated, under the title of Rana of Golud or Gohd. Since that period it has changed mafters more than once ; the Mahrattas, whofe domivions extend to the neighbourhool of

- the Rana: but the micuns of tranfet were ahways eithe fomine on :reathery, nothing like a fiege having everluen atwaterl.

Gualeor wa in the poffeffon of Madajee Scindia, a NHhatata chict, in 1700 , at the chole of which year the conncil-genem of bengal conchaded an alliance with the Rana; in confegucne of which, four battalions of fepery of 500 men each, and fone pleces of artillery, were fent to his afmaner, his ditritit being over-mun by the Mahrattas, anj himelf almon that up in his fort of Cohad. The grand olject of his alliame was to penetrate into Scindia's emmty, and finally to chaw Scindia homfoff from the wetsern lide of lalin, whore he was attending the moions of general Goddard, who was then emplaged in the reduction of Guyerat ; it being Mr Hattings's itea, that when Seindia fonnd his orn dominions in danger, he would detach himbelf from the confuleacy, of which he was the prineipal member, and thos leave matuers open for an ancommodation with the court of Joonah. It fellout exactly as Mr Halines predicted. Mujor Willi:m Pophan was appointed to the command of the little army fent to the kana's affllance; and was very fuccelsful, as well in clearing lis conntry of the enemy, as in driving them out of one of their own mot valuable diftricts, and keeping poffefion of it: and Mr HaAlings, who jutly concluded that the capture of Gualeor, if practicable, would not only open the way into Scindia's country, but would alio add to the reputation of our arms in a degree much beyond the rifk and expence of the undertaking, repeatedly expreffod his opinion to major Popham, together with a wih that it might be attempted; and founding his hopes of fiuccels on the confidence that the garrion would prebably have in the natural ftrength of the place. It was accordingly undertaken; and the following account of the place, and the manner of our getting pofleffoun of it, was writen by captain Jonatian Scott, at that fime Perian interpreter to major Pupham, to his brother inzor fohn Scott.
"The fortrels of Gualeor flands on a vall rock of abunt furm miles in length, but narrow, and of uncqual breadth, and nearly flat at the top. The fides are fo fteep as to appear almoft perpendicular in every part ; for where it was mot naturally fo, it has been feraped away; and the lecight from the phain below is from 200 to 300 fuct. The rampart conforms to the edge of the peceppice all round ; and the only entrance to it is by thepranning up the fide of the rock, defended on the dide next the country by a wall and bations, and farthor guarded by feven llone gateways, at certain dillances from each other. The area within is full of noble buidians, refervoirs of water, wells, and cultivated land : fo that it is really a little ditlrict in itfelf. At the noth-well foot of the mountain is the town, pretty lage, and well butt ; the houles all of flone. 't's have befreged this place would be vain, for nothing but a firprife or blockade could have carrical it.
"A trike of handitti from the dilrict of the Rama had been accultomed to rob about this town, and once in the dead of might had climbed up the rock and got inzo the fort. 'This intelligence they had communicated so the Rana, who ofton thought of availing hamfelf $\mathrm{N}^{\mathrm{r}} 145$.
of it, but was fealful of tindertaking an enterprize of foch monent with his own troops. At length he informod major lopham of it, who fent a party of the wobers to conduct fome of his own fpics to the fpen. They acemaingly slimbed up in the night, and fonnd that the ginats generally went to fleep after their rounds. Popham now ordered ladders to be matie: hut with for mush fecrecy, that until the night of fuprife only mylilf and a few others kntwit. On the 3 d of Angull, in the evening, a paty was ordered to be in readinefs to march under the command of eaptain William Bruce; and Popham Fut himelf at the head of two batalions, which were imsediatiy to follow the ftuming party. To present as much as poflible any noife in approaching orafcending the rock, a kind of moes of woollen cloth were made for the repoys, and ftufed with cotton. At eleven o'dock the whole dotachment marchaed from the comp at Reypour, eight miles from Gualeor, thro' unflequated pathe, and reached it at a little before day break. Juft as captain Brace arried at the fout of tae rock, he faw the lights which accompanied the rounds moving along the rampart, and heard the fentinds cough (the mode of fignifying that all is well in an Indian camp or garrion), which might lave damped the fpirit of many men, but ferved only to itifire him with more confitence, as the moment for action, that is, the interval between the palling the rounds, was now atcertained. Accordingly, when the lights were goue, the wooden ladders were placed againft the rock, and one of the robbers firf mounted, and returned with an account that the geard was retired to flcep. Liemtenant Cameron our engibecr, next mounted. and tied a ropeladder to the battlements of the wall; this kind of lader being the only one adapted to the parpole of fealing the wall in a body (the wooden ones only forving to afoend from crag to crag of the rock, and to adill in fixing the rope-ladders). When all was ready, captain Bruce, with 20 fepoys, grenadiers, afcended without being difcovered, and fquatted down mider the parapet ; but before a reinforcencot arrived, three of the paty had fo littie recollection as to fre on fome of the garrifon who happened to be lying alleep near them. 'This had nearly ruined the whole plan; the garrifon were of courfe alarmed, and ran in great numbers towards the place; but, ignorant of the ilrength of the affailants (as the men fired on had been killed outright), they fuffered themflves to be flopped by the warm fire kept up by the fmall party of the grenadiers, until major Pophanm himfelf, with a confiderable reinforcoment, came to their aid. 'The gamion then retreated to the inner buildings, and difcharged a few rockets, but foon afterwards retreated precipitately through the gate; whitt the principal efficers, thas deferted, affembled together in one houfe, and hung out a tlag. Najor Poplam fent an offiece to give them affurance of quarter and protcction; and thus, in the foace of two hours, this important and allonifhing fortrefs was completely in our profeffion. We liad only 20 men wounded and $:$ killed. On the fide of the enemy, Bapogee the governor was killed, and moll of the principal officers wound d."

Thus foll the flrongefl fortrefs in Itindoflan, garrifond by a chofon Lodis of 1200 men , on Augult 4.

1780;

1780; and which, before the capture of it by the Britifl, was pronounced by the princes of Hindoftan, as far as their knowledge in the military art extended, to be impregnable. In 1783 Madajee Scindia befieged this fortrefs, then poffeffed by the Rana of Gohud, with an army of 70,000 men, and effected the reduction by the treachery of one of the Rana's officers, who formed the plan of admifion of a party of Scindia's troops; thicfe were immediatcly fupported by another party, who attacked an oppofite quarter, and got admiffion alco.

GUAM, the largeft of the Ladrone iflands in the South Sea, being about 40 leagues in circumference. It is the only one among the imnumerable iflands that lie fcattered in the immenfe South Sea which has a town built in the European Ityle, with a regular fort, a church, and civilized inhabitants. The air is excellent, the water good, the garden fluffs and fruits are exquifite, the flocks of buffaloes innumerable, as are thofe of goats and hoge, and all kinds of poultry abnuad in an aftonifhing degree. There is no port in which worn-out failors can be more fpeedily teftored, or find betier or n:ore plentiful refreflments, than in this.

But Guam did not former!y enjoy this flate of abundance. When it was firlt difcovered by Magellan in 152 t , with the other eight principal iflands that lie north of it, which, with a multitude of fmaller ones, form together that archipelago known by the name of the Ladrones, they were all crowded with inhabitants, but aforded no refrefhments to navigators except finh, bananas, cocoa nuts, and bread fruit; and even thefe could not be procured but by force, amidat fhowers of the arrows and lances of the natives. The Spaniards carried thither from America the firlt fock of cattle, of fowls, of plants, and feeds, and fruits, as well as garden lluffs, which are all now found in fuch abundauce.

The Ladrone iflands, and Guam in particular, were covered with inhabitants when they were dificosered. It is faid that Guam alone contained upon its coafts more than 20,000 people. Thefe men were ferucious favages and beld thicves, as all the inlanders in the fouth feas are, undoubtedly becaufe they were unacquainted with the rights of property; hut they were fo farayge, fo incapable of fupporting the yoke of civilization, that the Spaniards, who undertook to bring them nnder the regulations of law and order, have fuen their nunbers almof annililated within the fpace of two canturies. Under the government of their miffionaries, thefe lierse iflanders, after having long defended, by cruel wars, the right of living like wild beafts undet the guidance of inftinet, bsing at laft obliged to yield to the fuperiority of the Spanith arms, gave themfelves up to defpair: they took the refolution of adminillting potions to their women. in order to procurc abortions, and to render them fterile, that they might not bring into the world, and leave behind them, beings that were not free, accolding to the ideas that they had of liberty. A refolution fo violewt, and fo contrary to the views and intentions of nature, was perfifled in with fo much obftinacy in the mine Ladrone iflands, that their population, which at the time of the difcovery confilted of more than 60,000 fouls, does not now exceed $\varepsilon 00$ or $g=0$ in the whole Vol.VilI. Part I.
estent of the archipelago. About 20 or 30 years ago, the feattered fragments of the original natives were collected and eftablifhed in the ifland of Guam, where they now begin to recover by the wife precantions, and prudent, though tardy, exertions of a government more adapted to the climate of thefe inands and to the genius of their inhabitants.
The principal fettlement, which the Spaniards call the town of Agana, is lituated about four leaguea north-ealt of the landing-place, on the fea-fhore, and at the foot of fome hills not very high, in a beaut ful well-watered country. Befides this, there are 21 fmaller fettlements of Indians round the ifland, all on the fea-fhore, compofed of five or fix families, wh, cultivate fruits and grain, and employ themfelves in firhing.
The centre of the ifland is ftill uncleared. The trees are not very tall, but they are fit for the building of houfes and of boats. The foretts are in general very thick. The Spaniards at firft cleared certain portions of land to turn them into favannahs for the fceding of cattle. The formation of favannais contite in multiplying within the forctts fmall cleared lpots feparated only by thickets and rows of trees, 3 and kept clean from mirubs of every kind. The Spaniards fow thefe foots with grafs feeds, and other indigenous plants that are fit for pafturage. Thefe meadows, being effectually haded on every quarter, preferve their frethnefs, and afford the flocks and herds a thelter from the fun and the great heat of noon. The cattle that were formerly brought to the favannahs of Guan from America have multiplied aftonifingly : they are become wild, and mutt be hot when wanted, or taken by itratagem.

The woods are likewife full of goats, of hogs, and fowls, which were all originally brought thither by the Spaniards, and are now wild. The fich of all thefe animals is excellent. In the favannahs, and even in the heart of the forefts, there is a vaft multitude of pigeons, of parroquets, of thrufhes, and of hlackbirds.

Among the indigenous trees of the country, the moft remarkahle are, the cocoa-nut tree and the breadfruit tree. The woods are alfo filled with guavas, b ananas, or plantanes of many varieties, citrcus, lemons, and oranges, both fwect and bitter, and the fmall dwarf thorny china-orange with red fruit. Tlee caper-bufh abounds in all the Ladrone iflands; and as it is conftantly in flower, as well as the citron and orange hrubs, with many other of the indigen e, plants, they perfume the air with the moft agreeable fmells, and delight the eye with the richent colours.

The rivers of Guam, which are either rivulets or torrents, abound in fifh of an excellent quality : the Indians, how ever, eat none of them, hut prefer the inhabitants of the lea. The turtle, which grow here as large as thofe in the ifland of A feention, are not eaten either hy the Indians or Spaniards.

The cultivated crops lately introduced are, the rice, the maize, the indigo, the eoton, the cocos, the fa-gar-canc, which have all fucceeded. That of the maize, efpecially, is of aftonifhing fertility : it is common to find in the fields where this grain is cultivated plants of twelve feet high, bearing eight or ten foikes from nine to ten inches in length, fet rourd with well. filled feeds. The gardens are fored with mangnes X and

Glamanga and pine-apples. The former is one of the finelt fruits eaten in great quantity without any bad confequenees. - Horfes have been brought to Guam from Manilla, and afks and manks from Acapulen. The Indians have been taught to tame and domenicate the ox, and to employ lim in the dranght.

This ifland, the land of which rifes gradually from the fea-fore towards the centre by a gatle acclivity, is net very mountainous. The inhabitants fay, that its foil is equally rich and fertile over the whole illani, except in the nothern fart, which forms a peninfula almoft deffitute of water. But in the rell, you cannot go a league without meeting a rivulet. Upon penctrating a little way into the interior pare of the comntry, to the ealt and the fouth of Agana, many fprings of fine water are found, forming, at little dif. tances, bafons of purc water, which, being haded hy thick trees, preferve a moft agrecable coolnefs in fpite of the heat of the climate.

The indigenous inhabitants are fuel as they were deferibed by Magellan; of fmall flature, futficiently ugly, black, and in general dirty, though they ate continually in the water. The women are fur the molt part handfome, well made, and of a reddifh colour. Burh fexes have long hair. This fcanty people have become hy civilization gente, honeft, and hofpitalie. They have, however, at the fame time acquired a vice that was unknown to their favape anceltors. Thie wen are a litule addicted to drankennefs, for they drink fretly of the wine of the cocoa-nut. They love mulice and dancing much, but labour little. They are paffonately fond of cock-fighting. On Sandays and holidays they gather together in eroxds after the fervice, at the door of the church; where each Indian brings his coek to match him with that of his neighbour, and each bets upon his own. - The miffion of Guam is now in the hands of the Augutine friars, who have fupplanted the Jefuits. E. Long. 139.25. N. Lat. 30. 26.

GUAMANGA, a confiderable town of South A. merica, and capital of a province of the fame name in Peru, and in the andience of Lima, with a bithop's fue. It is remarkable for its fiveetmeats, manufactures, and miacs of gold, fiver, luadfone, and quiekfilver. 3V. Lone 7. 5c. S. Lat. 3. C.

GUANUCO, a tich and handfome tom of South America, and capital of a ditrict of the fame name in ite audicnce of Lima. W. Long. 72. 55. S. Lat. 9. 55.

GUANZAVELCA, a town of South America, in Prou, and in the audience of Lima. It abounds in mines of quiekfilver. W. Long. 7t. 59. S. Lat. 12. 40.

GUARANTEE, or Warrantee, in law, a term relative to warrant or warranter, properly fignifying bim whem the warranter undertakes to indemnify or fecure from damage.

Guaranite is morefiequemly ufed for a warranter, or a perfon who undertakes and obliges himifelf to fee a fecond jerfon perform what he has itipulated to the thiod. Sec Warranty.

GUARANTY, in matters of polity, the engagement of mediutorial or acturel hates, wherby they
plight their faith that certain treaties fhall be inviolably obferved, or that they will make war againt the aggrefior.

GUARD, in a general fenfe, fignifies the defence or prefervation of any thing; the act of obferving what patles, in order to prevent furptife; or the care, precaution, and attention, we make ufe of to prevent any thing from happeaing concraly to our intentions or inclinations.

Guard, in the military art, is a duty performed by a body of men, to fecine an army or place from being fiurprifed by an enemy. In garrifon the guards are velieved every day: hence it comes that every foldier mounts guand once every three or four days in time of peace, and much oftener in time of war. Sce Honours.

Aldamad Guakn, is a party of either horfe or fout, that marches before a more confiderable body, to give notice of any approaching danger. Thefe guald are cither made flronger or weaker, aceording to fituation, the danger to be apprehended from the enemy, or the nature of the country.

Vina Cuisto. See Alaumad Guard.
Arillerg $G \subset A R n$, is a detachment from the army to fecure the antlley whea ia the ficld. Their corps cecourde is in the front of the artillury park, and their centries difperfed romed the fame. This is generally a thohrs $^{8}$ guard; and upon a march, this guard marches in the front and year of the artillery, and mult be fure to leave nothing behind: if a gun or wasgon breaks down, the officer that commands the guard is to leave a fufficient number of men to affil the gamers and matroffs in getting it up again.
Artillery Quarter-Gband, is frequenty a non-comminioned oficer's guard from the royal regiment of artillery, whofe corts de garde is aluays in the front of their inc impment.

Ahtillery Rarr.Guakv, confits in a corporal and lix men, polted in the rear of the park.

Corps do Gakde, are fodiers entruated with the guard of a poll, undet the command of one or nare ©ficers. 'This word alio tignifies the place where the guard manuts.

Grand Guard; three or four fumadrons of horfe, commanded by a field-officer, pofled at about a mile or a mile and a half from the camp, on the right and left wings, towards the enemy, for the better fecurity of the camp.

Forgge Guakn, a detachment fent out to fecure the foragers, and who are polted at all places, where either the enemy's party may come to dillurb the foragers, or where they may be fpread too near the enemy, fo as to be in danger of being taken. This guard confifts bath of horfe and foot, and muift remain on their polts till the foragers are all come off the ground.

MIain GuatD, is that from which all other guards are dutached. Thofe who are for mounting guard affomble at their refpective captan's quarters, and march from thence to the parade in good order; wherc, after the whole guard is drawn up, the fmall guards are detached to their refpective polss: when the fubalterns throw lots for their guards, who are alt under
irs. unter the command of the captain of the main guard. This guard mounts in garrifon at different hours, according as the governor pleafes.

Piquet Guard, a good number of horfe and foot, always in readinefs in cafe of an alarm: the horfes are generally faddled all the time, and the riders booted.

The foot draw up at the head of the battalion, frequently at the beating of the tat-too; but afterwards return to their tents, where they hold them.felves in readinefs to march upon any fudden alarm. This guard is to make refiftance in cafe of an attack, until the army can get ready.

Baggage GuARD, is always an officer's guard, who has the care of the baggage on a march. The waggons fhould be numbered by companies, and follow one another regularly: vigilance and attention in the paffage of hollow ways, woods, and thickets, mull be ftrictly obferved by this guard.
$\mathcal{L}^{2}$ uarter Guard, is a fmall giard commanded by a fubaltern officer, pofted in the front of eacli battalion, at 222 feet before the front of the regiment.

Rear GUARD, that part of the army which brings up the rear on a march, generally compofed of all the old grand guards of the camp. The rear guard of a party is frequently eight or ten horfe, about 500 paces. behind the party. Hence the advance.guard going out upon a party, form the rear-guard in their retreat.

Rear Guard, is alfo a corporal's guard placed in the rear of a regiment, to keep good order in that part of the camp.

Stundard Guard, a fmall guard under a corporal, out of each regiment of horfe, who mount on foot in the front of each regiment, at the diftance of 20 feet from the freets, oppofite the main freet.

Trench Guard, only mounts in the time of a fiege, and fometimes confits of three, four, or fix battalions, according to the importance of the fiege. This guard mult oppofe the befieged when they fally out, protect the workmer, \&c.

Provof GUisd, is always an officer's guard that attends the provoll in his rounds, either to prevent defertion, marauding, rioting, isc. See Provost.

Guard, in fencing, implies a poilure proper to defend the body from the fword of the antagonift.

Ordinary Guizds, fuch as are fixed during the campaign, and relicved daily.

Extraordimary Guarns, or detachments, which are only commanded on particular occations; either for the further fecurity of the camp, to cover the furagers, or for convoys, efcorts, or expeditions.

Guards, alfo imply the troops kept to guard the king's perfon, and conlift both of horfe and foot.

Morfe Guskds, in England, are gentlemen chofen for their bravery, to be entrufled with the gruard of the king's perfon; and were divided into fuur troops, called ibe $1 / 2,2 d, 3 d$, and $4^{t h}$ troop of berfe guards. The firtl troop was raifed in the year $1 \% 60$, and the command given to lord Gerard ; the fecond in $16 G \mathrm{I}$, and the command given to Sir Philip Howard; the third in :693, and the command given to earl Feverfham; the fourth in 1792, and the comnaand given to carl Newburgh. Each troop liad one colonel, two licutenant.colonels, one cormet and major, one guidon
and major, four exempts and captains, four brigadiers and lieutenants, one adjutant, four fub-brigadiers and cornets, and 60 private men. But the four troops are now turned into two regiments of life-guards.

Horfe. Grenadicr Guards, are divided into two troops, called the y tand ad troops of borfe.grenaticr guards. The firt troop was raifed in 1693, and the command given to lieutenant-general Cholmondeley; the fecond in 1702, and the command given to lord Forbes. Each troop has one colonel, lieutenant-colonel, one guidon or major, three exempts and captains, thrce lieutenants, one adjutant, three cornets, and 60 private men.

Yeomin of the Guard, firt raifed by Henry VII. in the year 1485 . They are a kind of pompons fuotguards to the king's perfon; and are generally called by a nickname the Leef. Eaters. They were anciently 250 men of the firt rank under gentry; and of larger ftature than oidinary, each being required to be fix feet ligh. At prefent there are but 100 in conttant duty, and 70 more not on duty; and when any one of the 100 dies, his place is fupplied out of the 70. They go drefled after the manner of king Henry VIIl's time. Their firft commander or captain was the earl of Oxford, and their pay is 28.6 d . per day.

Foot Gugrds, are regiments of foot appointed for the guard of his majelly and his palace. There are three regiments of them, called the $1 / \rho, 2 d$, and $3 d$ regiments of foot-guards. They were raifed in the year 1660 ; and the command of the firt given to colonel Ruffel, that of the fecond to general Monk, and the third to the earl of Linlithgow. The firlt regiment is at prefent commanded by one colonel, one lieutenantcolonel, three majors, 23 captains, oue captain-lieutenant, 3 l lieutenants, and 2.4 enfigns; and contains three battalions. The fecond regiment has one colonel, one lieutenant colonel, two majurs, it captains, one captain-lieutenant, 18 lieutenants, 16 enfigns; and contains only two battalions. The third regiment is the fame as the fecond.

The French Guards are divided into thofe within, and thofe without, the palace. - The firl are the gardes du corps, or body-guards; which confift of four companies, the firl of which companies was anciently Scots. See Scots Guards, infra.

The guards without are the Gens d'Armes, light horfe, mufqueteers, and two ather regiments, the one of which is French and the other Swifs.

New arrangements, however, have taken place in this department as well as others fince the late revolution.

Scots Guards; a celebrated land, which formed the firlt company of the ancient gardes du corps of France.

It happented from the ancient intercourfe between France and Scotland, that the natives of the latter king. dom had often ditinguifhed themfelves in the fervice of the former. On this foundation the company of Scots guardes, and the company of Scots gendarmes, were initituted. - Both of them owed their inftitution to Charles VII. of France, by whom the firf flanding army in Europe was formed, anno 1454; and their fates cannot but be interefting to scotficen. See Gendarmes.

Valour, honour, and fidelity, mult have been very confpicuous features of the national character of the

## $G$ U A

Guard. Seots, when fo great and civilized a people as the French could be induced to choofe a body of them, foreigners as they were, fur guarding the perfons of their fovereigns.-Of the particular occafion and reafons of this predilection, we have a recital by Louis XII. a fucceeding monarch. After letting forth the fervices which the Scots had performed for Charles VII. in expelling the Engliih out of France, and reducing the kingdon to his obedience, he adds-" Since which

Hija. of
Luvis 3 17. by C'aud Sejfil, miaRer of re. quefts to thas jrince reduaion, and tor the fervice of the Scots upon that occafion, and for the great loyalty and virtue which he found in them, he ielected 200 of them for the guard of his perfon, of whom he made an hundred men at arms, and an hundred life-guards: And the hundred men at arms arc the hundred lances of our ancient ordinances; and the lifeguard men are thofe of our gnard, who hitl are near and about our perfon." -As to their fideliey in this honourable fation; the hifto. rian, fpeaking of Scotland, fays, "The French have so ancient a friendfhip and alliance wilh the Scots, that of 400 men appointed for the king's life-guard, there are an hunded of the faid nation who are the neareft to his perfor, and in the night keep the keys of the opartment where he fleeps. There are, moreover, an hundred complete lances and two hundred yeomen of the faid uation, betides feveral that are difperfed thro' the enmpenies: And for folong a time as they have ferved in France, never hath there been one of them found that hath committed or done any fault againt the kings or their Atate; and they make ufe of them as of their own fubjects."

The ancient rights and privileges of the Scotrifl life-guards were very honourable; efpecially of the twenty-four firl. The author of the Ancient Alliance fays," On bigh holidays, at the ceremony of the royal touch, the erection of knights of the king's order, the reception of extraordinary ambafladors, and the public entries of cities, there mult be fix of their number next to the king's perfon, three on each fide; and the body of the king mutt be carricd by thefe only, wherefoever ceremony requires. They have the seeping of the keys of the king's lodging at night, the keeping of the chnir of the chapel, the keeping the boats where the king paffes the rivers: and they have the honour of bearing the white filk fringe in their arms, which' in France is the coronne colcur. The keys of all the cities where the king makes his entry are given to their captain in waiting or out of waiting. He has the privilege, in waiting or out of waiting, at seremonies, fuch as coronations, marriages, and fuserals of the kings, and at the baptifn and marriage of their children, to take duty upon him. The coro-sation-robe belongs to him: and this company, by the death or change of a captain, never changes its rank, as do the three others."

This company's firft conmander, who is recorded as a perfon of great valour and military accomplifh. ments, was Robert Patillock, a mative of Dundee; and the band, ever ardent to dillinguifh itfelf, continued in great reputation till the year 1578 . From that period, the Scots guards were lefs attended to, and their privileges came to be invaded. In the year 1612 , they remonflrated to Louis XIII. on the fubject of the injuftice they had fuffered, and fet before Lim the fervices they had rendered to the crown of

172 ] G U A
France. Attempts were made to re-efahlifh them on their ancient foundation; but no negociation for this parpole was effectual. The tronps of France grew jealous of the honours paid them: the death of Francis 1I. and the return of Mary to S:otland, at a time when they had much to hope, were unfortunate circumllances to them: the change of religion in Seotland, was an additional blow: and the acceffion of James VI. to the throne of England, ditunited altoget her the interelts of France and Scotland. The Scots guards of France had therefore, latterly, no connection with Scotland but the name.

Guard-Boat, a boat appointed to row the rounds amongt the flips of war which are laid up in any harbour, $\& c$. to oteferve that their officers kcep a good looking-out, calling to the guard-boat as the paffes, and not fuffering her crew to cone on board, without having previoully communicated the watcheword of the night.
Gusid-Ship, a veffll of war appointed to fuperintend the marine affais in a habbour or river, and to fee that the fhips which are not cormmiflioned have their proper watchwand kept duly, by fending her guard-boats around them every night. She is alfo to receive feamen who are imprefled in the time of war.
GUARDIAN, in law, a perim who has the charge of any thing; but more comnonly it fignifics nue who has the cuilody and cducation of fuch perfons as have not fufficient difertion to take care of themfelves and their own affairs, as chil! ren and ideots.
Their bulinefs is to take the prolits of the minor's lands to his ufe, and to acconat for the fane: they ought to fell all moveables within a reafonable time, and to convert them into land or money, except the minor is near of age, and may want fuch things himfelf; and they are to pay interef for the money in their hands, that might have been fo placed out ; in which cafe it will be prefumed that the guardians made ufe of it themfelves. They are to funain the lands of the heir, without making deflruction of any thing thereon, and to keep it fafely for him: if they commit watte on the lands, it is a forfeiture of the guardianthip, 3 Edw. I. And where perfons, as guardians, hold over any land, withou: the confent of the perfon who is next intitled, they fhall be adjudged trefpaffers, and thall be aecountable; 6 Aun. cap. xviii.
Guardian, or Warden, of the Cinque ports, is an officer who has the jurifdiction of the cinque ports, with all the power that the admiral of England has in other places.

Camden relates, that the Romans, after they had fetted themfelves and their empire in our inand, 'appointed a magiftrate, or governor, over the eaft parts, where the Cinque-ports lie, with the title of comes liforis Saxonici per Brilanniam; having another, who bose the like title, on the oppofite fide of the fea. Their bufinefs was to ftreng then the fea coaft with munition, againtt the outrages and robheries of the barbarians; and that anticuary takes our warden of the Cinque-ports to have been erected in imitation thereof. The wardenfhip is a place of value, fuppofed worth L. 7000 per annum.

Guakdan of the Spinitualitics, the perion to whom the firitual jurifdistion of any diocefe is committed, during the time the fee is vacant. A guardian of the

## G U A

fpiritulities may likewife be either fuch in lave，as the archbihop is of any dincefe within his province；or by delegation，as he whom the archbifhop or vicar－ general for the time appoints．Any fuch gardian has power to hold courts，grant licences，difpenfations， probates of wills，\＆c．

GUAREA，in botany：A genus of the monogynia order，belonging to the cetandria clafs of plants．The calyx is quadrifid；the petals four ；the nectarium cy－ lindric，having the anthere in its mouth；the capfule is quadrilucular and quadrivaluular ；the feeds fulitary．

GUARINI（Battifta），a celebrated Italian poet， born at Ferrara，in 1538．He was great－grandion to Guarino of Verona，and was fecretary to Alphonfo Duse of Ferrara，who intrufted him with feveral im－ portant commifions．After the death of that prince， be was fuccefively fecretary to Vincenzio de Gonza－ ga，to Ferdinand de Medieis grand duke of Turca－ ny，and to Frarcis Maria de Fel：ri duse of Urbino． But the only advantages he reaped under thefe various mafters，were great encomiums on his wit and corpoti－ tions．He was well aequainted with polite literature； and aequired immortal reputation by his Italian poems， efpecially by his Paflar Füllo，the mof known and ad－ mired of all his works，and of which there have heen innumerable editions and tranhations．He died in 1612.

GuARDIA，or Guarda，a tnwn of Portugal，in the province of Betia，with a bilhop＇s fee．It con－ tains about 2300 inhabitauts，is fortiied both by art and nature，and has a tlately cathedral．W．Long． 5 ． 17．N．Lat．40． 20.

Guabdi－Alferez，a town of Italy，in the kingdom of Naples，and in the Contado－di Molife，with a bi－ Thop＇s iev．E．Long．15．53．N．Lat．51．50．

GUARGAIA，or Gueggula，a town of A． frica，and capital of a tinall kingdon of the fame name， in Biledulgerid，to the fouth of Mouat Atlas．E．Long． 9．55．N．Lat．28．o．

GUARIBA，in natural liftory，the name of a fpe－ cics of monkey found in the We＇t Indies．See Smia．

GUASTALLA，a ftrong town of Italy，in the duchy of Mantua，with the title of a duchy，remark－ able for a battle between the French and Imperialifts in 173t．It was ceded to the duke of Parma in 1749，by the treaty of A ix la Chapeile．It is feated near the river Po，in E．Long． 10.3 3．N．Lat．44． 55.

GUATIMALA，the fludence of，in North A． merica，and in New Spain，is above 750 miles in length，and 450 in breadth．It abounds in chocolate， which they make ufe of inftead of money．It has 12 provinces under it ：and the rative Americans，under the dominions of Spain，profefs Chrifianity；but it is mixed with a grcat many of their own fuperftitions． There is a great chain of high mountains，which run acrofs it from E．to W．and it is fubject to earthquakes and form3．It is however very fertile；and produces， bcfides checolate，great quantitics of cochineal and cotton．
Guatimala，a province of North America，in New Spain，and in the Audience of the fame name； bounded on the W．by Soconjufco，on the N．by Ve－ rapaz and Honduras，on the E．by Nicaragua，and on the S．by the fouth fea．St Jago de Guatimala is the capital of the whole audience．

Guatimala，a large and rich town of North A－

## 173 ］G U A

merica，in New Spain；and capital of a government Gautimala of tbe fame name，with a bihop＇s fee，and an univer－
fity．It carries on a great trade，efpecially in choco－
late．Ti．Long． 9 I．20．N．Lat．14． 0.
Gautimala（the Volcano of），is a mountain，which throws ont fire and fmoke．St Jago de Gautinala was almont ruined by it in 1541 ．It was afterwards rebuilt at a good diftance from this dreadful mountain． A few years ago，however，it was again deftroyed， with circumflances more terible perhaps than any mentioned in hiftory．

GUAVA，in botany．See Psidiua．
GUAXACA，a province of North America，in New Spain，which is very fertilc in wheat，Indian corn，cochineal，and callis．It is bounded by the gulph of Mexico on the north，and by the fouth fea on the fouth．It contains mines of gold，filver，and cryftal． Guaxaca is the capital town．

Guazaca，a town of North Ameriea，in the Au－ dience of Mexico，and capital of a province of the fame name，with a bifhop＇s fee．It is without walls， and does not contain above 2 coo inhabicants；but it is rich，and they make very fine fwect－meats and cho． colate．It has feveral rieh convents，both for men and women．W．Long． 100 ．N．Lat． 17,45 ．

GUAYRA，a ditrict of the province of La Pla－ ta，in South America，having Brail on the eaft，and Paraguay on the weil．

GUBEN，a handfome town of Germany，in Low－ er Lulatia，feated on the river Neific，and belongring to the houfe of Sax－Merfeaburg．E．t．59．N．Lat． 51.55.

GUBER，a kingdom of Africa，in Negroland．It is furrounded with high mountains；and the villages， which are many，are inhabited by people who are em－ ployed in taking eare of their cattle and hleep．There are alfo abundauce of artificers，and hinen－weavers， who fend their commodities to T＇ombuto．The whole country is overlowed every year by the inundations of the Niger，and at that time the inhabitans fow their rice．There is one town which contains almot 6000 families，among whom are many merchants．

GUBIO，a town of Italy，in the territory of the church，and in the dichy of Urbino，with a binoper fce．E．L．ng．12． 4 I．N．Lat．43． 18.

GUDGEON，in ichibyology ；a ípecies of cypri－ mis．See Cyprinus．
This fih，though fmall，is of fo pleafant a talte， that it is very litile inferior to fmelt．They fawn twice in the fumner－feafon；and their feeding is much like the tatbels in Arcams and on gravel，Aiphting all manner of flies：but they are eafly taken with a fomall red worm，fifhing near the ground；and being a leather－ mouthed finh，will not eally get off the hook whea ftuck．－The gudgeon may be filhed for with float， the hook being on the ground；or by hand，with a running line on the grouad，without cork or float． But although the finaii red worm above mentioned is the bell bait for this filh，yet wafps，genales，and cad－ baits will do very will．You may alfo fith for gudgeons with two or three hooks at once，and find verypla． fant fiport，where they rife any thing large．When you angle for them，thir up the fand or gravel with a long pole；：his will make them gather to that place， bite fatiter，and with morc eagernefs．
Sat－Gudgeni，Rock－fh，or Black Goys：See Gomurs．

Glubres, or Gabres. Sec Gazres.
GUELPHS, or Guelrs, a colcbrated faction in Italy, antagonits of the Gibelins. See Gibelins.

The guelphs and Gibelins filled Italy with blood and carnage for many years. The Guclphs thood for the Pope, againft the emperor. Their sife is referred by fome to the time of Conrad III. in the twelfth century ; by others, to that of Frederic I.; and by others, to that of his fucceffor Frederic 11. in the thirteenth century.

The name of Gudph is commonly faid to have been formed from $W_{\text {elfe }}$, or $W_{e} l j g$, on the following occafion: the emperor Conrad IIL. having taken the duchy of Havaria from Welfe V'I. brother of Henry duke of Bavaria, Welfe, affited by the forces of Roger king of Sicily, made war on Conrad, and thus gave birth to the faction of the Guelfs.

Others derive the name Guelfs from the German W'olf, on acconnt of the grievons evils cummitted by that cruel faction: others deduce the denomination from that of a German called Guelfe, who lived at Pifloye; adding, that his brother, named Gibel, gave his name to the Gibrlins. See the articie Gibetrys.

GUELDERLAND, one of the united provinces, bounded on the W. by Utrecht and Holland, on the E. by the bithoprick of Munter and the duchy of Cleves, on the N. by the Zuyder fa and Overyfel, and on the $S$. it is feparated from Brabant by the Daes. Its greateft extent from N. to S . is aborith 47 miles, and from W. to E. near as much; but its ligure is very irregular. The air here is much heathier and clearer than in the maritime provinces, the land lying higher. Excepting fome part of what is called the Feluwe, the foit is fruitful. It is watered by the Rhine, and its three branches, the Wahah, the Yffel, and the Leek, befides leffer theams. In 1079 , it was raifed to a county by the empror Henry IV. and in 1339 to a duchy by the emperor Lous of Bavaria. It had dukes of its curn till :528, when it was yidded up to the emperor Clanles V. In 1570. it acceded to the union of Utrecht. It is divided into three diftricts, each of which has its Atates and diets. Thofe for the whole province ire held twice a-year at the capital towas. The province fends 19 deputies to the flates. seacral. Here are computed 285 Calvimit miniters, ${ }^{1}+$ Roman Catiolle cougregations, 4 of the L wheran peritafion, hefides 3 others of Romonftrants and Anabapiits. 'The places of mont note are Nimeguen, Zutphun, Arnheim, Harderwyk, Loo, \&c.

GUELDDRES, a Atrong town of the Netherlands, in the ductiy of the fame name. It was ceded to the king of Prulfa by the peace of Utrecht, and is feated among marthes. E. Long. 6.21.N. Lat. 5 t. 30.

GEERCINO. See Barbieri.
GITERICEE, or GuEriche, (Otho), the mot celebrated mathematician of his time, was born in 1Go2. He was the inventor of the air pump; and aththor of feveral works is natural plislofophy, the chief of which is Espformonta Magdoursia. IHe dicel in 1685.

GUERNSEI, an ifland in the Englift channel, on the coalt of Nurmandy, fubject to lbritain ; but (as well as the ddjacent illands) governed by it own laws. See Jersey. It extends from eall to weit in the form of a harp, and is thirteen miles and a half from the
fouth-welt to north-calt, and twelve and a half, where Giettard broadeft, from eaft to weft. The air is very healthy, and the Coil naturally more rich and fertile than that of Jerfey ; but the iahabitants neglect the cultivation of the had for the fake of eommerce : they are, however, fufficiently fupplied with corn and cattle, both for their own ufe and that of their flips. The ifland is well fortified by nature with a ridge of rocks, one of which abounds with emery, ufed by lapidaries in the polihing of llones, and by various other artificers. Here is a better harbour than any in Jerfey, which occafions its being more reforted to by merchants; and on the fouth.fide the flore bends in the form of a cref. cent, enclofing a bay capable of receiving vary large thips. The ifland is full of gardens and orehards: whence cyder is fo plentiful, that the eommon people ule it inltead of fmall beer, but the more wealthy drink French wine.

GUETTARDA, in botany: A genus of the heptandria order, belonging to the moncecia clafs of plants; and in the natural method ranking under the 3 sth order, Tricocca. The male calyx is eylindrical; the cosolla cleft into feven paits, and fumel-fiaped. The female calyx cs lindrical: the corolla eleft into Seven parts; one pittil, and the fruit a dry plum.

GUIANA, a large country of South America, is bounded on the caft and north by the Atlantic ocean, and the river Oroonoko; on the fouth, by the river of the Amazons ; and on the wett, by the provinces of Grenada and New. Andalulia, in Terra-Firma, from which it is feparated both on the weft and north by the river Oroonoko. It extends above 1200 miles from the north-ealt to the fouth-west, that is, from the mouth of the river Oroonko to the mouth of the river of Amazons, and near 600 in the contrary dilecaion.

Molt geographers divide it into two parts, calling the country along the coaft Carribbcano Proper, and the interiur comitry Guiana Proper: the latt is alfo Atyled El Dormo by the Spaniards, on account of the immenfe quantity of zold it is fuppofed to contain.

The Poringuefe. French, and Datch, have all fettlements along the coalt. What lics fouth of Cape North belongs to the dirt of the fe nations ; the coait hetucen Cape North and Cape Orange is poffeffed by the natives; French Guiana, Old Cayenne, or Equinoctial Irance, estends from Cape Orange, about 240 miles along the coaft, to the river Marani; where the Dutch territory begins, and extends to the mouth of the Oroonoko.

Along the coalt, the land is low, marfhy, and fub. ject to inundations in the rainy feafon, from a multitude of rivers which defcend from the inland mountains. Hence it is, that the atmofphere is fuftocating, bot, moilt, and unhealthful, efpecially where the woods have not been cleared away. Indeed, the Europeans are forced to live in the moft difagreeable fi. tuations, and fir their colonies at the mouthe of the rivers, amidit lliaking marfose, and the putrid ooze of falt moraffes, for the convenieney of exportation and importation.
" Dutch Guiana (according to an account lately publifled by a genteman who refided feveral years at Surinam as a phyfician) was firt difoovered by Columbus in 1498 . It lise between the $7^{\circ}$ of north
iara and the $5^{\circ}$ of fouth latitude, and between the $53^{\circ}$ and $60^{\circ}$ of longitude welt from London. It is bounded on the north and eat, by the Atlantic; on the welt, by the rivers Oroonoko and Negres; and on the fouth, by the river of Amazons.
"It is a we divided between the Span:ards, Dutch, French, and Portuguefe ; but, except its fea-coall, and lands adjacent to its rivers, it has hitherto remained unknown to all but its original watives; and even of thefe, it is only the Dutch territorics that foreigners have any knowlelge of; for thofe of the Spaniards, French, and Portuguefe, are inacecffible to them.
"This country, on account of the diverfity and fertility of its foil, and of its vicinity to the equator, which paffes through io, afords almolt all the productions of the diferent Ametican countries between the tropics, be lides a varicty peculiar to itlif."

Datch Guiana was formerly the property of the Englifh, who made fettements at Surinam, where a kind of corrapt Enghth is till fooken by the negroes. The Dutch tnok it in the reign of Charles the Sccond; and it was ceded to them by a treaty in 1674 , in exchange for what they had poffefled in the province now allied Neve York.

The land for 50 miles up the countery from the feacoall is Hat ; and, during the rainy feafons, covered two feet high with water. This renders it inconceivably fertite, the earth, for 12 inches deep, being a Atratum of perlect inantire: an attempt was once made to carry fome of it to Babbado:s; but the wood-ants fo much injured the vefiel, that it was never repeated. The excefive richnefs of the foll is a cifadvantage, for the canes are to huxuriant to make good fugar; and therefore, during the firl and fecond crop, are converted into rum.

There are fome trees on this part; but they are fmall and low, confiting chiefly of a fmall fpecies of palm, intermixed with a leaf near 30 fect long and three feet wide, which grows in clufters, called a Trualie; and, at the edges of running-water, with mangrowes.

Farther inward the country rifes; and the foil, though atill fertile, is lefs durable. It is covered with forells of valuable simber, that are always green: and there are fome fandy hills, though no mountains; in the French territories, however, there are monntains, according to the report of the Indians, for they have never been vifited by any other people.

In this. country the heat is feldom difagreeable: the trade winds by day, the land breezes in the cvening, and the invariable length of the niehts, with gentle dews, refrefly the air, and render it temptrate and falubrious. There are two wet feafens and two dry, of three months each, in every year; and, during more than a month in each wet feafon. the rain is inceffant. The dry feafons commence fix weeks before the equinoxes, and continue fix week; after. The wet feafons are more wholefone than the ciy, becaufe the rains keep the waters that cover the low lands, next the fea, frech and in motion; but daring the dry feafon it flagnates, and, as it waltes, becomes putrid, fending up very manholefore exhalaturs. Blofloms, green and ripe fiut, are to be found upon the fame tree in every part of the ycar. There are
fome fine white and red agaies in Guiana, which remain untonched; and mines of gold and filser, which the Dutch will not fulfer to be wrouglit.

The inhabitants of Guiam are either natives, who are of a reddifh brown; or negroes and Eur,peans; or a mixed prugeny of thele in sarious combinations. The natives are divided into different tribes, tnore or Iffs enlightened and polithed, as thay are more or lefs remote from the fettements of the Europeans. They allow polygamy, and have no divition of lands. The men go tu wirs, hunt, and filh; and the women look after donetic concerns, fin, weave in their fahion, and marage the planting of caffava and manive, the only things which in this country are cultivated by the natizes. Their arms are bows and arrews; tharp poifoned arrows, blown through a reed, which they ufe in hunting; and clubs made of a lecay wood ealled Iron-mogot. They eat the dead bodies of thofe that are flain in war; and fell for flaves thofe they take prifoners ; their wars being chichy undertaken to furnifh the European plantations. All the different tribes go naked. On particular occations they wear caps of feathers; but, at culd is wholly anknown, they cover no part but that which diftinguinaes the fex. They are cheerful, bumane, and fricudly; but timid, except when heated by liquor, and drunkennefs is a very common vice among them.
'l'heir houfes conlife of four llakes fet up in a quadrangular form, with crofs polcs, bound together hy flit nibbets, and covered with the large leaves called troties. Their life is ambulatory : and their houfe, which is put up and taken down in a few hours, is all they have to carry with them. When they remove from flace to place, which, as they inhabit the banks of rivers, they do by water in fmall canoes, a few voflels of clay made by the women, a flat ftone on which they bake their bread, and a rough tlone on which :hy grate the roots of the callawa, a hammock and a hatclet, are all their furniture and utenfils; noll of them, however, have a bit of looking glafs fran:ed in paper, and a comb.

Their puifond arrows are made of $\int_{\text {plinters }}$ of a hard lazey wood, called cacaris; they are about 12 inches long, ard fomewhat theker than a coarfe knitting, medic: one cod is fornied into a fharp point; round the otlier is wound fome coiton, to make it fit the bore of the reed through which it is to be blown. They will blow thefe arrows $\ddagger 0$ yards with abfolute certainty of hitting the mark, and with furce enough to draw blood, which is certain and immediate death. Againft this poifon no ant:dose is known. The Indians never ufe thele poifoned arrows in war, but in hurting only, and chiefly againg the monkies; the flefh of an animal thus killed may be fafely eaten, and even the poifon it felf fwallowed with impunity.

GUIAQUIL, a town, bay, and harbour of South America, in Peru, and capital of an audience of the fame rame. W. Loalg. -6.55 . S. Lat. 2. O.

GUlARA, a lea-port town of South America, and on the Caracca coalt. I'he Englifh attempted 20 take it in 1539 and 17.43 ; but they were repulfed both times. W. l.ong. 65. 5. N. Lat. 10. 35 .

GUICCIARDINI (Francifco), a celehrated hiftcrian, born at Florence in $1+82$. He profefled the civil law with reputation, and was emploged in feve-
cuicciar- ral embafies. Leo X. gave him the government of the huly places: they were alfo to affilt them in cafe Guienn
dim Modena and Rexgio, and Clement VHI. that of Romagna and Bologna. Guicciandini was alfo hieute-nant-general of the pope's army, and dilinguifhed himfelf by his bravery on feveral oceafions; but Paul 1H. having taken from him the government of Bologht, he retired to Florence, where he was made comufllor of Atate, and was of great fervice to the houfe of Mcdicis. He at length retired into the country to write his hiftory of btaly, which he compofed in lialian, and which comprebends what paffod from the year 1494 to 1532 . This hiftory is greatly efteemed; and was continued by John Baptif Adriani, his friend. IIe died in 1540 .

Guicciakdini (Lewis), his nephew, compofeda hiftory of the Low Countries, and memoirs of the afairs of Europe, from 1530 to 1560 . He wrote with great fpirit againt the perfecution of the duke d'Alsa, for which he imprifoned him. Died in 1583 .

CUIDES, in military language, are ufually the country people in the neighbourhood of an encampmont; who give the army intelligence conceruing the country, the roads by which hey are to march, and the probable route of the enemy.

GUIDI (Alexander), an eminent Italian poet, born at l'avia in 1650 . Having a defire to fee Rome, lie there attracted the notice of queen Chriftina of Sweden, who retained him at her cont ; he befide obtained a confiderable benefice from pope Innocent XI. and a penfion from the duke of Parma. For a good office he did the fate of Milan with prince Eugcae, he was eurolled among the mobles and de. curinus of that town; and died in 1712. Nature had kecn binder to his intellects than to his extelior form ; his Lody was fmall and crooked, his head was large, and lie was blind of his right eye. A eollection of Sis works was publifted at Verona in 1726.

Guido Aretin. Sce Aretin.
Guido (Reni), an illuttrious Italian painter, born at Bologna in 1595. In his early age he was the difcieter of Denis Calvert, a Flemilh matter of good scputatinn ; but afterwards entered himfelf in the fuhool of the Caracci. He firt imitated Ludovico Caracci; but fised at laft in a peculiar ftyle of his own, that fecured hin the applaufe of his own time and the admiration of pofterity. He was much honoured, and lived in fplendor: but an unhappy attachment to gaming ruined his circumflances; the reftection of which brought on a languifhing diforder, wat put an end to his life in 1042. There are feveral defigns of this great matter in print, etched by himede.

GUIDON, a fort of flag or fandard borne by the king's life-guard; being broad at one extreme, and almote pointed at the other, and flit or divided into 2wo. The guidon is the entign or flag of a troop of horfeguards. See Guard.

Guidon alfo denotes the officer who bears the guidon. The guidon is that in the horfe-guards which the enfizn is in the foot. The guidon of a troop of horfe takes place next below the cornet.

Guidons, guidones, or fibola guidonum, was a company of pricfls etablifhed by Chartemagne, at Rome, so conduct and guide pilgrims to Jerufalem, to vifit
$\mathrm{N}^{3}+5$ 。
they fat fick, and to perform the laft offices to them Guilandi in cafe they died.

GULLNNE, the largeft province of France, bounded on the aorch by Saintogne, Angoumois, and Limofin; on the ealt by Limofin, Auvergne, and Languedoc; on the fonth by the Pyrenees, Lower Navarre, and Bearn; and on the well by the ocean. It is about 225 miles in length, and 200 in breadth. It is divided into the Upper and L.ower. The Upper comprethends Querci, Rouergue, Armagnac, the territory of Comminges, and the county of Bigorre. T'be Lower contains Bourdelois, Perigord, Agenois, Condomois, Bazadois, the Iander, Proper Gafcony, and the diltrict of Labour. The prineipal rivers are, the Garonne, the Adour, the Tarn, the Aveiren, and the Lot. Bourdeaux is the capital town.

GUilandina, the kickar tree: A genus of the monogynia order, belonging to the decandria clats of plants ; and in the natural method rankiog under the 33 d order, Lomentacce. The calys is monophyllous and falver-fhaped; the petals, inferted into the neck of the calyx, nearly equal. The feed-veffel a legumen.
Species. 1. The bonduc, or yellow nickar. 2. The bonducella, or gray nickar. Thefe are climbing plants, natives of the Weft Indies, where they tife to the height of twelve or fourteen feet : the flowers come out at the wings of the ftalks; and are compofed of five concave yellow petals. They are fucceeded by pods about three inches long and two broad, clofely armed with flender fpines, opening with two valves, each inclofing two hard feeds about the fize of childrens marbles, of a yellowith colour. 3. The moringa, or morunga nickar, is a native of the ifland of Ceylon, and fome places on the Malabar coalt. It rifes to the height of 25 or 30 fect, laving flowers produced in doofe bunches from the fide of the branches, and compofed of an unequal uunber of petals.

Culure and Ufes. Thefe plants being natives of warm climates, require to be kept through the winter in a ftove in this country. They are propagated by feeds; but thofe of the firlt fort are fo hard, that unlefs they are foaked two or three days in water before they are put into the ground, or plaeed under the pots in the tan-bed to foften their covers, they will remain for years without vegetating. - The roots of the third fort are fcraped when young, and ufed by the inhabitants of Ceylon and Malabar as thofe of horfe-radifh are in Europe. The wood dycs a beautiful blue colour. It is the lignam nephriticum, or nephritic wood, of the difpenfatories; and is brought over in large, compact, ponderous picces, without knots, of a whitifh or pale yellow colour on the outfide, and dark coloured or reddilh within: the bark is ufually rejected. This wood imparts to water or rectified $\rho_{\text {pirit }}$ a deep tincture ; appeariag, when placed between the eye and the light, of a golden colour; in other fituations blue : pieces of another wood are fometimes mix. ed with it, which give only a yellow colour to water. The nephritic wood has fearce any fmell, and very little talle. It ftands recommended in difficulty of urine, rephritic complaints, and all diforders of the kidneys and urinary paflages ; and is faid to have this peculiar advar-

## G U I $[177] \quad$ G U I

ild advantage, that it does not, like the warmer diuretics, heat or offend the parts. Prasitioncrs, however, have not found thefe virtues warranted by experience.

GUILD, (from the Saxon guildan, to "pay"), fignifies a fraternity or company, becaufe every one was gildare, i.e. to pay fomething towards the charge and fupport of the company. As to the original of thefe guilds or companies: It was a law among the Saxons, that every freeman of fourteen years of age Should find fureties to keep the peace, or be committed: upon which certain neighbours, confifting of ten families, enter into an affociation, and became bound for each other, either to produce him who committed an offence, or to make fatisfaction to the injured party : that they might the better do this, they raifed a fum of money among themfelves, which they put into a common ftock; and when one of their pledges had committed an offence, and was fled, then the other nine made fatisfation out of this flock, by payment of money, according to the offence. Becaufe this affociation confifted of ten families, it was called a decennary: and from hence came out later kinds of fraternities. But as to the precife time when thefe guilds had their origin in England, there is nothing of certainty to be found; fince they were in ufe long before any formal licence was granted to them for fuch meetings. It feems to have been about the clofe of the eleventh century, fays Anderfon, in his Hiftory of Commerce, vol. i. p. 70, that merchant-guilds, 'or fraternities, which were afterwards fyled corporations, came firft into general ufe in many parts of Europe. Mr Madox, in his Firma Burgi, chap. i. § 9. thinks, they were hardly known to our Saxon progenitors, and that they might be probably brought into England by the Normans; although they do not feem to have been very numerous in thofe days. The French and Normans might probably borrow them from the free cities of Italy, where trade and manufactures were much earlier propagated, and where poffibly fuch communities were firft in ufe. Thefe guilds are now companies joined together, with laws and orders made by themfelves, by the licence of the prince.

Guild, in the royal boroughs of Scotland, is ftill ufed for a company of merchants, who are freemen of the borough. See Borough.

Every royal borough has a dean of guild, who is the next magiftrate below the bailiff. He judges of controverfies among men roncerning trade; difputes between inhabitants touching buildings, lights, watercourfes, and other nuifances; calls courts, at which his brethren of the guild are bound to attend; manages the common fock of the guild; and amerces and colleets fines.

Guxid, Gild, or Geld, is alfo ufed among our ancient writers, for a componfation or mule, for a fault committed.

Guild-Hall, or Gild-Hall, the great court of judicature for the city of London. In it are kept the mayor's court, the theriff's court, the court of huftings, court of confciencc, court of common council, chamberlain's court, \&c. Here alfo the judges fit upon nifi prius, \&c.

GUILDFORD, or Guiderord, a borough-town of Surry, fituated on the river Wye, thirty-one miles fouth-weft of London. Near it are the ruinous walls Vor. VILI. Part I.
of an old caftle, this having been in the Saxon times Guilfiord a royal villa, where many of our kings ufed to pafs the feftivals. Here is a corporation confifting of a mayor, recorder, alderman, \&c. which lent members to parliament ever fince parliament had a being. The great road from London to Chichefter and Portfmouth lies through this town, which has always been famous for good inns, the cleaneft of linen, and other excellent accommodations; and the affizes are often held here. Its manufactory formerly was cloth, of which there are ftill fome fmall remains. Here is a fchool founded by king Edward V1. alfo an almhoufe endowed with lands worth 300 I. a-year, of which icol. to be employed in fetting the poor at work, and the other 2001 . for the maintenance of a mafter, 12 brethren, and 8 filters, who are to have 25.6 d . a-week. There are, befides, two cbarity fchools for 30 boys and 20 girls. There were three churches in this town, but one of them fell down in April $174^{\circ}$. There is a fine circulas courfe for horie-matches, which begin when the Newmarket races are ended. King William III. founded a plate of 100 guineas to be run for here every May, and ufed to bonour the race with his prefence, as did once king George I. The river Wey is made navigable to the town, and by it a great quantity of timber is carried to London, not only from this neighbourhood, but from Suffex and Hampfhire woods, above 30 miles off, from whence it is brought hither in the fummer by land carriage. This navigation is alfo of great fupport to Farnham market, corn bought there being brought to the mills on this river within feven miles diftance, and, after being ground and dreffed, is rent down in barges to Londori. The road from hence to Farnham is very remarkable, for it runs along upon the ridge of a high chalky hill, called St Catharine's, no wider than the road itfelf, from whence there is an extenfive profpect, viz. to the N. and N. W. over Baghot-Heath, and the other way into Suffex, and almof to the South Downs. The town fends two members to parliament ; and gives title of earl to the North family.

GUILLEMOT, in ornithology. See Colymbus.
GUILLIM, (John), of Welfh extraction, was born in Herefordfhire, about the year 1565 . Having completed his education at Brazen-nofe college, Oxford, he became a member of the college of arms in London; and was made rouge croix purfuivant, in which poft he died in 162 I . He publifhed, in 1610, a celebrated work, intitled the Dijplay of Heraliry, folio, which has gone through many editions. To the fifth, which camc out in 1679, was added $A$ treatije of bonour civil and military, by captain John Lorggan.

GUINEA, a large traCt of country lying on the weft fide of the continent of Africa, extends along the coalt three or four thoufand miles, beginning at the river Senegal, fituated about the 17 th degree of north latitude (being the neareft part of Guinea as well to Europe as to North America). From that river to the niver Gambia, and in a foutherly courfe to Cape Sierra Leona, is comprehended a coait of about 700 miles ; being the fame tract for which Queen Elizabeth granted charters to the firt traders to that coaft. From Sierra Leona, the land of Guinea takes a turn to the ealtward, extending that courfe about 1500 miles, including thofe feveral divifions known by the names of the Gra:n Cozft the Inory Conft the Gould Ccafl, and the
$Y$ Slave

## G U I $\left[\begin{array}{lll}173 & \text { G U I }\end{array}\right.$

Gainea. Slave Colf, with the large kinçdom of Benin. From thence the land runs fouthward along the coait about 1200 miles, which contains the kingdoms of Congo and Aogola; where the trade for haves ends. From which to the fouthermot cape of Africs, called the Cage of Good Mos, the country is fettled by Caffes and Hottentots, who have never been concenned in the inalaing or folling flaves.

1. Of the parts which are above mentioned, the firt is that fituated on the great river Senegal, which is faid to be narigable more than 1000 miles, and is by travellers deferibed to be very agreeable and fruitful. Mr Brtue, priacipal facior for the French African company; who lived is years in that country, after deferibing it fruitfulnefs and plenty near the Lea,
vol. ii.
P. 4 . adds *, "The farthen yon go from the fea, the comnIty on the river feems the more fruitful and wall im. proved, abounding with Indian corn, pulfe, fruit, \&e. Here are valt meadows, which feed large herds of great and fmall cattle, and poultry numerous: the villages that lie thick on the river, fhow the country is well peopled." The fame author, in the accaunt of a voyage he made up the river Gambia, the month of which lies arout 300 miles fouth of the Senegal, and is navigable about 600 miles up the country, fays, "t that he was furprized to fee the land fo well cultivated; [carce a foot lay unimproved; the low lands divided by fmall canals were all fowed with rice, Ecc. the higher ground planted with millet, Indian corn, and peale of different fort; their beef excellent ; poultry plenty and very cheap, as well as all other necellaries of life." Mr Moor, who was fent from Jinsland abont the year 1735 , in the fervice of the African company, and relided at James Fort on the niver Gambia, or in other factories on that river, about fire years, confirms the above accouni of the fruitfulwef; of the conntry. Captain Smith, who was fent in the year 1726 by the African company to furvey their futiements throughout the whole coaft of Guinea,

+ Foyare to fivst," the country about the Gambia is pleafant and
Gunes, fentitul; provifions of all kinds heing plenty and ex-

5. $3 \mathrm{r}, 3 \mathrm{H}$.
"the ancienteft are preferred to be the peince's connfellors, who keep always about his perfon; and the men of molt judgment and experience are the judges." The Fulis are fettled on both fides of the river Senegal: their country, which is very fruitful and populous, extends near 400 miles from eatt to wett. 'They are generally of a deep tawny complexion, appearing to bear fome affuity to the Moors, whofe country they join on the north: they are good farmers, and make great harveit of corn, cotton, tobacco, \&ec. and breed great numbers of cattle of all kinds. But the molt particular account we have of thele people is from Moore, who lays ", "Some of thele Fuli blacks, * Trsex who ducdl on hoch lides the river Gambia, are in fub- into dyp. jection to the Mandingos, amonglt whom they dwell, parts of having been probubly driven out of their country by porims, war or famine. They have chiefs of their own, who rule whit much modetation. Few of them will drink brandy, or any thing Aronger than water and fugar, being trict Mahometans. Their form of government goes on ealy, becanfe the people are of a good quiet difpofition, and fo well inftructed in what is right, that a man who does ill is the abomination of all, and none will fupport him againtt the chief. In thefe countries the natives are not covetous of land, defiring no more than what they ule ; and as they do not plough with horfes and catile, ther can ule but very little; therefore the kings are willing to give the Fulis leave to live in their contry, and cultivate their lands. If any of their pcople are known to be made llaves, all the Fulis will join to redeem them; they alfo fupport the old, the blind, and lame, amonget themidues; and as far as their abilities go, they fupply the neceflities of the Mandingos, great numbers of whom they have maintained in famine." The author, from his own obfervations, fays, "They were rarely aqgry, and that he never heard them abufe one another."

The Mandingos are faid by Mr Brue before men. tioned, "to be the moft numerous nation ou the Gambia, befides which, numbers of them are difperfed over all thefe countries; being the molt rigid Mahometans among t the negroes, they drink neither wine nor brandy, and are politer than the other negroes. The chief of the trade goes through their hands. Many are induttrious and laborions, keeping their ground well cultivated, and breeding a good ftock of cattle $\dagger$. Every town has an alkadi, or governor, + Afle who has great power ; for moft of them having two Collet? common fields of clear ground, one for corn, and the p. 296 other for rice, the alkadi appoints the labour of all the people. 'The men work the corn ground, and the women and girls the rice ground; and as they all equally labour, fo he equally divides the corn amongt them; and in cafe any are in want, the others fupply them. This alkadi decides all quarrels, and has the firf voice in all conferences in town affairs." Sume of thefe Mandingos, who are fettled at Galem, far np. the river Senegal, can read and write A rabic tolerably; and are a good hofpitable people, who carry on a trade with the inland nations. "They are extremely populous in thofe parts, their women being fruitfal, and they not fuffering any perfon amongit them, but fuch as are guilty of crimes, to be made flaves." We are told from Jobion, "That the Mahometan Negroes lay their prayers thrice a day. Each village
nea. has a prief who calls them to their duty. It is furprizing (fays the author), as well as commendable, to fee the modefly, attention, and reverence they obferve during their worhip. He akked fome of their prietts the purport of their prayers and ceremonies; their aniwer always was, "that they adored God by proAtrating themfelves before him; that by humbling themfelves, they acknowleged their own infignificancy, and farther intreated him to forgive their faults, and to grant them all good and neceflary things, as well as deliverance from evil." Jobfon takes notice of feveral good qualities in thefe negro priefts, particularly their great fobriety. They gain their livelihood by keeping fchool for the education of the cliildren. The boys are taught to read and write. They not only teach fchool, but sove about the country, teaching and inftructing, for which the whole country is open to them; and they bave a free courfe through all places, though the kings may be at war with one another.

The three fore-mentioned nations practife feveral trades, as fmiths, potters, faddlers, and weavers. Their fmiths particularly work neatly in gold and filver, and make knives, hatchets, reaping hooks, fpades, and fhares to cut iron, \&c. Their potters make neat tobacco pipes, and pots to boil their food. Some authors fay that weaving is their principal trade: this is done by the women and girls, who fin and weave very fine cotton cloth, which they dye bluc or black. Moore fays, the Jabofs particularly make great quantities of the cotton cloth; their pieces are generally 27 yards long, and about nine inches broad, their looms being very narrow; thefe they few neatly together, fo as to fupply the ufe of broad cloth.
It was in thefe patts of Guinea that M. Adanfon, correfpondent of the Royal Academy of Sciences at Patis, was emplayed from the year 1749 to the year 1753, wholly in making natural and philofophical obfervations on the country about the rivers Scnegal and Gambia. Speaking of the great heats in Senegal, he fays $\ddagger$, "it is to them that they are partly indebted for , \&e. the ferility of their lands; which is fo great, that, with little labour and care, there is no fruit nor grain but grows in great plenty."

Of the foil on the Gambia, he fays, "it is rich and deep, and amazingly fertile ; it produces foontaneoufly, and almolt without cultivation, all the neceflaries of life, grain, fruit, herbs, and roots. Every thing matures to perfection, and is cacellent in its kind." One thing which always furprized him, was the prodigious rapidity with which the fap of thees repairs any lofs they may happen to fuftain in that country; "And I was never (lays he) more aftonihhed, than when landing four days after the loculls had devoured all the fruits and leaves, and even the hads of the trees, tofind the trecs covered with, new leaves, and they did not feem to me to have fuffered much." "It was then (fays the fame author) the fifh feafon; you might fee them in fhoals approaching towards land. Some of thofe thoals were $; 0$ fathoms fquare, and the fifh crowded together in fuch a manner, as to roll upon one another, without being able to fwim. As foort as the negroes perceive them coming towards land, they jump into the water with a bafket in one hand, and fwim wiht the other. They need only to plunge
and to lift up their bakiet, and they are fure to return loaded with fihh." Speaking of the appearance of the country, and of the difpolition of the people, he fays, " which way foever I turned mine eyes on this pleafant fpot, I beletd a perfect image of pure nature; an agreeahle folicude, bounded on cvery fide by charming landfcapes; the rural fituation of cottages in the midt of trees; the eafe and indolence of the negroes, reclined under the hade of their fpreading foliage; the fimplicity of their drefs and manners; the whole revived in my mind the idea of our firlt parents, and [ feemed to contemplate the world in its primitive ftate. They are, generally fpeaking, very good-natured, fociable, and.obliging. I was not a little pleafed with this my firt reception; it convinced me, that there ought to be a confiderable abatement made in the accounts I had read and heard every where of the favage character of the Africans. I obferved, both in the negroes and moors great humanity and fociablenefs, which gave ine ftrong liopes that I fhould be very fafe amonglt them, and meet with the fuccefs I defired in my inquiries af. ter the curiofities of the country." He was agreeably amufed with the convcrfation of the negroes, their fables, dialogues, and witty fories with which they entertain each other alternately, according to their cuttom. Speaking of the remarks which the natives made to him with relation to the flars and planets, he fays, " it is amazing, that fuch a rude and illiterate people fhould reafon fo pertinently in regard to thofe heavenly bodies; there is no manaer of doubt, but that with proper inltruments, and a good will, they would becone excellent altronomers."
2. That part of Guinea known by the name of the Grain and Ivory, Coaff extends about 500 miles. The foil is faid to be in general fertile, producing abundance of ,ice and roots; indigo and cotton thrive without cultivation, and tobaceo would be excellent if carefully manufactured; they have fifh in plenty: their flocks greatly increafe; and their trees are loaded with fuit. They make a cotton cloth, which fells well on the coaft. In a word, the country is rich, and the commerce advantageous, and might be greatly augmented by fuch as would cultivate the friendhip of the natives. Thefe are reprefented by fome writers as a rude, treacherous people ; whill feveral other authors of ercdit give them a very different character, defcribing them as fenfible, courteous, and the fairelt traders on the coaft of Guinea. In the Collection, they are faid + to be averfe to drinking to excefs, and fucb + voi. iio as do are feverely punifhed by the king's order. pis 56. On inquiry why there is fuch a difggreement in the character given of thefe people, it appears, that though they are naturally inclined to be kind to Arangers, with whom they are fond of trading, yet the frequent injuries done them by Europeans have occafioned their being fufpicious and thy: the fame caufe has been the occation of the ill treatment they have fometimes given to innocent Arangers, who have attempted to trade with them. As the Europeans have no fettle: ment on this part of Guinea, the trade is carried on by fignals from the 隹ips, on the appearance of which the natives ufually come on board in thcir canoes, bringing their gold-duft, ivory, \&cc. which has given opportunity to fome villanous Europeans to carry them of with their effects, or retain them on board till a ran-

Guines fom is paid. It is noted by fome, that fince the European voragers have carried away feveral of thefe people, their multruft is fo great, that it is very difficult to prevail on them to come on board. Smith remarks, "As we pall along this coaft, we very often lay before a town, ard fired a gun for the natives to come Nat: but no foul came near us: at length we learnt by fome thips that were trading down the coalt, that the natives came feldom on hoard an Englifh thip, for fear of being detained or earried off: yet at latt fome ventured un board; but if thefe chaneed to fpy any arms, they would all imonediately take to their canoes, and make the bett of their way home. They had then in their pofftifion one Denjamin Crofs, the mate of an Eurlih veffel, who was detained by them to make repritals for fome of their men, who had formerly been carried away by fome Englim veffel." In the Collection we are told, "This villanons euftom is too often pratifed, clictly by the Brifol and Livtrpool flips, and is a greaidetriment to the flave trade on the wind. f Derriptionward coar." Juhn Snock, mentioned in Bolman f, of Guine,t, when on the coalt, wrote, "We calt anchor, but not p. 440 .
one negro coming oa board, I went on thore; and after having Itaid a white on the ltrand, fome negroes came to me; and being defitous to be informed why they did not come on board, I was anfwered, that ahout two months before, the Englith had been there with two large veffels, and had ravaged the country, deAtroyed all their eanoes, plundered their houfes, and carried off fume of their people, upon which the remainder fled to the inland country, where moll of them were at that time; fo that there being not much to be done by us, we were obliged to retura on baard. When I inquired after their wars with other countries, they iold the they were not often troubled with them; but if any difference happened, they chofe rather to end the difpute amically than to come to arms.†" He found the inhabitanis civil and good natured. Speaking of the king of Rio Seftro, lower down the coalt, he fays, "He was a very agreable, obliging man; and all his fuljeets are civil, as well as very laborions in agriculture and the purfuits of trade." Marchaio $\ddagger$ fays, "Tleat though the country is very populons, yet none of the natives (except criminals) are fold for llaves" Vaillant never heard of any fettlement being made by the Europeans on this part of Guinea; and Smith remarksy, "That thefe coafts, which are divided into feveral little kingdoms, and have feldom any wars, is the reafon the flave trade is not fogood here as on the Gold and Slave Coaft, where the Europeans have icveral furts and fattories." A plain evidence this, that it is the intercourfe with the Europeans, and their fettlements on the coaft,

3. Next adjoining to the Ivory Coaft are thofe called the Goll Ceaft and the Slave Coaf; authors are not agreed about their bounds, but alieir extent together alung the coall may be about 500 miles. And as the pulicy, produce, and economy of thefe two kingdu:ns of G aines are much the fame, they thall be defribed iogulier.

Here the Europeans have the greateft number of forte and factoins: from whanee, by means of the negro factors, at trube is carried on above 70 miles back in the inland country; wheteby great numbers of flaves
are procured, as well by means of the wars which arife amongt the negroes, or are fomented by the Europeans, as thofe brought from the back country. Here we find the natives more reconciled to the European manners and trade; but, at the fame time, much more inured to war, and ready to affit the European traders in procuring loadings for the great number of velfels which come yearly on thofe coalts for flaves. This part of Guinea is agreed by liftorians to be, in general, extraordinary fruitful and agreeable; producing (according to the difference of the foil) valt quantities of rice and other grain, plenty of fruir and routs, palm wine and oil, and fifh in great abundance, with much tame and wild eattle. Borman, principal factor for the Dutch at D'Elmina, fueaking of the conntry of Axim, which is fituated towards the beginning of the Gold Coalt, fays, "The negro inhabitants are generally very rich, driving a great trade with the Europeans for gold: 'That they are indulti. oully employed either in trade, fifhing, or agriculture ; but chiefly in the culture of rice, which grows here in an incredible abundance, and is tranfported hence all over the Gold Coaft : the inhabitants; in lieu, returning full fraught with millet, jamms, potatocs, and palm oil." The fame author, fpeaking of the country of Ante, fays, "This country, as well as the Gold Coaft, abounds with hills, enriched with extraordinary high and beautiful trees; its valleys, betwixt the hills, are wide and extenfive, producing in great abundance very good rice, millet, jamms, potatoes, and other fruits, all good in their kind." He adds, "In Thort, it is a land that yields its manurers as plentiful a crop as they can wifh, with great quantities of palm wine and oil, befides heing wrll furnifhed with all forts of tame as well as wild beats; but that the lalt fatal wars had reduced it to a miferable condition, and Itripped it of moll of its inhabitants." The adjoining country of 「etu, he fays, " was formerly fo powerful and populow, that it liruck terror into all the neighbouring nations; but it is at prefent fo drained by continual wars, that it is entitely rnined ; there does not remain inhabitants fufficient to till the country, though it is fo fruizful and pleafant that it may be compared to the country of Ante jult before deferibed; frequently (fays our author), whea walking through it before the lalt war, I have feen it abound with fine well built and populous towns, agretably enriched with vaft quantities of eorn, cattle, palm wine, and oil. The inhabitants all applying themfelves without any diftinction to agriculture; fomc fow corn, others prefs oil, and draw wine from palm trees, with both which it is plentifully thored."

Smith gives much the fame account of the before mentioned parts of the Gold Coalt; and adds, " the eountry about D'Elmina and Cape Coalt is much the fane for beauty and goodnefs, but more populous; and the nearer we come towards the Slave Coaft, the more delightful and rich all the countries are, producing all forts of trees, fruits, roots, and herbe, that grow with. in the torrid zone." Baroot alfo remarks *, with re- - Bo fpect to the countries of Ante and Adom, "That the foil is very good and fruitful in corn and other produce; which it affords in fuch plenty, that befides what ferves for their own ufe, they always export great quantities for fale: they have a competent number of cattle, both tame and widd, and the rivens abundantly Atored
flored with fih; fo that notling is wanting for the fup. port of life, and to make it cafy." In the Collection it is faid " That the inland people on that part of the coaft employ themfelves in tillage and trade, and fup. ply the market with corn, fruit, and palm wiue ; the country producing fuch valt plenty of Indian corn, that abundance is daily exported, as well by Euro. ropeans as blacks reforting thisher from other parts." Thefe inland people are faid to thise in great union and friendhip, being generally well tempered, civil, and tractable; not apt to thed human blood, except when much provoked; and ready to afiit one antother. In the Collection it is faid, "Thast the in in. ing bufincts is efteened on the Guld Coat nexs to tra. ding ; that thofe who profis it are nore numerous than thofe of ocher emploganems. That the greatet number of thefe are at Komnendo, Mina, and Kormantin ; from tach of whicb phaces, there go out every morning (Thefday excepted, which is the Fetifh day, or day of ret!) tive, fix, and fometimes cight hundred canoes, froun 13 to $1+$ feet long, which Spread them. felves two leagucs at fea, each fifherman carrying in his canoc a fuord, with brad, water, and a litile fre on a large thone to roall finh. Thus they labour till noon, when the feabereze blowing freth, they return on the flore, generally lajen with filh; a quantity of which the inland inladitants come down to buy, which they fell again at tu.c enuntry markets."
Smith fays, "Thic country abolt Acra, where the Englifh and Dutch have each a ftrong fort, is very delightfful, and the natiives courteons and civil to ftrangers." He adds, "That this plact feldom fails of an extraordinary good trade from the inland country, elipecially for flaves, whereot feveral are fuppofed to cone fiom very remote parts, becaufe it is not un. common to find a Malayan or two amongit a parcel of other flaves: The Malaya people are gencrally natives of Malacea, in the Eat Indies, fituated feveral thourand miles from the Gold Coall." They differ very much from the Guinea negross, being of a tawny coniplexion, with tong black hair.
Molt parts of the flave coafts are reprefented as e. qually fertile and pleafant with the gold coaft. The king ion of whidah bas been partereularly noted by travelle rs. Smith and Bofman agree, "Thiat it is one of the molt deligheful countries in the world. The great number and variety of tall, beantiful, and fhady trees, which feem planced in groves; the verdant fields every where cultivated, and no otherwife divided than by thofe groves, and in fone places a fmall foot-path, together with a great number of villages, contribute to aflord the molt delightful profpet ; the whole country being a fine, cafy, and almoft imperceptible afeent fur the ipace of 40 or 50 miles from the fea. That the farther you go from the fea, the more beautiful and populous the country appears. That the natives were kind and obliging, and fo indultrious, that no place which was thought fertile could efcape being planted, even within the hedges which inclofe thcir villages. And that thic next day after they had reapec, they fowed aggin."

Snetgrave alfo fays, "The country appears full of towns and villages; and being a rich foil, and well cultivated, looks like an entire garden." In the Coifection, the huffandry of the negroes is defribed to be cartied on with great regularity. "The rainy fea-
fon approaching, they go into the fieids and woods. to hix on a proper place for fowing ; and as here is nu property in ground, the king's licence being obtained, the people go out in troops, and firit clear the ground from buthes and weeds, which they burn. The field thus cleared, they dig it up a foot deep, and fo let it remain for eight or ten days, till the refl of their neighbours have difpofed their ground in the fame manner. They then coufule about fuwing, and for that end affemb!e at the kiner's court the uext fetifh tlay. 'The king's grain mutt be fown init. 'lhey tucn fro aszin to the fiedd, and give the gronad a fecond dizging, and fow their feed. Whillt "the hing or fovernor's land is fowing, he fonds out wise and fefh, ready dreffed, enough to ferve the labourers. Afterwards, they in like manner fow the ground allotted for their neighbours as diligently as that of the king's, by whom they are alfo feafted; and fo cor!tirue to work in a body for the public benetit till every man's ground is tilled and fowect. Nosse but the king, and a few great men, are exempted from this labou:. Their grain foon fpronts out of the ground. When it is about a man's height, and begins to ear, they raife a wooden boufe in the centre of the field, covered with Itraw, in which they fet their children to watch their curn, and fright away the birds."

Bufman fpeaks in commendation of the civility, kindnefs, and great induftry of the natives of Whidah. This is confirmed by Sinith, who fays, "The natives here feem to be the molt gentleman-like negroes in Guinea, abounding with good manners and cereinony to each other. The inferior pay the utmolt deference and refpect to the fuperior, as do wives to their hubands, and children to their parents. All here are naturally induftrious, and find conftant employment ; the men in agriculture, and the women in fpinning and weaving cotron. The men, whofe chice talent lics in hubandry, are unacquainted with arms; otherwife, being a numerous people, they could have made a better defence againt the king of Dahome, who fubducd them without much trouble." According to the Collction, there are, throughont the grold coath, regular markets in all villages, furnithed with provilions and merchandife, beld every day in the week except Tuefay, whence they furply not only the inhabitants, but the European thips. The negro women are very expert in buying and felling, and ex. tremely indutrious; for they will repair daily to market from a confiderable ditance, luaded like pack. horfes, with a child perhaps at their back, and a heavy burden on their heads. After felling their wares, they buy fih and other neceffaries, and return home loaded as they came. 'There is a masket held at Sabi every fourth day, alfo a weekly one in the province of Apologua, which is fo reforted to, that there are ufually 5 or 6000 merchants. 'Pheir markets are fo well regulated and governed, that feldom any diforder happers; each feccies of merchandife and merchanes have a feparate place allotted then by themfelves. The buyers may baggle as much as they will, but it mui be vithont nvife or frand. To keep order, the king appoints a judge; who, with four clficers well armed, ufpects the markets, hear all complaints, and in a fummary way decidea all differences; he has

- Bofman, p. II9.
power to feize, and fell as laves, all who are catch. ed in llealing or diftubing the peace. In thefe warkets are to be fold men, women, children, oxen, theep, goats, and fowls of alt kitds; European cloths, linen and woollen; printed calicoes, tilk, grocery ware, china, gold.dult, iron in bars, Eic. in a word, moll forts of European goods, as will as the produce of Africa and Aha. They have other markets, refembling our fairs, once or twice a year, to which all the country repair; for they take care to order the day fo in different goverminents as not to interfere with each other:"

With refpect to government, Smith Cays*, "that the gold coaft and flave coaft are divided into diffe. rent diatricts, fonce of which are governed by their chiefs or kings: the others, being more of the nature of a commonwealth, are governed by fome of the principal men, called Caloceros; who, Bofman fays, are properly denominated civil fathers, whofe province is to take care of the welfare of the city or vil. lage, and to appeafe tumults." But this order of goveinment las been much broken fince the coming of the Europeans. Both Bofman and Barbot mention murder and adultery to be fevercly punifhed on the coalt, frequently by death ; and robbery by a fine proportionable to the goods Itolen.

The income of fome of the kings is large. Bofman fays, "t that the king of Whidah's revenues and duties on things bought and fold are confiderable; he having the tithe of all things fold in the market, or imported into the country." Both the above mentioned authors fay, the tax on flaves mipped off in this king's dominions, in fone years, amounts to near L.. 20,000.

Bofnan tells us, the Whidah negroes have a faint idea of a true God, afcribing to him the attributes of almighty power and omniprefence: but God, they day, is too high to condefcend to think of mankind; wherefore be commits the govermment of the world to thofe inferior deities which they workip." Some authors fay, the wifelt of thefe negroes are fenlible of their miltake in this opiuion; but dare not forfake their own religion, for fear of the populace rifing and killing them. 'This is confirmed by Smith, who fays, "that all the natives of this coall believe there is one true God, the author of them and all things; that they have fome apprehenfion of a future Itate; and that almof every village has a grove, or public place of worflip, to which the prineipal inhabitants, on a fet day, refort to make their offerings."

In the Collection it is ramarked as an excelleney in the Guinea government, "that however poor they may be ingenesal, yet there are no begrars to be found amongt them; which is owing to the care of their chief men, whofe province it is to takecare of the welfare of the city or village, it being part of their office to See that fuch people may earn their bread by their labour; fome are fet to blow the fmith's bellows, others to prefs palm oil, or griad colours for their mats, and fell provifion in the markets. 'The young men are lifed to lerve as foldiers, fo that they iuffer no common beggar." Bofman aloribes a further reafon for this good order", viz. "that when a negrofinds he cannot fubfitt, he binds hinifelf for a certain fum of money, and the mafter to whom he is bound is obliged to lind him neceffaries; that the ma-

Iter fets him a fort of talk, which is not in the leaft flavih, being chiclly to defund his mater on ocea. fions, or in fowing time to work as much as himfelf pleakes."

Adjoining to the kingdom of Whidah are feveral fmall governments, as Coto, great and fmall Popo, Ardrah, Eic. all lituated on the liave coalt, where the chicf crade for llaves is carried on. Thefe are governed by their refpective kings, and follow much the fame cuttoms with thofe of Whidah, except that their principal living is on plunder and the nave trade.
4. Nest adjoining to the Slave Coafl, is the kingdom of Benin, which, thougl it extends but about 170 miles on the fea, yet fpreads fo far inland as to be elleemed the molt potent kingdom in Guinea. By accounts, the foil and produce appear to be in a great meafure like thofe betore deferibed, and the natives are reprefented as a reafonable good-natured people. Artus fays*" "they are a fincere, inoffenfive people, "Cdia. and do no injutice either to one another or tu than-vol.iii. gers." Sntilh confirms this account, and fays, "that p. 228. the inhabitants are generaily very good-natured, and exceeding courteous and civil. When the Europeans make them prefents, which in their coming thither to trade they always tho, they endeavour to return them doubly." Bolman tells us, "that his comutrymen the Dutch, who were often obliged to trult them till they returned the next year, were fure to be honefly paid their whole debts."

There is in Benin a confiderable order in government; theft, murder, and adultery, being leverely punified. Smith fays, "their towns are governed by officers appointed by the king, who have power to decide in civil cafes, and to raife the public taxes; but in criminal cales, they mult fend to the king's court, which is held at the town of Oedo or Great Benin. This town, which covers a large extent of ground, is about Go miles from the fea." Barbot tells us, " that it contains 30 Aterts, 20 fathom wide, and almof two mikes lung, commonly extending in a Atraight line from one gate ro another; that the gates are guarded by foldiers; that in thefe freets marhets are held every day, for cattle, ivory, cotton, and many forts of Eurupean guods. This large town is divided into feveral wards or dillricts, each governed b; its refpective king of a Areet, as they call them, to adminilter jullice, and to keep grood order. The inhabitants are very civil and good natmed, condefeending to what the Europeans require of them in a civil way." The fame author confirms what las been faid by others of their jullice in the payment of their debts; and adds, " that they, above all othor Gaincans, are bery honett and jutt in their dealings; and they have fuch an averfion tor theft, that by the law of the country it is punifhed with death." We are tuld by the fance autnor, "that the king of Benin is able upon occation to maistain an army of $100,0 c 0$ men; but that, for the moft part, lie dues not keep 30,000 . Sce the article Benin.
5. The laft divition of Guinea from which flaves are imported, are the kingdoms of Congo and Ango$l a$ : thefe lie to the fouth of Benia, extendiag with the intermediate land about 1200 miles on the coatt. Great numbers of the natives of both thefe kingdoms profers the Chrillian relgion, which was long fince

## G U I [ 18; ] G U I

inea. introduced by the Portuguefe, who made carly fettlementa in that couriry. Sec Congo and Angola.

In the Collection it is faid, that both in Congo and Angola, the foil is in general fruitful, producing great plenty of grain, Indian corn, and fuch quantizies of rice, that it hardly bears any price, with fruits, roots, and palm oil in plenty. The natives are generally a quiet people, who difcover a good underfanding, and behave in a friendly manner to ftrangers, being of a mile converfation, affable, and cafly orescome with reafon. In the government of Conro, the king appoints a judge in every particular divilion, to hear and determine difputes and civil caufes; the judges inprifon and seleafe, or impofe fines, according to the rule of culom; but in weighty matters, every one may appeal to the king, before whore all criminal canfes are brought, in which he giveth fentence; but feidom condemnetl, to death. The town of L.eango flands in the mid非 of four lordnips, which abound in corn, fruit, esc. Here they make great quantities of cloth of divers kinds, very fine and curious; the inhabitan's are feldom idle; they even make needle-work caps as they walk in the llreets. The flave trade is here principally maraged by the Portuguefe, who carry it far up into the irland countries. 'Ihey ate faid to fend off irom thefe parts 15,000 haves each year. At Angola, about the bcth degree of fouth latitude, ends the trade for lizes.

As all thefe comatries lie between the tropics, the air is exceflively hot, efpecially from the beginning of September to the end of March; which, with the coolnefs of the nights, the freoutnt thick, fioking, fuphusreous mills, and the perioulical rains, when the flat country is overflowed, makes i: very unhealthy, eipecially to Europeans. The natives, however, are little affected with the unwholefome air. Accurding to Barbot, they keep much within doors in tempeftuous times; and when expofed to the weather, their fkins being fuppled and pores clofed by daily anointing with palm oil, the weather can make but little impreffion on them. They generally, therefure, enjoy a gond tlate of health, and are atle to procure to them. felves a comfortable fubfillence, with much lefs care and toil than is necelary in our more northern climate; which laft advantage arifes not only from the warmth of the climatc, but alfo from the overfiowing of the rivers, whereby the land is regulariy moifened and rendered extremely fertile; and teing in many places improved by culture, abounds with grain and fruits, eattle, poultry, \&c. The earth yields all the year a freth fupply of food: Few cloaths are requifite, and little art neceffary in making them, or in the conftruction of their houfes, which are very fimple, principally calculated to defend them from the tempelluous feafons and wild beaft: a few dry reeds covered with natts ferve for their beds. The other furniture, ex eept what helongs to cookery, gives the women but little trouthe; the moveables of the greateit among them amounting only to a few earthen puts, fome wooden utenfils, and gourds or calabathes; from thefe laf, which grow almon naturally over their huts, to which they affurd an agreeable finade, they are abundaunly flocked with gend ciean velfels for molt houfehold ufes, being of diferent fizes, from half a pint to feveral galluns.

The difempers the Europeans are fubject to on Ginez. this coaft, are fevers, fluxes, and colics, which are occationed by indifferent water and bad air; their fettlements lying near the coall, whers the fors and fteams ariling from the ooze and falt-marhes, and the Atinking fith the natives dry on the beach, corrupt the air, and render it fatal to the foreigners. The moft temperate men find it difficult to prele:ve their heaith; but a great many haten their death by their intemperance, or negligence, expofing thenielves to the cold air in the evening, after a very hot day. This fudden change, from one extreme to the other, has often very bad effers in hot climates.

Of mountains in Guinea, the moft rema kable are thofe of Sierra Leon. The pincipal capes are thofe of Crpe lblanco, Cape Verd, Cape Leon, Cape St Ann's, Cape Palmas, and Cape 'Three-Points, Cape Iurnofa, Cape Monte, Cape St John, Cape Lopas, Cape Lede, and Cape Negro. 'I'he chief bays are the Cyprian or Cistra Bay, and the Bite of Cuinea. Of the rivers, the mott conliderable are thofe of Co anzo and Ambrifi, the Zaara, the Lunde, the Cameron, the Formofa, the Volta, the Sierra Leon, and the Sherbro. All thefe run fiom ealt to welt (except the Volta, which runs from noth to fouth), and fall into the Atlantic.

Belides gold, ivory, and Лlaves, Guinea affords indigo, wax, gum-fenega, gum-tragacanth, and a ruriety of other gums and drugs.

The molt ancient account we have of the country Hiftory of of the negroes, particularly that part fituated on and the Gunta between the two great rivers of Senegal and Gambia, trade. is from the writings of two ancient zuthors, one an Arabian, and the other a Moor. The firft wrote in Arabic"abont the 1 zth century. His works, printed in that language at Rome, were afterwards tranfated into L.atin, and printed at Paris under the patronage of the famous Thusanus chancellor of France, with the title of Gengraplica Nubierfis, containing an account uf all the nations lying on the Senegal and Gambia. 'The other was written by Johon Leo, a Moor, born at Granada in Spain, before the Moors were totally expelled from that kinsdom. He relnded in Africa; but being on a voyage from Tripoli to Tunis, was taken by fu:ne Italian corfairs, who linding him poffeffed of feverd Arabian books, belides his own manufcripts, apprehended him to be a man of learning, and as luch prefented him to Pope Leo X. This pope encouraging him, he embraced the Romilh religion, and lis defcription of Africa was publimed in Italian. From thefe writings we gather, that after the Malometan religion had extended to the kingdom of Morncco, fome of the promoters of it crofing the fandy defarts of Numidia, which feparate that country from Guinea, found it inhabited by men, who, though under no regular government, and deftitute of that know. ledge the Arabians were favoured with, lived in content and peace. The firt author particularly remarks, " that they never made war, or travelled abroad, but employed themfelves in tending their herds, or labouring in the ground." J. Leo Cays, p. 65. "That they lived in common, having no property in land, an tyrant nor fuperior lord, but fupported themfelves in an equal ftate, upon the natural produce of the country, which afforded plenty of roots, game, and honey.

Guirea. That ambition or avarice never drove them into foreign countries to fubdue or cheat their neighbours. Thus they lived without toil or fuperfluities." "The ancient inhabitants of Morocco, who wore coats of mail, and ufed fwords and fpears headed with iron, coming amouglt thefe harmlefs and naked people, foon brought them under fubjection, and divided that part of Guinea which lies on the rivers Senegal and Gambia into 15 parts; thofe were the 15 kingdoms of the negroes, over which the Moors prefided, and the common people were negroes. Thefe Moors taught the negroes the Mahometan religion, and arts of life; particularly the ufe of iron, before unknown to them. About the $14^{\text {th }}$ century, a native negro, called Heli Ijchia, expelled the Moorifh conquerors; but though the negroes threw oll the yoke of a foreign nation, they only charged a Libyan for a negro mafter. Heli Ifchia himkelf becoming king, led the negroes on to foreign wars, and eftablifhed himfelf in power over a very large extent of country." Since Leo's time, the Europeans have had very littie knowledge of thofe parts of Africa, nor do they know what became of his great empire. It is highly probable that it troke into pieces, and that the natives again refumed many of their ancient culloms; for in the account publifhed by Moore, in his travels on the river Gambia, we find a mixture of the Monrih and Mahometan cuftoms, joined with the original fimplicity of the negroes. It appears by accounts of ancient voyages, collected by Hackluit, Purchas, and others, that it was about 50 years before the difcovery of America, that the Portuguefe attempted to fail round Cape Bojador, which lies between their country and Guinea: this, after divers repulfes occafioned by the violent currents, they effected; when landing on the weftern coafts of Africa, they foon began to make incurfions into the country, and to feize and carry off the native inhabitants. As carly as the year 1424 . Alonzo Gonzales, the firit who is recorded to have met with the natives. being on that coaft, purfued and attacked a number of them, when fome were wounded, as was alfo one of the Portuguefe; which the author records as the firt blood fpitt by Chritians in thofe parts. Six years after, the fame Gonzales again attacked the natives, and took 12 prifoners, with whom he returned to his veffels : he afterwards put a woman on fhore, in order to induce the natives to redeen the mifoners; but the next day 150 of the iohabitants appeard on hotfes and camels, provoking the Portuguefe to land; which they not daring to venture, the natives difcharged a volley of thones at them, and went off. After this, the Portugucfe thill continued to fend veffels on the coaft of Africa: particulanly we read of Iheir falling on a village, whence the inhabitants fed, and, being purfued, 25 were taken; " he that rau beft (fays the anthor), taking the moft. In their way home they killed fome of the natives, and took 55 more prifoners. Afterwards Dinifanes Dagrama, with two other velfels, landed on the ifland Agguin, where they took 54 Moors; then running along the ruatt 80 leagues farther, they at feveral times took 50 Saves: but here furen of the Portuguefe were killed. 'I'hen being joined by feveral other veffels, Dinifanes propofed to defroy the illand, to revenge the lofs of the feen loreugus ; of which the Aleors being appated.

N 1.45.
fled, fo that no more than 12 were found, whereof Guine only four could be taken, the ret being killed, as alfo one of the Portuguefe." Many more captures of this kind on the coaft of Barbary and Guinea are recorded to have been made in thofe early times by the Portugucfe; who, in the year 148 t, erected their firt fort at D'Elmina on that coalt, from whence they foon opened a trade for flaves with the inland parts of Guinea.

From the foregoing accounts, it is undoubted, that the practice of making flaves of the negroes owes its origin to the early incurfions of the Portuguefe on the coalt of Africa, folely from an inordinate defire of gain. This is clearly evidenced from their own hiftorians, particularly Cada Mofto, about the year 1455, who writes*, "That before the trade was fettled for pur- - collea chafing flaves from the Moors at Arguin, fometimes vol. i. four, and fometimes more Portuguefe veffels, were ufed p. 576. to come to that gulph, well armed; and landing by night, would furprife fome fifhermens villages: that they even entered into the country, and carried off Arabs of both fexes, whom they fold in Portugal." And alfo, "That the Portuguefe and Spaniards, fetthed on four of the Canary iflands, would go to the other ifland by night, and feize fome of the natives of both fexes, whom they fent to be fold in Spain."

After the fettlement of America, thofe devattations, and the captivating the miferable Africans, greatly increafed.

Anderfon, in his Hiltory of Trade and Commerce, P. 336, fpeaking of what pafled in the year 1508 , writes, "That the Spaniards had by this time found that "the miferable Indian natives, whom they had made to work in their mines and fields, were not fo robuft and proper for thofe purpofes as negroes brought from Africa: wherefore they, about that time, began to import negroes for that end into Hifpaniola, from the Portuguefe fettlements on the Guinea coalts; and alfo afterwards for their fugar-works."

It was about the year 155 t , towards the latter end of the reign of Edward VI. when fome London merchants fent out the firft Englifi fhip on a trading voyage to the coaft of Guinea. This was foon followed by feveral others to the fane parts; but the Euglifh not having then any plantations in the Weft Indies, and confequently no occafion for negroes, fuch thips traded only for gold, ele phants teeth, and Guinea pepper. 'This trade was carricd on at the hazard of lofing their thips and cargoes, if they liad fallen into the hands of the Portuguefe, who claimed an exclulive right of trade, on account of the feveral fettlements they had made there. In 1553, we find captain Thomas Windham trading along the coatt with ito men, in three thips, and failing as far as Benin, which lies about 3000 miles down the coaft, to take in a load of pepper. Next year John L.ock traded along the coalt of Guinea, as far as D'Elmina, when he brought away confiderable quantities of gold and ivory. He fpeaks well of the natives, and fays, "That whoever will deal with them muft behave civilly, for they will not traffic if ill ufed." In 2555 , William Towerfon traded in a peaceable manner with the natives, who made complaint to him of the Pottuguefe, who were then fettled in their caftle at D'Elmina; faying, "They were bad men; who made them flaves if they could take them, puttigg irons on their legs."

This bad example of the Portuguefe was foon followed by fome evil difpofed Euglifhmern: for the fame captain Towerín relates*, "That in the courfe of his voyage, he pereeired the natives near D'Elmina unvilling to come to him, and that he was at laft attacked by them; which be undertood was done in revenge for the wrong done them the year before by one captain Gainfh, who had taken away the negro captain's fon and three others, with their gold, \&ec. This caufed them to join the Portuguefe, notwithanding their hatred of them, againft the Englifh." The next year captain Towerfon brought thefe men back again; whereupon the negroes fhowed him much kindnefs. Quickly after this, another inftance of the fame kind oecurred in the cafe of captain George lienuer, who being on the coalt with three veffels, was alfo attacked by the negroes, who wounded feveral of his people, and violently carried three of his men to their town. The captain fent a meffenger, offering any thing they defired for the ranfom of his men: but they refufed to deliver them; lutting him know, "That three weeks before, an Englifh fhip, which came in the road, had carried off three of their people; and that till they were brought again, they would not reflore his men, even though they fhouid give their three thips to releafe them." It was probably the evil conduct of thefe and fome other Englifmen which was the oceafoon of what is mentioned in Hill's Naval Hiftory, viz. "That when captain Hawkins returned from his firft voyage to Africa, queen Elizabeth fent for him, when the expreffod her concern, left any of the African negrnes fhould be carried off without their free confent; which the declared wouid be deteftable, and would call down the vengeance of heaven upon the undertakers." Hawkins made great promifes, which neverthelefs he did not perform ; for his next woyare to the coatt appears to have been principally calculated to procure negro flaves, in order to fell them to the Spaniards in the Weft Indies; which occafioned the fame author to ufe thefe remarkable words: "Here began the herrid practice of forcing the Africans into flavery: an injufice and harbarity, which, fo fure as there is sengeance in heaven for the worlt of crimss, will fome time be the deftruction of all who act or who encourage it." This captain Hawkins, afterwards Sir John Hawkins, feems to have been the firt Englithman who gave public countenance to this wicked traffic: for Anderfon, befnre mentioned, at p. 401, fays, "That in the year 1562 , captain Hawkins, affitted by fubfrription of fundry gentemen, now litted out three thips; and having learnt that negroes were a very good commodity in Hifpaniola, he failed to the cuatt of Guinea, took in negroes, and failed with them for Hifpaniola, where he fold them, and his Englifh commodities, and loaded his three veffels with hides, fugar, hincer, \&e. with which he returned home ano 1563 , naking a profperous soyage." As it proved a luerative bufinefs, the trade was continued both by Hawkins and others, as appears from the Naval Chronicle, p. 55 ; where it is faid, "That on the 18 th of October 1564 , captain John Hawkins, with two thips of $i C 0$ and $4+0$ tons, failed for Africa; that on the Sth of December they anchored to the South of Cape Verd, where the captain manned the beat, and ferit so men in armnur into the country, to fee if they could Voz. VIII. Part I.

take fome negroes; but the natives $f$ fying from then, they returned to their thips, and proceeded farther down the coatt. Here they ftaid certain days, fonding their $m \in n$ athore, in order (as the author fays) to burn and fpuil their towns and take the inhabitants. The land they obfersed to be well culivated, there being plenty of grain and fruit of feveral forts, and the towns prettily laid out. On the 25 th, being informed by the Portuguefe of a town of negroes called Bymb, where there was not only a quartity of gold, but 1,40 irhabitants, they refolved to attack it, having the Portuguefe for their guide; bue by mifmanagement they took but ten nerroes, having feven of their own men killed and 27 wounded. They then went farther down the cuatt; when having procured a number of negroes, they proceeded to the Wef Indies, where they fold them to the Spaniards." And in the fame Naval Chronicle, at p. 76, it is faid, "That in the year 1;6-, Francis 1)rake, before performing his voyage rourd the world, went with Sir Juln Hawkins in his expedition to the coall of Guinea, where taking in a cargo of flaves, they determined to flecr for the Cariblec inands." How queen Elizabeth fuffered fo grievous an infingement of the rights of mankind to be perpetrated ty her fubjects, and how the was perfuaded, about the zoth year of her reign, to grant patents for carsing on a trade from the north part of the river Senegal to 100 leagues beyond Sierra Leona, which gave rife to the African Company $t, t$ see $C_{0}$. is hard to accouat for, any otherwife than that it ${ }^{p}$ any, vol. r . arofe foom the mifreprefentation made to her of the fituation of the negroes, and of the advantages it was pretended they wount reap from being made acquainted with the Chritian ueligion. This was the care of Lounis XIII. of France : who, Labat, in his account of the ifes of America, tells us, " was extremely uneafy at a law by which the negroes of his colunies were to be made haves; but ic being flrongly urged to him as the readiet means of their converfion to Chritianity, he acquieford therewith." Neverthelefs, fome of the Chriftian powers did not io eafly give way in this matter: for we find ", "That cardinal Cibo, one of the pope's principal minitters of ilate, wrote a letter oa behalf of the college of cardinals, or great council at Rome, to the mifionaries in Cungo, complaining that the pernic:ons and abominible abufe of felling naves was yet continued; requiring them to remedy the fame if pulfible; but this the miflonaries faw litte hopes of accomplithing, by reafon that the trade of the country hay wholly in faves and ivory:"
lt has been urged in jullification of this trade, that by purchafing the captives taken in battle, they fave the lives of fo many human creatures, who otherwife would be facrificed to the implacable revenge of the victors. But this pretence has becon refuted by an appeal to reafon and fact. Fur if the negroes apprehended they fhould be cruelly put to dath if they were not fent away; why, it is alked, do they manifelt fuch reluctance and dread as they generally do, at being brought from their native country? Smith, in his Account, p. 28. fays, "The Gambians abhor llavery, and will atrempt any thing, thourh ever fo defperate, to avoid it." And Thomas Philips, in his account of a voyage he perfurmed to the coaft of Guinca, writes, "They (the negroes) are fo loth to

## G U I

$\underbrace{\text { Guinea, leare their own country, that they have often leaped }}$ out of the canoc, boat, or hip, into the fa, and kept under water till they were drownce, to avoid being taken up." But lad the fact even been otherwife, the above plea is mrged with an extreme bad grace, when it is notorious that the very wars faid to be produetive of fuch cruelty were fomented by the infamous arts of the Europeans. From the foregoing accounts, as well as other authentic publications of this kind, it appears, that it was the unwarrantable luft of gain which firf ftimulated the Portuguefe, and afterwards nother Europeans, to cngage in this hourid traffic. By the moll unqueftionable relations of thofe early times, the natives were an inoffenfive people, who, when civilly ufed, taded amicably with the Emopeans. It is recorded of thofe of Beuin, the largef kingdom in Guinta, that they were a gentle, loving, people; and Reynold fays, "They found more lincere proofs of love and good will from the natives, than they could find from the Spaniands and Portugufe, even though they had relieved them from the greateft mifery." And from the fame relations there is no reaton to think otherwife, but that they generally lived in peace amongh themfelves; there occurring no accounts of any wans at that early period, nor of any fale of cap. tives taken in battle.

In fact, it was long after the Portuguefe had made a practice of violently forcing the natives of Africa iuto flavery, that we read of the different negro nations making war upon each other, and felling their cap. tives. And probably this was not the cafe, till thofe bordering on the coafl, who had been ufed to fupply the veffels with neceffaries, had become corrupted by their intercourfe with the Europeans, and were excited by drunkennt fs and avarice to join them in carrying on thofe wicked fehemes, by which thofe unatural wars were perpetrated; the inhabitauts kept in continual alarms; the country laid wafle; and, as Moore expreffes it, "infinite numbers fold into flavery." But that the Eurofeans are the principal canfe of thefe devaltations, is particularly evidenced by one whofe connection with the trade would rather induce him to repefent it in the fairef colours, aiz. Captain Smith, the gerfon fent in the ytar 1,726 by the African company to furvey their fullements; who, from the information he reccived of one of the factors who had relided ten years in that country, fays, "That the difcerning natives accourt it their greated unlappi-
nefs, that they were ever vifited by the Europeans. "" "That we Chrifl:ans introduced the traffic of flaves; and that before our coming they lived in peace."

In the accounts relating to the African trade, we find this melancholy truth farther afferted by fome of the principal directors in the different factories; par-
$\dagger$ Colle cion, wol. ii.
P. $9^{8 .}$
\} $2 \cdot 3 \mathrm{I}$.

- Swith,
p. 266 . ticularly A. Bruc fayst, "That the Europeans were
far from defiring to act as peact-makers amoncrl the ne from ; which would te aeting conimary to their interfll, fince the greater the wars, the more haves were procured." And William Bofman alfo remarkst,"That one of the former commanders gave large fums of money to the negroes of one nation, to induce them to attack fome of the neightouring nations; which occafioned a battle which was more bloody than the wars of the negroes ufually are." This is confirmed by J. Barbot, who fays, "That the comntry of D'E]-
mina, which was formenly very powerful and populons, was in his time fo much drained of its inhabitants by the intelline wars fomented amongit the negroes by the Dutch, that there did not remain inhabitants enough to till the country."

It has alfo been advanced as an argument in favour of keeping the negroes in bondage, that there areflaves in Guinea, and that thofe antongit us might be fo in their own country. Not to dwall upon the inconfillency of our giving any countenance to favery, becaufe the Africans, whom we efteem a barbarous and favage people, allow of it, and perhaps the more from our example; the very circumilance flated, when inquired into, muft afford caufe of blufhing, rather than lerve as a palliation of fuch iniquitous conduct: for it will appear, that the 朖ery endured in Guinea is by no means fo grievous as that in the colonies. Captain Moore, fpeaking of the natives living on the river Gambia, fays, "That fome of the negroes have many houfe flaves, which are their greatelt glory; that thofe flaves live fo well and eafy, that it is fometimes a hard matter to know the flaves from their malters or miftreffes. And that though in fome parts of Africa they fell their daves bon in the family, yet on the river Gambia they think it a very wicked thing." The author adds, "He never heard of but one that ever fold a family llave, except for fuch crimes as they would have been fold for if they had been free." And in Aftley's Collcetion, fpeaking of the cuitoms of the negroes in that large extent of country further down the coall, particulatly denominated the Coafl of Guinea, it is faid, "They have not many llaves on the coalt; none but the king or nobles are permitted to buy or fell any: fo that they are allowed only what are neceffary for their families, or tilling the ground." The fame author adds, "That they generally" ule their flaves well, and feldom correct them."

From the foregning accounts of the natural difpofi: tion of the negroes, and the fruitulnets of moft parts of Guinea, which are confirmed by authors of candour, who have written from their own knowledge, it mate well be concluded, that the negroes acquaintance with the Europeans might have been a happinefs to them: but thefe, forgetful of their duty as men and Chriflans, have conducted themfelves in fo iniquitous a manner, as mutt neceffarily raife in the minds of the thoughtful and well-difpofed negroes the utmoft fiom and deteftation of the very name of Chriltians. Ald other confiderdions have given way to an infatiable defire of gain, which has been the principal and mo. ring caufe of the molt detetlable and barbarous fcenc that was perhaps ever acted upon the face of the earth; inflead of making ufe of that fuperior knowledge with which the Almighty, the common Parent of mankind, had favoured them, to Atrengthen the principle of peace and good will in the breafts of the incautions negroes, the Europeans have, by their bad example. led them into excefs of drunkennefs, debauchery, and avarice: whereby cvery paffion of corrupt nature be, ing inflamed, thcy have been eafly prevailed upon to make war and captivate one another, as well to furnifh means for the exceflis they had been habituated to, as to fatisfy the greedy defre of gain in their profligate employers; who to this intent have furnifhed them with pronigious quantities of ams and ammmi.

## G U I

tion. Thus they bave been hurried into confufion, diftrefs, and all the extremities of temporal mifery; every thing, even the power of their kings, has been made fubfervient to this wicked purpofe; for intead of being protectors of their fubjects, fome of thofe 11 lers, currupted by the exceflive love of fprituous liquors, and the tempting baits laid before them by the factors, have invaded the liberties of their unhappy fubjects, and are become their oppreffors.

Here it may be neceffary to obferve, that the accounts we have of the inhabitants of Guinea are chiefly given by perfons engaged in the trade, who, from felf.intercfted views, have defcribed them in fuch colours as were leaft likcly to excite compaffion and répect, and endeavoured to reconcile fo manifelt a violation of the rights of mankind to the minds of the purchafers; yet they cannot but allow the ncgroes to be poffeffed of fome good qualities, though they contrive as much as poffible to calt a fhade over them. A particular inflanee of this appears in Aftley's Collection, vol. ii. p. 73; where the author, fpeaking of the Mandingos fettled at Galem, which is fituated goo milcs up the Senegal, after faying that they carry on a commerce to all the neighbouring kingdoms, and amafs riches, adds, "That execpting the vices peculiar to the blacks, they are a good fort of people, honeft, hofpitable, jull to their word, laborious, induftrious, and very ready to learn atts and fciences." Here it is difficult to imagine what vices can be peculiarly attendant on a people fo well difyofed as the author defaribes thefe to be. With refpest to the charge fome -authors have brought againdthin, as being void of all natural affection, it is frequently contradicted by others. In vol. ii. of the Collection, p. 275 and 629, the negroes of North Guinea and the Gold Coait are faid to be fond of their children, whom they love with tendernefs. And Bofiman fays, p. 340, "Not a few in his country (viz. Holland) fondly imagine, that parents here fell their children, men their wives, and one brother the other: but thofe who think fo, deceive themfelves; for this never happens on any other ac--count but that of neceflity, or fome great crime." The fame is repeated by I. Barbot, p. $32 G$, and alfo confirmed by Sir Hans sloane in the introduction to his natural hillory of Jamaica; where, fpeaking of the negrocs, he fays, "they are ufually thought to be haters of their own children; and therefore it is believed that they fell and difpofe of them to itrangers for money : but this is not truc; for the negroes of Guinea being divided into fcreral captainhips, as well as the Indians of America, have wars; and befides thofe flain in battle, many prifoners are taken, who are fold as flaves, and brought thither: but the parents here, although their children are flaves for ever, yet have fo great love for them, that no malters dare fell or give away one of their little ones, unlefs they care not whether their parents hang themfelves or no." J. Barbot, fpeaking of the occafion of the natives of Guinea being reprefented as a treacherous people, afcribes it to the Hollanders (and doubrlefs other Europeans) ufurping authority, and fomenting divifions between the negroes. At $\mathrm{P}_{\mathrm{E}} 1 \mathrm{to}$, he fays, " lt is well known that nany of the European nations trading among it there people, have very unjufly and inhumanly, with. out any provocation, flolen away, from time to time,
abundance of the people, not only on this coall, but almolt every where in Guinca, who have come on board their hips in a harmlefs and confiding manner: thefe they have in. great mumbers carried away, and fuld in the plantations, with other flaves which they had purchafed." And although fome of the negroes may be juftly charged with indolence and fupinenefs, yct many others are frequently mentioned hy authors as a careful, indutrious, and even laborious people.

By an inquiry into the laws and cultoms formerly in ufe, and fill in force among the negroes, particularly on the Gold Coaft, it will be found, that provifion was made for the general peace, and for the fafety of individuals; even in W. Bofman's time, long after the Europeans liad cftablifhed the flave-trade, the natives were not publicly enlaved, any otherwile than in punithment for crimes, when prifoncrs of war, or by a violent exc. tion of the power of their corrupted kings. Where any of the natives were ftolen in order to be fold to the Luropeans, it was done fecrecty, or at lealt only connived at by thofe in power: this appears from Barbot and Bofman's account of the matter, both agreeing that man.ftaling was not allowed on the Gold Coaft. The firft fays, "Kidnapping or thealing of human crcatures is punihed there, and even fometimes with death." And Borman, whofe long refidence on the coalt enabled hims to fpeak with certainty, fays, " That the laws were fevere againft murder, thievery, and adultery;" and adds, "That man- tealing was punifhed on the Gold Coaft with rigid feverity, and fometimes with death itfelf." Hence it may be concluded, that the fale of the greatelt part of the negroes to the Europeans is fupportcd by violence, in defiance of the laws, through the knavery of their principal men, who (as is too often the cafe with thofe in European countries), under pretence of encouraging trade, and increafing the public revenue, difregard the dictates of jullice, and trample upon thofe libertics which they are appointed to preforve.
Moore alfo mentions man-ftealing as being difcountenanced by the ncgro governments on the river Gambia: and fpeaks of the inflaving the peaceable inhabitants, as a violence which only happens under a corrupt adminiftration of juftice. He fas s, "The kings of that country generally advife with their head men, fcarcely doing any thing of confequence without confulting them firt, except the king of Barfailay, who being fubject to hard drinking, is very abfolute. It is to this king's infatiable thirf for brandy, that his fubjects frecdoms and families are in fo precarious a fituation. Whenever this king wants goods or brandy, he fends a meffenger to the Englifh governor at Jaries Fort, to defire he would fend a floop there with a cargo : this nequs being not at all innuefcome, the governor fends accordingly; againt the arrival of the floop, the king goes and ranfacks fome of his enemics towns, feizing the pcople, and felling them fo- fuch commodities as he is in want of, which commonly are brandy, ouns, powder, balls, piftols, and culaffes, for his attendants and foldiers; and coral and filver for his wives and concubines. In cafe he is not at war with any neighbouring king; he then falls upon one of lis own towns, which are numerous, and ufes them in the fane manner. He often gree' with fome of his troops be a to n in the day time, and returning in the night, tess fire
$\xrightarrow{\text { Guinea. }}$

Cowiea, tuthree parto of it, and pustiag guards at the fourth, there feizes the people as they run out from the fire: he tics their arms behind them, and marches them cither to Joar or Cohone, where he fells them to the Europeas."."

Ar Brue, the French direfor, gives much the fame
vol. it.
P. 69. account, and fays *, "That having reccived goods, he wrote to the king, that if he had a fufficiont mun:ber offaves, he was ready to trade with him. This pxince, as well as the other negro monarchs, his alvays a fure way of fupplying his deviciencies, by folling his own fuligets, for which they feldom want a pretence. The king bad recourfe to this method, hy Eeizing 300 of his own people, and fent word to the director that he had the llaves ready to deliver for the goods." It feems the king wanted double the quantity of goods which the fator would give Rim for thefe 300 flaves; but the falar refufing to truit him as be was already in the company's debt, and perceiving that this refutal had put the king much out of temper, th: propofed that he thould give bim a licence for taking fo many muse of his people as the goods he flill wanted were worth: but this the king refufed, faying, "It might occalion a diftubance amongt his fubjects." Except in the above inllance, and fome others, where the power of the negro kings is unlawfllly exerted over their fubjects, the flave-trade is carried on in Guinea with fome regard to the laws of the country, which alluw of no:se to be fold but prifoners taken in their national wars, or people adjudged to flavery in punithment for crimes; but the langenefs of the country, the number of kingdoms or commonwealths, and the great encouragement given by the Europtans, afford frequent pretences and opportunities to the bold defirning pru:igates of one king dom, to furprize and feize upun nut coly thofe of a neighbouring government, hot atio the weak and helplefs of their own; and the unhappy people, taken on thofe occalions, are, with impunty, fold to the Europans. Thefe practices are doubtefs difapproved of by the mont confiderate amonglt the negroes; for Bofman acquaints us, that even their national wars are not agreeable to fuch. Tle lave, " if the perfon who occafioned the beginring of the war be taken, they will not cafly acmit Lima to rantom, thoagh his weight in gold hould be of ered, for fear he thould in future form fome new defen againtl their repore."

We thall conchude this articte with the following account of the thocking methods ufed in the carrying on of the fave-irade, as dulerited by fators of different nations.

Mr Mooret, factor for the Euglih African Company on the river Gambia, wrics," Thas there are a number of negro traders, called ourcos of mer hants, who fultur the lave-trats as a butmers; their place of refidence is fo hish up the comaty as to be fix weeks travel from James Fort, which is Guvated it the ino. ath of that miver. Thefe merehants briag cown eleptants tecth, and in fome years 2000 haves, moit of which, they fay, are prifoners taken in war. They buy them from the diferent princes who tale them; many of them are Bumbrongs and Petcharies; sations who each of them have diflere ot languages, and are brorest from a what way inland. Their way of bringiag them is sying them by the uck with leather thengs, at about
a yard ditant from each other, 30 or 40 in a Atring, having generally a bundle of corn or elephants teeth upon each of their heads. In their way from the mountains, they travel through very great woods, where they camnut for fome days get water; fo they carry in fin bags enough to fupport them for a time. 1 cannut (adds Moore) be certain of the number of merchants who fullow this trade, but there may, perhaps, he about tco, who go up into the inland country with the goods which they buy from the white men, and with them purchafe, in various countries, gold, haves, and elephants teeth. Befides the flaves which the merchants bring down, thereare many bought along the river: Thefe are cither taken in war, as the former are, or men condemned for crimes; or, alfe people folen, wolich is arry frequent. -Since the flave-trade has been ufed, all punihments are changed into flavery; there being aa advartage on fuch condemmation, they arain for crimes qery bard, in ordor to get the leneft of folling the criminal."

John Barbot, the French fastor, in his account of the manaer by which the flaves are procured, fays, "The faves fold by the neghocs are for the moft part prifoners of war, or taken in the incurfions they make into their enemies territurics: others are nuten away by their neighbours, when found ahroad on the road, or in the wouds; or elie in the cora fidds, at the time of the year when their parents keep them there all the day to fcare away the devouring fimath birds." Speaking of the tranfactions on that part of Guinea called the Slave Coaf, where the Europeans have the mont factories, and from whence they bring away much the graat:ft number of laves, the fame author fays, "The inbabitants of Coto do much mifehief in Atealing thofe flaves they fell to the Europeans from the upland country. - - That the inhabitants of Popo excel the former; being endowed with a much larger thare of conrage, they rob more fuccefstuly, by which means they increafe their riches and trade." The author pasticulanly remarks, "That they are encouraged in this practice th Eurchans: fometimes it hoppens, according to the fuccefi of their indand exzurtions, that they are able to furnin 200 haves or more in a fer days." And he lays, "I lie biacks of Fida, or Whisah, are fo txperatious in tadng for haves, that they can deliver tose every manth." -" If there happelis to be no Aoch of faves there, the fact: mula trult the blacks with his goods, to the value of 1501 or 2001. which groeis they cerry up imo the inland country to bay dlaves at all markets for above 600 miles up the country, where they are kept like cattle in Europe; the: llaves foid there being generali; prifoners of war, taken from their enenices like other booty, and perbaps. func fe:w fold by ticir cwn cuandymen, in extreme want, or up re a fannine, as aifo fonie as a puniflment of heinows crimers." So fa: Barbut's account. That given by Doinan is as follows: "When the flaves which are brongrit from the intand countries come to Whidah, they are put in prifon together; when we treat, concerning buying then, they are all brought out together in a large plain, where, by our furgeons, theyare thoroughly examined, and that naked, both men and women, without the lealt dillinction or modelty. Thofe which are approved as good, are fet on one fide; in the mata while o bunning iron, with lise arms or
tinea. name of the compary, lies in the fire, with which ours are marked on the brean. When we have agreed with the owners of the faves, they are returned to theis prifons; where, from that time forward, they are kept at our charge, and co\& us two pence a day each flave, which ferses to fubfit them like criminals on bread ard water: fo that to fave charges, we fend them on board our hips the very firt opportunity: before which, their maiters Atrip them of all they have on their hacks, fo that they come on board ftark naked, as well women as men. In which condition they are obliged to continue, if the nalter of the fhip is no: fo charitable (which he commorily is) as to betlow fomething on them to cover their nakefnefs. Six or feven hancred are formetimes put on board a vettel, where they lie as clufe together as it is poffible for them to be crowded."

When the grear income which arifes to the negro kings on the Slave Coath, from the flaves brought through their feveral gavernments to be flipped on board the liuropean veficts, is conlicered, we have no caule to wonder that thery give fo great a comutenance to that trade. Bofman fays, "Thar tach thip which comes to Whidali to trade, reckoning one with another, either by toll, trade, or cuftom, pays about anol. and fometimes 50 thips come hither in a year." Barbot confirms the fame, and adds, "'lhat in the neighbouring kingdom of Ardah, tlie duty to the king is she value of 70 or 80 ीlaves for each trading Phip;" which is near half as much more as at Whidah. Nor can the Europeans conserned in the trade, with any degree of profriets, blame the African kings for combtenancing it, while they continue to fend vellels on purpole to take in the dives whichare thus dolen, and that they are permiticd, under the fancion of national lans, to fell them to the colonies.

According to a late ferlible writer, Mr Ramfay, the annual Britidh exports to the coalts are eftimated at $500,0 c o l$. including a confiderable quantity that is smmally exchanged with American and other foreign trasers :here; about 50,0c01. of this is returned in ivery, gold cu!t, gum, \&ec. The grateft part of the profits of the flave trade is aifed on the furgar planta. toms. If by ettabliming facenies, and encouraging civilization on the coatt of Africa, and returning fome of our Weft Indian flaves to their original country, we tried so make up for ous patt tricachery to the narises, and inftucted the inhabitants in the criture of tobaces, indigo, cotton, rice, \&c. to barter with us for our manufactures, and fupply us with thofe articles, our demand for which has been fo advarageons to America great would be our profits. Were Africa cisilized, and could we prooccupy the aftetions of the natives, and introduce gradually our religion, manners, and languape among them. we frould open a market that would fully employ our manufacturers and feamen, morally fpaking, till the end of time. And while we enriched our felves, we fhould contribute to thei happinefs. For Africa, in its highe!t probable late of culture, could not poffibly inierfere with the flaple of Britain, fo as to hinder an extenfise and mutually ad. vantageous trade from being carried on between the conntries. The great difference of climate and fuil mut always diftinguifh the fupplies and wants of each.

The flave-trade indeed las been long confidered as difgraceful to an enlightened age; and in this country
a fpirit is arifen which feem; bent on anaihilating it Now Guialtogether, or fo changing the nature of it as to blead humanity with policy. During the Setton 1 gS8, the philenthopy of parliament, fupported by that of the nation, paid a very particular attention to this odicus branch of traffic. It was, however, a filljeet of too comprehenfive a nature, and too materially connecied with our African commerce at large and our Well h:dian colonies, to come to an immediate decifon upon it. P'drliament, therefore, was abliged to contelit itfolf for that time with a temporary bill to regulate the dhipping and carrying flaves in Britifh weffels fro:u thole coafts. But the public attention has been fince kept awake by a great varicty of publications on both fides of the queftion; ind the final arrangement of this important bufrefs, in which the honcur of the Britifl commerce and the Britifh chasacter, as well as the hap. pinefs of millions of our rable African brethren, is in. volved, is expected ro take place duritig the prefent fethon 179r.- This trafic in human beings is not, lonwever, without its adsocates. But the molt fpecisus arguments of its ablet defenders reach no further than political expediency, wheh can never alter the real nature of thimos. "lhat in quettion would not remain lefa an nejutt, croel, and wicked trade, in its very nature eftimbally and umatesal ly wrong. Its abolition, therefore, not in a sath, but in as gerotke and equitatle a way as circmattances will aliow, is devoutly to be wihh-d, and it is hoped inay tee accomplified.

Neru Gers: , a long and uarrow illand of the Eait Indies, very imperfectly !nown. It was fuppofed r, be connested wi:h New Holland, unil Captain Cook difcoverce the \&ait which feparates them. Now Gninea, including Papua, irs north-wotkern part (which aceoding to Bongainville's conjecture is fepara:ed from it by a ftrait), reaches from the equator to the $12: h$ degree of fouth latitude, and from 131 to 150 degrees eaft longitude; in one part it docs not appear to be abuse 50 miles lroad. It was firf vinted by an European thip in 1;20. Saavedra, a Purtuguefe, wlo made the difcovery of the north wet part of thiscban. try, called it Terra de Papuas ar Papos. Van Schouton, a Dutch difcoverer, aftomards gave the name of New Geing to its fouth-weftern part. Admiral Roggewain alfo touched here: and tefore him Datppies, 1!1 Janvary 1700. Captain Cook made the coat̂ of New-Guinea, in latitucie 6 degrees 15 minutes, longigitude 138 eall, on the 3 d of September, and landed in the pinnace, accompanied by Mr Banks, Doctur Solander, nine of the Kip's crew, and fervants well aramed, and leaving two fcamen to take care of the hoat, adsanced fome little way up the country ; but coning to the fieirts of a thick wood, they judged it prudent to procced no further, laß they fhould fall into an ambulcade of the natives, and their retreat to the boat be cut off. Having advanced about a quarter of a mile from the boat, three Indians ruthed out of the wood with a hideous thout; they threw thetr darts, and fhowed fuch a hootile difpoftion, that the party, $: 0$ prevent the deftrustion of the fe people, reinened to the boat, as ther bad no intention forcibly :o insade their country, either to gratify their appetites on chriobly, and it was evident nothing could be done upon friend. ly terms. When they got on board the boat, they rowed along the nore, and the number of Indiaas af.
femblect

Sewe Gui- fembled feened to be between 6o and rov. They nes made much the fame appearance as the New-Hollanders, being Itarl: naked, and their hair cropped mort. All the while they were fhouting defiance, and throw. ing fomething out of their hand which burnt exactly like gun-powder, but made no report ; what the fefres were, or for what purpofe intended, could not be guef. fed at; thofe who difcharged them had in their hands a flort piece of 哣k, poffibly a hollow cane, which they fwung fidewife from them, and immediately fire and fmoke iftued, exactly refembling the difcharge of a mufket, and of no longer duration, This wonderful phrnomenon was obferved from the thip; and the deception was fo great, that the people on board thought they had fire-arms; and even in the boat if they had not been fo near as that they mult have heard the report, if there had been any, they fhould have thought they had been firing volleys. After looking at them attontively for fome time, without taking any notice of their flafhing and vociferation, the failors fired fume inukets over their heads. Upon heariag the balls rattle among the trees, they walked leifurely away, and the boat returned to the Thip. Upon examining fome weapons which the natives had thrown, they were found to loe light darts, about four feet long, very ill made, of a reed or bamboo cane, and pointed with hard wood, in which there were many barbs. They were difcharged with great force, for at 60 yards dillance they went beyond the party; but in what manner they were thrown conld not be exactly feen. But the general opinion was, that they were thrown with a fick in the manner practifed by the New-Hol. landers.

The land here is very low, as is every other part of the coalt ; but it is covered with a luxuriance of wood and herbage that can fearcely be conceived. Here the cocoa-nut, plantain, and bread-fruit, flourifh in the higheft peifection.

Guinea, a gold coin, Atuck and current in Brifain. The value or rate of guineas has varied: it was fuft ftruck on the footing of 20 s . by the fcarcity of gold was afterwards advanced to 21 s .6 d . but it is now funk to 21 s .

The pound weight troy of gold is cut into 44 parts and a half; each part makes a guinea.-This coin took its denomination guinea, becaufe the gold, whereof the fitt was ftruck, was brought from that part of Africa called Guinea; for which reafon it likewife bore the imprefion of an elephant.

GUIPUSCOA, the northealt divifion of the province of Bifcay in Spain, fituated on the contines of Navarre.

GUISE, a fmall town of France in Picardy, and in Tierache, with a very ftrong caftle, and the title of a duchy. It is feated on the river Oufe, in E. Long. 3. 42. N. Lat. 49. 54 .

Guise (Henry) of Lorrain, duke of Guife (elde? fon of Francois of Lorrain duke of Guife), memorable in the hiftory of France as a gallant officer ; but an imperious, turbulent, feditious fubject, who placed himfelf at the head of an armed force, and called his rebel
band, The Leconu. The plan was formed by the cardinal, his younger brother; and under the pretext of defending the Roman Catholic religion, the king Henry III. and the freedom of the ftate, againtt the defign of the Huguenote, or French Proteftants, they carried on a civil war, maffacred the Huguenots, and governed the king, who forbid his appearance at Pa. ris: but Guife now became nn open rebel, entered the city againf the king's exprefs order, and put to the fword all who oppofed him; the flreets being barricaded to prevent his progrefs, this fatal day is called in the French hittory, The daj' of the larricades. Matters of Paris, the policy of the Guifes failed them : for they fuftered the king to efcape to Blois, though he was deferted in his palace at $\mathrm{l}^{\prime}$ aris by his very guards. At Blois, Henry convened an allembly of the Aates of France ; the duke of Guife had the boldnefs to appear to a fummons fent hin for that purpofe: a forced reconciliation took place between him and the king, by the advice of this affembly; but it being accidentally difcovered, that Guife had formed a defign to dethrone the king, that weak monarch, inftead of refolutely bringing him to juftice, had him privately affaffinated, December 23.1558, in the 38 th year of his age. His brother the cardinal flared the fame fate the next day.

GUITTAR, Guitarra, a mufical inftument of the flringed kind, with five double rows of flrings; of which thofe that are brals are in the middle, except it be for the burden, an octave lower than the fourth. ——This inftrument was firlt ufed in Spain and by the Italians. In the former country it is thill greatly in vogue. There are few of that nation who cannot play on the guittar ; and with this inftrument they ferenade their miltreffes at night. At Madrid, and other cities in that country, it is common to meet in the Areets young men equipped with a guittar and a dark lanthorn, who, taking their flation under the windows, fing, and accompany their voices with this inftument; and there is fearce an artificer or day-labourer in any of the cities or principal towns who does not entertain himfelf with lis guittar.

GULDENSTAE1)T (John Anthony), was born at Riga, April 26. 1745; received the rudiments of his education in that town; and in $1-63$ was admitted into the medical college of Berlin. He completed his Iludies at Frankfort upon the Oder, and in 1767 received the degree of M. 1). in that univerfity. On account of his knowledge of foreign languages, and the confiderable progrefs he liad made in natural hiflory, he was confidered as a fit perfon to engage in the expeditions which were planned by the imperial academy. Being invited to St Peterfburg, he arrived in that city in 1768 , was created adjunt of the academy, and afterwards, in 1770 , member of that fociety, and profeftor of natural hillory. In June 7 -6i he fet out upon his travels, and was abfent frven years. From Mofcow, where he continued till March i769, he paised to Voronetz, Tzarizin, Altracan, and Kifar, a fortrefs upon the weltern hore of the Cafpian, and clofe to the confines of Perlia. In 1770 he examined the diftricts watered by the rivers Terek, Sunfaa, and Alkfai, in the eaftern extremity of Caucafiss; and in the courfe of the enfuing year penetrated into Offetia, in the highelt part of the fame mountain; where he col-
lected vocabularies of the languages fpoken in thofe regions, made inquiries into the hiftory of the people, and difcovered fome thaces of Chriftianity among them. Having vifited Cabarda and the northern chain of the Caucafus, he proceeded to Georgia, and was admitted to an audience of prince Heraclius, who was encamped about ten miles from Tefllis. Having paffed the winter here, and in examining the adjacent countiy. he followed in fpring the prince to the province of $\mathrm{K}_{\mathrm{o}}$. ketia, and explored the fouthern diftricts inhabited by the Turcomau Tartars in the company of a Georgian magnate, whom he had cured of a dangerous diforder. In July he paffed into Imeretia, a country which lies between the Cafpian and Black Seas, and is bounded on the eaft by Georgia, on the north by Offetia, on the wefl by Mingrelia, and on the fouth by the Turkifl dominions. He penctrated into the middle chain of mount Caucafus, vifited the confmes of Mingrelia, Middle Georgia, and Eaftern and Lower Imeretia; and, after efcaping many imminent dangers from the binditti of thoie parts, fortunately returned to Kiflar on the 18 th of November, where he paffed the winter, colleeting various information concerning the neighbouring Tartar tribes of the Cancafus, and particularly the Lefgees. In the following fummer he iourneyed to Cabarda Major, contimued his courfe to mount Befh:on, the higlielt point of the firlt ridge of the Caucafus; infpected the mines of Madhar, and went to Tcherkafh upon the Don. From thence he made expeditions to Azof and T'nganrog, and then, along the new limits to the Dnieper, he finifhed this year's route at Krementhuk, in the government of New Ruffis. In the enfuing fpring, he was proceediog to Crim Tartary; but rectiving an order of tecal, he returned through the Ukraine to Mofcow and St Peterburg, where he arrived in the month of March 1775. Upon his return, he was employed in arranging his papers; but before lie could finifh them for the prefs, was feized with a violent fever, which carried him to the grave in March 178 s . His writings which have been hitherto publifhed conlift of a number of curious treatifes, of which a lift is given in Coxe's Travels, Vol. I. p. 162.

GULA, in anatomy, the cfophagus or gullet; that conduit by which animals take down food into the flomach. See Anatomx, no 92.

GULE of August, the day of St Petcr ad vinctha, which is eclebrated on the fint of Augult. It is called the gule of Aurugh, from the Latin gula, "a throat," for this reafon, that one Quirinus, a tribune, having a daughter that had a difeale in her throat, went to Rope Alexander, the fixth from Si Peter, and defired of him to fee the chains that St Ptter was chained with under Nero; which requeft being granted, and the, kiffing the clains, was cured of her difeafe; whereupon the Pope inftituted this feaft in honour of St Pe ter; and, as before, this day was termed only the calends of Augult, it was on this occafion called indifferently cither the day of St Peter ad vincula, from what wre ght the miracle; or the gule of Auguff, from that part of the virgin whercon it was wrought.

GULLES, in heraldry, a corruption of the French word geules, which in this fciense fignifies "red," and
is reprefented in engraving by perpendicular lines. It may ferve of itfelf to denote martial prowefs, boldnefs, and hardinefs: for the ancients ufed this colour to make themflves terrible to their enemies, to ftir up magnaninity, and to prevent the feeing of blood, by the likenefs of the colours; for which reafon perhaps it is ufed by the Englifi. But, according to G. Leigh, if this tincture is compounded with

This colour is by the generality of the Englifh heralds. ranked before azure ; but French heraldo, N. Upton and his followers, prefer azure to it.

GULL, in ichthyology. See Larus.
GULF, a broad and capacious bay comprehended between two promontories, and fometimes taking the name of a far when it is very extenfive ; but particulatiy when it only communicates with the fea by means of a Arait. Such are the Euxine or Black Sea, otherwife called the Gulf of Confantinople; the Adriatic Sea, called alfo the Gulf of Venice; the gulph of Sidra near Barbary; and the gulph of I,ions near France. All thefe gulfs are in the Mediterranean. There are, befides the gulf of Mexico, the gulf of St Lawrerce, and the gulph of California, which are in North America. There are alfo the gulf of Perfia, otherwife called the Red Sea, between Perfia and Arabia; the gulf of Bengal in India; and the gulfs of Cochinchina and Kamtfchatka, near the countries of the fame name.
The word comes from the French golfe, and that from the Italian golfo, which fignify the fame. Some deduce thefe further from the Greek roaner; which Guifhart again derives from the Hebrew ${ }^{2}$ נא gob. Du Cange derives them from the barbarous Latingulfum, or gulfius. which fignify the fame thing.
GUllet. See Gula.
GUM (Gummi), is a concrete vegetable juice, of no particular fmell or tafte, becoming vifcous and tenacious when moittened with water ; totally diffolving in water into a liquid, more or !efs glutinous in propor tion to the quantity of the gam; not diffolving in vinous fpirits or in oils; burning in the fire to a black conl, without melting or catching flame; fuffering no diffipation in the heat of boiling water.

The true gums are gum arabic, gum tragacanth, gum fenega, the gum of cherry and plum trees, and fuch like. Allelfe have more or lefs of refin in them.

Guna Arabic is the produce of a fpecies of Mimosa; which fee.

The medical character of gum arabic is its glutinous quality, in confequence of which it ferves to incraffate and obtund thin acrid humonrs, fo proves ufeful in tickling coughs, alvine fluxes, hoarfeneffes, in fluxes of the belly with gripes, and where the mucus is abraded from the bowels or from the urethra. In a dyfu* ria the true gum arabic is more cooling than the other fimple gums, fo fhould be preferred.

One ounce of gum arabic rendersa pint of water confiderably glutinotis: four ounces gives it a thick fyrupy

Gun?.
confitence: but for mucilage, ore part gum to two parts water is required; and for fome purpofes an equal proportion will be neceffary.

In D: Percival's Effays we have the following curious account, by Mr Henry, of the faculty which this gum hath of diffolving arad keeping fulpended in water not only refinows but alfo other fubitances, which fhould feem not likely to be at all affeeted by it.
"One feruple of balfam of tolu, rubbed with half an ounce of diftilled rain-wat $t$, added gradually to it for 15 minutes, formed a mixture, which on fanding about a minute fubfided, thut re-united by thaking: being fat by a few days, the baliam became a concrete mafs, nut arain mifeible by fhaking up the bottle. The fame quantity required more trituration to mix it with coaninn pump-water. One feruple of the fame, rubhed with 15 grains of gum arabic, was nearly as long in perfectly aniting with half an ounce of difilled waitr as that without the gum. This was perhaps owing to the latter piece being more refinous; however, though on long flanding there was a finall fediment, it immediately reunited a week after by ayitation. Fif-t-6a graius of balfan capivi united very fmothly with hadif an ounce of diltilld water, by the medium of three grains of gum arabic. Five grains of the gum were not fo effectual with pump-water. Balfam Peru ten drops, with gum arabic three grains, diflilled water half an ounce, formed a reat white emulion, but with common water a very unequal mixture. Gum myrrh (powdered that there might be no difference in the fewral quantities ufed), half a fcruple, diffolved readily with gum arabic three grains, in both kinds of water, and even mixed with them by longer trituration without any medium, but more eafily with diftilled than common fpring water. Olibanum, mattich, gum guaiacum, and galbanum, may likewile be mixed with water by rubbing, without any gum arabic or egg. The fpring-water made ufe of in thefe expeniments was very aluminous.
" In the making of all the faline preparations, when any confiderable quantities of water are ufed, ditilled or pure rain or river water is greatly to be preferred; for the calcareons, aluminous, and felenitical matter, which fo much atounds in moff fpring water, will render any falt diffolved in it very impure.
"The folution of crude mercury with mucilage of gum arabic being fo calily accomplifhed, and it being very difagrceable to many patients, and to fome almoft imponible, to fwallow pills, bolufes, or electuaries, I was indaced to try whether calomel, cinnabar, and the other heavy and metalline bodies commonly adminitercd only under thefe forms, might not by the fame means be renderet mifcible with water, fo as to be given more agreeably in a liquid form. I accordingly rabbed ten grains of cinnabar of antimony and a feruple of gum arabic, with a fufficient quantity of dilthlled water to form a mucilage, and added a drachm of fimple fyrup and three drachms more of water. This makes an agrecable little draught; and having food about half an hour withour depofiting any fediment, I added thee drachms more of water to it; and notwithAanding the mucilage was rendered fo much more dilate, very little of the cinnabar fuidided even after it had food tome days.
"Steel finply prepared, and prepared tin, were both $\mathrm{N}^{2}+5$.
mixed with water by their own weight of gun arabic, and remained fufpended, except a very fmall portion of each, which was not reduced to a fufficiently fine powder.
"Five grains of calomel were mixed with two drachms of dittlled water and half a drachm of fimple fyrup by means of five grains of gum arabic, which kept it fulficiently fufpended: a double quantity of the gum preferved the mixture uriform flill longer. In this form it will be much more eafily given to children than i. fyrups, conferves, \&e. as a great part of it is generally watted, in forcing thofe vifeid wehicles into them; and it may be joined with feammony and other refinous purgatives by the fame method, and of thefe perhaps the yum arabic would be the bett corrector.
"Guu arabic likewife greatly abates the difagreeable talte of the corrofere fublimate, mixed with water intlead of brandy; and (from the few trials I have made) lits eaficr on the flomach, and will not be fo apt to betray the patient by the faell of the brandy.
"Mr Plenck, who fint infrueied us in the method of mixing quickitiver with mucilage, obferves (and experience contirms the truth of it), that this preparation is not fo apt to bring on a fpitting as the argent. aiv. mixed by aay other medium, or as the faline and other mercurial preparations. - How far the theory by which he accounts f,r it may be jult is soot of much importance; but it may perlaps he worth while to inquire, whether it would not be equally efictual in preventing calomel, and the other preparations of mercury, from afiecting the mouth. If fo, is it not improper, where a falivation is intended, to give emulfions with gum arabic and other mucilagians liouors for the patient's common driak, as by that means the fpitting may be retarded? And, on the contrary, may it not be a ufeful medicine to diminifh the difcharge when too copious?
"The following cafe may in fome meafure ferve to confirm the abose oblervation.-A gentleman, always eafly affected by mercurials, havins takén about 26 grains of calomel in dofes from one to three grains, notwithttanding he was purged every thiid day, was fuddenty feized with a faivation. He fpar plentifully, his breath was very fetid, tceth loofe, and his guns, fauces, and the margia of his tongue, greatly ulecrated and inflamed. He was directed to ufe the fullowing garcle. K. Gum. arab. foniunc. folve in aqua font. bullient. frib. \& a adde mel. rofuc. unc. unam. M. ft. gargar. And to drink freely of a ptifan prepated with aq bord. lib. ij, gum. aratic. unc. ij. nitr. pur. drachm. ij. facchar. alb. uric. $j$. His purgative was repeated the fucceeding mornigg. The next day his gums were lefs inflamed; but the floughs on his tongue. \&c. were ftill as foul: lis fistting was much the fane: he had drank about a pint of the ptifan. Some fit. atitrioli was added to the gargle. From this day to the fourth he was purged every day withont effect, his falivation fill continued, his mouth was no better, be had neglected the mucilayinous dink. This evening lie wac perfuaded to drink about a pint of it which remained, rif he had it repeated, and drank very freely of it that night. On the fifth morning the purgative was again repeated. Though it opcrated very little, yet the change was very furprifing: his mouth was nearly well, and his ptyalifm greatly decreafed. The ptifan was repeated; and

## G U M

and on the fixth day, being quite well, h: was permitted to go abroad."

In Mr Haffelquif's 'Travels we have an inflance of the extraordinaty nutritive virtues of this gum. "The Abyflinians (fays he) make a journey every year to Cairo, to fill the products of their countay. They muft travel over terrible defarts, and their journey depends as much on the weather as a voyage at fea: confequently they know as little as a' feaman how long they muft bc on their journey; and the neceffaries of life may chance to fail them when the journey lafts too long. This happened to the Absfinian caravan in the year 1740, their provifions being confurced when they had fill two months to travel. They were then obliged to fearel for fomething among their metchandife wherewith they might fupport nature; and found nothing more proper than gum arabic, of which they had carricd a confiderable quantity along with them. This ferved to furport above 1000 perfons for two months; and the caravan at laft arrived at Cairo without any great lofs of people cither by lhunger or difeafes."

Gcm Sinea, is a gum extremely refembling gum arabic. It is brought to us from the country through which the tiver Senega runs, in loofe or fingle dreps: but thefe are mach larger than thofe of the gum arabic ufually are; fometimes it is of the bignefs of an egg, and fometimes much laiger: the furface is very rough or wrinkled, and apfears much lefs bright than the inner fubflance where the maffes are broken. It has no fincll, and fearce any tafte. It is protably produced from a tree of the fame kind with the former. The virtues of it asc the fame with the gum arasic; but it is rarely ofed in medicine, unlefs as mixed with the gum arabic: the dyers and other artiticers confume the great quantitics of it that are annually imported hither. The negroes ciffolve it in milk, and in that nate make it a principal ingredient in many of their difhes, and often fied on it thus alone.

Gus Tregaconth, the gum of the tragacanth, a thorny bün growing in Crete, Alia, and Greece. See A. stragalus.
Other fubflances known by the name of gums are as fullow:

Gem Ammoniac. See Ammnnac.
Gum Elcmi. See Amyras.
Gear Kemo. Sue Kevo.
Gum Guahuum. See Guatacum.
Gim Lacca. Sel Coecus and Lacea.
Gum, among kardeners, a hind of gangrene incident to fruit-trees of the llore kind, arifing from a corruption of the fap, which, by its vifeidity, not being able to make its way through the fibres of the tree, is, by the protrufion of other juicc, made to extravafate and ooze ont upon the bark.

When the diflemper furrounds the branch, it admits of ne remedy; but when only on one part of a bough, it flould be taken off to the quick, and fome cowdung clapped on the wound, covered over with a linen cloth, and tied down. M. Quininie directs to cut of the metbid branch two or three inches below the part 2 effeted.

GUMMA, a fort of venercai cxcrefcence on the periofteum of the bones.

GUMS, in anatomy, the hard felmy fubtance in Vol. VIII. Part I.
either jaw, through which the teeth fpring from the jawbone. Sce Anatomy, $\mathrm{n}^{\circ} 102$.

Gen.
The gums are apt to become fpongy, and to feparate from the teeth; but the caufe is freq̧uently a fony kind of cruft, which forms itfelf therein, which when feparated, the gums foon return to their former flate, efpecially if rubbed with a mixture of the infufion c: rofes four parts, and the tincture of myrrh one part.The furvy is another diforder which affects the gume. This diforder, when not manifeft in any other part, fonetimes appears in this: indecd, when a fcorbutic ciforder invades the whole habit, its firt fympton is a puerid flate of the gums.

GUN, in the military art, a fire-arm, or weapon of offence, which forcibly difcharges a ball or other hard ard folid mater through a cylindric tube, by meants of inflamed gun-powder. See Gur-Poraer.

The word gun now includes moft of the fpeeies of fire-arms; piltols and mortars being almod the onty ones excepted from this denomination. They are divided iuto great and fmall guns: the former including all that we alfo call cannon, ordnance, or artillety; the latter includes mufquets, ca:abines, nufquetoone, blunderbuffes, fowling-pieces, \&c.

It is not known at what tinie thefe weapons were firt invented. Though, comparatively \{peaking, the introduction of guns into the weflern part of the world is but of a modern date; yet it is certain that in fome parts of Afia they have been ufed, though in a very rude and imperfect manner, for many ages.- PhiloAtratus fpeaks of a city near the river Hyphafis in the Indies, which was faid to be impregnable, and that its inhabitants were relations of the gods, becaufe they threw thunder and lightning upon their enemies. Hence fome imagine that guns were ufed by the eaflern nations even in the time of clexander the G:eat; but however this may be, many of our modern travellers affert that they werc ufed in China as far back as the year of Chrift 85 , and have continued in whe ever fince.

The firt hint of the invention of guns in Europe is in the works of Koger Bacon, who floutifhed in the 13 th century. In a treatife written by him about the year 1280 , he propofes to apply the violent explufive force of gun-powder for the deliruction of armies. In 1320, Bartholomew Schwartz, a German monk, is commonly faid to have invented gun-powder, though it is certainly known that this compofition is deferibed by Bacon in fome of his treatifes long before the time of Scharartz. The following is faid to lave been the manner in which Schwartz invented gun-powder. Haring pounded the materials for it in a mortar, which he afterwards covcred with a fone, a fpark of lire accidentally fell into the mortar and fet the mixture on fire; upon which the explofion blew the fone to a con. fiderable diftance. Hence it is probable that Schwarte mighe be taught the fimplett method of applying it in war; for Bacon feems rather to have conceived the manner of ufing it to be by the violerit effont of the flame unconfined, and which is indeed capable of producing allonining effects *. 'The figure and name of mortar's' See Guso given to a fpecies of old artillery, and theit employment poider. (which was throwing great ltone-bullets at an clevation), very much corroborates this conjecture.

Soon after the time of Schwartz, we find gans commonly made ufe of as initruments of war. Gieat A a
gung

Gun. gats were firt ufed. They were oiginally made of Gron-bars folterd together, and fortified with firung iron hoops; fome of which are thll to be feen, viz. one in the Tower of London, two at Woolwich, and one in the royal arfemal at Lifbon. Others were made of thin theets of iron rolled up together and hooped; and on emergencics they were made of kather, with plates of iron or copper. Thefe picces were made in a rude and imperfeet manner, like the fint effays of many new inventions. Stone balls were thrown out of them, and a fmall quantity of powder ufed on account of their weaknefs. Thefe pieces had no ornaments, were placed on their carriages by rings, and were of a cylindrical form. When or by whom they were made is uncertain: the Venetians, howeror, ufed cannon at the fiege of Clandia Jeffa, now called Chioggia, in 1366 , which were brought thither by two Germans, with fome powder and leaden balls; as likewife in their wars with the Genoefe in 1379. King Edward III. made wfe of camon at the bathe of Crefly in $13+4$, and at the fiege of Calais in $13+7$. Cannon were made ufe of by the Turks at the fiege of Conftantinople, then in poffefLon of the Chritians, in 1394 , and in that of $1+52$, that threw a weight of 100 lb . but they generally burit either the firf, fecond, or third Got. Louis XII. had one calt at Tours, of the fame fize, which threw a ball from the Bafile to Charenton. One of thofe famuns cannon was taken at the fiege of Dicu in $15+6$, ly Don John de Cattro; and is in the catte of St Juiliao da Larra, 10 miles from Libon: its kngth is zo fect 7 inches, diameter at the centre 6 feet 3 iaches, and it difcharges a ball of 100 ib . It has n ither dolphime, rings, nor button; is of a curicas kind of metal; and bes a large Indodtan infeription upon it, which fays it was catt in 1400 .

Formerly the camon were diguified with uncommon manes; for, in 1503 , Louis XII. had 12 brafs canwon catt, of an extraudinary fize, called after the names of the 12 peers of France. The Spanifh and Portuguefe called them after the faints. The empeyor Chartes S. whenlie marched before Tunis, founted the 12 apolles. At Milan there is a 70 pounder, called the limortelit; and one at Boisle-duc, called the $D_{\text {coil }}$. A 60 pmader at Dover.cafte, called Quan Eliacteth's pocket-piglul. An eo pounder in the Tower of Londun (forminly in Edinburgh-caftle), called Hounts-meg. An 8o pouncer in the royal arfenal at Berlin, called the Thunderer. An 80 pounder at Ma. lago, called the Teritle. Two curious 60 pounders in the arfenal at Bremen, called the Meffengrers of tad neius. And, lafly, an uncommon 70 pounder in the calle of St Angelo at Rome, made of the nails that fattened the copper-plates which covered the ancient Pantheon, with this infeription upon it: Ex: chavis Toldulitbus portious Agrippe.

In the beginning of the f th century thefe uncommon names were generally abolified, and the following more univerfal ones took place, viz.

| Pounders, | Cwt. |
| :---: | :---: |
| $\left.\begin{array}{l} \text { Cannon royal, or } \\ \text { carthoun } \end{array}\right\}=48$ | about yo |
| $\left.\begin{array}{c}\text { Ballard camon, } \\ \text { or } \frac{3}{4} \text { carthoun }\end{array}\right\}=36$ | 79 |
| ${ }_{2}^{1}$ Calthoun $=2+$ | 60 |
| Wholeculverins $=10$ | 52 |

Moyens, which carried a ball of 10 or 12 ounces, Se. Rabinet, which carried a ball of 16 ounces.

Thefe carious names of bealls and bids of prey were adupted un account of their fwiftnefs in motion or of their cruelty; as the falconet, falcon, facker, and culverin, \&c. for the ir fwiftnefs in flying; the banlif, ferpentine, afpike, dragon, fyren, \&c. for theis cruelty-

At prefent cannon take their names from the weight of the ball they difeharge. Thus a piece that difcharges a ball of $2 . f$ ponnds, is called a $2+$ founder; one that carries a ball of 12 pounds, is called a 12 poundicr; and fo of the rell, divided into the following forts, vis.
Ship-guns, conffitis in $f^{2}, 35,3=24,18,12$, 9, 6 , and 3 pounders.

Ganifon-guns, in $42,32,2+18,12,9$, and 6 pounders.

Battering-guns, in 24, 18, and 12 pounders.
Ficld picese, in 12, 9, 6, 3, 2, $1 \frac{1}{2}, 1$, and $\frac{7}{2}$ pounders.

Mortars are thought to have beca fully as ancient as camon. They were employed in the wars of Italy, to throw balls of red hot iron, ftones, \&c. long before the inveution of thells. Thefe talt ate thought to be of Girman invention, and the ufe of them in war to have been taught by the following accident. A ciatzen of Venlo, at a cortain fellival celebrated in honour of the du'se of Clewes, threw a mumber of thells, one of whicls foll on a huse aad fet free to it, by which nisfortune the greateit part of the town was redued to afmes. The frit account of fuells ufed for military purpoles is in 1.35 , when Naples was befieged by Charles VIII. Flithory infurms us with more certaiaty, that the lis were thrown out of mortars at the flege of Wacitendouk, in Guederhand, in 1588, by the En:l of Mansfield. Air Malter, an Englith engincer, fint taught the French the art of throwing fhells, which they pratiicd at the fiege of Mutte in $163+$. The methos of throwing red hot balls out of montars was firlt certainly par in practice at the liege of Straliund in 1675 by the electur of Erandenburgh; though fome fay in 1653 at the fiege of Bremen. For the proper dimenforns of guns, their weight, the metal of which they are formed, \&c. fee the article Gunnfry.
Mulkets were firt ufed at the fiege of Rhege in the year 1521. Tht Spaniards were the firlt who armed part of their foot with thefe weapons. At futt they were very heavy, and could not be ufed without a reft. They had match-beks, and did execution at a great ditance. On thear mach the foldiers carried only the refts and ammunition, and had boys to bear their mulkets after them. They were very fow in loadinty not only ly reafon of the tanvidinefs of their pieces, .
anclia, and becnure they carried the powier and ball feparate, but from the time it took to prepare and adjult the match; fo that their fire was not near fo brifk as ours is now. Afterwards a lighter matchlock-mufket came in ufe: and they carried their ammunition in bandeliers, to which were hung feveral little cafes of wood covered with leather, tach containing a charge of powder. The balls were carried lonfe in a pouch, and a priming-horn harging by their fide. The mufkets with refts were ufed as late as the beginning of the civil wars in the time of Charles I . The lighter kind fucceeded them, and continued till the begioning of the prefent century, when they alfo were difufed, and the troops throughout Europe armed with firelocks.

GUNDELIA, in botany: A genus of the polygamia legregate order, belonging to the fyngentfia clafs of plants; and in the natural methow rarking under the 49th order, Compgite. There is fearce any caly'x, but quinqueforous, with tubuisr hermaphrodite florets; the receptacle briftly, with fearce any pappus. -GUNELLUS, in ichthyology. See Bleanius.

GUNNER, an ofiver appointed for the fervice of the camon, or one flilled to lirc the guns.

In the Tower of London, and other garrifons, as well as in the fiels, this officer carries a field flaff, and a large powder-horn in a fling over this lefe moulder: he marches by the guns; and when there is any apprehenion of danger, his feld.faff is armed with match. His bufinefs is to lay the gun to pafs, and to help to load and traverfe her.

Miffer Gunner, a patent-officer of the ordnance, who is appointed to teach all fuch as learn the art of gunnery, and to certify to the mafter-general the ability of any perfon recommended to be one of the $\mathrm{king}^{3}$, gunners. To every fcholar he adminiters an oath not to ferse, without leave, any other prince or flate; or teach any one the art of gunnery but fuch as have taken the faid oath.

GUNNERA, in botiny; a genus of the diandrid order, belonging to the synandria clafs of plants. The amentum confits of unill rous feales; there is neither calyx nor corolia; the germen is bidented, with two ftyles and one feed.

$$

I$S$ the art of charging, uitrecting, and exploding firearms, as cannons, mortars, mulkets, \&c. to the bett adrantage. - As this art depends greatly on laving the guns and thot of a proper fize and figure, and well allapted to each other, it hence follows that the proper dimenfions, 太cc. of cannon and fnall arms come properly to be confidered under the prefent article.

## Sect. I. Hifory of Gumery.

The ancients, who knew not the ufe of gunpoweer and fire-arms, had notwithtanding machines which were capeble of difcharging Aones, darts, and arrows, with great force. Thefe were actuated chictly by the ctaftic force of ropes, or of fitrong fypings, and reguired a great number of men to work them; for which reafon, the cxplotion of gunpowder, as acting intantaneoufy, and feemingly with irrefitible force, feemed to be a mofl proper fuccedaneum for all the Fowers by which the military engines in former times were actuatce. It fonn appeared, however, that this force was not very eafily applid. 'Though the experiment of Bartholomew: Schwartz, mentioned under the article Gus, had given a good hint towards this application in a fuccefful manner, yet the violent reaction of the indamed powder on the containing vellels rendered them very apt to bart, to the great danger of thofe who focd near them. The gunpowder in thofe days, therefore, was much weaker than it is now mack; though this proved a very infuffient remedy for the inconseatience above mentioned. It was alfo fuon lifcoucted, that iron bullets of much lefs weight than ftone ones would be more eflacacions if impelled by greater quantitics of llonger powder. This occafiened in alteration in the matter and form of the cannon, which were now caft of hrafs. Thefe were lighter and more manageable than :le former, at the fame time that they were Aronger in propartion to their bore. Thus they were capable of cnduring greater charges of a better porder than what had been formerly ufed;
and their i:on-bullets (which were from 40 to 60 pounds weight), being imptlied with greater velocitics, were more cffectual than the heavieft tones could ever prove. This change took place about the latter end of the 15 th century.

By this means powder compounded in the manner now practifed over all Enrope came firl in ufe. Bue the change of the proportion of matcrials was not the only improvement it received. The method of graining it is undoubtedly a confulderable alantage. At firt the powder was always in the form of time meal, fuch as it was reduced to by grinding the materizls tngether. It is doubtful whether the firt graining of powder was intended to increnfe its Itrength, or only to render it more convenient for filling into fmall chages and the charging of fmall arms, to which alune it was applied for many years, whill meal-powder was fill mate ale of for canion. Dut at latt the additional flength which the graised powter was found to acquire from the free paflage of the air between the grains, occationed the meal-powder to lee entirely laid alide.

For the laft two handred ycars, the formation of cannon hath heen very little improzed; the beft pieces of modern artillery difering little in their proportions from thofe wed in the time of Charles V. Indeed lighter and thorter pieccs have been offan propofed and effayed; but though they have their advantages in particular cales, yet it feems now to be agreed that they are altogether infufficient for general fervice. But though the proportions of the pieces lave not been much varied within that perind, jet their ufe and application have undergone confilerable alterations; the fame ends being now accomplithed by fmaller ficees than what were formerly thought neceffary. Thus the battering cannon now univerfally approved of are thofe formerly called demi. cannons, carrying a ball of $=+$ pounds weight ; it being found by experience, that their froke, though lefs violent than that

- hiverg
of hager pieces, is yet fuificiently adapted to the firmeth of the utual protites of fontification ; and that the facility of their carriage and management, and the ammunition they fpare, give then geat advantages beyond the whole cannons formenly emplayed in making breaches. Ttee method alfo of making a brach, by firit cuting of the whole wall as low as poflible before it upper part is attemyred to be beat down, fems affo to be a contiderable modern improvement in the practical part of gunnery. But the moft contederable improvement in the practice is the method of thing with frall quantities of powder, and elevating the piece fo that the bullet may jult go clear of thee farapet of the enemy, and drop into thic works. By th:s means the rulkt, coming to the ground at a imall angle, and with a fanall velocity, does not bury ited, bet baunds or rolls along in the direction in which it was fired: and therefore, if the piece be placed in a line with the battery it is intended to filence, or the froat it is to fweep, each fhot rakes the whole lergth of that battery or front; and has thereby a much greater chance of difabling the defendants, and difnounting their cannon, than it would lave if fired in the common manuer. This method was invented by Vrouban, and was by him Ityled Bath.vie is Ri. coikt. It was firf put in pracice in the year 1692 at the liege of Actb. - Somethang limilar to this was put in practice by the king of Pruflia at the hatule of Rofbach in 1557. He had feveral fixinch mortars, made with trumions and mounted on taveling carriages, which firest obliquely on the enemy's lace, and amongt their horfe. They were charges with cight ounces of powder, and clevated at an angle of one degree fifteen minutes, and did great execution; for the fhells rolling along the lines with burning fufes made the touted of the enemy not wait for their burting.

## Sect. II. Theory of Gunnery.

Theory of punnery firft atempted by 3: talea

The ufe of firc-arins had been known for a long time before any theory concerning them was attempted. The finf author who wrote proffifedy on the fight of camon-fhot was Tartalea. In $15: 3$ he publihed a book, at Venice, intitled Nova Scientiat; and afterwards another, intitled $\mathcal{Q u}^{\text {nefiti et Inventioni }}$ cizerf, printad at the fame place in 1546 , in which he teats profefedly on thefe motions. His difcovetiss were but few, on account of the imperfect thate of mechanical knowledge at that time. However, he dicermince, that the greatef range of cannon was with an elcuation of +5 degrets. He likewife determined, (contrary tu the opinion of practitioners), that no part oi the tract defcribed by a bullet was a right line; ahhough the curvature was in fome cafes folittle, that it was not attended to. He compared it to the furEqce of the fea; which, though it appears to be a plane, is yet undoubtedly incurvated round the eentre of the carth. He alo affumes to himhlf the invention of the gumer's quadrant, and often gave flurewd gueffes at the event of fome untried methods. But as be had not opportunities of being converfant in the practice, and founded his opinions only on fpeculation, he was condemued by molt of the fucceeding writers, though often without any fufficient reafon. The phibofoplicrs of thofe times alfo intermedded in the que-
flions hence arifing ; and many difputes on motion were fet on foot (efpecially ia Italy), which continued till the time of Galileo, and probably gave rife to his celebrated Dialogues on motion. Thefe were publided in the year 1638 ; but in this interval, and before Galileo's doctrine was thorouglaly eftablifhed, many theories of the motion of military projectiles, and many tables of therr comparative ranges at different elevations, were publimed; all of the en egregioully fallacious, and utterly irreconcileable with the motions of thefe bodics. Very few of the ancients indeed refrained from indulging themfelves in Ipeculations concerming the difference betwixt natural, violent, and mixed motions; although fearce any two of them could agree i. their theories.

It is Itrange, hosicuer, that, during all thefe con- Experitelt, fo few of thone who were intulted with the mentsh charge of artillery thought it worth while to tring pifferent thefe theories to the telt of experiment. Nir Robins phe ran informs ns, in his Proface to the Nea Praciphes of of arule Gunnery, that he had met with no more than four authors who had treated on this fubject. The firt of thefe is Coliado, whor has given the ranges of a falconct earrying a three-pound thot to cach puint of the gunner's quadrant. But from his numbers it is manifelt, that the piece was nut charged with its cmitomary allotment of gun-powder. The refults of his trials were, that the point-blank furs, or that in which the path of the ball did not fenfisly deviate from a right line, extended 268 paces. At an devation of ore point (or $7^{\circ \frac{1}{2}}$ of the gumer's quadrant) the range was $59+$ paces ; at an clevation of two points, 794 paces; at three poinis, 954 paces; at foar, 1010 ; at tive, 1040 ; and at fix, 1053 paces. At the feventh point, the range fell between thofe of the third and founth; at the eighth point, it fell between the ranges of the fecond and third; at the ninth point, it fell between the ranges of the firll and fecond; at the tenth point, it fell between the point-blank diflance and that of the firt point ; and at the eleventh point, it fell very near the piece. - The paces foke of by this author are not geonetrical ones, but common Iteps.

The year after Collado's treatif, another appeared on the fame fubject by one Bourne an Englifhman. His elevations were not regulated by the points of the gumer's quadrant, but by degrees; and he afcertains the propotions between the ranges at diffreat elevations and the extent of point-black thot. According to him, if the extent of the point blank mot be reprefented by 1 , the range at 50 elevation will be $2 \frac{2}{\frac{2}{y}}$, at $10^{\circ}$ it will be $3 \frac{1}{5}$, at $15^{\circ}$ it will be $4 \frac{1}{5}$, at 20 it will be $4 \frac{5}{\delta}$, and the greatefl random will be $5 \frac{1}{2}$. This latt, he tells us, is in a calm day when the piece is elevated to $4^{2}$; but according to the itrength of the wind, and as it favours or oppofes the flight of the flout, it may be from $45^{\circ}$ to $36^{\circ}$. - He lath not informed us with what picee he made his trials; though by his proportions it feems to have been a f:nall one. This however ought to have been attended to, as the relation between the extent of different ranges varies cxtremely according to the velocity and denfity of the bullet.

After hin Eldred and Anderfon, both Englifhmen, publifed treatifes on this fubject. The lirlt pub-

lifhed his treasife in $16+6$, and has given the actual ranges of different pieces of antillery at fmall elevations all under ten dagrecs. His principles were not rigosomly true, though not liable to very conliderable errors; yet, in confequence of their deviation from the truth, he found it impeffible to make fome of his experiments agree with his principles.

In 1638 , Galileo printed his dialogues on motion. In thefe lie pointed out the general laws oblerved by nature in the production and compolition of motion; and was the hitt who deteribed the aetion and effects of gravity on falling bocies. On thefe principles he determined, that the fight of a camnon flot, or any other projectile, woold be in the curve of a parabola, exerpe in as far as it was diverted from that track by the rofitance of the air. Ihe has alfo propofed the means of examinting the inequaltics which arife from thence, and of ditovering what fonlible effects that refillance wndrl produce in the motion of a bullet at fome given dillance from the piece.

Though Gaileo had thas hown, that, independent of the sefllanee of the air, all projectiles woult, in their Right, defcribe the curve of a parabola; yet the fe who cane after him. fecm never to have imagined that it was neceffary to confider how far the operations of gunnery were affected by this relitance. The fubsequent writers indeed boldy afferted, without making the experiment. that no conliderable variation could urife from the refltance of the air in the firgh: of thalls or caunon thot. In this perfuation they fuppotid themelves chictly by confidering the exte:ne ratity of the air, compared with thofe denfe and punderons bedies; and at lait it becume an almot generally eltablifled maxim, that the fistat of the fe bodies was nearly in the curve of a parabola.

In $167 t$, Mr Anderfon above mentioned publifl. ed his treatife on the nature and effects of the gan; in which he proceeds on the arinciples of Gabliten, and ftrenoouly affere, that the flight of all bullets is in the curve of a parabola; undertating to andwer all objections that coul. be brought to the contrary. The fance thing was alfo wahertaken by Mr Blondy, in a treatife publifhed at laris in 1683 ; where, after long diftuftion, the author concludes, that the variations from the air's etilitance are fo fight as fearce to merit notice. The fame fubjict is treated of in the Philofophical Tranfactions, N 216 . p. 68. by Dr Halley; and he allio, fwayed by the yery great cifproportion between the denfity of the air and that of iron or lead, thinks it reafonable to believe, that the oppotition of the air to large metal-fhot is feareely cifcernible; al. thought in fnall and light thut he owns that it mult be accounted for.

But though this hypotheliz went on frmothly in fpectataion; yet Anderlon, who made a great number of trials, found it imposflible to fupport it without fome new nodification. For though it dues not appear that he ever examined the conparative ranges of either canon or mufket flot when fired with their ufoal velocities, yet his experiments on the anges of thells thrown with finall velocities (in comparifon of thofe above mentioned), convinced hin that their whole tract was not parabolical. But inftead of making the proper inferences from hence, and concluding the refiftance of the air to be of confiderable eftiacy, lie
framed a new hoypothelis; which was, that the fheli or hullet, at it.. bert difcharge, Alew io a certain ditance in a right line, from the end of which line only it bega: to deferbe a parahola. And this right line, which the calls the line of the impalfe of the fire, he fuppofer to be the fame in all elcrations. Thus, by arigning a proper leugth to this line of impulfe, it was alxays in his power to reconcile any two thots made at different angles, let them difier as widely as we pleale to furpofe. But this he could not have done with three fints; nor indeed doth he ever tell us the evens of his experinents when three ranges were tried at one time.

Therry.

When Sir lfaac Newton's Princisia was publifnad, laws of he particularly coalidered the relitance of the air to projectiles which moved with finall velocities; but as he never had an opportunity of making experiments New:on. on thofe which move with fuch prodigious fwitnefs, he did not imagine that a diference in velocity could make fuch differences in the refiflance as are now found to take place. Sir faace found, that, in finall velozities, the refllance was increafed in the daplicate proportion of the fwiftne?s with which the bady moved ; that is, a body moving with twice the velocity of another of equal magnitule, w:uld meet with four times as much refilance as the liril, widn thrice the waciey it would mest with nine times the relitance, 2 ke - This prim-Erroment ciple itfolf is now found 5 , be erroneous with regard to m milicar $f$ malitary projectiles; though, if it ha! been properly proceates. attended to, the refilane of the air might even from thence have beca reckoned mach mare condidabie than was commanly done. S, far, howestr, wate thefe wh, treated this fuhjeet icientilically, from giving a proper allowance for the refiltance of the aimofphere, that their therries differed moft egregiouly from the truth. Inaygens alone feens to have attended to this painciple: for, in the year 1690 , he pailitied a tratife on Gravity, in which he gave an a conat of fome experimertes tending to prow, that the traile of ail prajectiks maving with very faifi motions was wadely different from that of a parabsla. All the refl of the learned acquiefeed in the jutanefs of Gatileo's dacirine, and very erronenas calculations concerning the ranges of cannon were accordingly given. Nor was any rotice taken of thede crrors till the year 1\%15. At that time Mr Reflons, a Fiench oft- All thefo cer of arsillery, dillinguifhed ty the mamber of lieges at which he had lerved, by his high military rank, and by tions lions fions his abmites in his profefion, gave in a momoir to che cru:l. the Royal fieademy, of which he was a member, importing, that, "ahthongh it was agreed, that theory juined with practice did conllitute the perfaction of every art ; yct experience had taught him, that theory was of very littic fersice in the ufe of mortars: That the works of M. Blondel had jully enough deferibed the fereal parabolic lines, according to the different degrecs of that elevation of the piece; but that practice had convince! him, there was no theory in the efo fce of gapowior; for having endeavoured, with the greatelt pricifion, to point a mortar agreably to the fo calculations, he had never been able to ellablifh any folid foundation upon them."

From the hintory of the academy, it doth nat appeas that the fentiments of Mr Reflons were at any time controverted, or any reafon cfferd for the failme of
the thes yof propertan when appled tonfo. Nothing fantur, however, was dome till the time of beriamion Rubins, who in $17.7^{2}$ publithed a tratile, intited, Ar Rubin New labiaples of Gumery, in which he hath treated firf in ro particularly not only of the refiltance of the atmo. duces a true fihere, but almoll every thing che relating to the llighe theory. of military projectics, and indect advaned the :lecory of gumery much noarer perfection than she it was before.
Hinnechod The firt thing confodered by Mr Robins, an w which of deterni- is indeed the foundation of all other partieulars relaning the torce of gunpow. der.
 ty ying the cxperment, the quatitics of pe weder are fo wery bmall that it is diaticult to adoertain thefe proportians with the requifte degrce of exactnefs, I took a hage receiver containing abov: $; 20$ inche: and letting fall at onee on the red-hot iron one drachon or the fixtecnth part of an onnce avoirdapoois of powder, the raceicet leing firt nearly cxhanted; the mercury, after the explotion, was fubtided two inches exaetty, and all the poveder had taken tire. Thea leating the iron a fecond time, and exhauting the receiver as before, two drechms were lot down at once, which fank the mercury three inches and three gatatcre ; and a fuall part of the powder had fallen betide the iron, which (the boitom of the receiser being wet) did not lire, and the quantity which thus efcaped did appear io be nearly fuffecient, had it fallen on the iron, to have funk the mercury a quarter of an inch more; in which cale the two defeents, viz. two inches and four incheg, would have been accura:ely in the proportion of the refpective quantities of powder; from which proportion, as it was, they vory little varied.
" as different kinds of guopowder produce diffe. rent guantities of this flud, in proportion to their different degrces of goodnefs, before any defnite determination of this kind can take plase, it is neceffary to afeertain the particular fpecies of powder that is propofed to be uled. (Ifare Mr Kobins determines in all his experiments to make ufe of government-powder, as confiting of a certain and invariable proportion of materials, and therefore preferable to foch kinds as are made according to the fancy of private perfons.)
" This being lettled, we mull further promife thefe two pinciples: I. That the elafticity of this fluid in watics by heat and diminithes by cold, in the fame manner as that of the air; 2. That the dendity of this fluid, and confequently its weight, is the fame with the weight of an equal bulk of air, having the fame clallicty and the fame temperatue. Now from ti.e laft experiment it appuars, that 's of an cunce ao voirdupois or about 27 grains Troy of powder, funk the gage, on its explefirm, two inches; and the mercury in the barometer flanding at near 30 inches, $\frac{15}{6}$ the of an ounce avoirdupois, or flograins Troy, would have filled the receiver with a 1 haid whofe elallicity wond have been equal to the whole preflare of the atmofphere, or the fame with the challicity of the air we breathe; and the contsnt of the recener being abont 520 cubic inches, it follows, that: $\frac{5}{6}$ the of an ounce of powder will prodace 520 cubic inches of a fluid poffio lmor the fame degree of elalicity with the common air; whence an ounce of powder will produce near $575 \mathrm{ca}-$ bic inches of fuch a fluid.
"But in onder to afcertain the denfity of this fuic, we mutt contider what part of its elaticity, at the time of this detcrmination, was owing to the leat it recelred from the included hot-iron and the warm receiver. Now the general heat of the reciver beibs manifetly kefs than that of boinng water, which is known to increafe the claticity of the air to fomewhat more than I of its augmented quantity ; 1 collekt from heuce and other cirenmances, that the atementations of falficity from this canfe was about of the whele : that is, if the fluid ariting from the explofom had been reduced to the temperature of the external air, the defeent of
heory. the mercurial gage, intead of two inches, would have been only $1 \frac{1}{5}$ inch ; whence 575, reduced in the pronor tion of five to four, becomes +60 ; and this laftmmber repreferts the cubic inches of an elafice fluid equal in denfity and elaticity with common air, which ase produced from the explotion of 1 ounce avoirsupois of runpowder ; the weight of which quantity of iluid, accorsding to the afual eftimation of the weight of air, is 131 grains; whence the weight of this lluid is $\frac{1}{4} \frac{3}{5} \frac{3}{7}$ or $\boldsymbol{i}^{\frac{3}{7} \text { the }}$ nearly of the weight of the generating powder. The ratio of the bulk of gunpowcer to the bulk of this fluid may be determiued from confidering that $i 7$ drams avoirdupois of powder fill two cubic inches, if the powder be well hook together: therefore, augmenting the number taft found in the proportion of 16 to 17 , the refulling term $4^{48}$ 娅 is the number of cubic inches of an elatlic fluid, equal in dentity with the air produced frem two cubic inches of powder: whence the ratio of the refpective bulk of the puwder, and of the fluid produced from it, is in round numbers as ito $2+\ldots$."This calculation was aftenwards juflified by experinecris.
"If this fuid, inflead of expanding when the powder was fired, had been confined in the fame fpace which the powter filled befure the explution; then it would have had, in that confined fiate, a degree of clafticity $2+4$ times greater than that of common air; and this independent of the great angmentation this elallicity would reecive from the action of the fire in that inflant.
"Hence, tlocn, we are certain, that any quantity of powder, fired in a contince frace, which it adequately fills, exerts, at the intant of its explotion, againf the foles of the veffel contaming it, and the bodies it impels before it, a force at leall $2+t$ times greater than the elallicity of the common air, or, which is the fame thing, than the preflure of the atmolphere; and this without confidering the great addition which this force will receive from the violent degree of heat with which it is affected at that time.
"To determine how far the claficity of air is antmented when heated to the extremell degree of redhot iron, ! took a piece of a mliket-barrel about fix inches in length, and ordered one end to be clufed up entirely; but the other end was drawn out conically, and finilhed in an aperture of abour $\frac{1}{3}$ of an inch in diameter. The tube thus fitted, was heated to the extremity of a red heat in a fmith's forge; and was then immerfed with its aperture downords in a bucket of water, and kept there till it was cool; after which it was taken out carefully, and the water which had entered it in cooling was exactly weighed. The heat given to the tube at each time, was the beginning of what workmen call a white beat; and to prevent the rufhing in of the aqueous vapour at the immerfion, which would otherwife drive out great part of the air, and render the experiment fallacious, I had an iron wire filed tapering, fo as to fit the aperture of the tube, and with this 1 always Aopped it up before it was takon from the fire, letting the wire remain in till the whole was cool, when, removing it, the due quantity of water would enter. The weight of the water thus taken in at three different trials was G10 graise, 595 giains, and 600 grains, refpectively. The content of the whole cavity of the tube was jyg grains of water; "lence
the fpacts remainan wombl in thefe thre experiments were 18G. 201, and $19^{5}$ arpains refpectively. Thefe fpaers umboustany contatacd all the atir mbich, when the tube was red-hot, citcnded ihrough its whole cuncavity; comrequently the chalicity of the atr, whea heated to the extreme heat of vedhut iron, was to the elalticity of the fanse air, when reblaced to the temperature of the ambient atenofphere, as the whale capacity of the tube to the refoctive feaces laken up by the cooled air: that is, a; 796 to 186, zor, 156: or, taking the nudium of thefe three trials, as 750 to $10 .{ }^{\frac{1}{3}}$.
"As air and his fluid apptar to he equally; aflected by heat and cold, and confequently have their clafticities cqually augmented hy the addition of equal degrees of heat to cach ; if we fuppofe the heat with which the flame of fired powder is endowed to be the fame with that of the extreme heat of red-hot iron, then the elalticity of the gencrated fluid will be greater at the time of the explution than afterwards, when it is reduced to the tomperature of the ambient air, in the satio of $79^{5}$ to 194 nearly. It being allowed then, (which furcly is very reafonable), that the flame of gunpowder is not lefs hot than red.lat iron, and the clafticity of the air, and confequently of the fluid gencrated by ihe explofon, being awamented in the extremity of this heat in the ratio of $10+\frac{1}{5}$ to $79^{\%}$, it follows, that if $24+$ be angmented in this ratio, the refulting number, which is $999 \frac{3}{3}$, will determine how many tirce the elaticity of the flame of fired powder exceeds the claticiry of common air, fuppones it to be curiased in the fane fase which the powder fillod before it was fired. - Hence then the abfolute quantity of the preffure txerted by guaporder at the mement of its expluti no may be alfigued; for, fitice the flaid then generated has an ciaflicity of $992 \frac{1}{5}$, or in round nuaburs 1000 times grenter than that of the atmofflere, and fince common air by its clatlic!iy exerts a preflare on any given furface equal to the weight o! the ineumbert atmofphere with which it is in equitiorio, the prethure exerted by fired powder before it dilated itfelt is 1000 times greater than the preflure of the atmof, here: and confequettly the quantity of chis force, on a furface of an inch fequare, amomets to abse fix ton weight; which force, however, diminithes as the fuid dinates itfeif.
" But thungh we have here finppofed that the heat of gumpowder, when fired in any confiderable quanti$t y$, is the fame with iron heated to the extremity of red heat, or to the beginning of a white heat, yet it cannut be doubted but that the fire produced in the explofion is fomewhat varied (like all other fires) by a greater or leffer quantity of fuel; and it may be prefumed, that, according to the quantity of powde: fired together, the flame may have all the different degrees, from a languid red heat to that fufficient fo: the vitrification of metals. But as the quantity of Fowder requifite for the production of this laf mentioned heat, is certainly greater than what is ever fired togrther for any military purpale, we cannot be far from our feope, if we fuppole the heat of fuch quantities as are ufually fired to be uearly the fame with that of redhot iron; allowing a gradu. 1 angonentation to thig heat in larger quanities, and dmanibliag :t when the quatitiog are bery franor

Tutamtanecu, tirmig a! powder.

I Iaving this determined the forse of the gunponder, Air kowins next proeseds to dearmine the velo. city "ith which the lall is difolarged. The folution of this frem depernes on the two following prin(ip)les 1. That the ation of the powder on the butlet cafes as foon as the bullet is got out of the piece. 2. 'llat all the powder of the charge is fired and eonveried into claftic fluad before the buthet is finfibly moved from its place.
"The firt of thefe (fays Mr Rohins) will appear manifell wen it is confudered la fudenty the flame will extend infelf on every lide, by its own dafticity, When it is once got ont of the mouth of the pice ; for by this means its force will then be difipated, and the lullet no longer fenfibly affeeted by it.
"The fecord principle is indeed lefs obvious, being contrary to the general opinion of almott all writers on this fubject. It nuight, however, be fufficient for the proof if this poltion, to oblerve the prodigious comFrefliun of the flame in the chamber of the piece. Thote who attend to this circumitance, and to the eafy paltage of the flame through the irtervals of the grains, may fone fatisfy themflves, that no one grain contained in that chamber can continue for any time uninfaned, when thus furrounded and preffed by fuch an active firc. However, not to reiy on mere feculation in a matter of for much confequence, I conlidered, that if pat only of the powder is fired, and that fucceffively; then by laying a greater weight be fore the charge (fuppofe two or three bullets inftead of one), a greater quantity of powder would neceffarily le fired, fince a heavior weight would be a longer time in pathing through the barral. Whence it fhould foliu:i, that two or three bullets would be impelled by a much greate foree than one only. But the eontrary to this appears by experiment ; for firing one, two, :ind three buthets laid contiguons to each other with the fame charge refpectively, I have found that their selucities were not much different from the reciprocal of their fubduplicate quantities of matter ; that is, if a given charge would communicate to one bullet a velucity of 1,00 fect in a fecond, the fame charge would commmicate to two bullets a velocity from 1250 to i3:0 fuet in a fecond, and to three builets a velocity from 1050 to 1110 feet in the fame time. From lence it appears, that, whether a pieee is loaded with a greater or lefs weight of tullet, the action is neally the fame; fince all mathematicians know, that if bodies containing different quantities of matter are fueceflively impelled through the fame face by the fame power acting with a determined force at cach point cf that fpace; then the velocities given to thefe different hodies will be reciprocally in the fubduplicate ratio of their quantities of maticr. The excefs of the shocitiss of the two and three hullets aloove what they ought to have been by this rule (which are that of 1200 and $; 80$ feet in a \{icond), undoubtedly arifes from the flame, which, efcaping by the fide of

14
Why Gome f"wder is i lownout ef the nouth of a cannon without be ing tised. the finf bullet, acts on the fusface of the fecond and third.
"Now, this excels has in many experiments been imperceptible, and the velocities lave been recipen. cally in the fubduplicate ratios of the number of bulletz, to fufficient exactutef; and where this error has beengreater, ii has never arifen to ad cighth part of N 145.
the whole : but if the common opinton was true, that a farall part only of the pow derfires at Girt, and other parts of it fucceftrely as the butle paffes through the harrel, and that a confiderable part of it is often blown out of the piece without firing at all; then the velocity which three bullets received from the explotion ought to have been much greater than we have found it to be.- But the truth of this fecond poftulate more fully appears from thofe experiments, by which it is hown, that the velocities of bullets may be afeertaned to the fame exactnefs when they are acted on through a harrel of four inches in length only, as when they are dif. charged from one of four feet.
"With refpect to the grains of powder which are often blown out unfired, and which are always urged as a proof of the gradual firing of the charge, I believe Diego Uffano, a perfon of great experience in the art of grunnery, has given the true reafon for this accident ; which is, that fome fmall part of the charge is often not rammed up with the reft, but is left in the piece before the wad, and is by this means expelled by the blaft of air before the fire can reach it. I muit add, that, in the charging of cannon and frall arme, (fpecially after the firlt time, this is fcarculy to be avoided by any method I have yet feen practifed. Perhaps, too, there may be fome few grains, in the belt powder, of fuch an heterogencous compofition as to be Lefs fufeeptible of firing ; which, I think, I have myfelf obferved: and thefe, though they are furrounded by the flame, may be driven out unlired.
"Thefe poftulates being now allowed to be juft, let AB reprefent the axis of any pirce of artillery, $A$ the brecth, and $B$ the morzle: 1)C the diameter of its bore, and IDEGC a part of its cavity filled with powder. Suppofe the ball that is to be impelled to lie with its hiuder furface at the line GE; then the preffure extried at the explofion on the circle of which GE is the diameter, or, which is the fame thing, the prefture excred in tha direction FB on the furface of the ball, is eafly known from the known dimenfions of Hast circle. Draw any line FH perpendicula: to FD, and AI parallel to $\Gamma H$; and throngl the point $[H$, to the afymptotes $I A$ and $A B$, deferibe the hyperbola KIINQ; then, if IUI reprefents the furce impelling the ball at the point $F$, the force impelling the ball at any other point as at M, will be reprefented by the line MN, the ordinate to the hyperbola at that point. For when the fluid impelling the body along has dilated itfelf to M , ita denfity will be then to its original denlity in the face IVEGC reciprocally as the fpaces through which it is extended; that is, as FA to MA, or as MN to FH; but it has been fhown, that the impelling force or elatticity of this flud is directly as ita denfity; thercfore, if FH reprefents the force at the point 1 , MN will reprefent the like force at the point M.
"Since the abrolute quantity of the force impelling the ball at the point F is known, and the weight of the ball is alfo known, the proportion between the force with which the ball is impelled and its own gravity is known. In this proportion take FH to FL, and draw L.P parallel to FB ; then, MN the ordinate to the hyperbola in any point will be to its part MR, cut off by the line L.P, as the impelling force of the powder in that point hif to the gravity of the Lall; and

## t. II.

eory. confequently the line LP will determine a line proportional to the uniform force of gravity in every point; whillt the hyperbola HNQ determines in like manner fuch ordinates as are proportional to the impelling force of the powder in every point; whence by the 39th Prop. of lib 1. of Sir Ifaac Newton's Principia, the areas $F L P B$ and $F H Q B$ are in the duplicate proportion of the velocities which the ball would acquire when acted upon by its own gravity through the fpace FB, and when impelled through the fame fpace by the force of the powder. But fince the ratio of AF to $A B$ and the ratio of $F H$ to FL are known, the ratio of the area FL1'B to the area FHQB is known; and thence its fubduplicate. And fince the line FB is given in magnitude, the velocity which a heavy body would acquire when impelled through this line by its own gravity is known ; being no other than the velocity it would acquire by falling through a face equal to that line: find then another velocity to which this laft mentioned velocity bears the given ratio of the fubduplicate of the area FLPB to the area FHQ 13 ; and this velocity thus found is the velocity the ball will acquire when impelled through the fpace FB by the action of the inflamed powder.
" Now to give an example of this: Let us fuppofe $A B$, the length of the cylinder, to be 45 inches, its diameter DC, or rather the diametcr of the ball, to be $\frac{3}{4}$ ths of an inch; and AF, the extent of the powder, to be $2 \frac{1}{8}$ th inches; to determine the velocity which will be comonunicated to a leaden bullet by the explofion, Cuppofing the bollet to be laid at firft with its furface contiguous to the powder.
"By the theory we have laid down, it appears, that at the firf inftant of the explofion the flame will exert, on the bullet lying clofe to it, a force 1000 times greater than the preffure of the atmolphere. The medium preflure of the atmofphere is reckoned equal to a column of water 33 feet in height; whence, lead being to water as 11,345 to 1 , this preffure will be equal to that of a column of lead 34,9 inches in height. Multiplying this by 1000 , therefure, a column of k ad 34900 inches (upwards of half a mile) in height, would produce a preffure on the bullet equal to what is exerted by the powder in the firft inflant of the explofion; and the leaden ball being ${ }^{3}$ ths of an inch in diamster, and confequently equal to a cylinser of lead of the fame bafe half an inch in height, the preffure at firft aeting on it will be equal to $34900 \times 2$, or 6980 c times its weight : whence FL to FH as ito 69800 ; and FB to FA as $45-2 \frac{5}{8}$; or $42 \frac{3}{8}$ to $2 \frac{5}{8}$; that is, as 339 to 21; whence the rettangle FLPB is to the rectangle AFHS as 339 to $21 \times 6,800$, that is, as 1 to 4324.-And from the known application of the loga. rithms to the menfuration of the hyperbolic fpaces it follows, that the rectangle AFHS is to the area FHOB as $43,429, k \mathrm{c}$. is to the tabular logarithm of $\frac{A B}{A F}$; that is, of $\frac{160}{2} 0^{\circ}$ which is $1,23+0579$; whence the ratio of the rectangle FLPB to the byperbolic area FHQB is compounded of the ratios of ! to 4324- and of ,43429, \&\&. to 1,23+5579; which together make up the ratio of 1 to 12263 , the fubduplicate of which is the ratio of 1 to 110,7 ; and in this ratio is the velocity which the bullet would aequire by gravity in fallVol. VIII. Part I.
ing through a face equal to $F B$, to the velocity the bullet will acquire from the action of the powder itnpelling it through FB. But the fpace FB being $42 \frac{3}{3}$ inches, the velocity a heavy body will acquire in falling through fuch a fpace is known to be what would carry it nearly at the rate of 15.07 feet in a fecond; whence the velocity to which this has the ratio of 1 to 110,7 is a velocity which would carry the ball at the rate of 6688 fett in one fecond. And this is the velocity which, according to the theory, the bullet in the prefent circumftances would acquire from the action of the powder during the time of its dilatation.
"Now this velocity being once computed for one cafe, is eafily applied to any other; for if the cavity 1)EGC left behind the bullet be only in part filled with powder, then the line HF, and confequently the area FHQB will be diminifhed in the proportion of the whole cavity to the part billed. If the diameter of the bore be varied, the lergths $A B$ and $A F$ remaining the fame, then the quantity of powder and the furface of the bullet which it acts on, will be varied in the duplicate proportion of the diameter, but the weight of the bullet will vary in the triplicate proportion of the diameter; wherefore the line 1 H , which is directly as the abfolute impelling force of the powder, and reciprocally as the gravity of the buller, will change in the reciprocal proportion of the diameter of the bullet. If AF, the height of the cavity left behind the bullet be increafed or diminifhed, the rectangle of the hyperbola, and confequently the area correfponding to ordiuates in any given ratio, will be increafed or diminifhed in the fame proportion. From all which it fullows, that the area FHCB, which is in the duplicate proportion of the velucity of the impelled body, will be oirectly as the logarithm $\frac{A B}{A F}$ (where $A B$ reprefents the length of che barrel, and AF the length of the cavity left behind the bullet) ; alfo direcily as the part of that cavity filled with powder; and inverfely, as the diancter of the bore, or rather of the bullet, likewife directly as AF, the height of the cavity $\mathrm{l} f \mathrm{ft}$ behind the bullct. Confequently the velocity being computed as above, for a bullet of a determined diameter, placed in a piece of a given length, and impelled by a given quataty of powder, occupying a given cavity behind that bullet ; it follows, that by means of thefe ratios, the velocity of any other bullet may be thence deduced; the neceffary circumflanecs of its pofition, quantity of powder, \&ec. being given. Where note, That in the inflance of this fuppofition, we have fuppofed the diameter of the ball to be ${ }^{3}$ ths of an inch; whence the diameter of the bore will be fonething more, and the quantity of powder contained in tle fpace 1)EGC will amount exactly to 12 pennyweight, a fmall wad of tow included.
"In order to compare the velocities communicated to bullets by the explofion, with the velocities aefulting from the theory by computation, it is neceflary that the actual velocities with which bullets move hould be difcovered. The only methods hicherto practifed for this purpofe, have been either by obferving the time of the flight of a not chrough a given fpace, or by meafuring the range of a fhot at a given elevation; and thence computing, on the parabolic hypo-

Bb
theris, thefis, what ecgree of vlociey would produce this range. - The hirt mothodiahours under this infurmount able cifinculty, that the velocities of thefe botics are often $n$ fwift, and confonently the sime obrerved is fo tho , that an impenceptible crror in that time may secafion an error in the velocity thus found of 2,3 , A, 5, or 600 fect, in a fecond. The otlur method
 mofphere (to which inequality the firt is alfo liable), What the velocities thus afigened may mor perhaps be the tenth part of the actual velocities fought.
"The hapleit mechod of determining this veloci-

Machire difcovering the veluej? ics of bu'. lets. $t y$ is ty means of the initument reprefented fig. 2 . where $A B C D$ stprefents the body of the machine compofed of the three poles $\mathrm{B}, \mathrm{C}, \mathrm{l}$, fpreading at botom, and joining together at the top A; being the fane with what is vulgarly ufed in lifting and weighing vely havy bodies, and is called by workmen the driturghes. On two of thefe poles, towards their tops, are forewed on the fockets RS; and on thefe fockets the fendulum EFCHIK is hung by means of its crofspiece EF, which beconcs its axis of fuipoofon, and on which it mut be made to vibrate with great freedon. The body of this pendulum is made of iron, having a bioad past at Lottom, and its lower part is covered with a thick piece of wood (;KIH, which is fallened to the iton by ferews. Something lower than the bottom of the pendulum there is a brace $O P$, joining the two poles to which the pendulum is fuppeuded; and to this brace there is fallened a contrivance MNU, made with two edges of Ateel, bearitig on each other in the line UN, fomething in the mannce of a drawing pen; the frength with which thefe edses prefs on cach cther beirg diminifhed or increafcd at pleafure by means of a forew $Z$ going through the upper picce. There is faltencd to the bottom of the pendulum a narrow ribbon $L N$, which paffes between thefe fteel eiges, and which afcrwards, by means of an optning cat in the lower piece of Aced, hangs loofly down, as at W.
be free and eafy, though with fome minute reflefance; then fetting the pendulum at rell, let the part $\mathrm{L} N$ between the pendulum and the edges be deawn ftrait, but not Arained, and lix a pin in that part of the sibbon which is then contiguous to the cdges: let now a ball impinge on the pendulum; then the pendulum fwinging back will draw ont the ribbon to the jul exteat of its vibration, wheh will confequently be determined by the interval on the ribbon between the edges UN and the place of the pin.
"Tice weisht of the whole pendulum, wood and all, was 56 lb . $30 \%$. its cenire of gravity was 52 inches diftant from its axis of fufpenfon, and 200 of its fmall fwings were performad in the time of 253 feconds; whence its centre of ofcillation (determined from heace) is $62 \frac{2}{3}$ d inches dillant from that axis. The centre of the picee of wood GKIH is ditant from the fame axis 66 inches.

In the compound ratio of 66 to $62 \frac{2}{3}$, and 66 to 52 , take the quantity of matter of the pendulum to a fth quastity, which will be $4^{2 \mathrm{lb}} \frac{\frac{1}{2} \mathrm{oz} \text {. Now geometers }}{}$ will know, that if the blow be flruck on the ceatre of the piece of wood GKIH, the pendulun will relit to the froke in the fame manner as if this laft quantity of matter only ( $4^{2} \mathrm{lb} . \frac{1}{2} \mathrm{oz}$.) was concentrated in that point, aod the relt of the peodulum was taken away: whence, fuppofing the weight of the bullet impinging in that point to be the $\frac{1}{x}$ th of a pound, or the $\frac{1}{5}$ ot th of this quantity of matter searly, the velacity of the point of ofcillation after the Atroke will, by the laws obferved in the congrefs of fuch bodies as rebound not from each other, be the $\frac{1}{5} \mathrm{E}^{\text {th }}$ th of the velocity the bullet moved with before the droke; whence the velocity of this point of ofcillation after the ttroke being afcertained, that multiplied by 50 ; will give the velocity with which the ball impinged.

- But the velocity of the point of ofcillation after the ftroke is ealily deduced from the chord of the arch, through which it afcent; by the blow; for it is a wellknown propofition, that all pendulous bodies atcend to the fame leeight by their vibratory motion as they would do, if they were projected directly upwards from their lowelt point, with the fame velucity they have in that point: wherefore, if the verfed has of the afeending arch be found (which is eatily deterrained from the chord and radius being given), this verfed tine is the perpendicular height to which a body projected upwards with the velocity of the point of ofcillation would arife; and confequeritly what that velocity is, can be ealily computed by the common theory of falling bodies.
"For intarice, the chord of the arch, defcribed by the afcent of the pendulum after the itroke meafured on the sibbon, has been fometimes $17 \frac{1}{4}$ th irches; the diftance of the ribbon from the axis of fufpenfion is $71 \frac{3}{8}$ th incles; whence reducing $17 \frac{1}{4}$ th in the ratio of $7 \frac{1}{8}$ th to 66 , the refulting number, which is nearly 16 inches, will be the chord of the arch through which the centre of the board GIIH afcended after the firoke; now the verfed fibe of the arch, whofe chord: is 16 inches, and its radius 66 , is 1.03939 ; and the velocity which wouid carry a body to this height, or, which is the fame thing, the velocity which a body would acquire by defeerding threegh this face, is nearly that of $3 \frac{1}{7}$ th fuct in $1^{\prime \prime}$.
" Co
"To determire then the velocity with which the bullet impinged on the centre of the wood, when the chord of the arch defcribed by the afeent of the pendulum, in confequence of the blow, was $17 \frac{1}{9}$ th inches meafured on the ribbon, no more is neceffary than to multiply $3^{\frac{1}{2}}$ th by 505 , and the refulting number $16+1$ will be the feet which the bullet would defcribe in :', if it moved with the velocity it had at the moment of its percuffion: for the velocity of the point of the pendulum, on which the buller Aruck, we have jult now determined to be that of $3 \frac{1}{5}$ th fect in $\mathrm{t}^{\prime \prime}$; and we have before thown, that this is the $\frac{1}{5}$ th of the velocity of the bullet. If then a bullet weighing $\frac{1}{T_{2}}$ th of a pound flrikes the pendulum in the centre of the wood GKIH, and the ribbon be drawn out $17 \frac{1}{7}$ th inches by the blow; the velocity of the buller is that of $1 \sigma_{+1}$ feet in $\%^{\prime}$. And fince the length the ribbon is drawn is always neally the chord of the arch defcribed ly the afcent, (it being placed fo as to differ infenfibly from thofe chords which molt frequently occur), and thefe chords are known to be in the proportion of the velocities of the pendulum acquired from the Alroke ; it follows, that the proportion between the lengths of ribbon drawn out at different times, will be the fame with that of the velocitics of the impinging bullets; and confequently, by the propartion of thefe lengths of ribbon to $\mathrm{t} \frac{1}{3}$ th, the propotion of the velocity with which the bullers impinge, to the known valocity of $\sigma_{i} 1$ feet in $\mathbf{1}^{\prime \prime}$, will be determined.
"Hence then is fhown in general how the velocitics of bullets of all kinds may be found out by means of this infrument ; but that thofe who may be difpofed to try thefe experiments may not have unforcfen difficulties to ftruggle with, we fhall here fubjoin a few obfervations, which it will be neceflary for them to attend to, both to ferure fuccefot to cheir trials and fafety to their perfons.
" And firlt, that they may not conceive the piece of wood GKIH to be an unneceflary part of the machine, we muft inform them, that if a bullet impelled by a full charge of powder fhould trike ditectly on the iron, the bullet would be beaten into fhivers by the ttroke, and thefe f:ivers will rebound back with fuch vioknce, as to bury themfelves in any wood they chance to light on, as I have found by hazardous expericnce; and befides the danger, the pondulum will not in this intance afcertain the velocity of the bullet, becaufe the velucity with which the parts of it rebound is unknown.
"The weight of the pendulum, and the thicknefs of the wood, mult be in fome meafure proportioned to the fize of the bullets which are ufed. A pendulum of the weight hare defcribed will do very well for all ts:!lets tander three or four ounces, if the thicknefs of the buard be increafed to feven or eight inches for the heavic at bullets; heech is the toughet and properent wood tor this purpofe.
"It is liazardous ftanding on the fide of the pendulum, unlefs the board be To thick, that the greatelt part of the bullet's force is lolt bcfore it comes at the iron; for if it trikes the iron with violence, the fhivers of lead, which cannot return back through the wood, will force themfelves out between the wood and iron, and will fy in a confiderable dittance.
"As there is no effctual way of fallening the wood
to the iron but by ferews, the heads of which muit Thenry. come through che board; the bullets will fometimes light on thofe fcrews, from whence the hivers will difperfe themfelves on evcry lide.
"When in thefe experinients fo fmall a quantity of powder is ufed, as will not give to the bullet a velociey of more than $+\infty 0$ or 500 feet in $\mathrm{t}^{\prime \prime}$; the bullet with not tick in the wood, but will rebound from it catire, and (if the wood be of a very hard texture) with a very confiderable velocity. Indeed I have never examined any of the bullets which have thus rebounded, but 1 have found them indented by the bocies they have Atruck araint in their rebound.
"To avoid then thefe dangers, to the braviag of which in philofophical refearches no honour is annex. ed ; it will be convenient to lix whatfoever barrel is ufed, on a ftrong lieavy carriage, and to tire it with a litthe now match. Let the barrel ton be very well fortified in all its length; for no barrel (I fpeak of mut. l:et barrcts) forged with the ufal dimemtions will bear many of the experiments without burfing. The barrel I lave molt relied on, and which I prozured to be made on purpofe, is neanly as thick at the muzzel as at the breech; that is, it has in each place neanly the diameter of its bore in thicknefs of metal.
"The powder ufed in thefe experiments hould be exactly weighed: and that no part of it be fateered in the barrel, the piece mult be clarged with a ladle in the fame manner as is practifed with cannon; the wad flould be of tow, of the fume weight each time, and no more than is juft neceflary to confine the powder in its proper place: the length of the cavity left behind the ball fonuld be deternined each time with exactnefs; for the increafing or diminifhing that fpacc will vary the velocity of the fhot, although the bullet and quantity of powder be not changed. 'The ditance of the mouth of the piece from the pendulum onght to be fuch, that the impalie of the flame may not act on the pendulam; this will be prevented in a common barsel charged with $\frac{1}{s}$ an ounce of powder, if it be at the diltance of 16 or 18 feat: in larger clarges the impulfe is fenfible farther off; I have found it to extend to above 25 feet; however, between 25 and 18 feet is the diltance 1 have wfually chofen."

Wieh this infroment, or others fimilar to it, Mr Accome of Robins made a great nurber of experiments on bar- Mrr Rorels of different lengths, and with different charges of bispocxpowder. He hath given us the refults of 61 of thefe; ;erineentzo and having compared the astual welocities with the computed ones, his theory appears to have come as near the truth as could well be expteted. In feven of the experiments there was a perfect coincidence: the charges of powder being fix or twelve penayweights; the bariels $45,24.312$, and 7.06 inches in length. The diameter of the firt (maiked A) was $\frac{3}{3}$ this of an inch; of the fecond (B) was the fame; and of $D, 83$ of an inch. In the reft of the experiments, another barrel (C) was ufed, whofe lengeth was 12.375 inches, and the diameter of its bore $\frac{3}{3}$ th inches. - In 14 more of the experiments, the difference between the length of the chord of the pendulum's arch hown by the theory and the actual experiment was $\mathrm{r}^{\mathbf{t}}$ th of an inch over or under. This fhowed an error in the theory varying according to the different lengths of the chord from $T+T$ to Th $^{2}$ of the whole; the charges of powder

Thenry were the fame 25 in the lat.-In 6 other experiments the ernor was ${ }^{2}$ thas of an inch, varying from $\frac{1}{8}$ to $i_{5}$ of the whole; the charges of powder were 6,8 , 9, or 12 pennyweights - In feven other experiments, the error was $3^{3}$ iths of an inch, varying from ${ }^{\frac{1}{2}}$ to rit of the whole; the charges of powder fix or twetve pennywaights. In eight experiments, the difference was $\frac{4}{3}$ ths of an inch, indicating an error from $\frac{1}{4}$ to $a^{\prime}$ of the who!e; the charges being $6,9,12$, and 24 pennywights of powder. In three aperiments, the
 whole; the charges 8 and 12 pennyweights of powder. In wo experiments the error was ${ }^{6}$ the, in one cafe amounting to fomuthing lefs than $\frac{3}{3}$, in the other to $z^{\prime 2}$ of the whole; the clarges 12 and 36 penny. weights of powder. Jy one experiment the error was feven, and by another eight, tenths; the firlt amounting to ${ }^{7}$ th nearly, the latter to almod $\frac{x}{9}$ th of the whole : the charges of powder 6 or 12 pennyweights. The latt enror, however, Mr Robins aferibes to thee wind. The two romaining experiments aaried from theory by 1.3 inches, fomewhat more than $\frac{x}{9}$ th of the whole: the charges of powder were 12 pennyweights in each: and $\mathrm{M}_{1}$ Robins alcribes the error to the dampnefs of the powder. In another cafe, he alcribes an trror of $\frac{6}{8}$ the to the blalt of the powder on the penduium.

From thefe experiments Mr Robins deduces the fol lowing conclufions. "I'lie varicty of thele experiments, and the accuracy with which they correfpond
to the theory, leave us no room to doubt of its cer-tainty.- This theory, as here eftablifhed, fuppofes, that, in the firing of gurpowder, about $\frac{7}{c}^{3}$ ths of its fublance is converted by the fudden inflammation into a fermanently claftic fluid, whofe elallicity, in proportion to its heat and denfity, is the fame with that of common air in the tike circumblances; it farther fuppoles, that all the force excrted by gunpowder in its mot violent operations, is no more than the action of the clatacity of the fluid thas generated; and thefe principles enable us to determine the velocities of bul? iets impelled fiom fire-arms of all kinds; and are fully iufficient for all purpofes where the force of ganpowder is to be ettimated.
"From this theory many deductions may be made of the greateft confequance to the practical part of gunnery. From benee the thicknefs of a piece, which will enable it to conline, without burting, any given tharge of powder, is talily determined, fuce the effort "the powder is known. From henee appears the inconclulivencis of vihat fome modern authors have ad. vared, itlating to the advantages of particular forms of chambers fur mortars and cannon; for all their laboured fpeculations on this head are evidently founded on very erroncous opinions abont the action of fired powder. From this theory ton we are taught the neeffity of laving the fane face behind the bullet when we would, by the fame quantity of powder, -ommunicate to it an equal degree of velocity; fince, on the principles already laid down, it follows, that the bame powder has a greater or hefs degree of elatlicity, accoring to the diflerent faces it occupies. The method which 1 have always practifed for this purpore has been by marking the rammer; and this is a maim whibls ought not to be difpenfed with when
cannon are fred at an elevation, panticularly in thofe [heory. called by the lirench bateries á riooches.
"Eron the contiaued action of the powder, and its manner of espanding deferibed in this theory, and the length and weight of the picee, one of the molt effential circunitances in the well directing of artillery may be eafily afeertained. All practitioners are agreed, that no thot can be depended on, unlefs the piece be placed on a folid platform: for if the platform thakes with the firt impulle of the powder, it is impoffible but the piece mint alfo flake: which will alter its direction, and render the hot uncertain. lo prevent this aceident, the platform is ufually made extremely firm to a conliclerable depth backwards; to that the piece is not only well fupported in the beginning of its motion, bat likewife through a great part of its recoil. However, it is fufficiently obvious, that when the bullet is feparated from the piece, it can be no longer affected by the trembling of the piece or platform ; and, by a very ealy computation, it will be found, that the bullet will be out of the piece before the latter hath recoiled half an inch: whence, if the platform be fufficiently folid at the beginang of the recoil, the remaining part of it may be much flighter; and hence a more compendious method of constructing platforms may be found out.
'F From this theory alfo it appears how greatly thefe authors have been miltaken, who have attributed the force of gunpowder, or at leall a conliderable part of it, to the action of the air contained either in the powder or between the intervals of the grains: for they have fuppofed that air to exill in its natural elaflic llate, and to recrive all its addition of force from the beat of the explofion. But from what hath been already delivered concerning the increale of the air's elalicity by hat, we may conelude that the heat of the explofion canot ausment this elatticity to five times it common quantity; confoquenty the force arifing from this caufe only canot amount to more than the 200th part of the real forse cxeried on the occafion.
"If the whole fubitanee of the powder was converted into an elatlic land at the intlant of the explofion, then from the known elaticity of this fuid afGigned by our theory, and its known denfity, we could eahly determine the velucity with which it would begin to expand, and could thence trace out its future augmentations in its progrefs through the barrel: but as we have fhown that the elattic flaid, in which the activity of the gunpowder conlifts, is only ${ }^{3}$ the the of the fubltance of the powder, the remaining ry ${ }^{7}$ ths will, in the explolion, be mixed with the elallie part, and will by its weight retard the activity of the explotion; and yet they will not be fo completely united as to move with one common motion; but the unelaftic part will be lefs accelerated than the reft, and fome will nost even be carried ont of the barrel, as appears by the confderable quantity of unctuous matter which adheres to the infide of all lire-arms after they have been wled. - Thele inequalities in the expanfive motion of the llame oblige ns to recur to experiments for its accurate determination.
"The experiments made ufe of for this purpofe were of two kinds. The firt was made by charging the barrel A with 12 pennyweights of powder, and a
fmall
cory. fimall wad of tow only ; and then placing its mouth 19 inches from the centre of the perdulum. On tiring it in this fituation, the impulie of the flame made it afeend throurh an arch whofe chord was 13.7 inches; whence, if the whule fubltance of the powder was fuppofed to ltrike againt the pendulum, and each part to llike with the fame velocity, that common velucity mult have been at the rate of about 26,5 feet in a fecond. - But as fome part of the veluecty of the flame was lott in pafing through 19 inches of air; I made the remaining experiments in a manner not liable to this inconvenience.
"I fixed the barrel A on the pendulum, fo that its asis might be both hoizontal and alfo perpendicular to the plane HK ; or, which is the fame thing, that it might be in the plane of the pendulum's vibration: the height of the axis of the piece above the eentre of the pendulum was fix inches; and the weight of the piece, and of the iron that fatlened it, \&ec. was $12 \frac{1}{2} \mathrm{ib}$. The barrel in this lituation teing elarged with 12 penny-weights of powder, without either ball or wad, only put together with the raminer; on the difcharge the penduhum afcended through an areh whofe chord was 10 inches, or reduced to an equivalent blow in the centre of the pendulum, furpoling the barrel away, it would be $1.4+$ inches nearly.-The fame experiment being iepeated, the chord of the afeending arch was 10.1 inches, which, reduced to the centre, is 14.6 inches.
"To determine what difference of velocity there was in the "different parts of the vapour, I loaded the piece again with 12 pemur-weights of powder, and rammed it down with a wad of tow, weighing one pemy-weight. Now, I conccived that this wad being very light, would prefonty aequire that velocity with which the ealtic part of the fluid would expand itfelf when uncomprefled; and I accordingly found, that the chord of the afcending arch was by this means increafed to 12 inches, or at the centre to 17.3: whenee, as the mediam of the other two experiments is 14.5 , the pendulum afeended through an arch 2.8 iuches longer, by the additional motion of one penny weight of matter, moving with the velocity of the fwiftell part of the vapour ; and confeguently the velocity with which this penny-weight of matter moved, was that of about 7000 feet in a fecond.
" It will perhaps be objected to this determina. tion, that the augmentation of the arch through which the pendulum vibrated in this cafe was not all of it owing to the quantity of motion given to the wad, but part of it was produced by the conlinement of the powder, and the greater quantity thereby fired. But if it were true that a part only of the powder fired when there was no wad, it would not happen that in fring different quantities of powder without a wad the chord wonld increafe and decreafe nearly in the ratio of thefe quantities; which yet I have found it to do: for with nine pennyweights that chord was 7.3 inches, which with 12 pennyweights we have feen was only 10 , and 10.1 inches; and even with three pennyweights the chord was two inches; deficient from this proportion by .5 only; for which defect too other valid reafons are to be affigned.
"And there is fill a more convincing proof that
all the powder is fired, although no wad be placed be. Therry. fore the charge, which is, that the part of the recoil ariting from the expantion of powder alone, is found to be no gicater when it impels a leaden butlet before it, than when the fame quantity is fired without any wad to confine it. We have feen that the chord of the arch through which the penduluin rofe from the expanfive force of the powder alone is 10 , or 10.1 .; and the chord of that areh, when the picce was charged in the cuflomary manner with a bullet and wad, I found to be the firlt time $22 \frac{1}{4}$, and the fecond $2 \frac{2}{3}$, or at a medium 22.56. Now the impulfe of the ball and wad, if they were fuppofed to tlrike the pendulum in the fame place in which the barrel was fufpented, with the velocity they had acquired at the month of the piece, would drive it through an arch whofe churd would be about $\mathbf{t 2 . 3}$; as is known from the weight of the pendulum, the weight and pofition of the barrel, and the velocity of the bullet determined by our former experiments; whence, lubtracting this number 12.3 from 22.56 , the remainder 1026 is nearly the chord of the arch which the pendulum would have afcended through from the expanfion of the powder alone with a bullet laid before it. And thio number, 10.26, differs but hitte from 20.1, which we have above found to be the chord of the afcending arch, when the fame quantity of powder expanded itfelf freely without either bullet or wad before it.
"Again, that this velocity of 7000 feet in a $f c$. cond is not much beyond what the molt active part of the flame acquires in expanding, is evinced from hence, that in fome experiments a hall has been found to be difcharged with a velocity of 2400 feet in a fecond; and yet it appeared not that the action of the powder was at all diminifled on account of this inmenfe celcrity: coufequently the degree of fwiftuefs with which, in this inllance, the powder fullowed the ball without lofing any part of its preffure, mult have been much frott of what the powder alone would have ex. panded with, had not the ball been there.
"From thefe determinations may be deduced the force of petards; fince their action depends entirely on the impulfe of the flame: and it appears that a quanity of powder properly difpufed in fuch a machine, may produce as siolent an cfiert as a bullet of twice its weight, moving with a velocity of 1400 or 1500 feet in a fecond.
" In many of the experiments already recited, the A hullet' ball was not laid immediately contiguons to the pow. ficieff der, but at a imall diflance, amounting, at the ut- wre the molt, only to an inch and a half. In thefe cares the Ereacty wetheory agreed very well with the experiments. But laidst a dhif a bullet is placed at a greater ditance from the thate fr $\cdots$ powder, fuppofe at 12, 18, or $2+$ inches, we cannot ${ }^{\text {the }}$ owder. then apply to this ball the fame principles which may be applied to thofe laid in contact, or nearly fo, wi:h the powder; for when the furface of the fircel powder is not confined by a heavy body, the flame dilates itfalf with a velocity far exceeding that which it can communicate to a bulle by its continucd preflure: confequently, as at the diftance of 12,18 , or $2+$ incher, the powder will have acquited a confiderable degree of this velocity of expantion, the firt mution of the ball will not be produced by the contimed preffue of the powder, but by the actual percufion of the
flame; and it will therefore begin to move with a quantity of motion proportioned to the quantity of this flame, and the velocities of its refpective parts.
"From lence then it follows, that the velocity of the bullet, haid at a contiderable dittance before the charge, ought to be greater than what would be communicated to it by the preflure of the powder acting in the manner already mentioned: and this deduction from our theory we have confirmed by manifold experience; by which we have found, that a ball laid in the barrl'A, with its hinder part $11^{\frac{1}{5}}$ inches from its breech, and impelled by 12 pennyweights of powder, has acquired a velocity of about 1400 feet in a fecond ; when, if it liad been acted on by the prefliure of the flame oniy, it would not have acquited a velocity of 1200 fect in a fecond. The fame we have found to hold true in all other greater dilances (and alfu in leffer, though nut in the fane degree), and in all quantities of powder: and we have likewife found, that thefe effects nearly correfpond with what has been already laid down about the velocity of expantion and the elallic and unelallic parts of the flame.
"From hence too arifes another conlideration of great confequence in the prattice of gunnery; which is, that no bullet flould at any time be placed at a confiderable diftance before the charge, unlefs the piece is extremely well fortilied: for a moderate charge of powder, when it has expanded itfelf through the vacant face, and reaches the ball, will, by the velocity each part has acquired, accumulate itfelf behind the ball, and thereby be condenfed prodigionfly; whence, if the barrel be not extremely firm in that part, it mul, by means of this re-inforced elallicity, infallibly burf. The truth of this reafoning I have experienced in an exceeding good Tower mufket, forged of very tough iron; for charging it with 12 pennyweights of powder, and placing the ball 16 inches from the breech, on fring it, the part of the barrel juft behind the bullet was fwelled out to double its diameter like a blown bladder, and two large pieces of two inches long were burft out of it .
" Having feen that the entire motion of a bullet laid at a confiderable diftance from the charge, is acquired by two different methods in which the powder adts on it ; the firlt being the percufion of the parts of the flame with the velocity they hal refpectively acquired by expanding, the fecond the continned Freflure of the flame through the remaining pant of the barrel; I endeavoured to feparate thefe diferent actions, and to retain that ouly which arofe from the continued preflure of the 马ame. For this purpofe I wo longer placed the powder at the breech, from whence it would have full fcope for its expanfion ; but I feattered it as uniformly as I could through the whole cavity left behind the bullet; imagining that by this means the progrefive veloci:y of the flame in each part would be prevented by the expanfion of the neighbouring parts: and I found, that the ball being laid $11^{\frac{1}{7}}$ inches from the breech, its velocity, infeand of 1400 fect in a fecond, which it acquired in the latt experiments, was now no more than 100 feet in the fecond, which is 100 feet fhort of what according to the theory fhould arife from the continued prefiure of the powder only.
"The reafon of this deficiency was, doubtlefs, the

N ER Y.
inteftine motion of the flame: for the accenfion of the powder thus dillributed through fo much larger a fpace than it could fill, mult have produced many reverberations and pulfations of the flame; and from thefe internal agitations of the nluid, its preffure on the containing furface will (as is the cafe of all other flaids) be confiderably diminifhed; and in order to avoid this irregularity, in all other experiments 1 took care to have the powder clofely confined in as fmall a fpace as poffible, even when the bullet lay at fome littie diftance from it.
" With regard to the refiftance of the air, which Of the ${ }^{23}$ fo remarkably aflects all military projectiles, it is ne-fitance ceffary to premife, that the greatef part of authors the air til have eftablifhed' it as a certain rule, that while the fame the motie body moves in the fame modiam, it is always refilted in the duplicate propurtion of its velocity; that is, if the relifted body move in one part of its track with three times the velocity with which it moved in fome other part, then is refllance to the greater velocity will be nine times the refitance to the leffer. If the velocity in one place be four times greater than in another, the refiltance of the fluid will be 16 times greater in the firlt than in the fecond, \&c. This rale, however, thouth pretty near the truth when the velocities are contined within cortain limits, is exceflively erroneous when applied to military projectites, where fuch refillances often occur as could fcarcely be effected, on the commonly received principles, evcu by a treble augmentation of its denfit\%.
" By means of the machine already defcribed, I have it in my power to determine the velucity with which a ball moves in any part of its track, provided I can dircit the piece in fuch a manner as to canfe the bullet to impinge on the pendulum placed in that part: and therefore, charging a mulket-barrel three times fucceffively with a leaden ball $\frac{3}{3}$ of an inch in diameter, and about half its weight of powder; and taking fuch precaution in weighing of the powder and placing it, that I was aflured, by many previous tials, that the velucity of the ball could nut differ by 20 fect in a fecond from its medium quantity; I fired it againtt the pendulum placed at 25,75 , and 125 feet ditance froan the mouth of the piece refpectively; and I found that it impinged again! the pendnhm, in the lirtt cafe, with a velocity of 16,0 feet in a fecond; in the fecond cafe, with a velocity of 1550 feet in a fecond; and in the third enfe, with a velocity of $142 ;$ feet in a fecond: fo that, in piffing through 50 feet of air, the bullet loft a velocity of 120 or 125 feet in a fecond; and the time of its pafing through that face being about $\frac{1}{3^{2}}$ or $\frac{5}{5}^{\frac{7}{3}}$ of a fecond, the micdiam cquantity of sefitance mull, in thefe inflances, have been about 120 times the weight of the hall; which (as the ball was neally $\mathrm{I}_{\mathrm{z}}^{\mathrm{z}}$ of a pound) amounts to about 10 lb . avoird"puite.
"Now, if a computation be made according to the method haid down for compreffed fluids in the 3 sth propofition of Newton's Principia, fuppofing the weight of water to that of air as 850 to 1 , it will be found, that the refillance to a globe of an inch diameter, moving with a velucity of about 1600 feet in a fecond, will not, on thefe principles, amonnt to any more than $40^{1}-1 \mathrm{t}$. avoirdupoife; whence. as we know that the rulks contaned in that propolition are
heory. very accurate with regard to flow motions, we may hence concinde, that the retiftance of the air in flow nustions is lefs than that in fwift motions, in the ratio of $4 \frac{1}{6}$ to 10; a proportion tetween that of 1 to 2 , and 1 to 3 .
"Again, I charged the fame piece a mumber of times with equal quataties of powder, and balls of the fame weight, taking :lll poifible eare to give to every fhot an equal veloenty; and, liring three times againit the pendalum placed only 25 feet from the mouth of the piece, the medium of the velocities with which the batl impinged was maraty that of toyo feet in a fecond: then removing the piece 175 feet from the pendulum, I found, taking the medium of five flots, that the velocity with which the ball impinged at this dillance was : 300 fect in a feeond; whence the batl, in paffing through 150 fect of air, loft a velocity of about 300 feet in a fccond; and the relillance computed from thefe numbers, comes out fomething nore than in the preceding inflance, it amounting here to between 11 and 12 pounds avoirdupoife; whence, according to thefe experiments, the refilling power of the air to fwift motions is greater than to flow ones, in a ratio which approaches nearer to that of 3 to 1 than in the preceding experiments.
" Having thus examined the reffilance to a velocity of 1700 feet in a fecond, I next examined the refillance to fmaller velocitiss: and for this purpofe, I charged the fame barrel with balls of the fame diameter, but with lefs powder, and placing the pendulum at 25 feet dillance from the piece, 1 fired againit it five times with an equal clarge each time: the medium velucity with which the ball impinged, was that of 1 so feet in a fecond; then, removing the pendulum to the diltance of 250 feet, the medium velocity of five fhots, made at this dillance, was that of 950 feet in a fecond: whence the ball, in pafing through 225 feet of air, loll a velocity of 230 fect in a fecond: and as it pafed through that interval in about $r^{3}$ of a fecond, the retillance to the middle velocity will come out to be near $33 \frac{1}{\frac{1}{3}}$ times the gravity of the ball, or $=!6.10 \mathrm{oz}$ a a oirdupaife. Now, the reflance to the fame velocity, according to the laws ubferved in flow. er motions, amounts to In $^{2}$ of the fame quanitity ; whence, in a velocity of acos feet in a iecond, the rebilling power of the air is augmented in no greater a proportion than that of 7 to 11 ; whereas we have fien in the former experiments, tha: to thill greater degrees of velocity the augmentation approached very near the ratio of orie to three.
"But farther, I ïred three fhot, of the fame fize and weight with thofe a!:eady montioned, over a large jiece of water; fo that their diopping into the water being very difeernible, both the ditarce and time of their fight might be aecurately afcertained. Each fiot was difelarged with a velocity of $q 00$ feet in a fecond; and I had fatistied myfelf by many previous trials of the fame charge with the pendulum, that I could rety on this velocity to ten feet in a fecond. The firft fhot flew $3: 3$ yards in four feconcs and a quarter, the fecond llew 3 ' 9 yards in four feconds, and the third 373 yards in five teconds and an lialf. Accoruing, to the theory of refifance eltablifled for flow motions, the firt fhot ought to have fpent no more than 3.2 fuconds in its flight, the fecond 3.28, and the third 4 feonds: whence it is evident, that every fout was
retarded confaderably mere than it ought to have been had that theory taken place in its motion; confequently the refiftance of the air is wery fentibly increafed, even in fuch a fmall velocity as that of +00 feet in a fecond.
"As no large fhot are ever projected in pratice Plate with velocities exceeding that of 1700 fect in a fecond, five 3 . it will te fufficient for the purpofes of a practical gunner to determine the refitance to all lefer velocities; which may be thus exhibited. Let AB be taken to AC , in the ratio of 1700 Seet in a fecond to the givell velocity to which the reffiting power of the air is required. Continue the lise AB to D), fo that BD may be to $A D$, as the refilting power of the air to flow motions is to its refifting power to a velocity of 1700 feet in a fecond; then thall CD ) be to AI ) as the refilling power of the air to llow motions is to its refifting power to the given velocity reprefented by AC.
"From the computations and experiments already mentioned, it plainly appears, that a leaden ball of $\frac{1}{4}$ of an inch diameter, and weighing nearly itoz avoirdupoife, if it be fired from a barrel of 45 inclies in length, with half its weight of powder, will iffuc from that piece with a velocity whicb, if it were uniformly continued, would carry it near 1700 feet in a fecond. -If, initead of a leaden ball, an iron one, of an equal diameter, was placed in the fame fituation in the fame piece, and was impelled by an equal quantity of powder, the velocity of fuch an iron-bullet would be greater than that of the leaden one in the fubduplicate ratio of the fpecificate gravities of lead and iron; and fuppofing that ratio to be as three to two, and computing on the principles already laid down, it will appear, that an iron bullet of $2+\mathrm{lb}$. weight, flot fiom a piece of 10 fect in length, with 1 Glb . of powder, will acquire from the explution a velucity which, if uniformly continued, would carry it nearly 1650 feet in a fecoul.
"This is the velocity which, according to our theory, a camnon bail of ${ }^{2}+\mathrm{lb}$. weight is difcharged with when it is impelicd by a full charge of powder; but if, intead of a quantity of powder weigheng tw? hhirds of the ball, we fuppofe the charge to be onir half the weight of $i t$, then its velocity will on the fame principles be no more than tyo feet in a fecond. The lame would be the velocities of every leflir bullet lired with the fame proportions of poowder, if the tengths of all picces were conilantly in the fance ratio with the diameters of their bore; and although, according to the ufual dimentions of the fimiller picces of artillicry, this proportion does not always hold, yet the dificrence is not great enough to occafion a very great variation from the velocities here afiggned; as will be obrious to any one who frall make a computation thercon. But in thafe determinations we fuppofe the windage to be no mure than is juft fufficient for putting down the bullet cafily; whereas in real fervice, either through negligrence or unkilfulnefs, it often happens, that the diameter of the bore fo much exceeds the diameter of the bullet, that great part of the inflamed fluid efuapes by its lide; whence the velacity of the flot in this cafe may be confiderably lefs than what we have afligned. However, this perhaps may be compenfated by the greater beat which in all probability attends the firiag of thefe large quantities of powder.

＂We have now determined the velocity of the fhot both when fired with twothirds of its weight and with half its weight of powder refpectively；and on our theory，the muit remark，that on the principles of incrafe the charge of powder will rives at a certaing of the flot，till the powder ar－ be increafed，the velocity of the fhot will din powder The quantity producing the great fot whil diminifh． proportion between that gratect velocicy $y$ ，and the locity communicated by grater and leffer charges，may be thus affigned．Let $A B$ teprefent the axis of the piece；draw $A C$ perpendicuar to it，and to the afymp－ totes $A C$ and $A B$ draw any hyperbola LI，and draw BF parallel to $A C$ ；find olt now the point 1 ，where the rectangle ADEG is equal to the hyperbolic area DEFB；then will $A D$ reprefent that height of the charge which communicates the greatelt velocity to the thot：whence $A D$ bein；to AB as 1 to 2.71828 ，as appears from the table of logarithms，from the length of the line $A D$ thus determined，and the diameter of the bore，the quantity of powder contained in this charge is eafly known．If，inttead of this charge，any other filling the cylinder to the height $A 1$ be uled， draw itl parallel to $A C$ ，and though the point H to the fame alymptotes $A C$ and $A B$ defaibe the hyper－ bula HK；then the greatelt velucity will be to the ve－ locity communicated by the charge Al，in the lub－ duplacate peportion of the rectangle AE to the fane rectangle diminifhed by the trilinear lpace ズKに．

## Tixicednis

 sitance of the air．
＂li hath been already hown，that the refitance of the arr on the furface of a buliet of $\frac{3}{4}$ of an inch dia－ muter，moving with a velocity of 1670 feet in a fecond， amounted to alsout rolb．It hath alfo been thown， that an in－Eulhet weighing $2 ;$ th．if ！ired with 16 lt ． of powder（which is ufually eftecmed its proper bat－ tering charge），acquires a velocity of about 1650 feet in a fecond，frarcely diffeing from the other：whence， $\mathrm{N}_{4} \mathrm{C}$ ．
as the furtace of this lalt bullet is more than 54 times greater than the furface of a bullet of $\frac{3}{3}$ of an inch dia－ meter，and their velocities are nearly the fame，it followe，that the reffance on the larger bullet will a－ mount to more than 540 lb ．which is aear 23 times its own weight．
＂The two laft propofitions are principally aimed againft thofe theoritts who have generally agreed in fuppoling the flight of thot and fhells to be nearly in the curve of a parabola．The reafon given by thofe authors for their opinion is the fuppofed incontiderable refiftance of the air ；fince，as it is agreed on all fides that the tract of projectiles would be a perfect parabo－ la if there was no refllance，it has from thence been too rally concluded，that the interruption which the ponderous bodies of thells and bullets would receive from fuch a rare medium as air would be fcarcely fen－ fible，and confequently that their parabolic flight would be hereby fcarcely affected．
＂Now the prodigious refiftance of the air to a bul－ let of $2+\mathrm{lb}$ ．weight，luch as we have here ettablifhed it，fufficiently confutes this reatoning；for how erro－ neous mult that hypothefis be，which neglects as in－ confiderable a force amounting to more than 20 times the weight of the moving body：＂＂But here it is necef－ fary to affume a few particulars，the demonftations of which，on the commonly received principles，may be feen under the article Projectiles．
＂I．If the relittance of the air be fo fmall that the Comio motion of a projected body is in the curve of a para－maxims bola，then the axis of that parabula will be perpendi．concern cular to the horizon，and confequently the part of the curve in which the body afeends will be cqual and fini－of prof lar to that in which it defcends．
＂2．If the parabola in which the body moves be terminated on a horizontal plane，then the vertex of the parabold will be equally ditant from its two ex－ tremities．
＂3．Alfo the moving body will fall on that horizou－ tal plane in the fame angle，and with the fame velocity with which it was firf projected．
＂+ ．If a body be projected in different angles but with the fame velocity，then its greatelt horizontal range will be when it is projected in an angle of 45 with the horizon．
＂5．If the velocity with which the body is projected be known，then this greatelt horizontal range may be thus found．Compute，according to the common theory of gravity，what fpace the projected body ought to fall through to acquire the velocity with which it is projected：then twice that fpace will be the greatelt horizontal range，or the hurizontal range when the body is projected in an angle of $+5^{\circ}$ with the horizon．
＂6．The horizontal ranges of a body，when projec－ ted with the fame velocity at difierent angles，will be between themfelves as the lines of twice the angle in which the line of projection is inclined to the horizon．
＂7．If a body is projected in the fame angle with the horizon but with different velucities，the horizon－ tal ranges will be in the duplicate proportion of thofe veluchties．
＂Th hefe poltulates which contain the principles of Prodigw the modern art of gunncry are all of then falfe；for crions

1
eory. it hat heen already finown, that a mulket-bail $\frac{1}{2}$ of an inch in dianeter, fited with half its weight of powder, from a piece 45 inches long, moves with a velocity of near 1700 feet in a fecond. Now, if this ball Alew in the curve of a parabela, its horizontal range at $+5^{\circ}$ would be found by the fifth poftulate to be about 17 miles. But all the practical writers affure us, that this range is really fhort of half a mile. Diego Ufano afigns to an arquebufs, four feet in length, and carrying a leaden ball of 1 foz. weight (which is very near our dimenfions), an horizontal range of 797 common peces, when it is elevated between 40 and 50 degrees, and charged with a quantity of fine powder equal in weight to the ball. Merfennus alfo tells us, that he found the horizontal range of an arquebuifs at $45^{\circ}$ to be lefs than 400 fxhom, or 800 yards; whence, as either of thefe ranges are fhort of half an Englifimme, it follows, that a muket flot, when fired with a reafonable charge of powder at the elevation of $45^{3}$, flies not $\mathrm{r}^{\mathrm{r}}$ part of the dittance it ought to do if it moved in a parabola. Nor is this great contraction of the horisontal range to be wondered at, when it is confldered that the refiflance of this bullet when it firit if. fues from the piece amounts to 120 times its graviey, as hath been experimentally demonitrated, $1^{2} 23$.
"To prevent objections, our next inftance frall be in an iron bullet of $2 \ddagger \mathrm{lb}$. weight, which is the heavieft in common ufe for land ferviee. Such a but. let fired from a piece of the common dimentions with its greatelt allotment of powder hath a velocity of 1650 feet in a fecond, as already fhown. Now, if the horizontal range of this flot, at $45^{\circ}$, be computed on the parabolic hypothefis by the fifth poitulate, it wil come out to be about 16 miles, which is between five and fix times its real quantity; for the practical writers all agree in making it lefs than threc miles.
"But farther, it is not only when projectiles move with thefe very great velocities that their flight fenfibly varies from the curve of a parabola; the fame aberration often takes place in fuch as move flow enough to have their motion traced out by the eye : for there are fow projectiles that can be thus examined, which do not vifibly difagree with the firlt, fecond, and third poltulate; obvioufly defeending thro' a curve, which is fhoter and lefs inclined to the horizon than that in which they afcended. Alfo the higheft point of their flight, or the vertex of the curve, is much nearer the place where they fall to the ground than to that from whence they were at firlt difcharged.
" I have found too by experience, that the fifth, fixth, and feventh poflulates are excelfively erroneous when applied to the motions of bultets moving with fmall velocities. A leaden bullet $\frac{3}{2}$ of an inch in diameter, difeharged with a velocity of about 400 feet in a found, and in an angle of $19^{\circ} 5^{\prime}$ with the horizon, 'ranged on the horizontal plane no more than $44^{8}$ yards: whereas its greatelt horizontal range being found by the fifth poltulate to be at lealt 1;00 yards, the range at $19^{\prime} 5^{\prime}$ ought by the fixth poftulate to have been 1050 yards; whence, in this experiment, the range was not 4 of what it mult have been had the commonly receised theory been true."

From this and other experiments it is clearly proved, that the track defcribed by the gight even of Vor. VIII. Part I.
the heavief mot, is neither a parabula, nor approach ing to a parabola, except when they are projected with deferibed by them is explained under the article $P_{\text {gon }}$ jectiles. But as a fpecimen of the great complication of that fubject, we fhall here infert an account of a very extraordinary circumblance which frequently takes place therein.
"As gravity atts perpendicularly to the horizon, it is evident, that if no other power but graviry deflected a projected body from its cours, its mosion would be conflantly performed in a plane perpendicular to the horizon, paffing though the line of its original direction : but we have found, that the body in its motion often deviates from this plane, fometimes to the right liand and at other times to the left; and this in an incurvated line, which is convex towards that plane: fo that the motion of a billet is frcquently in a line having a double curvature, it be. ing bent tuwards the horizon by the force of gravity, and again bent out of its original direetion to the right or left by forne other force: in this cafe no part of the motion of the bullet is performed in the fame plane, but its track will lie in the furface of a kind of cy:inder, whofe axis is perpendicular to the hotizon.
"This propotition may be indifputably proved by the experience of every one in the leaft converfant with the practice of gunnery. The fame piece which will carry its bullet within an inch of the intended mark at 10 yards diftance, cannot be relied on to 10 inches in 100 yards, much lefs to 30 inches in 3 co yards. Now this inequality can only arife from the track of the bultet being incurvated lideways as well as downwards: for by this means the diflance between that incurvated line and the line of direction will increafe in a much greater tatio than that of the difance; thefe lines being coincident at the mouth of the piece, and aftewards feparating in the manner of a curve and its tangert, if the mouth of the piece be confidered as the point of contact. - To put this matter ont of all doubt, however, I took a barrel carrying a ball $\frac{3}{4}$ of an inch diameter, and lixing it on a heavy carriage, I fatisfied myfelf of the teadinefs and truth of its direction, by firing at a beard $i \frac{1}{7}$ feet fquare, which was placed at 180 feet diftance; for I found, that in 16 fucceffive flots I miffed the mark but once. Now, the fame barrel being fixed on the lame carriage, and fired with a fmaller quantity of puwder, fo that the fhock on the difcharge would be much lefs, and confequently the direction lefs changed, I found, that at 760 yards difance the ball Rew fomecimes 100 yards to the right of the line it was pointed on, and fumctimes as mucli to the left. I found, too, that its direction in the perpendicular line was not lefs uncertain, it falling one time above 200 yards fhort of what it did at anotler; although, by the nicell examination of the piece after the difcharge, it did not appear to have itarted in the leaft from the pofition it was placed in.
"The reality of this doubly curvated tract being thus demonftrated, it may perliaps be alked, What can be the caule of a moiion fo different from what has been hitherto fuppofed? And to this I anfwer, 'That the deflection in queftion muft be owing to forme power asting obliquely to the progreffive motion of the

[^13] of the air. If it be farther anked, how the refilance of the air can ever come io be obligue to the progreffive motion of the body? I farther reply, that it may fometimes arife from incqualitios in the refilted furface; but that its general caufe is coubtlefs a whirling motion acyuired by the bullet about its axis : for by this motion of rotation, combined with the progref. five motion, each part of the bullet's furface will frike the air very differently from what it would do if there was no fuch whirl; and the obliquity of the action of the air arifing from this caufe will be greater as the motion of the bullet is greater in propurtion to its progreffice one.
"This whinding motion undoubtedly arifes from the friction of the bullet againft the fides of the piece; ard as the rotatory motion will in fome part of iss revolution confpire with the progreffive one, and in another part be equally oppofed to it ; the refitance of the air on the fore part of the bullet will be hereby affeced, and will be increafed in that part where the whinling motion confpires with the progreflive one, and dimmifted where it is oppofed to it: and by this means the whole effort of the reffance, inftead of being appolite to the direction of the body, will become oblique thereto, and will produce thofe effects already mentioned. If it was puffible to predict the polition of the axis round which the bullet fhould whirl, and if that axis was unchanguable during the whole flight of the bullet, then the aberration of the bullet by this oblique fore would be in a given direetion; and the incurvation produced thereby would regularly extend the lame way from one end of its track to the other. For intance, if the axis of the whirl was perpendicular to the horizon, then the incurvation would be to the right or left. If that axis was horizontal, and perpendicular to the direction of the bultet, shen the incurvation would be upwards or downwards. But as the firft polition of this axis is uncertain, and as it may perpetually fhift in the courfe of the bullet's flight; the deviation of the bullet is not neceffarily either in one certain direction, or tending to the fame fide in one part of its track that it does in another, but more ufually is continually changing the terdeney of its deflection, as the axis round which it whirls mult fre. quently flift its pulition to the progreflive motion by many intvitable accidents.
"That a bullet genersilly acquires fuch a rotatory motion, as here deferibed, is, I think, demonftrable: hoverer, to leave no room for doubt or difpute, I confurmed it, as well as fome other parts of my theory,
by the following experiments.
" 1 caufed the machine to be made reprefented Plate CCXXV. fig. 4. BCDE is a brafs barrel, moveable on its axis, and fo adjufted by means of frictionwheels, not reprefented in the figure, as to have no friction worthatending to. The frame in which this barrel is fixed is fo placed that its axis may be perpendicular to the horizon. The axis ithelf is contimed above the upper plate of the frame, and has fallened on it a light hollow cone, $A F G$. From the lower part of this cone thete is extended a long arns of wood, GH , which is very thin, and ent feather-ed.ged. At its extronity there is a contrivance for fixing on thic bedy, whofe reffance is to be invefigated (as here the
globe P ) ; and to prevent the arm GFI from fwaying out of its horizontal polition by the weight of the annexed body $P$, there is a brace, $A H$, of tine wire, faftened to the top of the cone which fupports the end of the arm.
"Round the harrel BCDE, there is wound a fine filk line, the turns of which appear in the ligure; and after this line hath taken a fuflicient number of turns, it is conducted nearly in a horizontal direction to the pully $L$ over which it is paffed, and then a proper weight $M$ is hung to its extremity. If this weight be left at liberty, it is obvious that it will defeend by its own gravity, and will, by its defcent, turn round the barrel BCDE, cogether with the arm GH, and the body P faftened to it. And whilt the refiflance on the arm GH and on the body P is lefs than the weight M, that weight will accelerate its motion; and thereby the motion of GH and P will increafe, and confequently their refillance will inereafe, till at latl this refitance and the weight $M$ become nearly cqual to each other. The motion with which $M$ defcends, and with which P revolves, will not then fenfibly differ from an equable one. Whence it is not difficult to conceive, that, by proper obfervations made with this machine, the relillance of the body $P$ may be determined. The moll natural method of proceeding in this inveltigation is as follows: Leet the machine firft have acquired its equable motron, which it witl ufually do in abour five or lix turns from the beginuing; and then let it be obferved, by counting a number of turns, what tione is taken up by one revolution of the body $P$ : then taking off the hody $P$ and the weight $M$, let it be examined what finaller weight will make the arm GH revolve in the fame time as when $P$ was fixed to it: this fmaller weight being taken from $M$, the remainder is obriounty equal in effort to the refilance of the revolving body P ; and this remainder being reduced in the ratio of the length of the arm to the femidiameter of the barrel, will then become equal to the abfolute quantity of the relitance. And as the time of one revolution is known, and confequently the velocity of the revolving body, there is hereby difcovered the abfolute quantity of the refitance to the given body Pmoving with a givan degree of celerity.
"Here, to avoid all objections, 1 have generally chofe, when the body P was removed, to fix in its Itead a thin piece of lead of the fame weight, placed horizontally ; fo that the weight which was to turn round the arm GH , without the body P , did alfo carry round this piece of lead. But mathematicians will eafily allow that there was no neceflity for this precantion. - The diameter of the barrel BCDE, and of the filk ftring wound round it, was 2.06 inches. The length of the arm GH, meafured from the axis to the furface of the globe $P$, was 49.5 inches. The body P, the glube made ufe of, was of palteboard; its furface very nestly coated with marbled paper. It was not much diftant from the fize of a 12 lb . thot, being in diameter 4.5 inches, fo that the radius of the circle deferibed by the centre of the globe was 51.75 inches. When this globe was fixed at the end of the arn, and a weight of laalf a pound was hung at the end of the Aring at Ml , it was examined how foon the motion of the defecnding weight $M$, and of the revolving body I, would become equable as to fenfe. With this view,
hory. three rewolutions being fuffered to elapfe, it was found that the next 10 were performed in 27 73 $^{\prime \prime}, 20$ in lefs than $55^{\prime \prime}$, and 30 in $82 \frac{1}{2} \frac{1}{2}^{\prime \prime}$; fo that the firit 10 were performed in 2 圭 $^{\prime \prime}$, the fecond in $27 \frac{1}{4}^{\prime \prime}$, and the third in $27 \frac{1}{2}$.
"Thefe experiments fufficientiy evince, that even with half a pound, the fmalief weight inade ofe of, the motion of the machine was fufteciently equable after the firt three revolutions.
"The globe above inentioned being now fixed at the end of the arm, there was hung on at Ma weight of $3 \frac{1}{\frac{1}{4}} \mathrm{lb}$. and 10 revolutions being fuffered to elapfe, the fucceeding 20 were performed in $21 \frac{t_{2}^{\prime \prime}}{2}$. Then the globe being taken off, and a thin plate of lead: equal to it in weight, placed in its room; it was found, that infted of $3^{\frac{1}{4}} \mathrm{lb}$. a weight of one pound would make it revolve in lefs time than it did before; performing now 20 revolutions after 10 were elapted in the face of 19 ".
"Hence then it foilows, that from the $3^{2} \mathrm{ll}$. firft hung on, there is lefs than l lb. to be deducted for the refiftance on the arm; and confequently the refiltance on the globe itfelf is not lefs than the cffort of $2^{\frac{1}{3}} \mathrm{H}$. in the fituation M : and it appearing from the former meafites, that the radius of the barrel is nearly "ro of the radiu, of the circle, deferibed by the centre of the globe; it follows, that the alfolute refiltance of the globe, when it revolves 20 times in $21 \frac{1}{2}^{\prime \prime}$, (about 25 feet in a fecond), is not lefs than the goth part of two pounds and a quarter, or of $3^{6}$ ounces ; and this being confiderably more than half an ounce, and the globe nearly the fize of a twelve-pound thot, it irrefragably confirms a propofition I ha! formerly laid down from theory, that the refillance of the air to 212 lb . iron fhot, moving with a velocity of 25 feet in a fecond, is not lefs than half an ounce.
" The relt of the experiments were made in order to confirm another propofition, namely, that the refiltance of the air within certain limits is nearly in the duplicate proportion of the velocity of the retifter bady. To insefligate this point, there were fucceffively hung on at MI, weighits in the propartion of the numbers $1,4,9,16$; and letting 10 revolutions firit clapie, the following obfervations were made on the refl.- With $\frac{1}{2} \mathrm{lb}$. the globe went 20 turns in $5 t_{\frac{1}{2}^{\prime \prime}}$, with 2 lb . it went 20 turns in $277^{\frac{1}{4} / 4}$, with $+^{\frac{7}{2}} \mathrm{lb}$. it went 30 turns in $27 \frac{1}{2}$, and with 8 lb . it went to turns in $27 \frac{3}{2}$. - Hence it appears, that to refiftances proportioned to the numbers $\mathrm{I}, 4,9,16$, there correfpond relocities of the refitted hody in the proportion of the numbers $1,2,3,4$; which proves, with great nicety, the propofition above mentioned.
"With regard to the rotatory motion, the firlt experiment was to evince, that the whirling motion of a ball combining with its progreffive motion would produce fuch an oblique refiftance and deflective power as already mentioned. For this purpofe a wooden ball of $4 \frac{5}{8}$ inches diameter was fuipended by a double tring, about eight or nine fect long. Now, by turnrigg round the ball and twitting the double ftring, the ball when left to itfelf would have a revolving motion given it from the untwitting of the aring again. And $\stackrel{H}{3}$, when the Atring was twilled, the ball was drawn to a confiderable diftance from the perpendicular, and there let go; it would at forit, before it had acquired
its revolving motion, vibrate deadily enough i: the fame vertical plane in which it fint began to move: but when, by the untwilting of the thring, it liad aequined a fufficient degree of its whinting motion, it contantly detected to the righit or left of its firlt track; and fometimes proceeded io far as to have its direction at right angles to shat in which it began its motion; and this deviation was not produced by the Atring itfelf, but appeared to be entirely owing to the reliftance being greater on the one patt of che leading furface of the globe than the other. For the deviation continued when the ftring was totally untwithed; and even during the time that the fling, by the mortion the globe had received, was twitting the contrary way. And it was always caly to predict, before the ball was let go, which way it would dellict, only by confidering on which fide the whirl would be combined wheh the procreflive motion; for on that tide always the deflective power atted, as the refiltance was greater hore than on the lide where the whirl and progreffive motion were oppofed to one another."

Though Mr Robins comidered this experiment as an incoutellable proof of the truth of his theory, he undertook to give ocular demon!!ration of this deflection of mulket-bullets even in the fhort fpace of 100 yards.
"As all projectiles," fays he, " in their flight, are acted upon by the power of gravity, the defleztion of a bullet from its primary direction, fuppofes that defection to be upwards or downwards in a vertical plane; becaufe, in the vertical plane, the action of gravity is compounded and entangled with the defletive force. And for this reafon my experiments thave bec:a primeipally directed to the examination of that deflection which carries the bullet to the right or lefe of that plane in which it began to move. For if it appears at any time that the bullet has fhifted from that vertical plane in which the motion began, this will be an inconteflable proof of what we have advanced. - Now, by means of fereens of exceeding thin paper, placed parallel to each other at proper ditances, this deneetion in quedtion may be many ways inveltigated. For by firing bullets which flall traverfe the fereens, the flight of the bullet may be traced; and it may eatily appear whether they do or do not keep invariabiy to one vertical plane. This examination may proceed on three different principles, which I fhall here feparately explain.
" For firt, an exactly vertical plane may be traced out upon all thefe fcreens, by which the deviation of any fingle bullet may be more readily invelligated, only by meafuring the horizontal diflance of its trace from the vertical plane thus delineated; and by this means the abfolute quantity of its aberration may be known. Or if the defeription of fuch a vercical plane fhould be efteemed a matter of difficulty and nicety, a fecond method may be followed; which is that of relting the piece in fore fixed notch or focket, fo that though the piece may have fome little play to the right and left, yet all the lines in which the bullet can be directed fhall interfect each other in the centre of that fixed focket : by this means, if two different fhot are fired from the piece thus fituated, the horizontal dillances made by the two bullets on any two fcreens ought to be in the fame proportion to each other as
the refpertive ditances of the foreens from the focket in which the piece was laid. Ared if thefe horizontal diflances differ from that proportion, then it is certain that onc of the thot at leat hath deriated from a vertical plane, although the abfolute quantity of that deriation cantot hence be afigned; becaufe it cannot be known what part of it is to be imputed to one bullet, and what to the other.
"But if the contant and invariable pofition of the notech or focket in which the phece was placed, be thought too hard an hypothefis in this very nice affair; the thind method, and which is the fimpleft of all, requires no more than that two thot be fired through three fercens without any regard to the pofition of the piece each time: for in this cafe, if the fhots diverge from ezelı other, and both keep to a vestical plane, then if the horizontal ditances of their traces on the firt fereen be taken from the like horizontal diftances on the fecond and third, the two remainders will be in the fame proportion with the difances of the fecond and third ? creen from the firtt. And if they are not in this proportion, then it will be certain that one of them at lealt hath been delleated from the vertical plane; though here, as in the ladt cafe, the quantity of that deflection in each will not be known.
"All thefe three methods I have myfelf made ufe of at diferent times, and have ever found the fuecefs agreeakle to my expectation. But the meft eligible method feemed to be a compound of the two laft. The apparatus was as follows.--Two fereens werc fet up in the larger walk in the charter-houfe garden: the firk of then at 250 feet diftance from the wall. which was to ferve for a third fereen; and the fecond 200 feet from the fame wall. At $g 0$ feet before the firlt fereen, or at 300 feet from the wall, there was placed a large block weighing about $2 c 0 \mathrm{lb}$. weight, and having lixed into it an iron bar with a focket at its extremity, in which the picce was to be laid. The piece itfelf was of a common length, and bored for an ounce ball. It was each time loaded with a ball of 17 to the pound, fo that the wincage was extremely finall, and with a quarter of an ounce of good powder. The fercens were made of the thinneft iffue paper; and the refiltance they gave to the bullet (and confequently their probability of defle\&ting it) was fo fmall, that a bullet lighting one time near the extremity of one of the fereeas, left a fine thin fragment of it towards the edge entire, which was fo very weak that it was difficult to hande it without breaking. Thefe things thus prepared, five thot were mate with the piece retted in the notel above mentioned; and the horizontal diftaners between the fall thort, which was taken as a ftandard, and the foar fucceeding ones, both on the dirt and fecond fereen and on the wall, meafured in inches, Were as follow:
alt Bereen. 2dScreen. Wall:
$\begin{array}{ccccc}102 & 1,75 \mathrm{R} . & 3,15 \mathrm{R} . & 16,7 & \mathrm{R} . \\ 3 & 10 & \mathrm{~L} . & 15,6 \mathrm{~L} . & 60,25 \mathrm{~L} .\end{array}$
$\begin{array}{cccccc}3 & 10 & \mathrm{~L} . & 15,6 \mathrm{L.} & 69,25 & \mathrm{~L} . \\ 4 & 1,25 & \mathrm{~L} . & 4,5 \mathrm{~L} . & 15,0 & \end{array}$ $\begin{array}{lllll}4 & 1,25 \mathrm{l} . & 4,5 \mathrm{~L} . & 15,0 \mathrm{~L} . \\ 5 & \therefore+1 ; \mathrm{L} . & 5,1 & \mathrm{~L} . & 10,0 \mathrm{~L} .\end{array}$
"Herc the letters $R$ and $L$ denote that the Thot in gration went ether to the right or left of the firlt.
"If the polition of the fucket in which the piece sais placed be fuppofed fixed, then the horizonal diAarces meafured above on the firt and ferond ferecn, Itances of the firlt fereen, the fecond fercen, and the wall from the focket. But by only looking over thefe numbers, it appears, that none of them are in that proportion ; the horizontal diftance of the fir? and third, for inflance, on the wall being above niue inches more than it flould be by this analogy.
" If, without Suppofing the invariable pofition of the focket, we examine the comparative horizontal diflances according to the third method defcribed above, we fhall in this cafe difeover divarications fill more extraordinary; for, by the numbers fet down, it appears, that the horizontal diltances of the fecond and third fhot on the two fereens, and on the wall, are as under.

$$
\begin{array}{ccc}
1 \text { it Screen. } & \text { 2d Screen. } & \text { Wall. } \\
11.75 & 18.75 & 83.95
\end{array}
$$

Here, if, according to the rule given above, the diftance on the firlt fereen be taken from the diflances on the other two, the remainder will be 7 , and $74 \cdot 2$ : 'and thefe numbers, if each fhot kept to a vertical plane, ought to be in the proportion of 1 to 5 ; that being the proportion of the diflances of the fecond fereen, and of the wall from the firlt: but the lalt number 74.2 exceeds what it ought to be by this analogy by 39.2 ; fo that between them thire is a deviation from the vertical plane of ahove 39 inches, and this too in a tranfit of little more than so yards.
"But farther, to how that thefe irregularities do not depend on any accidental circumitance of the balls fitting or not titting the piece, there were five fhots more made with the fame quantity of powder as before; but with fmaller bullets. which ran much loofer in the picce. And the horizontal diflanees being mealured in inches from the trace of the firlt bullet to each of the fucceeding ones, the numbers were as under.

|  | 10 Screen. | 2 d Scree |  | Trall. |
| :---: | :---: | :---: | :---: | :---: |
| 1 to 2 | 15.6 R . | 31.1 | R. | 94.0 Rm |
| 3 | $6.4 \mathrm{L}$. | 12.75 | I. | 23.0 L. |
| 4 | 4.7 R | 8.5 | R. | 155 R . |
| 5 | 12.6 R | 24.0 | $R$. | 63.5 R . |

Here, again, on the fuppofed tixed pofition of the piece, the horizontal dittanee on the wall betwecn the firft and third will be found above 15 inches lefs than it fhould be if each kept to a vertical plane; and like irregularities, though fmaller, oceur in every other ex. periment. And if they are e:amined according to the third method fet down above, and the horizuntal dittances of the third and fourth, for inftance, are compared, thofe on the firlt and fecond fereen, and on the wall, appear to be thus.

$$
\begin{array}{ccc}
\text { if Sercen. } & \text { Id Sereen. WaH. } \\
11.1 & 21.25 & 38.5
\end{array}
$$

And if the horizontal dillance on the tirlt foreen be taken from the other two, the 1 emainders will be 10.15 , and 27.4 ; where the leal of them, infead of being five times the firt, as it ought to be, is 23.35 fhort of it; fo that here is a deviation of 23 inches.
"From all thefe experiments, the dellection in queRion feems to be $\therefore$ - onteftably evinced. But to give fome farther light : !is fubject, I took a barrel of the fame bore with that hithesto ufed; and bent it at about three or four inches from its muzzle to the left, the bend making an angle of three or four degrees
peory. with the axis of the piece. This piece thus bent was fircd with a loofe ball, and the fame quantity of pow. der hitherto ufed, the fereens of the laft experiment being fill continued. It was natural to expect, that if this piece was pointed by the general direction of its axis, the hall would be canted to the left of that direction by the bend near its mouth. But as the bullet, in paffing through that bent part, would, as I conceired, be forced to roll upon the right hand fide of the barci, and thereby its left fide would turn up againft the air, and would incereafe the refiltance on that fide; I predicted to the company then prefent, that if the axis on which the buller whirled, did not Thift its pofition after it was feparated from the piece; then, notwithflanding the bent of the piece to the left, the bullet itfelf might be expected to incurvate towards the right ; and this, uoon trial, did mall remarkably lappet. For one of the bullets fired fiom this bent pieee paffed through the fir! fereen about $1 \frac{1}{2}$ inch diflant froms the trace of one of the thot fired from the flraight piece in the lall fet of experiments. On the fecond fereen, the traces of the fame bullets were about three inches diltant; the bullet from the crooked piece pafing on both fereens to the left of the other: but comparing the places of thefe bullets on the wall, it appeared that the bullet from the crovked piece, though it diverged from the track on the two fcreens, had now crofficl that track, and was defleeted confiderably to the right of it; fo that it was obvious, that though the bullet from the crooked piece might firft be canted to the left, and lead diverged from the track of the other bullet with which it was compared, yet by degrees it ocviuted agaia to the right, and a little beyond the fecond fereen croffed that track from which it before diverged, and on the wall was defleted iot inches, as I remember, on the contrary fide. And this experiment is not only the molt convincing proof of the reality of this deflection here contenced for; but is likewife the f?rongeft confirmation that it is broughtabout in the very manner and by the very circuantances which we have all alony cefribed.
"I have now only to ajd, that as I fufpected the confideration of the revolving motion of the ballet, compounded with its progreffive one, might be confidered as a fubject of mathemstical fpeculation, and that the reality of any defocting force thence arifing might perlaps be denied by fome computills upon the principles hitherto received of the aetion of fuids; I thought proper to annex a few experiments, with a view of evincing the frange deficiency of all theories of this fort hitherto eflablifhed, an the uncxpected and wonderful tarieties which ceeur in thefe matteres: The propofition which I advanced for this purpofe being, That two cqual furfaces meeting the air with the fame degree of obliquity, may be fo differently refitted, that though in one of them the refilance is lefs than that of a perpendicular furface meeting the famc quantity of air, yet in another it thall be confideratly greater.
"To make out this propofition, I made ufe of the y in machine already deferibed: and having prepared a pafteboard pyramid, whofe bafe was four inches fquare, and whofe planes made angles of $45^{\circ}$ with the plane of its bale; and alfo a parallelogram four inches in
breacth, and $5_{5}^{*}$ in length, which was equal to the fur. Thenes. face of the pyramid, the globe P was taken off from $\underbrace{\text { P }}$ the machine, and the pyramid was firl tixed on: and 2 lb . being loung at $M$, and the pyramid fo fitted as to move with its vertex forwards, it performed 20 rewhlutions after the fult ten were clapfed in $33^{\prime}$. Then the pyramid being turned, fo that its bafe, whele was a plane of four incles fquare, went foremoll, it now performed 20 revolations with the fame weight in 38 ."-After this, taking off the pyramid, and fixing on the parailelogram with its longer fide perpendicular to the arm, and placing its furface in an angle of $45^{\circ}$ with the horizon by a quadrant, the parallelogram, with the fame weight, performed 20 revolutious in $+3 \frac{5^{2}}{2}$.
"Now here this parallelogram and the furface of the pyramid are equal to each other, and each of them met the air in an angle of $45^{\circ}$; and yet one of themmate 20 revolutions in $33^{\prime \prime}$, whild the other rook up 43. And at the fame time it appears, that a flat forface, fuch as a bafe of a pyramid, which mects the fame quantity cf air perpendicularly, nakes 20 revolutions in $38 \mathbf{x}^{\prime \prime}$, which is the medium between the other two.
"But to give another and fill more fimple proof of this prineiple; there was taken a parallelogram four inches broad and $8 \frac{1}{5}$ long. This being fixed at the end of the arm, with its long inde perpendicular thereto, and being placed in an angle of $45^{\circ}$ with the hori: zon, there was a weight hung onat M of 3 : Il wid which the parallelagram made 23 revolutions in $40 \%$. But after this, the pofition of the parallelogranı was hifted, and it was placed with its horter fide perpendicular to the arm, though its furface was llill inclined to an angle of $+5^{\circ}$ with the hosizon; and now, inftead of going flower, as might be expected from the greaier extent of part of its furface from the axis of the nachine, it went round much faher: for in this laft fituation it made 20 revolutions in $35^{\circ}$, fo that there were $5^{\prime}$ difference in the time of 22 revolations; and this from no other change of circumflance than as the larger or thorter fide of the oblique plane was perpendicular to the line of its direction.".

In the 73d volume of the Philofophical Trarfactions, feveral experiments on this fubject, but upon a lurger fcale, are related by Lovell Edgeworth, Efq. They confirm the thuth of what Mr Robins advances, but nothing is faid to explain the reafon of it.

Thefe are the principal experiments made by $\mathrm{Mr}_{\mathrm{W}}{ }^{33}$, ine Robins in contirmation of his theory, and which pot art of gunonly far exceed every thing that had becn formerly nery candone, but even bid fair for advancing the art of gun- not become nery to its ne plus utitra. It mu't be obfetved, hows. perfea. cever, that in this art it is impolfible we flould ever arrive at abfolute perfection; that is, it can never be expected that a gunner, by any method of calculation whatever, could be enabled to point his guns in fuch a manner, that the fhot would hit the mark if placed any where within its range. Aberrations, whieh can by no means be either forefeen or prevented, will take place from a great number of different caufes. A variation in the denfity of the atmofphere, in the dampnels of the powder, or in the figure of the fhot, will caufe variations in the range of the bullet, which cannot by any means be reduced to rules, and confequently

Thenry．

CcsxV．
fg． 5.
mut render the event of each flot sery precarions．The refilance of the atmorphere fimply contidered，without any of thofe anomalics arifing from its denlity at difie． ：ent times，is a problem which，notwithtanding the labours of Mr Robins and others，hath not been com－ pletely folved：and，indeed，if we confider the matter in a phyfical light，we fhall find，that without fome other data than thofe which are yet obtained，an exact folu－ tion of it is impoffihle．

It is an objection that hath been made to the mathe－ matical philofophy，and to which in many cafes it is mott certainly Hable，that it confiders the refflane of matter more than its capacity of giving motion to other matter．Hence，if in any cafe matter aets both as a refiting and a moving power，and the mathematician overlooks its effort towards motion，founding his de－ raontrations only upon its property of refiling，thefe demonitrations will certainly be falfe，tho＇they flould be fupported by all the powers of geometry．It is to an error of this kind that we are to attribute the great dif． fereuces already taken notice of between the calcula－ tions of Sir laae Newton，with regard to the reffifing force of fluids，end what actually takes place upon trial． Thefe calculations were made upon the fuppofition that the fluid through which a body moved could do no－ thing elfe but refift it ；yet it is certain，that the air（the fluid with which we have to do at prefent）proves a fource of motion，as well as refiftance，to all bodies which move in it．

To underfland this matter fully，let ABC reprefent a crooked tube made of any folid matter，and $a, l$ ，two piftons which exactly fill the cavity．If the face be－ tween thefe piftons is full of air，it is plain they cannot come into contact with each other on account of the clatticity of the included air，but will remain at fome certain diftance as reprefented in the figure．If the pi－ fton $b$ is drawn up，the air which preffes in the direc－ tion $\mathrm{C} b$ acts as a refilling power，and the piton will not be drawn up with fuch eafe as if the whole was in vucuo．But though the colamn of air preffing in the direction $\mathrm{C} b$ acts as a relitting power on the pitton $b$ ， the column preffing in the direction $A$ a will act as a moving power upon the pifton $a$ ．It is therefore plain， that if $b$ is moved upwards till it comes to the place marked $d$ ，the other will defcend to that marked $c$ ． Now，if we fuppofe the pifton a to be removed，it is plain，that when $b$ is pulled upwards to $d$ ，the air de－ fcending through the leg AaCB will prefs on the under fide of the pillon $b$ ，as ttrongly as it would have done upon the upper fide of the pifton $a$ ，had it been pre－ fent．Therefore，though the air paffing down through the leg CB relifts the motion of the pifon $b$ when drawn upwards，the air prefling down through the leg $A B$ for－ wards it as much；and accordingly the pifton $b$ may be drawn up or pufthed down at pleafure，and with very little trouble．But if the orifice at A is ftopped，fo that the air can only exert its refifting power on the pifton $b$ ，it will require a confiderable degree of Itrength to move the pilton from $b$ to $\mu$ ．

If now we fuppofe the tube to be entirely removed （which indeed anfwers no other purpofe than to render the action of the air more evident ），it is plain，that if the pitton is moved cither up or down，or in any other direction we can imagine，the air preffes as much upon the back part of it as it refilts it on the fore part ；and
of confequence，a ball moving through the air with any degrec of velocity，ought to be as much accelera－ ted by the attion of the air behind，as it is retarded by the ation of that before．－Here then it is natual to all．If the air accelerates a moving body as much as it retards it，how comes it to make any refiltance at all ？ yet certain it is，that this foid doth refit，and that very confiderably．To this it may be anfwered，that the air is always kept in fome certain flate or confitu－ tion by another power which rules all its motions，and it is this power undoubtedly which gives the reffitance． It is not to our purpofe at prefent to inquire what that power is；but we fee that the air is often in very cif－ ferent llates：one day，for inflance，its parts are vio－ lencly agitated by a florm；and another，perhaps，they are compratively at reft in a calm．In the firld cafe， nobody hefitates to own，that the ftorm is occalioned by fome caufe or other，which violently refifts any other power that would prevent the agitation of the air． In a calm，the cafe is the fame；for it would require the fame exertion of power to excite a tempelt in a calm day，as to allay a tempeft in a formy one．Now it is evident，that all projectiles，by their motion，agi－ tate the atmofphere in an unnatural manner；and confe－ quently are refited by that power，wha：ever it is，which tends to reflore the equilitrium，or bring back the at－ mofphere to its former thate．

If no other power befides that above mentioned ac－ ted upon projectiles，it is probable，that all refillance to their motion v：ould be in the duplicate proportion of their velocities；and accordingly，as long as the ve－ locity is fmall，we find it generally is fo．But when the velocity comes to be exceedingly great，other four－ ces of refitance arife．One of thefe is a fubtraction of part of the moving power；which though not pro－ perly a refflance，or oppoling another power to it，is an equivalent thereto．This fubtraction arifes from the following caufe．The air，as we have already ob－ ferved，preffes upon the hinder part of the moving bo－ dy by its gravity，as much as it relifts the forepart of it by the fame property．Neverthelefs，the velocity with which the air prefles upon any body by means of its gravity，is limited；and it is poffible that a body may change its place with fo great velocity that the air hath not time to ruth in upon the back part of it， in order to afitit its progreflive motion．When this happens to be the cafe，there is in the firft place a de： ficiency of the moving power equivalent to 15 pounds on every fquare inch of furfuce；at the faine time that there is a pofitive refiftance of as much more on the forepart，owing to the gravity of the atnofphere， which mult be overconse before the body can move for－ ward．

This deficiency of moving power，and increafe of re－ fiftance，do not only take place when the body moves with a very great degree of velocity，but in all motions whatever．It is not in all cafes perceptible，becaufe the velocity with which the body moves，frequently bears but a very fmall proportion to the velocity with which the air preffes in behind it．Thus，fuppofing the velocity with which the air rufhes into a vacuum to be 1200 fect in a fecond，if a body moves with a velo－ city of 30,40 ，or 50 feet in a focond，the force with which the air preffes on the back part is but $\frac{1}{2}$ at the utmoft lefs than that which refitts on the forepart of it．
which will not be perceptible: but if, as in the cafe'of bullets, the velocity of the projectile comes to have a confiderable proportion to the velocity wherewith the air ruthes in behind it ; then a very perceptible and otherwife unaccountable retiflance is obfersed, as we have feen in the experiments already related by Mr Robins. Thus, if the air preffes in with a velocity of 1200 feet in a fecuad, if the body changes its place with a velocity of 600 feet in the fame time, there is a rcifitance of 15 pounds on the fore part, and a pref. fure of only $7 \frac{7}{2}$ on the back part. The refiftance therefore not only overcomes the moving power of the air by $7^{2}$ epounds, but there is a deficiency of other $7 \frac{1}{2}$ pounds owing to the want of half the preflure of the atmofphere on the back part, and thus the whole lofs of the moving power is equivalent to 15 pounds; and hence the exceeding great increafe of refiftance oblerved by lif Robins beyond what it ought to be according to the common computations. - The velocity with which the air rufhes into a vacuun is thercfore a defideratum in gunnery. Mr Robins fuppofes that it is the fame with the velocity of found; and that when a bullet moves with a velocity greater than that of 1200 feet in a fecond, it leaves a perfeat vacuum belind it. Hence he accounts for the great increafe of refilance to bullets moving with fuch velocities; but as he doth not tabe nosice of the lofs of the air's moving power, the anomalies of all lefer velocities arc inexplicable on his principles. Nay, he even tells us, that Sir Ifaac Newton's rule for computing refillances may be applicu in all velocities iffs than 1100 or 1200 feet in a fecond, though this is exprefly contradiated by his own experiments mentioned $n^{3} 23$.

Though for thefe reafons it is evident how great difficulties mult occur in attempting to calculate the refift. ance of the air to military projectiles, we have not ceen yet difcorered all the fources of refiltance to the fe bodies when moving with immenfe velocities. Another power by which they are oppofed (and which at latt becomes greater than any of thofe hitherto mentioned), is the air's clafticity. This, however, will not begin to hlow itfelf in the way of refiftance till the velocity of the moring body becomes con fiderably greater than that by which the air preffes into a vacuum. Having therefore firit afcertained this velocity, which we Shall fuppofe to be 1200 feet in a fecond, it is plain, that if a body moves with a velucity of 1800 fect in a fecond, it nauft comprefs the air before it ; becaufe the Ruid hath neither time to expand itfelf in order to fill the vacuum left behind the moving body, nor to ruik in by its gravity. This compreffion it will relift ty its elaftic power, which thus becomes a new fource of refitance, increafing, without any limit, in proportion to the velocity of the moving body. If now we fuppofe the moving body to fet out with a velocity of 2.400 feet in a fecond, it is plain, that there is not only a vacuum left behind the body, but the air before it is comprefled into half its natural fpace. The lofs of motion in the projectile therefore is now Ivery confiderable. It firt lofes is pounds on every fquare inch of furface on account of the deficiency of the moving power of the air behind it; then it lofes 15 pounds more on account of the refiftance of the air before it; again it lofes 15 pounds on account of the elafticity of the comprefled air; ind latly another 15 pounds on ac.
count of the vacuum behind, which takes off the weight Theorg. of the atmofphere, that would have been equivalent to one half of the elafticity of the air before it. The whole reliftance thercfore upon every fquare inch of furface moving with this velocity is 60 pounds, befides that which arifes from the power tending to preferve the general thate of the atmofphere, and which increafes in the duplicate proportion of the velocity as already mentioned. If the body is fuppofed to move with a velocity of 480.0 feet in a fecond, the refiltance from the air's elafticity will then be quadrupled, or amount to 60 pounds on the fquare inch of furface; which added to the other caufes, produces a refitance of 105 pounds upon the fquare inch; and thus would the refittance from the elatlicity of the air go on continually increafing, till at lat the motion of the projectile would be as effectually Itopped as if it was fired againft a wall. This obtacke therefore we are to confider as really infuperable by any art whatever, and thercfore it is not advifable to ufe larger cliarges of powder than what will project the thot with a velucity of 1200 feet in a fecond. To this velocity the elafticity of the air will not make great refillance, if indeed it do make any at all: for though Mr Robins hath conjectured that air rufhes into a vacnum with the velocity of found, or between 14 and 1200 feet in a fecond; yet we have no decilive proaf of the truth of this fuppofition. At this velocity indeed, according to Mr liobins, a very fudden increafe of reliftance takes place: but this is denied by Mr Glenie *, who fuppofes that the refitance pro. - Mif. cto ceeds gradually; and indeed it feems to be pretty ob. Gunnery. vious, that the refiftance cannot very fuddenly increafe, $\mathrm{p} \cdot \mathrm{t}^{\mathrm{s}}, 5=$ if the welocity is on!! iscreafed in a fmall degree. Yet it is certain, that the fwifteft motions with which can-non-balls can be projected are very foon reduced to this Itandard; for Mr Robins acquaints us, that " a 24 -pound hot, when difcharged with a velocity of 2000 feet in a fecond, will be reduced to that of 1200 feet in a fecond in a flight of little more than 500 yards."

In the 7 th volume of the Philofophical Tranfac. tions, Mr Thomfon has propofed a new method of determining the velocities of bullets, by meafuring the force of the recoil of the piece. As in all cales action and re-ation are fuppofed to be equal to one another, it appears that the momentum of a gun, or the force of its recoil backwards, mult always be equivalent to the force of its charge: that is, the velocity with which the gun recoils, multiplied into its weight, is equal to the velocity of the bullet multiplied into its weight ; for every particle of matter, whether folid or fluid, that iffues out of the month of a piece, mull be inpelled by the action of come power, which power muft $r_{i}$-at with equal force againf the bottom of the bore.- Even the fine invifible clallic fluid that is generated from the powder in its inflammation, cannot put itfelf in motion wihhout re-acting againtt the guns at the fame time. Thus we fee pieces, when they arc fired with powder alonc, recoil as well as when their charges are made to impel a weight of hot, though the recoil is not in the fame degree in both cafes. It is eafy to determine the velocity of the recoil in any given cafe, by fufpenting the gun in an horizontal pofition by two pendulous ruds, and meafuring the are of its afcent by means of a ribbon, as mentionted under
the artiele Cuwrowder; and this will give the mo-
mentum of the gun, its weight being known, and confequently the momentum of its charge. But in order to determine the velocity of the bullet from the momentun of the recoil, it will be neceffary to know how much the weight and velocity of the elatic fluid contributes to it.
"That part of the recoil which arifes from the expanfion of the fluid is always very nearly the fame whether the powder is lised alone, or whether the clarge is made to impel one or more bullets, as has been determined by a great variety of experiments. If therefore a gur, fufpended according to the method preferibed, is fired with any given charge of powder, but without any bullet or wad, and the recoil is obferved, and if the fame picce is afterwards fired with the fame quantity of powder, and a bullet of a known weight, the excels of the veloeity of the recoil in the latter cafe, over that in the former, will be proportional to the velocity of the bullet; for the difference of thefe velocities, multiplied into the weight of the gun, will be equal to the weight of the bullet multiplied into its velocity. - Thus, if $W$ is put equal to the weight of the gun, $\mathrm{U}=$ the velocity of the bullet when fired with a given charge of powder without any bullet; $V=$ the velocity of the recoil, when the fame charge is made to impel a bullet; $\mathrm{B}=$ the weight of the bullet, and $v=$ its relocity; it will be $v=$ $\overline{\mathrm{V}-\mathrm{U}}+\mathrm{W}$.

B
To deterninc how far this theory agreed with practice, an experiment was made with a charge of 165 grains of powder without any bullet, which produced a recoil of 5.5 inches; and in another, with a bullet, the recoil was 5.6 inches; the mean of which is 5.55 inches; anfwering to a velocity of 1.1358 feet in a fecond. In five experiments with the fame charge of powder, and a bullet weighing 580 grains, the mean was $1+.6$ inches; and the velocity of the recoil anfwering to the length jult mentioned, is 2.9880 feet in a fecond: confequently V-U, or $2.9880-1.135^{\circ}$, is equal to 1.8522 feet in a fecond. But as the velocities of recoil are known to be as the chords of the ares through which the barrel afeends, it is not neeeflary, in order to determine the velocity of che buller, to compute the velocities V and U ; but the quantity $\mathrm{V}-\mathrm{U}$, or the differenee of the velocities of the recoil when the given charge is fired with and without a oullet, may be computed from the yalue of the difference of the chords by one operation.-Thus the velocity anfwering to the chord 9.05 , is that of 1.8522 feet in a fecond, is jult equal to V-U, as was before found.

In this experiment the weght of the barrel with its carriage was juft $47^{\frac{3}{f}}$ pounds, to which $\frac{3}{4}$ of a pound were to he added on account of the weight of the rods by which it was fufpended; which makes $W=+8$ pounds, or 336,000 grains. The weight of the bullet was 50 grains; wherce $B$ is to $W$ as 580 to 33 6,000; that is, as 1 to 579.31 very neasly. The value of $\mathrm{V}-\mathrm{U}$, anfwering to the expuimen:s before mentioned, was found to be 1.8522 ; confequently the velocity of the bullets $=21$, was $1.8522+579.31=1073$ fect, which differs only by 10 from 1083 , the vacocities found by the pendulum.

The velocities of the bullets may be found from the $\mathrm{N}^{2}{ }_{146}$.
recoil by a ftill more fimple method ; for the relocitics of the recoil being as the chords incafured upon the ribbon, if $c$ is put equal to the chord of the recoil expreffed in Engith inches, when the piece is fired with powder only, and $C=$ the chord when the fame piece is charged with a bullet: then $\mathrm{C}-c$ will be as $\mathrm{V}-\mathrm{U}$; and confequently as $\frac{\overline{V-U}+W}{B}$ which meafures the velucity of the bullet, the ratio of W to B remaining the fame.-If therefore we fuppofe a cafe in which C -6 is equal to one inch, and the velocity of the bullet is computed from that chord, the velocity in any other cafe, wherein $\mathrm{C}-c$ is greater or lefs than one inch, will be found by multiplying the difference of the chords C and $c$ by the velocity that anfwers to the dif. ference of one inch.-The length of the parallel rods, by which the piece was fufpended being 64 inches, the velocity of the recoil, $=\mathrm{C}-c=1$ inch meafured upon the ribbon, is $0.20+555$ parts of a foot in one fecond; which in this cale is alfo the value of $\mathrm{V}-\mathrm{U}$ : the relocity of the bullet, or 2, is therefore $0.204655+579$. $31=18.35$ feet in a fecond. Hence the velocity of the bulkt may in all cafes be found by multiplying the difference of the chords C and c by 118.35 ; the weight of the barrel, the length of the rods by which it is fufpended, and the weight of the bullet remaining the fame; and this whatever the charge of powder made ufe of may be, and however it may differ in ftrength and goodnefs.

The exactnefs of this fecond method will appear from the following experiments. On fring the piece with $1+5$ grains of powder and a bullet, the mean of three fets of experiments was $13.25,13.15$, and $\mathbf{1 3 . 2}$; and with the fame charge of powder without a bullet, the recoil was $4.5,4.3$, or $4.4: \mathrm{C}-\mathrm{c}$ therefore was $13.2-4.4=8.8$ inches; and the velocity of the bullets $=8.8+118.35=1045$ feet in a fecond; the velocities by the pendulum coming out 10.40 feet in the fame fpace of time.

In the far greaten number of experiments to determine the comparative aecuracy of the two methods, a furprifing agreement was found betwist the laft mentioned one and that by the pendulum; but in fome few the differences were very remarkable. Thus, in two where the recoil was 12.92, and 13.28 the veloeity, by computation from the chords is 1030 feet per fecond; but in computing by the pendulum it amounted only to 900 ; but in thefe fome inaccuracy was furpected in the experiment with the pendulum, and that the computation from the recoil was molt to be depended upon. In another experiment, the velocity by the tecoil execeded that by the pendulum by no lefs than $3+6$ fect: the former howing 2109 , and the latter only 1763 feet in a fecond. In two others the pendulum was alfo deficient, though not in fuch a degree. In all thefe it is remarkable, that where the difference was conliderable, it was ftill in favour of the recoil. The deficiency in thefe experiments appears to have been fornewhat embaraffing to our author. "It cannot be fuppofed, fays he, that it arofe from any imperfection in Mr Robins's method of determining the velocities of bullets; for that method is founded upon fueh prineiples as leave no room to doubt of its accuracy ; and the practical errors that occur in making the experiments, and which cannot be entirely prevented, or
exactly
nry. exactly compenfated, are in general fo fmall, that the difference in the velocities cannot be attributed to them. It is true, the effect of thote errors is mure likely to appear in experimentz made uncir fuch eircumananees as the prefert; for the bullet being very light ( $A$ ), the are of the afeent of the penculum was but fmall; and a fmall miltake in meafuring the chord upon the ribbon would have produced a very confiderable error in computing the velocity of the bullet: Thus a difference of one-tenth of an ineh, more or lefs, upon the ribbon, in that experiment where the difference was greateft, would have made a difference in the velocity of more than 120 feet in a fecond. But, independent of th.c pains that were taken to prevent miftakes, the flriking agretment of the velucities in fo many other experiments, affords abundant reafon to conelude, that the errors arifing from thofe eaules were in no ea'e very cendiderab!e.- But if both methods of determining the velocities of bullets are to be relied on, then the difference of the velocities, as determined by them in theie experiments, ean only be accounted for by fuppofing that it arofe from their liaving been diminifued by the refinance of the air in the paflage of the bullets from the mouth of the piece to the pendulum: and this fufpicion will be mueb ftrengthened, when we confider how great the refiftance of the air is to bodies that move very fwifty in it ; and that the bullets in thele experiments wete not only prijucted with great velocities. but were alfo very light, and confequently more liable to be retarded by the refitance on that acceunt.
"To put the matter beyond all doubt, let us fee what the refiftance was that thefe bulkets met with, and how much their velocities were diminifhed by it. The weight of the bullet in the moll erronieous experiment was 90 grains; its dianeter 0.78 of an inch; and it was projected with a velecity of 2109 feet in a fecond. If now a computation be made according to the law laid down by Sir Iface Newton for comprefed fluids, it will be found, that the relitanee to this bullet was not iefs than $\frac{1}{3}$ pound avoirdupoife, which is fomething more than 660 times its own weight. But Mr Robins has fhown by experiment, that the relitance of the air to bodies moving in it with very great velocity, is near three times greater than Sir Ifaac has determined it ; and as the veloeity with which this bullet was impelled is corfulerably greater than any in Mr Robins's experiments, it is highly probable, that the refirlance in this inflance was at halt 2000 times great. or than the weight of the bullet.
"The dillance from the month of the piece to the Fendulum was 12 feet; but, as the ere is reaton to think that the blaft of the powder, which always follows the bullet, cominucs to act upon it for fome fenfible fpace of time after it is out of the bore, and, by urging it on, counterbalances, or at lealk counteracts in a great meafure, the re littance of the atr, we will ioppole that the refiltance does not begin, of rather that the motion of the bullet does not begin to be rotarded. till it has got to the dillance of two feet from the muzzle. The diftance, therefore, between the barrel and thie pendulum, inftead of is feet, is to be eflin.ated at 10 Vol.VIII. Part I.
feet; and as the Lutct took up about $\frac{r}{x}$ : 2 part of a fecond in sunning over that fpace, it mult in that time have luft a velocity of ahout 335 feet in a fecond, as will appear upon making the computation; and this will very exactly account for the apparent diminution of the velocity in the experiment: for the difference of the velocitics, as determined by the recoil and the pendulum $=2109-1763=346 \mathrm{ftet}$ in a fecond, io extremely near 335 fuet in a fecond, the diminution of the velocity by the refiftanee as hore determined.
"If the diminution of the velocities of the belle:s in the two fubfequent expetments be computed in tike manner, it will tun out in one $\sigma_{5}$, and in the ofles 33. feet in a feeond: and, making thefe corrections, the comparifon of the two methods of afcertaining the velucities will fland thus:

| Velocitics by the peotumm, | ,-63 | 13.7 | 1135 |
| :---: | :---: | :---: | :---: |
| Relitance of air to be adsed, | 335 | 65 | 33 |
|  | 2008 | 1382 | 1109 |
| Velocity by the recoil, | 2109 | 1430 | 288 |
| Dillirence after correction, | +11 | + ${ }^{8}$ |  |

"It appears therefore, that notwithtanding thele eorrestions, the velocities as determined by the penduhum, particularly in the latt, were comfiderably deticient. liat the manifat ireegularity of the velucitios, in thofe inlanecs, afords ahumdant reafon 1.0 conchede, that it molt have arifen from fome acedental cowle, and therefore that little dipendence is to be put upon the refult of thofe experiments. I camat take upon me to determine pobitively what the cank was ahich prodiced this isregularity, but I Itrongly lufpect that is arofe from the locakin of the bultere in the barnet by the force of the explofion: for thefe bullete, ashas already beem mentioned, were formed of leald, hachoting lefler bullets of platter of Paris; ant 1 well remeniber to have obferved at the time feveral finall fragments of the plafter which had fallen down by the lide of the pendulum. I confets I did not the: $i$ ajorn mation tion to this circumftance, as I naturally comeluded chat it arofe from the brcaking of the bullet in penctratins the target of the pendulum; and that the 'mali pieeres of platter 1 faw upon the gromad, had falk on on of the hole by which the bullet entered. Bat if the bullets were nut abfolutely broken in pieces in tining, yet if they wore condiderably lmaifed, and the plater, or a part of it, were feparated from the had, fuch a eliange in the form might produce a great incrafe in the refittance, and even their initial velocities might be affected by it; for their form beino changed from that of a glabe to fame other figure, they mighs not fit the bore ; and a part of the force of the chare might be lull by the windage. That this actually happened in the experiment lait-mentiond, feems very probable; as the velocity with wirich the bullet was projected, as it was determined by the rccoil, was conliderably lefs in propertion in that experiment than in many others which preeeded and followed it in the fane fet.
"As aliowance has been made for the retiftauce of the air in thefe cafs, it may be expected that the fane D d
flould
(A) They were made of lead incloting a nucleus of Paris plater. infence, in the experiments with an ounce of powder, when the velocity of the bullet was mure than 1750 feet in a fecond, the diminution turns ont no more than 25 or 30 feet in a fecond, though we fuppofe the full refilance to have begun fon near as two feet from the mouth of the piece; and in all cafes where the velocity was lefa, the effect of the refiftance was lefs in a much greater proportion: and even in this inflance, there is reafon to thin's, that the diminution of the velocity, as we have determined it, is too great; for the flame of gunpowder expands with fuch amazing rapidity, that it is fcarcely to be fuppofed but that it follows the hullt, ard continues to act upon it more than two fect, or cren four feet, from the gun; and when the velocity of the bullet is kfs, its action upon it mult be femfible at a till greater diftance."

As this method of determining the velocities of bul. kits by the recoil of the piece did not occur to Mr Thomfon till after he had finifhed his cxperinents with a pendulum, and taken down his apparatus, he had it not in his power to determine the comparative flrength of the recoil without and with a bullet; and confequently the velocity with which the flame iflues from the mouth of a piece. He is of opinion, however, that every thing relative to thefe matters may be determined with greater accuracy by the new method than by any other formerly practifed; and he very juftly remarks, that the method of determining the velocity by the recoil, gives it originally as the bullet fets out ; white that by the pendulum hows it only after a part has been deftroyed by the refiftance of the air. In the courfe of his remarks, he criticifes upon a part of Mr Robins's theory, that when bullets of the fame diameter, but different weights, are difcharged from the fame piece by the fame quantity of powder, their velocities are in a fub-duplicate ratio of their weight. This theory, he obferves, is manifetly defective, as being found$\epsilon \mathrm{d}$ upon a fuppofition, that the action of the elaftic fluid, geteraced from the powder, is always the fame in any and every given part of the bore when the charge is the fame, whatever may be the weight of the bullet; and as no allowance is made for the expenditure of force required to put the fluid itfelf in motion, nor for the lofs of it by the vent. "It is true (fays he) Dr Ifutton in his experiments found this law to obtain without any great error; and poffibly it may hold good with fufficient accuracy in many cafes; for it fometimes happens, that a number of eurors or actions, whofe operations have a contrary tendency, fo compenfate each other, that their cffects when united are not fenfible. But when this is the cafe, if any one of the raufes of error is removed, thofe which remain will be detected. - When any given charge is loaded with a heavy bullet, more of the powder is inflamed in any sery fhort fpace of time than when the bullet is lighter, and the action of the powder ought upon that account to be greater; but a heavy bullet takes up longer time in pafling through the bore than a light une; and confequently more of the elaftic fluid generated from the powder efcapcs by the vent and by windage.

E RY.
It may happen that the augmentation of the force, on account of one of thefe circumitances, may be juit able to counterbalance the diminution of it arifing from the other ; and if it thould be found upon trial, that this is the cafe in general, in pieces as they are now conflructed, and with all the variety of fhot that are made ufe of in practice, it would be of great ufe to know the fact : but when, with Mr Robins, concluding too haltily from the refult of a partial experiment, we fup. pofe, that becaufe the fum total of the preflure of the elaftic fluid upon th: bullet, daring the time of its par. fage through the bore, happens to be the fame when bullets of different weights are made ufe of, that therefore it is always fo, our reafonings may prove very inconclutive, and lead to very dangerous crrors."

In the profecution of his fubject Mr Thomfon proves mathematically, as well as by actmal experiment, that the theory laid down hy Mr Robins in this refpect is eroncous. The excefs is in favour of heavy bulkets, which acquire a velocity greater than they ought to do according to Mr Robins's rule; and fo coniderable are the errors, that in onc of Mr Thomfon's expetiments, the difference was no kefs than 204.2 fect in a fecond. When the weight of the bullet was increafed four times, the action of the powder was found to be nearly doubled ; for in one experiment, when four bullets were difcharged at once, the collective preflure was as 1 ; but when only a tingle bullet was made ufe of, it was no more than 0.5825 ; and on the whole he coitcludes, that the velocity of bullets is in the reciprocal fub-triplicate ratio of their weights. Our author obferves alfo, that Mr Robins is not only miltaken in the particular juft mentioned, bui in his conclufious with regard to the abfolute force of gunpowder compared with the preflure of the atmofphere; the latter being to the force of gunpowder as I to 1000 according to Mr Robins; but as 1 to 1308 according to Mr Thamfon.

## Sect. III. Practice of Gunnery.

$W_{1 t h}$ regard to the practical part of gunnery, which ought to conffift in directing the piece in fuch a manner as always to hit the object againt which it is pointed, there can be no certain rules given. The following maxims are laid down by Mr Robins as of ufe in practice.
3. In any piece of artillery whatever, the greater the quantity of powder it is charged with, the greater will be the velocity of the bullet.
2. If two pieces of the fame bore, but of different lengths, are fired with the fame charge of powder, the longer will impel the bullet with a greater celerity than the horter.
3. If two pieces of artillery different in weight, and formed of different metals, have yet their cylinders of equal bores and equal lengths; then with like charges of powder and like bultets they witl each of them difcharge their thot with nearly the fame degree of celerity.
4. The ranges of pieces at a given elevation are no juft meafures of the velocity of the fhot; for the fame piece fired fucceffively at an invariable clevation, with the powder, bulkt, and cvery other circumftance as mearly
nearly the fame as poffible, will yet range to very dif. fcrent diflances.
5. The greater? part of that uncertainty in the ranges of piecee which is defcribed in the preceding maxim, can only arife from the refflance of the air.
6. The refinance of the air acts upon projectiles in a twofold manner : for it oppofes their motion, and by That means continually diminithes their celerity; and it befides diverte them from the regular track they would otherwife follow; whence arife thofe deviations and infections already treated of.
7. That action of the air by which it retards the motion of projectiles, theugh much neglected by wri. ters on artillery, is yet, in many inflances, of an im. menfe force: and hence the motion of thefe refilited bo. dies is totally dificrent from what it would otherwife be.
8. This retarding force of the air att with different degres of violence, according as the projectile moves with a greater er leffer velocity; and the refintances obferse this law, That to a relocity which is double another, the reffifance within certain limits is fourfold; to a treble velocity, ninefold; and fo on.
9. Bet this proportion between the refiftances to two difitrent velocities, does not hold if one of the velocitica be lefs than that of 1200 feet in a fecond, and the other greater. For in that cafe the reffiance to the greater velocity is near three times $2 s$ much as it would come out by a comparifon with the fimaller, according to the law explaned in the laft maxim.
10. To the extraordinary powicr excrted by the refillance of the air it is owing, that when two pieces of different hores are difcliaged at the fame tlevation, the pitce of the largeft bore ufually ranges farthen, provided they are both fired with fit bullets, and the cuAomary allotment of powder.
11. The greatett part of military projectiles will at the time of their difcharge acquire a whilling motion round their axis by mbbing againt the infide of that refpective pitces; and this whinting motion will caufe them to Itrike the air very differently from what they would do had they no other than a progreffive motion. By this means it will happen, that the reillanec of the air will not always be dircally oppofed to their Right ; but will frequently act in a line oblique to their conere, and will thereby foree them to deviate from the regular tract they would otherwife deferibe. And this is the true caufe of the irreguiarities defcribed in maxim 4 .
12. From the fudden trebling the quantity of the ain's refiltance, when the projectile moves fwifter than at the rate of 1200 feet in a feeond (as hath been cx. plained in maxim 9), it follows, that whatever be the regular range of a bullet difcliarged with this late mentiened velocity, that range will be but litte inctafed fow much foever the velocity of the bullet may be flill farther augmented by greater charges of powder.
${ }^{13}$. If the fame piece of cannon be fucceffively fired at an invariable clevation, but with various charges of pouder, the greateit clarge being the whole wight of the bublet in powder, and the leat ant Iefa than the fifth part of that wight ; then if the elevation te not lefs than eight or ton degrees, it will be found, that fome of the ranges with the leaft charge will caceed fome of thofe with the greaceft.
1.. If two pieces of cannon of the fame bore, but of different lengths, are fuccentively fired at the fone elevation with the fame charge of powder; then it will frequently happen, that fome of the ranges with the fhorter piece will exceed fome of thofe with the longer.
15. In diftant cannonadings, the advantages arifiñ from loug picces and large charges of powder are but of little inoment.
16. In firing againit troops with grape.fhot, it will be found, that charges of powder inuch lefs than thofe gencrally ufed are the moll advantageous.
17. The principal operations in which large charges of powder appear to be more efficacious than fmallones, are the ruining of parapets, the difmourting of batteries covered by tout merlons, or battering in breach; for, in all thefe cafes, if tire object be but intele remorad from the piece, every increafe of velocity will in. creafe the penetration of the builet.
18. Whatever operations are to be petformed by artillery, the leat charges of powder with which they can be cfeated are always to be preferred.
19. Hence, then, the proper charge of any piece of artillery is not that allotment of powder which will communicase the greated velocity to the bullet (as moll practitioners formerly maintained) ; nor is :t to be determined by an invariable proportion of its weight to the weight of the ball: but, on the contrary, it is fuch a quantity of powder as will produce the leat relocity for the purpofe in thand; and, inllead of bearing al. ways a fied ratio to the weight of the ball, it mull be different according to the different bufiaefs which is to be performed.
20. No hield picce ought at any time to be loaded
 its bullet in powder; nor flould the charge of any battering piece exceed of the weight of its bullet.

21 . Although precepte very dificrent from thofe we have here given have been often advanced by artille. rills, and have been faid to led derived from experience; yet is that pretended experience altogether fallacions: fince from our doctrine of refiflance ellabiinhed above, it follows, that every fpeculation on the fubject of artillery, which is only founded on the experimental ranges of bullets difcharged wih confiderable velocities, is liable to great uncertainy.

The greatell irregularities in the motion of bullets Doferptia are, as we have feen, owing to the whirling motion on Duterphet of their axis, acquired by the friation againtt the fides of rithed ba:the piece. The beft method hitherto known of pre-reb. venting thefe is by the nfe of pieces widh rigeulburels. Thefe pieces have the infides of their cylinders cut with a number of firal channels: fo that it is in reality a female ferew, varying from the common frewas only in this, that its threads o- rifles are kfofenfected, and approach more to a righe line: it being ufual for the threadz with which the riffed barrel is indented, to take little more than one curn in its whole length. The numbers of thefe threads are different in each barrel, according to the fize of the piece and the fancy of the workman; and in like manter the dephl to which they are eut is not regulated by any invari. able rulc.
The ufual method of charging thefe pieces is ihis: When the proper quamity of powder is put down, a Ddz
leaden

Practice.
bere of the piece was before the tilles were cut: and this owhe: being laid on the mutut of the piece, and conSequenaicy too large to go down of iffilf, it is furced It a lloung rammer impelled by a mallet, and by reponted bluws is drives lome to the powder; and the fof:nefs of the lead giving way to the violence with which the bellet is impelled, that zone of the bullet which is contignous to the piece varies its arcular form, and takes the fhape of the infide of the barrel; fo that it becomes part of a male ferew cxactly anavering to the indunts of the riffe.

In fome parts of Germany and Switzerland, howcier, an improvement is added to this practice; efpecially in the larger pieces which are ufed for thonting at great ditances. This is done by cutting a piece of very thin leather, or of thin futtian, in a circular fhape, fomewhat larger than the bore of the barrel. This circle being greafed on one fide, is laid upon the muzze with its greafy fide downwards; and the bullet being then placed upon it, is forced down the hargel With it : by which mitans the leather or futtian inclofes the lower half of the tullet, and, by its interpotition between the bullet and the rifles, prevents the lead foom being cut by them. But it mult be remembered, that in the barrels where this is practifed, the riffes are generally mallow, and the bultet ought not to be ton large. - But as both, thefe methods of charging at the mouth take up a good dal. of time; the rifled Larrels which have been made in Pritain, are con. trined to be charged at the breech, whare the piece is for this parpore made larger than in any other part. The forder and huilct are put in thangh the hide of the bancl by an opening, which, when the pisce is hadud, is then filled up with a forew. By this means, What the fiece is firca, the bullet is forcod through the ritas, and accuives the fpiral motion alıady de. fribed ; and perhaps fomewhat of this kind, f.ys Mr Pohins, though not in the maner wow practifot, would Es of eill whers the mot pation whethod for the conatrection uf thefe kinds of burrels.

From the whithog motion communicated by the rites, it happens, wat when the piece is find, that BAcntal wate of the bullut fultows the fweep of the
Res: and thereby, belijes its progreflive motion, acquires a circular motion romad the axis of the piece; alich cincular motion will be eintinued to the bathet after its feparation from the piece; and thus a bullet 6.fenarged from a rifled barrel is contantly made to whirl round an axis which is coincident with the tine of its flight. By this whirling on its axis, the aberration of the bullet which proves fo prejudicial to all eperations in gumery, is almolt totally provented The reafon of this may be eafly underthood from con--idering the flow motion of an arow through the air. for example, if a bent arrow, with its wings not placed in fome degree in a fuiral pofition, $f_{0}$ as to make it tovolve round its axis as it ties throngh the air, were Shot at a nark with a true diccetion, it would condanty deviate from it, in confequace of being preded th one fide by the conex part oppofing the air (blipaly. Let us now fuppofe this defietion in a fight of 100 yards to be cegulit to 10 yaths. Now, if the fame bent arow wore made to revolve round its axic once every two yarde wito flight, its greatulde-
viation wouk take phace when it has puoceded only ane yar.l, oi made half a. revolution : fince at the end ot the nest half revolution it worl agais return to the fame dincetion it had at firth; the comex ide of the arrow having bew once in opponte pofithons. Io this manner it would proced during the whold courle of its bight, coaltaty retuming to the true path at the end of every two yaids; and when it reached the mark, the 'rreateft deflection to cither fide that could happen wonld be equal to what it makes in proceedins one yard, equal to $\frac{\text { r }}{5}$ th pare of the former, or $3 . 万$ inches, a very fmall deflection when companed with the former one. In the fame manner, a canonball which turns not round its axis, deviates reatly from the true path, on account of the inceushtites on its furface; which, althmarh fmall, caufe great deviations by reafon of the refittance of the air, at the lame time that the ball acquires a motion round its axis in fome nacertain direction occafoned by the fristion againt its dides. But by the motion acquired from the rifles, the error is perpetmally corrceted in the manner juft now defcribed; and aceordingly fuch pieces ate much more to be depended on, and will do execution at a much greater diftance, than the other.

The reafons common'y alleged for the fuperiority of rifle-barels over momon onez, are, either that the inflammation of the powder is greater, by the revit. ance which the bullet makes by being thus forced into the barrel, and that herelos it receives a mach greater impulfe; or that the bulitet hy the compomating of its checular and revolving motions, did as it were bore the air, and thereby few 10 a much greater ditlane than it would otherwife have done; or that by the fame boring motion it made its way through ail font? fubtance, and prenetrated into them much despur than when fired in the common manaer. Eut Mir Robias hath proved thefe ratus to be altogether croncous, by a gerat number of experimenta made with rithe-barrelled fiews. "In thefecspument:," fay" he, "1 have fond that the vihuci:y of the i, ainet ins id from a ritid barrel was ufually lef's than that of the bulke fired from a common picce with the fand proportion of pawder. Inteed it is hat ralomble to expect that this formb be the cafe: for if the rithes are vely ceep, and the bullet is lave enowgh to fit them up, the frition bears a woy conideratle proportion th the effint of the power. And that in this cafe the friction is of conicquence enough to have its effects wherved, I hase difoused by the continued ufe of the fame barsl. For the metal of the hared being foft, and wearing away apace, its bore by half a yean's ufe was conlijerably culargen, and confequent1y the depth of its rifles dimbinfled; and then I found that the famc cluantity of powder would give to the ballet a veiocity niear a tenth part greater than what it had done at firit. And as the velocity of the bullet is not increafed by the ofe of rilled barrels, fo neithen is the diftance to which it fics, wor the depth of its penctation into folid futhances. Indeed thefe two latt fuppolitions fien at firlt fint too chimerical to defive a formal confutation. Bat I cammat help obferving that thoofewh have beer habituated to the ute of rill:d pieces are very exulabie in giving way to thefe prepofitions. Fo: the contantly tound, that with

Actice. with them they could Gre at a mark with tolerable fuecefs, though it were placed at three or four times the diflance to which the ordinary pieces were fuppofed to reach. And therefore, as they were irinorast of the true caufe of this variect, and did not know that it arofe only from preventing the defection of the hall ; it was not unnaturd for them to inagine that the fuperiority of effect in the riffed piece was owint cither to a more violent impalfe at tind, or to a mure cafy pallage through the air.
"In order to confirm the foregning theorv or rifebarrelled pieces, I made fome experiments by which it might be feen whether one fide of the ball difelaresed from them nnifurmly keeps foremoll during the whale courfe. Tค examine this particular, I to. $k$ a riffed barrel earrying a bullet of fix to the pound; tut infead of its leaden bullet I ured a wooden one of the fame lize, made of a foft fpringy wood, which bent itfelf eatily in:o the rifes without breaking. And firing the piece this loaded againf a wall at fuch a difance as the bullet might not be fhivered by the blow, I always found, that the fame furface which lay foremotl in the picee consinaed foremof wi:hout any fenfible de?lection du, ing the time of its fight. And this was eafily to be olferved, by examining the bullet; as boih the marks of the rities, and the part that impinged on the wall, were fulicien:ly apparent. Now, as thefe wooden bulless were but the iGh part of the weright of the leaten ones; I conclude, that if there had been any unequal refilance or deflective power, ins effects muft have been ex rennely fenlible upon this light body, and confequatly in forne of the trials I made-ilae furface which came furemolt from the piece mult bave been tuined round inio another fituation.
"But again, I took the fame picee, and, loading it now with a laden ball, I fet it nearly upright, foping it only three or four degrees from the perpendicular in the divection of the wind; ant firing it in this lituadon, the bullet generally consinued about half a minue in the air, it rifurg by computation to near three guarters of a mile perpendicular leight. In thefe trial; I found that the bullet eommonly erme to the gronnd to the lerward of the piece, and at fuch a diflance from it, as nearly correfpended to the angle of its inclination, and to the effort of the wind; it wfally falling not nearer tu the piece than : © , wor farther fiom it than 150 , ydrals. And this is a frong confirmation of the almolt tleady fight of this bulki for about a mile and a balf: for were the fame trial made with a common piece, I loubt not but the deviation would often amones: to half a mile, or perlaps confiderably more; though this experiment would be a very diflicult one to examitue, on account of the little chance there would be of difcovering where the ball fell.
"It mult be obforved, however, that though the bullet inpelled from a rifle-barrelled pieee keeps fos a time to its regular track with fuffecient nicety; yet if its fight be fo far extended that the track becomes confiderably ineurvated, it wi!l then underern confiderable deflecions. This, according to my cxperiments, arifes from the angle at latt made by the axis on which the bullet turns, and the direction in which it fles: for that axis continuing nearly parallel :o itfelf, it muft neccifarily diverge fiom the line of
the fight of the bullet, whan that line is bant fom pratice. its original direction; and whan of once haporas that the bollet whirls man axis which nolloger i. inciles with the line of its tiont, then the megital retitane formerly deforibed wiil take place, and the detlesíng power hence arifons will perpetually increate as the track of the bullet, by bating its ranse extended, becomes more and mor insurvated. - I lis natter I have experienced in a final? rille hatelled piece, carlying a laden ball' of near hatf an unnce weight. For this pisee, charged with one drachn of powder, ranged about 550 yards at an angle of 12 degrees with fuffiriont regularity; but being aftowatds devated in an ande of 24 degrees, it then ranged very irgegulatly, genematly deviating from the line of its disection to the keft, and in one cafe not lefs than 100 jards. 'lhis apparencly arofe from the caufe ahove mentionerl, as was coniirmed from the condank deviation of the bullet to the left; for by confidering how the revolving motion was continued with the progreflive one, it appented that a deviation that way was to be expeited.
"The bell remerjy I ean think of for this defect is the making ufe of bullets of an cagr like form inftead of fphaical ones. For if ficla a bullet hath its foorter axis made to fit the piece, and it be placed in the barrel with its fmaller end duwnwad, then it will acgnire by the rifes a rotation round its larger axis; ant its centre of gravity lying nearet to is fore than its hinder part, its longer axis will be conllantly forced by the refilance of the air into the line of its flight ; as we fec, that by the hame menas arrows eondanty lie in the line of tincir disection, howeser that hate be incurvated
"But, b. Fides this, there is another circumfance in the ne of the fe fieces, which renders the hight of their bullete umeertain whes dived at a emfiderable clevation. Fur I fid by my experiments, that the velucity of a bulat hived with the fane quastuty of posder from a ritted burrel, varies much mon fion itelf in ditlerent alals than whon fired from a commur piere-- - l"his, as I conceive, is owing to the great quantity of fif etom, and the inmoffibility of remering it equal in cathexperireme. Indetel, if the rifies are not de ph? cout, and if the bulict is aicels heted to the piece, to as not to westire a great foice to dive it down, ame if keather or fullian well greafed is made wee of besween the bullet and barrel, petlapa, by a eaternal atention to all thefe particulara, great part of the inegualite in the velocity of the bullet may be prerented, atid the difficulty in quettion be ios forme meafure obviated: but, till this be dune, it eannot be doubted, that the range of the fame piece, at an elevation, will vary conliderably in every trial; although the charge be each time the fame. Aud this I have myfolf experinnced, in a number of divertitied trials, with a rifte-barrelled piece loaded at the breech in the ling!ifh manner. For here the rittes being indented very deep, and the bullet fo large as to fill them up completely, I found, that hough it few with fufficient exactneds to the dittance of +0 or 500 yards; yet wher it was raifed to an angle of about 12 degrees (at uhichanghe, being lired with one-fifth of its weight in pewier, its mathan range in nearly 1000 yards) ; in this cafc. I fay, I fonnd that its range was variable,

inequatites in the quantity of powder, or in the mattner of charging. - And as, in this cafe, the angle was too fmaif for the firt-mentioned irtegularity to produce the obferwed efeects; they san only be imputed to the different velocities which the bullet each time received by the enecqual action of the friction."

Thus we fee, that it is in a manner impolible en. tirely to correct the aberrations arifing from the refifance of the atmofphere; as even the rifle-barrelled pieces cannot be depended ripon for more than onehalf of their actual range at any couliderable elevation. It becomes therefore it problem very difficult of folution to know, even within a very confderable diflance, how far a piece will cary its ball with any probability of hitting its mark, or doing any execution. The beft rales hitherto laid down on this fubject are thofe of Nat Robins. The foundation of all his calculations is the velucity with which the bullet fles off from the motth of the piece. Mr kobins himelf had not opPrtunities of making many experiments on the velocieves of cannon halls, and the calculations from fmaller ones cannot always be depended upon. In the G8th volume of the Phil. Tranf. Mr Huton hatl recited a number of experiments made on cannon carryiug balls from one to three pounds weight. His machine for difcovering the velocities of thefe balls was the fame with that of Mir Robins, only of a larger fize. His eharges of powder were two, four, and eight onnees; and the refult of 15 experiments which feem to have been the moll accurate, are as follow.

In another courfe, the mean velocities, with the fame dinarges of powder, were 613, 873,1162. "The nean velocitits of the balls in the fint courfe of experments (Gays Mif Iluton) with two, four, and eight ounces of powder, are as the mumbersi, $: .414$, and 1.993 ; but the fisbduplicate ratio of the weights (two, four, and cight ) give the numbers $1,1 \cdot+1$ and 2, to which the nthers are fulficiently near. it is obvioug, however, that the greateft diference lies in the laft number, which anfwers to the greatett velocity. It will fill be a litice more in defeet if we make the allowance for the weights of the balls; for the mean weigluts of the balls vitit the two and four cunces is 18.3 ounces, but of the eiglet ounces it is $18 \frac{3}{5}$ : diminiming therefore the number 1.093 in the reciprocal fubduplicate ratio of Ly to 18 是, it becomes 1.985 , wheh Ealls Mort of the number 2 by org, or the 133 d part of itfelf. A fi . milar defect wns obferved in the other courfe of expesiments; and both are owing to three cvident canfes, riz. 1. The lefalength of cylinder through which the hall was impelled; for with the cight-onnce charge it bay three or four inches ncarer to the muzale of the piece than with the others. 2 : 'The greater quantity of clattic fluid which eleaped in this cate than in the cthers by the windage. 'limis liapens from its moving
whit a greater velocity; in confequence of which, a greater quantity efeapes by the vent and windage than in fmaller velocitics. 3. The greater quantity of powder blown out untired in this cafe than in that of the leffer velocities; for the ball which was impelled with the greater velocity, would be fooner out of the piece than the others, and the more fo as it had a lefs length of the bore to move through; and if powder fire in time, which camot be denied, though indeed that time is marifetly very fhort, a greater quantity of it mult re. main untired when the ball with the greater velocity iffines from the piece, than when that which has the lefs veloeity goes out, and hill the more fo as the bulk of powder whiel: vas at frit to be inflamed in the one cale fo much exceeded that in the others.
"Let us now compare the correfponding velocities in both cafes. In the one they are 701, 993, 1397 ; in the other, $613,873,1162$. Now the ratio of the firit two numbers, or the velocities with two ounces of powder, is that of 1 to $1.1+36$, the ratio of the next two is that of 1 to 1.1375 , and the ratio of the lalt is that of 1 to 1.2022 . But the mean weight of the hot for two and four ounces of powder, was $28 \frac{8}{5}$ ounces in the furt courle and $18 \frac{1}{6}$ in this; and for eight ounces of powder, it was $28 \frac{2}{8}$ in the firlt and $18 \frac{3}{3}$ in this. Taking therefore the reciprocal fubduplicate ratics of thete weights of fhot, we obtain the ratio of 1 to 1.224 for that of the balis which were fired with two ounces and four ounces of powder, and the ratio of 1 to 1.241 for the balls which were fired with eight ounces. But the real ratios above found are not greatly different from thefe; and the variation of the actual velueities from this law of the weighte of thot, inclines the farne way in both courfes of experiments. We may now collect into one view the principal inferences that have refulted from thefe experments.

1. "It is evident from them, that nowder fires almolt joltantancoufy.
2. "The velocitics communicated to balls or thot of the fame weitht with diffecot quantities of powder, are nearly in rhe fubduplieate ratio of thefe quantities; a very fmall variation in defect talifig place when the guantities of powder become great.
3. "When thot of different wights are fired with the fame quantity of powder, the velocities communi. cated to them are nearly in the reciprocal Cubduplieate ratio of their weights.
4. "Shot which are of different weights, and im. pefled by different quantitics of powder, acquire velo. cities which are directly as the fquare roots of the qu-atities of powder, and inverfely as the fquare roots of the weights of the hot nearly."

The velocities of the bullets being thus found as nearly as pollible, the rangica may be found by the follownor rules laid down by Mr Robins.

1. "Piii the velocity of the projectile furpafes that of t1co fert iti a fecond, the relitiance may be reckoned to be in the duplicate proportion of the velocity, and its mean quantity may be teckoned about half an ounce aroirdupoife on a iz-pound thot, moving with a velocity of about 25 or 26 feet in a fecond.
2. "If the velocity be greater than that of 1100 or 1200 fect in a fecond, then the abfolute quantity of the rcfitance in thefe greater volocities will be near three times as great as it ihould be by a comparifon
dice. with the finaller velocities.-Hence then it appears, that if a projectile begins to move with a velucity lefs than that of 1150 feet in $1^{\prime \prime}$, its whole motion may be fuppofed to be confidered on the bypothefis of a refifance in the duplicate ratio of the velocity. And if it begins to move with a velocity greater than this lalt mentioned, yet if the fift part of its inotion, till its velocity be reduced to near 1100 feet i:1 $1^{\prime}$, be confidered feparately from the remaining part in which the velocity is lefs than 1100 feet in $1^{\prime \prime}$; it is evident, that both parts may be truly affigned on the fame hypothefis; only the abfolute quantity of the refintance is three times greater in the firt part than in the latt. Wherefore, if the motion of a projectile on the hypothefis of a refiftance in the duplicate ratio of the velocity be truly and generally affigned, the actual notions of refifted bodies may bs thereby determined, notwithifanding the increafed refiftances in the great velocities. And, to avoid the divifion of the motion intn two, I hall how how to compute the whole at one operation with little more trouble than if no fuch increafed refflanec took place.
" 'l'o avoid frequent circumlocutions, the dilance to which any projectile would range in a vacuum on the hotizontal plain at $45^{\circ}$ of elevation, I fall call the potential random of that projectile; the dittance to which the projectile would range in vacuo on the horizontal plane at any angle different from $+5^{\circ}$, I thall call the potential range of the projectile at that angle; and the dirance to which a projectile really ranges, I flall call its actual range.
"If the velocity with which a projectile begins to move is known, its potential random and its potential range at any given angle are eafily c'e'ermined from the common theory of projectiles *; or more generally, if either its original velocity, its potential random, or its potential range, at a given angle, arc known, the other two are eafily found out.
"To facilitate the computation of relifed bodies, it is neceflary, in the confideration of each refifted body, to affign a certain quantity, which I fhill denominate $F$, adapted to the refiflance of that paticular projectile. To find this quantity $F$ to any projectile given, we may proceed thus: Fift find, from the principles already delivered, with what velocity the projectile mutt move, fo that ins refifance may be equal to its gravity. Then the height from whence a body mult defcend in a vacuum to acquire this velocity is the magnitude of F fought. But the concifeft way of finding this quantity $F$ to any fhell or bullet is this: If it be of folid iron, multiply its diameser meafured in inches by 300 , the product will be the magnitude of F expreffed in yards. If, inftead of a folid iron-bullet, it is a fhell or a bullet of fome other fubfance; then, as the fpecific gravity of iron is to the fpecific gravity of the fhell or bullet given, fo is the F correfponding to an iron-bullet of the fame diameter to the proper $F$ for the thell or bullet given. The quantity F being thus affigned, the neceffary computations of thefe relifted mutions may be difpatched by the three following propofitions, always remembering that thefe propofitions proceed on the hypothefis of the refiltance being in the duplicate proportion of the velocity of the refifted body. How to apply this principle, when the velocity is fo great as to have its reffifance augmented beyond this rate,
flall be fiown in a corellary to be annexed to the firtt propafition.

"PROP. I. Given the actual $1:$ nge of a given thellor bullet at any fmall angle not exceeding $8^{3}$ or $10^{\circ}$, to determine its potential range, and confequestly its potential random and original velocity.
"Sos. Let the actual range given be divided by the F correfponding to the given projectile, and find the quote in the firt column of the preceding Cable; then the correfpandiag number in the fecond column multiplied into F will be the potential range fought: and thence, by the methods already explained, the potential random and the original velocity of the projectile is given.
"Exam. An i8 pounder, the diameter of whofe thot is about 5 inches, when loaded with 2 lb of powder, ranged at an elevation of $3^{\circ} 30^{\prime}$ to the diftance of 975 yaris.
"The F correfponding to this bullet is 1500 yards, and the quote of the aetual range by this momber is 65 ; correfponding to which, in the fecond column, is .817; whence 817 F , or 1225 yards, is the potential range fought; and this, augmented in the ratio of the fine of twice the angle of elcration to the radius,
 it will be found, that tha vaccity of this prejecteto wis. that of ges feet in a ecomed.

- Cur. ill. If the consate of this propoltion beck. fredt ; that is, if the potential range in a fimali angte be given, and thenee the attual rage be fought ; this may be folded with the fame facility by the fame talle: for if the given patental range be dividad by its coma Pondent fo, then opporite to the gunte liowhe in the fecond column, there will be foumd in the ins (o) lumn a number which inultiplied into F will give the actual range required. And from hance is sullow, that if the actual ramge be siven at one angle, it may te found at every wher angic not exceeding of or $10^{\circ}$.
"Cor. zu. If the actual range at a given imall anfle be given, and ancther actual range be given, to which the angle is tou tht ; thionill be determined by finding the potential ranges corrfiponding to the two given actual ranges: then the angle correfponding to one of thefe potential rangrs beiny known, the angle cortefonding to the other will be found by the common theory of piofectiles.
"Con. 3 d. If the potential random deduced fiom the actual range by this propolition asceeds 13000 yads; then the original velucity of the projectile was fu great as to be affeted by the teoble refillance dreribes a Love; and confequently the real potential randon will De greater than what is here determined. However, in this cafe, the true potential random may be thus nearly afigned. Take a th $^{\text {th }}$ comtinued propotional to 13000 yards, and the potential random found by this propolition, and the +th proportional thens fomm may be aflumed for the true potential random fought. In hike manner, when the true potential randon is given greater than 13000 yards, we milt take two mean

The orie rations di. reted in this corollary are bet ferformed Ly the tuld of lopa. rithns.
proportionals butwe:a 13000 and this tandon *: and the lirit of thefe mean proportionais mult be afumad intlead of the rasiom given, in every uperation defcribed in thele propolitions and their corollaries. And this method will uearly allow for the increated reli, ance in large velocities, the difference only amounting to a fex minutes in the angle of director of the projected body, which, provided that angle exceeds two or three degrets, is whally fearee worth attending to.
"Of this proceis take the following example.
"A $2+$ pounder fired with 12 pounds of powder, when elewated at $7^{2} 15^{\prime}$, ranged aluut 2500 yards. Here the F being leear 1700 yalds, the quote to be fought in the dint column is 147 , to which the nuntber correfponding in the lecond culuma is 2.556 ; whence the potentidl ange is near 4550 yards, and the potentia, randon thence effung 17400 . Lut this bing nume than 1 zooc, we mant, to get the true potential random, take a filh continued proportional to 13000 and 17400 : and this $4^{\text {h }}$ proportional, which is about 31000 yards, is to be elleemed the true potential raurlom fought; whence the velucity is nearly that of 1730 feet in a fecond.
"Schotiun. Thes propolition is confined to fmall angles, not exceeding 8. or $10^{\prime \prime}$. Ia all poflible cafes of practice, this approximation, thus limitcd, will not differ from the matt rigorons fulation by fo mucia as what will often interveae from the variation of the denlity of the atmofphere in a few hours time; fo that the errors of the approximation are mush anese of N. 146.
athir inevita

- PROP. 11. Given the atual range of a given fre! ur butht, at any angut not exceeding $45^{\circ}$, to determine is patental rances at the fame minge; and thenee its potential randum and origimal velacity.
"Sub. 1):minifa the F correfpondiag to the fhellor bullet given in the propurtion of the radius to the cofine of $\frac{1}{4}$ the ande of elevation. Then, by means of the pecedias table, operate with this reduced F in the fame mannes as is preferibed in the folution of the lal propolition, atd the refuic will be the porential rance fought: whence the potential random, and the original velocity, aceally daternined.
"Ela'1. Anotar for lea-fervice, charged with :ollh. of powder, has formimes throwa its hell, of $12 \frac{3}{3}$ inches ciameter, and of za! lb weight, to the difance of 2 miles, or g 45 s yar is. Thiis at an elevation of $+5^{\circ}$.
'T The F to this lhell, if it were folid, is $3 \$ 25$ yards; but as the theil is only 去 of a fulid globe, the true 1 : is no mure than 3060 yards. This, diminifled in the ratio of the madins to the cofne of $\frac{3}{5}$ of the angle of elesation, becomes 254. The quote of the potential tange by this diminited $F$ is 1.384 ; which fought in the tirt column of the preceding table gives 2250 for the correfonding rumber in the fecond enlumn; and this matiplice into the reduced F, prodnces 5800 yarls for the potential range fought, which, as the angle of edevation was 45 , is alios the potential ratidum: and hence the original velocity of this fhall ippears to be that of about $7+8$ feet in a fecond.
"Cor. The comerfe of this propofition, that is, the determination of the actual range from the puscratial range given, is cally deduced from heace by mans of the quate of the potential raw re divided by the redn. cad F ; for this quate farclad not in the fecom 1 column will give a correfponding number in the firt colum, which multiplied into the redsed F , will be the actual range fought.
"Alfo, if the potential random of a projectile be given, or its actuai range at a given anoie of ceraLion; its achual range at any other angle of elcration, nut greater than 45 , may hence be known. For the poiential rariom will affign the potential range at any Liven angle; and thence, by the method of this corollary, the actual range may be found.
"Exan. A but mufquet ballet fired from a piece of the flandard dimenfurs, with $\frac{1}{5}$ of its weight in good powder, acquines a veiveity of near yyo feet in a fecond; that is, it has a porentioh tancum of near $8+00$ sartit. If now the aciuab range of this bullet at $15^{\circ}$ was fought, we math proceed thas:
"From the givea potential random it fuilo ws, that the putential range at $15^{\circ}$ is 4200 yards; the dianeter of the buhlet is $\frac{3}{3}$ of ais inch : and thence, as it is of lead, its proper $\overline{\mathrm{F}}$ is 3.37 .5 yards, which, reduced in the ratio of the radius to the colthe of + ut $15^{\circ}$, becames 331 yards. The quote of +200 by this num. ber is 12.7 hitaly; which, beiag fought in the fecond column, gives 3.2 neariy for the corictpmading number in the fint conman; add this matipliced :nto 331 yards (the reduced F) makes 1059 gards for the aitual range fought.
© Exam. 1I. The frame be:ler, fired with its whole weight in powder, aceptires a velucity of about 2100 feet
tiee. feet in a fecond, to which there correfponds a potential random of about 45700 yards. But this number greatly exceeding 13000 yards, it muft be reduced hy the method defcribed in the third corollary of the firf propofition, whell it becomes 19700 yards. If now the actual range of this bullet at $15^{\circ}$ was required, we hall from hence find, that the potential range at $15^{\circ}$ is $985^{\circ}$ yards ;which, divided by the reduced F of the laft example, gives for a quote 2975 : and thence following the iteps prefcribed above, the actual range of this bullet comes out 1396 yards, exceeding the former range by no more than 337 yards; whereas the difference between the two potential ranges is above ten miles. Of fuch prodigious efficacy is the refiltance of the air, which hath been hitherto treated as too infignificant a power to be attended to in laying down the theory of projectiles !
"Schol. I mult here obferve, that as the denfity of the atmofphere perpetually varies, increafing and diminifhing often by $\frac{3}{3}^{2} 0$ part, and fometimes more, in a few hours; for that reafon I have not been over rigorous in forming thefe rules, but have confidered them as fufficiently exact when the crrors of the approximation do not exceed the inequalities which would take place by a change of $\frac{1}{3}$ part in the denfity of the atmofphere. With this reftriction, the rules of this propofition may be fafely applied in all polfible cales of practice. That is to fay, they will exhibit the true motions of all kinds of fhells and can. non-hot, as far as $45^{\circ}$ of elevation, and of all mufket bullets fired with their largeft cuflomary charges, if not elevated more than $30^{\circ}$. Indeed, if experiments are made with extraordinary quantities of powder, producing potential raniloms greatly furpaffing the ufual rate; then in large angles fome farther modifications may be neceffary. And though, as thefe cafes are beyond the limits of all practice, it may be thought unneceflary to confider them; yet, to enable thofe who are fo difpofed to examine thefe uncommon cafes, I thall here infert a propofition, which will determine the actual motion of a projectile at $45^{\circ}$, how enormous foever its original veloeity may be. But as this propofition will rather relate to fpeculative than practical cafes, inftead of fuppofing the actual range known, thence to affign the potential random, I thatl now fuppole the potential random given, and the actual range to be thence inveltigated.
" PROP. Ill. Given the potential random of a given thell or bullet, to determine its actual range at $45^{\circ}$.

Sol. Divide the given potential random by the F correfponding to the hell or bullet given, and call the quotient $q$, and let 1 be the difference between the tabular logarithms of 25 and of $q$, the logarithm of 10 being fuppofed unity; then the aetual range fought is $3.4 \mathrm{~F}+21 \mathrm{~F}-\frac{11}{10} \mathrm{~F}$, where the double fine of 21 F is to be thus undertood; that if q be lefs than 25 , it muif be - 21 F ; if it be greater, then it mult be + 21F. In this folution, $q$ may be any number not lefs than 3, nor more than 2500.
"Cor. Computing in the manner here laid down, we thall find the relation between the potential randoms, and the actual range at $45^{\circ}$, within the limits of this propofition, to be as expreffed in the following table.

Vol. VIII. Part I.

Potential Random.
 Actual Range at Practice.

Whence it aprears, that, when the potential random is increafed from 3 F to 2500 F , the actual range is only increafed from $1 \frac{s}{2} \mathrm{~F}$ to 7 F ; fo that 20 increafe of 249.7 F in the potential random produces no great. er ao increafe in the actual range than $5_{\frac{1}{2} \mathrm{~F}} \mathrm{~F}$, which is not its $\frac{1}{4} 0$ part ; and this will again be greatly diminifhed on account of the increafed refiflance, which takes place in great velocities. So extraordinary are the effeets of this refiftance, which we have been hitherto taught to regard as inconliderable.
"Tbat the jutnefs of the approximations laid down in the 2 d and 3 d propofitions may be eafier examined; I thall conclude thefe computations by inferting a table of the actual ranges at $45^{\circ}$ of a projectile, which is refifted in the duplicate proportion of its velocity. This table is computed by methods different from thofe hitherto defcribed, and is fufficiently exact to ferve as a ftandard with which the refult of our other rules may be compared. And fince whatever errors occur in the application of the preceding propofitions, they will be moll fenfible at $45^{\circ}$ of elevation, it follows, that hereby the utmoft limits of thofe errors may be affigned.

"Thnongh brafs gums are not lishle to burt, yet Prat they are fooner rendered unferviceable in action than iron. For by the foftnefs of the metal, the went widens fo foon, ard they are follable to bend at the muzale, that it wonld be dangerous to fire them; as we found by experience at Belleifle, and where we were cobliged to take guns from the Mips to finith the fiege.
"Thofe bsing "ndeniable facts, no poffible reafon can ${ }^{1}$ a affigned againh ufing iron guns in both fea and land fervice, and therehy leften the expences of aro tillery fo confiderably as will appear by the following tablas.

Lengths and Weights of Iron Sbip-Guns.
Old Pirces.

" Guns of this conftructicu appear fumbently fronge from the proof of two thres pounders ma le for Lond Egront, and they sen ma: be made liguter and of equal Cervic...

Leng'l and Weight of Battering I'ieces.

" 'That the fe guns are fufficiently trong, is evideat from the former trial; befides, there are feveral 32 pounders of the fame dimentions and weight now exilting and ferviceable; though call in ling Charles II.'s time.
N. B Thefe baterin: pieces may ferve in garrifons.
"It appears from thefe tables, that no proportion has been oblerved in any guns hitherto made, in refpect to their length or weight, but mouly by guefs.

## Some Examples to foory nobat may be faved by this Sclieme.

Tl.- old Royal Genrge carried 100 brafs guns, which weighed together 218.2 tons; the ton cott 130 pounds, workmanhip included.
The expence of thefe guns is then 23366 pounds
A fet of iron gums of the fame number and calibers, according to my condraction, weighs
127.8 tons
'The ton coll 16 poun s , and the whole fet
2044.5 pounds

The Royal George carries then go. 4 rons more than is necelfary, and the cifference between the expence is
25321.2 pounds

That is, $12 . j$ times more than the new iton fet eoth: or 12 hlups of the fane rate may be fitced out at 1 lefs charge.
$\Delta$ fet of the $\left\{\begin{array}{l}\text { Old } \\ \text { New }\end{array}\right\} \begin{aligned} & \text { inon gans fre a } \\ & \text { firlt-rate weighs }\end{aligned}\left\{\begin{array}{l}204.4 \\ 127.8\end{array}\right\}$ tons
The difitence between the weight of the cld and new is
76.6 tons

The dfference betacen the expence is then
1225.6 pounds A fut of brafs batering picces weighs $11.3^{6}$ tons
A ton colls 130 pounds, and the fet $1+76.8$ pounds
A fit of the new weighs
7.55 tons

The ton cofts 16 pounds, and the fet 117.8 pounds
'Illat is, the old fet cons 11 times, and 632 over. rrove than the new fet; or 1 : fets of the new could He made at kisexpence than one of the old.
" This tatle fhows what may be faved in the nary ; end if we ad! thofe on board noops, the difierent gartions, and the beld train, with the grea: expence of their carriage in the tield, it may be fumd pritty aear es much norec.

This and other propofals for reducing the weight Iractice. and expence of guns hive been greatly attended to of late; and the Carron compuny in Scotland have nut only greatly improved thofe of the old eouftruction, but a gun of a new conftruation hath been isvonted by Mr Charles Gafcoigne director of that work, whith prase promifes to be of more effectual fervice than any hi-cuxxy. therto made ufe of.- Fig. 6. reprefents the form 43 and proportions of the guns made at Carron, and Proparwhich ferve fur thofe of all fizes, from $\frac{1}{2}$ pounders tions, \&ec. and upwards. The proportions are meafured by the of the gund diameters of the caliber, or bore of the gua, divided Cartor. into 16 equal parts, as reprefented in the figure. The following are the names of the difierent parts of a cannon.

AB , the length of the cannon.
AE, the firlt reinforce.
EF, the feeond reinforce.
FB , the chafe.
HB, the muzzle.
Ao, the cafcabel, or pomigtion.
AC , the breech.
CD , the vent-field.
FI, the chafe girde.
$r s$, the bafe ring and ogee.
$t$, the vent-ailtragal and bllets.
$p g$, the firt reinforce-ring and ogree.
va, , the fecond reinforce ring and ogec.
$x$, the chafe-atragal and fillts.
$\approx$, the mazzle aftragal and fillets.
$n$, the muzzle mouldings.
$m$, the fivelling of the muzzle.
A, the breech mouldings.
Tr, the trunnoins.
The dotted lines along the mildle of the piece frow the dimentions of the ealiber, and the dutted circle fhows the lize of the ball. Fig. 7 . flows a cohorn made alfo at Carron, and which may be neafured by the faric feale.
As tije bieech of the cannon reccives an equal im. Ufe and dee pulte with the billet from the action of the inlamed fiription of gunpowter, it thence follows, that at the moment the cartiadery bullet hies off, the picee itfulf puhtes backward with very great force. This is called the reco:l of the cannou: and if the piece is nut of a very conficerable weig't, it would fly upsatds, or to a fide, with ex. treme viofence. If again it "as firmly fattened down, fo that it could not move in the lealt, it would be veir apt to barik, on account of the extreme viclence with winch the powder would then ate upon it. For this reafon it hath been found necefiary to allow the recoil to take place, and confequently all rarge pieces of artillery are mounted upon carriages with wheels, which allow them to recoil freely; and thes they may be fired without any danger. There are feveral forts of carriages for ordnance, viz. baltand cantiages, with low whecls and high wheels; fea-carriages, made in imitation of thofe for mip-guns; and carriages for field-pieces, of which there ave two kinds. The carriages inult be proportioned to the pieces mounted on them. The ordinary proportion is for the carriage to have once and a lalf the length of the gun, the whetls to be half the length of the piece in height. Four times the diameter or caliber gives the depth of the planks in the fore end ; in the middle $3 \frac{3}{\frac{1}{2}}$.

Ee2

Practice.

## Deferipion

of elececarrerace.

- Ste C.gr Pe7..46.

Tig. 3. thows Mr Galcoigne's newly-invented or tather improved gun called a carronade*; and which, in June 1779, was by the king and council inftituted a dlandard navy.gun, and 10 of them appointed to be added to tach hip of war, from a firlt rate to a lloop. Of this gan the Carron company have publifhed the forlwing account.
"The carronade is made for fhort, that it is worked with its carriage in the fhip's port; the trumions lying immediately over the fill of the port: it is correctly bored: and the thot being perfectly round, fills the caliber with fuch exastnef;, that the leatt poffible of the impuife of the powder efeapes, upon explofion, betwen the cylinder and the fhot; which laft alfo is thereby mote truly dire c ed in its flight. The boitom of the cylinder is a hemifphere, to which the end of the cartridge is not liable to ltick, and in which the fmallut charge of powder envelopes the thot, exhaulting nearly the whole of its impelling force upon it: the trunnions are placed fo as to lefien the recoil, ard that the gun cannot relt againtt the fides of the carriage, and is balanced with the utmolt facility. There are views cait upon the vent and muzzle, to point the gun quickly to an object at 250 and 500 yards diHance. There is an handle A fixed upon the pommelend of the gun, by which it is horizontally ranged and puinted; and there is a ring calt upon the cafcabel, through which the breechin rope is reeved, the oaly rope ufd about thefe guns.
" The carronale is mounted upon a carriage $B$, with a perfectly fmooth bottom of frong plank, without trucks; inttead of which there is fised on the bottom of the cariage, perpendicular from the trumions, a gudgeon C of proper Rerength, with an iron wather 0 and pin E at the lower end thereof. This gudgeon is let into a correfponding groove F , cut in a fecond carriage G, called a Jide-carriage; the wather fupported by the pin over reaching the under-edges of the groove H. This lide-carriage is made with a month upper furface, upon which the gun-cariage is moved, and by the gudgean always kept in its right tation to the port; the groove in the nide-carriage being of a fufficient length to allow the gun to recoil and be loaled within boand. The flide-carriage, the groove included, is equally broad with the fore part of the gun-carriage, and about four times the length; the fore-part of the lide-carriage is fixed by hingebolts I, to the quick-work of the fhip below the port, the end lying over the fill, clofe to the outide plank, and the groove reaching to the fore end ; the gudgeon of the guu-carriage, and confequently the trunnions of the gun, are over the fill of the pert when the gun is sua out; and the port is made of fuch breadth, with its fides bevelled off within board, that the gun and cansase may range from bow to quarter. The flide-carmige is fupported from the deck at the hinder end, by a wedge K, or Aep. ftool; which being altered at pleature, and the fore-end turning upon the hingeboits, the carriage can be conilantly kept upon an bunzumal flane, for the more cafy and yuick working of tin gun when the thip lies along.
" The gun and car inges being in their places, the brechin rope, which mut be ftrong and limber, is reeved thou-h the ring on the breech, then led thro' an efc-bolt drove downwards, the rye flanding up-
right upon the upper edge of each cheek of the gun. Prat carriagc; from thefe eye-bolts the ends of the breechin rope are feized down as ufual to an eye bolt driven into the quick-work on each fide, in a line with the lower furface of the ilde-carriage.
" The gim being monnted and ready for action, is loaded with $\frac{1}{2}^{\frac{1}{2}}$ th part of the weight of its ball in fervice charge of powder put into a woollen cartridge, and the coll tied up with a worlted yarn, and plazed next to the fhot; and with a fingle ball, well rammed home upon the powder, without a wadding betweea them: the gun being then mon out in the port, is ranged and elevated with great facility, by means of the handle on the pommt!; and, by the views, very quickly pointed. - Upon difcharge, the gun attempts to kick upwards, which heing prevented by the wather of the gudgeon bearing hard againt the under part of the nide-carriage, the recoil takes place; and the gudgeon liding backwards in the groove (tbe wather Atill bearing againd an iron plate on the under edge of the groove), till the gun is brought up by the brcechin rope, as much re-action fucceeds as flackens the rope, fo that the gun and carriage may be inflantly turned fore and aft by the handle, and loaded again.
" This gun has many fingular advantages over the others of light contrution.-It is fo extremely light, that the fmalleft fhips can carry almolt any weight of fhot (the 12 -pounder weighing under 500 wt . and the other calibers in proportion), and that without being attended with the inconvediences imputed generally to light guns, fince it cannot injure its carriage, or jump ont of its hation in the port upon recoil; and it will never heat.
" It can be eafily managed and worked of all calibers, from the 12 pounders downwards with two hands, and the 18 and $2+$ pounders with three hands. It may be readily ranged, pointed, and difcharged, twice in three minutes, which doubles the Arength of the thip againft an enciny of equal force. It is wrought upon an horizontal plane to windward or to leeward how nuch foever the hip lies along under a preflure of fuil; and therefore, belides being hampered with no tackles or wher ropes, txcept the breechin rope, it may be worked with at much eafe and expedition in chace or in a gale of wiwd as in lying to for action. - It can be sanged fion bow to quarter, fo as to bring a broadfide to bear in a circuit of above 10 points of the compafs on each fide. - It is no more expenfive in ammunition than the old guns of two thirds lefs weight of thot; and it reguires very few hands above the complement neceffary for navigating mer-chant-fhips; and increafes the ftrength of privateers crews, by expoling few hands at the guns, and augmenting the number at frall arms.
"Though the carronade cannot, frictly feeaking, throw its hot to an equal difance with a longer gun; yet, from the fitnefs of the fhot to its cylinder, the powers of this gun will greatly furpafs the expectations of frich as are not in timately acquainted with the tfiects of the clattic foree of fired powder, fince, with $r^{\prime}$ 'th patt of the weight of its ball, at very fmall clevations, it will range its fhot to triple the dillance at which frips generally engage, with fufficient velocity for the greateflexecution, and with all the accuracy in
tice. its direction that can beattained from guns of greater lengths.
"There have been two feeming difadvantages im. puted to this gun, which it does not merit, viz. the nicety of fitting the fher to the bore of the gun, and its incapacity to holld more than two fhot at one charge. But as feamen have few opportmities of confirning themflves in jult opinions by experiments made on fhore, and cannot, in that cafe, be fully converfant with the fubject; the following loofe hines may not be inept :owards removing thefe objections.
"It is an axiom in projectiles, That a font cannot be impelled from a gun to any ditarice in a direction truly parallel to the axis of the cylinder of the piece, or what is cominonly called point-blank, ariling from Several we!tknown canfe's: for, however jult may be the cylinder, and however perfect and finooth may be the fplere of its correfpondinis fhot, and admitting that the inn pulfe of the powder alts through the centre of gravity of the fhot, and alfo that the fhot confequently leaves the piece in a dircalion parallel to the axis of its cylinker: yet is the thot no fooner difelarged, but it becomes more or lefs inflected by its gravith, and deflected, according to its velucity, by the reflance of the air and wind.
" Thefe irregularitics are of little importance in clofe fea-fights, and, being the effect of natural canfes, are cominon to all. Belidesthefe, the deviation of a fhot from its true direction, is further algmentel by the windage between the criinder and its fhot; but the greatell uncertainty in the flizht of a fhot, making allowatce for the aczion of its gravity, and the air's refirtance, fprings from the defects of the thot itfelf. Ruund thot for thip-guns are feldom nicely cexamined; and, unlefs they are eaff flil and trify ghbular, and free of all hollows, roughnefs, and other outfide bleminhes, and well fited to the gun, it cannot even be difcharged in the diration of the axis of the picce; to the difappoint. ment of thofe that ufe fueh, and to the difcredit of the gun founder, hawever jonly the piece is viewed, or difparted; but, being impelled againtt the furface of the cylinder, bounds and rebounds from fide to fide, ac. quires a ruatory motion, and when call hallow withal, and breaking within the cylinder before difcharge, (which fonetimes happen;, efpecially with double charges), never fails to injure; and, when often repeated, may at laft burlt the very telt guns. - Roundfhot fhould not be taken on board a mip, without being examined as to its fhape and furface, gaged for its
fize to the caliber of the gun, and weighed that it be not above or belozt the ftandard more than half ais ounce in the pound of its refpective caliber: good fhot then, being of the fame importance to all guns, remores the firt objection.
"If the direction of the night of a mot to its object is affected by fo many feeming trivial canfes, how much more uncertain mult it be, when two or more fhot are ¿ifeharged together from one gua? for the mot weat the powder being impelled with more celerity than that immediately before ir, Arikes again!t it after difcharge, and fome:imes Thivers itfelf to pieces, and never fails tochange oblignely the direction of both; and this harpens with round and double-headed, sec. and all doubie charges; and which, from their various ligures, cannot reach an object at the fame elevations with the round thot; cipecially when thefe other mats are of greater weight than the round, which is often the cafe. However frightful a broadlide with double charges may appear at fea, more confufion is created by them. and more time lolt, zuithin board, by the ftrain and exceflive recoil, than real damage done without Loord by the alditional charge: for upon a trial on thore, where the effect can be traced, it will be found, that, at 100 yads diftance, more hot will take place within a fmall compafs by fingle than by double eharges; and the charges will be oftener repeated in a given time, without heating the gun: and thefe facts being ellablifhed, remove alfo the fecond objection.'

The following account of the proof of one of thefe guns will perhaps ferve to give a more adequate idea of the great ufefulnefs of then, than any defeription:
"On Monday, OG. + - 779 , there was an experiment made at Carron, before the earl of Dunmore, Ecc. Sc. with a 68 pounder carronade, nearly of the weight of a Britifh navy 12 -pounder gun, and charged with the fame quantity (viz. 6 lb .) of powder. The carronade was mounted, on its proper carriages, into a port of the dimenfions of a it gan !hip's lower-deck port; was pointed without elevation, at a centre of eight inches diameter, marked on a bulk's head of the thicknels of two feet five inches folid wood, at 163 yards ditance; behind which, at 168 yards, there was another bulk's head of two feet four inches thick; and behind that again, at 170 yards diffance, a bank of earth. The fhot pierced the bulk's heads each time, and was huried froin three to four feet iuto the bank, and the fplinters were thrown about to a confiderable ditance on all fides.

"The Carronade was laid each time by the" views without an inftrament; and the fhot were all to the left of the mark, owing to a fmall error in difpartirg the views ; the third, fourth, and fith flot, made one
fracture, as did alfo lixth, feventh, and eighth, and the fixth and eiglth ? Prusk the fame fpot.
"The Carronade was eafily worked with four men, and may be readily worked and difcharged on boand a

Pradice. nipip twice a minut: with fix men- - With fix pound
$\underbrace{- \text { weight of powder the fhos was inpelled with a welucity }}$ of 1400 feet a fecond."
We have aiready feen of how mach eonequence rine-berets are in eiece to bring the art of gmoney to perfection; as they colarge the frace in which the
ball will fy withent any hatera! deflection to three or four times its ufual quanti:y. This improvencut, however, till very lately, only took place in muket-burctls. Sat in the teriming of the year $157+$, Dr Lind, and Captain Alexander Blair of the Ggth regiment of foot, invented a fpecies of rifed fieldpiceer, "They are rase of cal inn; and are ant bood like the common pieces, but have the ithes momblded on the core, afier which they are cleaned out and hinithed with proper influments.

Guns of this corflation, which are intended for the fill, ought never to be made to cary a ball of sbove one or two pounds weightat mon; a laden bullet of that weiglt being fufficicat to deftroy eibher man or hoofe.-A pound gun, of this contruction, of good metal, fuch as is now made by the Carron company, need not weigh above an hundred pronds weitht, and its earriage about another inndred. It can, thercfore, be ealily tranfonted from plate to phace, by a few men; and a couple of good hourfes may tranfort fix of thefe guns and their carriages, if put into a cart.

But, for making experiments, in erder to determine the refilanee which bodies moving with great velucities meet with from the air, a circumflance to which thefe guns are particularly well adapted, or for annoying an enemy's fappers that are carrying on their ap. proaches towards a befieged place, a laryer ealiber may be ufed.

The length of the gun being divided ints feven equal parts, the length of the firll reinfuree $A B$ is two of thefe parts; the fecond BC , one and $\frac{15}{5}$ of the diancter of the ealiber; the chatic CD, four wanting 10 of the diameter of the cal ber.

The dillance from the hind part of the bafe-ring $A$ to the berinning of the bore, is one ealiber and $\frac{{ }^{3}}{} \frac{3}{6}$ of a calibcr. The trumions TV are cach a caliter in brcadth, and the fame in lengtly; their centres are placed three-fevenths of the gun's length from the find part of the bafering, in fuch a monner that the axis of the trunnions paffes throtgh the centre line of the bore, which prevents the gun from kicking, and breaking its earriage. The length of the cafcable is one caliber and $\frac{15}{13}$ of a caliber.

The ealiber of the gun being divided into 16 equal parts:
The thicknefs of metal at the bafe-ring $A$ from the bore, is

At the end of the firlt reinforce ring $B \quad 17$
At the fame place, for the bogmning of the fecond reinforce

At the end of the fecond reinforce $C \quad 15$
At the fame place, for the begimanes of the chafe $c$

At the end of the chafe or mazzle, the monid. ings $a \mathrm{D}$ excluded
excluted - - 9
At the fwelling of the muzzle $b$ - 12
At the muzzle-fillet $c \quad 0 \quad 9,5$
At the extreme moulding D - 8

Diameter of the burtor E

1) iametro of its necte

The vent foold be placed aid sut half an inch from the butom of the chamber or bore, that the cartridge may be pricked, $k$ a fome of the buttom. of the cartridges thonld be left in when the gun is fionged, a circumftance which might retand the thing till the thot be again drawn (which is no eafy matter), and the gun be cleaned ont. From fome experiments of coloricl Defaguliers and Mr Muller, it has been imagined, that the powder never $h$ :s fo fromg an effeet as when it is fired clofe to the butum of the hore; yet it is found, by the experimerts of Count de la Lippe, to have the greatett effect when fine, near to the middle of the charge. This he proved by firing it with tubes, intoduced at a vent bored through the button and breech of the gun, of different lengths, fo as to reach the dific. rent parts of the powder. In the fame manner, a nulket or fouling piece is found to pufn more when the touch hale is placed at fome litule diflance from the buttom of the bore: which arifes from nothing but the porder's acting with more furce, by being inflamed to greater arivantage ; confequenty, in this eafe, the fame guantity of powder will have a greater efict, than when the touch bus is placed at the bottom of the bore, which may be of fone off in hanhanding the powder.

The alowe dinenfions are taken from fome ear, $\frac{3}{2}$ ponnd gune, which were made for the prince of A. flurias by the Carion company.

The ciths make one fpiral tum in the lengi of the bore ; but cio no nearer to the brech, in their full Feve, than two calitocs; and then trminate with a gentle flage in half a ealiher more, fo as bot to prevent the cartridye with the powder from kcing eafily fent thane to the botom of the gun, which womb otherwife eondtantly happen with the flanat catridges, and even fonattimes with paper ones, if not mede to enter very loofely. The thape of the rifles is funicircular, their breadth bing equal to the diameter, which is $3^{3}$ of a caliber, and their depth equal to the femidiameter, or is of a ealiber.
The bullcts, fig. 10. are of lead, having fix knobs eaf on them to fit the rilles of the gun. Being thus made of fuft metal, they do not wijure the rithes; and nay alfo fave an army the trouble of carrying a great quantity of thot about with them, face a fupply of
lead may be had in mot countries from roofs, sec. which can be cait into bailis as oecaition requires. Lead likewife being of greater fpecific gravity than calt iron, flies to a much greatcr ditance.

Kifed ordnance of any caliber might be made to carry iron hoot, for battering or for other purpofes; provided holes, that are a little wider at their bottoms than at their upper parts, be caft in a zone round the ball, fur receiving afterwards leaden knobs to fo the rifles of the cannon ; by which means, the iron thot will have its intended line of direction preferved, without injuring the rifes mote than if the whole ball was of lead, the rotatury motion round its axis, in the line of ins diection (which corrects the aberration) teing communicated to it by the leaden knobs, fullowiug the Spiral turn of the rilhs in its progrefs out of the gun. It is particularly to be obicerved, thet the balls malt be made to go cafily down into ulte piece, fo that the cat tridge with the powder and the bullet may be both fent hone tngether, with a fingle puh of the hand, without any wadding above cither povider or ball: by which means, the gun is quickiy loaded, and the ball flits farther than when it is fercibly driven into the gin, as was fuund from many experiments. The only reafon Why, in common rifled mulkets, the bulkets are ramned in forcibly, is this, that the zone of the bail which is contiguous to the infide of the bore may have the figure of the riftes inprefled upoa it, in fuch a manner as to become par: of a male ferew, exactly fitting the iadents of the rife, whinh is not at all neceflary in the prefent cale, the bigure of the rifles being originally calt upon the ball. Thefe knobs retard the fight of the thallet in fome degree: but this fmall cifadrantage is fully made up by the eafe with which the gun is louddd, its futrice being nea:ify as quick as that of a common field piece; and the retardation and quataty of the whirling motion which is communicated to the kullet being conitantly the fame, it wiil not in the lealk affect the expcriments made with theon, in order to deternine the retillance of the air.
and - In order to hit the mark with greater certainty than can be done in the comron randuan urcthon, thefe gens'are furnithed with a fecior, the principal parts of Which are, 1. The limb, which is divided in lith a manner as to thow elevatinns to $!5$ or 20 degrees. The iength of the racius is tive inches and an haif, and its wonius is fo divided as to forem minetes of a degree. 2. The teleicope, A B, 6g. 11. an achromatic efrac: tor, is feaen ineles in length (fach as is ufed on Hadley's quadrants, that are fitted for taking diftances of the moon from the fun or Alars, in order to obtain the long tude at fea), haviog crofs hairs is it. 3. The paraici cylindric bar, CD , is $\frac{{ }^{2}}{}{ }^{\circ}$ of an incls in diame. ter, having two rectangular ends EF, each half an inch fquare and an inch long. On one lide of the end next the limb of the fettor, is a mark correfponding to a li. miar one in the hinder cock of the gun, with which it mutt always coincide when placed on the gun. The length of the paralial bar, together with its ends, is feven inches. This bar is fixed to the feeior by means of two hollow cylinders, $\mathrm{G}, \mathrm{H}$, which alow the lector a motion round the bar. There is a finzer. icrew, $a$, up. on the hollow cylinder $G$, which is fit, in order to tighten it at pleafure upon the bar. 4. The circular level I, hig. A. aud 12 . for fething the plane of the
fector always perpendicular wher placed upon the gun, Praelice, is $\frac{1}{4}$ of an inch in diameter. Theer is a finalliferex, $, d,-$ to atjus the level at right angles to the plane of the fector. 5. The finger.feres, b, for fixing the index of the fector at any patticular degree of clevation propofed.

The line of collimation (tliat is, the line of vifion cat by the interfecting point of tile two cro!s hairs int the telefcope) mutt te aljufted truly parallel to the bar of the fector when at o degrees. This is done by Placing the fector fo that the vertical hair may exactly cave fone very diltant perpendicular lize. If it again covers it when the fector is inversed, by curning it half round upon the bar, which has all the while been kep: theady and firm, that hair is corrett; if not, corrcit hati the error ty mean 3 of the fitall forews, cde , liz. 11. and 83. at the eye-end of the telefcope, and the other half by moving the bar; place it agzin to cover the perpendicular line, and repeat the above operatio: till the hair covers it in both pofitions of the fector. Then turn the fector, till the horizontal hair cover the fame perpendicular line; and turning the fector helf round on its bar, correet it, if wrong, in the fame manner as you did the vert:cal hair.
$N . B$. Of the four fmall ferews at the eyeend of the telefcope, thofe at the light and left hand move whaterer hair is vertical, and thofe at top or underneath move whatever hair is horizontal.
On the fide of the gua upon the firt reinforce, are caft two kncbs, F, fig. 9 . and 1 t . having their midd? patt dillant from each other tix inches, for fixing on the brafs cucks, A, lig. $1+$ and 15 . Which rective the rectangular ends of the parallel cyhadric bar of the fector, when placed on the gun.
The next adjuftnent is to make the parallel bar, and line of collimation of the telefrope, when fet at o degrees, paraltel to the bore of the gun, and confequenthy to the dirction of the fant. The gin being loades, the cartridge pricked, and the gun primed, place the fector in the cocks of the ghtn; and laving firt fet the fector to what elesamy yen jndge veceffary, bring the interfotion of the crofs hairs in the tel fcope upoa the centre of the mark. the limb of the feetor being fe: vetical by means of the circular level, and then take of the fector without moving the gun. Fire the gun ; and if the Ualist hits any where in the gerperatictiar line, paffing thraugh the centre of the arark. the ino of collination of the telefope and direction of the thot agree. But if it hit to the riolot of the mark, io me:che do they differ. In order to correct which, bings the gan into the fare pofition it was in bufure fuing, and fecure it there. Then file away as mech of the foreecek, on the lice nest the gun, as will let the interfection of the crofoblair fali fonmewhe on the line pafsing perpendichlarly through the point where the thot fcll; and it is then adjulled in that polition, fo much being fled off the fied of the cock at $a$, fig. 14 . and 18. as with aliow the fide $l$ to be ferewed ciofer, that tire ends of the parallel bar may have no thake in the cocks. To correct it in the other polition, and fo to that the triee o degrees of the gun, that is, to bring the line of collimation of the telefcope, parallel-bar, and bore of the gun, truly parallel to each other, repeat the above with the trunnions parpendicular to the horizon, the frcior bcing tarued a cquarter round npon its
bar, fo as to bring its plane vertical. The deviation of
the fhot found in this way is corrected by deepening one of the cocks, fo that the vertical hair of the telefeope may be brought to cover the line paffing perpendicularly through the point where the bullet hats; the gun being placed in the fame pofition it was in before it was fired. This adjuftment being repeated two or three times, and any error that remains being corrected, the gun is fit to be mounted on its carriage for fervice. It is to be obferved, that this fector will fit any gun, if the cocks and rectangular ends, scc. of the parallel bar be of the above dinenfions, and will be equally applicable to all fuch pieces whofe cocks lave been adjulted, as if it had been adjulled feparately with each of them. And if the fector be fet at any degree of elevation, and the gun moved fo as to bring the interfection of the crofs-hairs on the obiect to be fired at (the limb of the fector being vertical), the bore of the gun will have the fame elevation above it, in the true direction of the fhot, whatever pofition the carriage of the gun is flanding in. A telefeope with crofs hairs, fixed to a comnon rifled mufket, and adjufted to the direction of the fhot, will make any perfon, with a very little practice, hit an object with more precifion than the mof experienced markfma:

For garrifon-ferviee, or for batteries, the hhip or garrifon carriage, with two iron ftaples on each fide to put through a couple of poles to carry thefe guns from place to place with more difpatch, are as proper as any. But, for the field, a carriage like that at fig. 16. where the flafts pufh in upon taking out the iron pins $a b$, and moving the crofs bar A , upon which the breech of the gun relts, as far down as the fhafts were puhed in, is the propereft, fince the whole can then be earried like a hand-barrow, over ditches, walla, or rough ground, all which may be eaflly undertood from the figure.

The principal advantage that will accrue from the ufe of rifled ordnance, is the great certainty with which any object may be hit when fired at with them, fince the thot deriates but little from its intended line of direction, and the gum is capable of being brought to bear upon the object, with great exalnefs, by means of the teleftepe and crofs-hairs.

The other pieces of artillery commonly made ufe of are mortars, howitzers, and royals. The mortars are a kind of fhort camon of a large bore, with chambers for the powder, alld are made of brafs or iron. Their ufe is to thow hollow fhells filled with powder, which falling ou any building, or into the works of a fortif. cation, butil, and with their fragments deftroy every thing near them. Carcales are alfo thrown out of them; which are a fort of thells with five hotes, filled with pitch and other matcrials, in order te fet buildings onf tire; and fometimes bafkets full of fones, of the fire of a man's fill, are thrown out of them upon an enemy placed in the covent-way in the time of a fiege. Of late the ingenious General Defagulicrs has contrived to throw bags filled with grape1hot, contaning in each bag from 400 to 600 hot of different dimentions, out of mortars. The effect of thefe is trenicndous to troops forming the line of battle, pafing a detile, or landing, se, the frot pourN'14.
ing down like a fhower of hail on a circumference of a. bove 300 feet.

Mortars are chiefly difinguifhed by the dimenfions of their bore; for example, a 13 th-inch mortar is one the diameter of whofe bore is 13 inches, \&c.-The land-mortars are thofe ufed in fieges, and of late in battles. They are mounted on beds, and both mortar and bed are tranfported on block carriages. There is likewife a kind of land-mrrtars mounted on travelling carriages, invented by count Buckeburg, which may be elevated to any degree; whereas all the Englifh mortars are fixed to an angle of $45^{\circ}$. This cultom, however, does not appear to have any foundation in reafon. In a fiege, fhells fhould never be thrown with an angle of 45 degrees, excepting one cafe only; that is, when the battery is fo far off, that they cannot otherwife reach the works: for when fhells are thrown out of the trenches into the works of a fortification, or from the town into the trenches, they fould have as little elevation as poffible, in order not to bury themfelves, but to roll along the ground, whereby they do much more damage, and occafion a much greater conflernation among the troops, than if they funk into the ground. On the contrary, when thells are thrown upon magazines, or any other buildings, the mortars fhould be clevated as high as pofible, that the thells may acquire a greater force in their fall, and confequently do more execution.

There are other kinds of mortars, called partridyemortars, band-mortars, and fivelock-nortars; which laft are alfo ealled bomberds. The partridge-mortar is a common one, furrounded with 13 other little mortars bored round its cireumference, in the body of the metal; the middle one is loaded with a fhell, and the others with grenades. The vent of the large mortar being fired, communicates its fire to the refl; fo that both the fhell and grenades go off at once. Handmortars were frequently ufed before the invention of cohorns. They were fixed at the end of a flaff four feet and a half long, the other end being fhod with iron to llick in the ground ; and while the bombardier with one hand elevated it at pleafure, he fired it with the other. The firelock mortars, or bombards, are fmall mortars fixed to the end of a firelock. They are loaded as all common fireloeks are ; and the grenade, placed in the mortar at the end of the barrel, is difcharged by a flint-lock. To prevent the recoil hurting the bombardier, the bombard refts on a kind of halberd made for that purpofe.

The chamber in mortars is the place where the powder is lodged. They are of diferent forms. and made varioully by different nations: but the eylindric feems to be preferable to any other form.

The howitz is a kind of mortar mounted on a field- H owi eaniage like a gun : it dificrs from the common mor-and re, tars in having the trunnions in the middle, whereas thofe of the mortar are at the end. The conftruction of howitzes is as various and uncertain as that of mortars, excepting that the chambers are all cylindric. They are diltinguithed by the diameter of their bore; for inHance, a 1 - ine h howitz is that which has a bore of 10 inches diancter, and fo of others. They were muel more latcly invented than mortars, and indeed are plainly derived from them.

Royale

Royals are a kind of finall mortars, which carry a Thell whofe diameter is 5.5 inches. They are mounted on beds in the fame way as other mortars.

Fig. 17. reprefents a mortar; and the names of its parts are as follow.
AB , the whole length of the mortar.
$A C$, the muzzle.
CD, chace.

ik, muzzle aftragal and fillets.
$k i$, muzzle-ring and ogee.
i m , muzzle mouldings.
$n$, thoulders.
Interiar parts.
o, chanber.
$p$, bore.
$q$, mouth.
$r$, vent.
The mortar-beds are formed of very folid timber, and placed upon very frong wouden frames, fixed in fuch a manner that the bed may turn round. The fore-part of thefe beds is an are of a circle defribed from the centre on which the whole turns.

There are leveral inltruments employed in the load1 ing of cannon. The names of thefe are as foliow:
t. The lantern or ladie, which ferves to carry the powder into the piece, and which contills of two parts, viz. of a wooden box, appropriated to the caliber of the picce for which it is intended, and of a caliber and a half in length with its vent; and of a piéce of copper nailed to the box, at the height of a half ca-liber.-This lantern muft lave three calibers and a half in length, and rwo calibers in breadth, being rounded at the end to load the ordinary pieces.
2. The rammer is a round piece of wood, commonly called a lox, faftened to a ftick 12 feet long, for the pieces from 12 to 33 pounders; and to for the 8 and 4 pounders; which ferve to drive home the powder and ball to the breech.
3. The fpunge is a long flaff or rammer, with a piece of heep or lamb-fkin wound about its end, to ferve for fcouring the cannon when difcharged, before it be charged with frefl powder; to prevent any fpark of hive from remaining in her, which would endanger the lite of him who fhould load her again.
4. Wad fcrew confills of two points of iron turned ferpent-wife, to extract the wad out of the pieces when one wants to unload them, or the dirt which had chanced to enter into it.
5. The botefeux are ficks two or three feet long, and an inch thick, fplit at one end, to hold an end of the match twifted round it, to fire the cannon.
6. The priming-iron is a pointed iron-rod, to clear the touch hole of the pieces of powder or dirt ; and alfo to pierce the cartridge, that it may fooner take Gure.
Vol. VIII. Patt I.
7. The primer, which muft contain a pound of pow. der at leath, to prime the picces.
8. The quoin of mire, which are pieces of wood with a notch on the fide to put the fingers on, to draw thera hack or pull them forward when the gunner points his piece. They are placed on the fule of the carriage.
9. Leaden plates, which are ufed to cover the touchhole, when the piece is charged, left fome cir: hould enter it and ftup it.
$B$ fore charging the piece, it is well ponged, $t$ clean watiton! of it of all firth and dirt withinfide; then the properna"aging Weighe of gunpowder is pat in and ramaned down; care : bem. being taken that the powder be not bruifed in ratamins, which wealens its efiect; it is then run over by a litele quantity of paper, hay, or the like; and latly, the ball is thrown in.

To point, level, or direct the piece, fo as to play againfl any certain point, is done by the help of a qusdrant with a plummet: which quadrant confits of iwo branches made of brafs or trood; one about a foot lung, eight fincs broad, and one line in thicknefs; the ollice four inches lung, and the fame thicknefs and breadth as the former. Between the fe branches is a quadrant, divided into 90 degrees, beginning frum the fhorter branch, and furnihied with thrtad and plummet.

The lonael branch of this inftrument is placed in the cannon's mouth, and elevated or lowered till the thread cuts the deyree neceflary to hit the propofed object. Which done, the cannon is primed, and then fet lire to. The method by the fector, however, propofed by Dr Lind, is certainly in all cafes to be preferred.
A 24 pounder may very well fire 90 or 100 mots every day in fummer, and 60 or 75 in winter. In cafe of neceflity it may fire more; and fume French officers of artillery affure, that they have caufed fuch a piece to fire every day 150 fhots in a fiege.-A 16 and a 12 pounder fire a little more, becaufe they are catier ferved. There have even been fome occafions where 200 hots have been fired from thefe pieces in the fpace of nine hours, and 138 in the face of five. In quick firing, tubes are made ufe of. They are made of tin ; and their diameter is two tenths of an inch, being juft fufficient to enter into the vent of the piece. They are about fix inches long, with a cap above, and cut hanting below, in the form of a pen; the point is flrengthened with fome folder, that it may pierce the cartridge without bending. Through this tube is drawna quickmatch, the cap being fitted with mealed powder moifened with fuirits of wine. To prevent the mealed powder from falling out by carriage, a cap of paper or Hannel fleeped in feirits of wine is tied over it. To range pieces in a battery, care mult be taken to reconnoitre well the ground where it is to be placed, and the avenues to it. The pieces mult be armed each with two lanterns or ladles, a rammer, a fpunge, and two pri-ming-irons. The battery muat alfo be provided with carriagee, and other implements, neceffary to remount the pieces which the enemy fhould chance to difmount.

To ferve expeditiounly and fafely a piece in a battery, it is neceffary to have to each a fack of leather, Ff
large
praticc. large enough to contain about 20 pounds of powder $\xrightarrow{-\infty}$ to charge the lanterns on ladtes, without carrying them to the magazine; and to aroid thertby making thofe twins of powder in bringing back the hatern from the magazime, and the accidents which frequently happen thereby.

A bittery of three picces nuf have 30 galions, becaufe fix are employed on each of the two fides or epaulments, which make 12, and nine for each of the two merlons.

There ought to be two gunners and fix foldiers to cach piece, and an officers of artillery.

The gumer poatd on the righe of the piece munt take care to have alwass a pouch full of powder and two priming irons: his office is to prime the piece, and load it with powder. The gumer on the left fetches the powder from the little marazine, and fills the lantern or lade which his corrade h lds; after which, he takes care that the match be very well lighted, and seady to fet fire to the piece at the firtlemmand of the officer.

There are three foldiers on the right and three on the left of the piece. The two firl take care to ram and Epunge the picce, each on his fide. The rammer and fpunge are placed on the left, and the lantern or lade on the inght. After having rammed well the wad put over the powder and that put over the butlet, they then take each a handfpike, which they paif between the foremoll fpokes of the whed, the ends whercof will pafs under the head of the carriage, to make the wheel turn round, leaning on the cther end of the handfoike, sowards the embrafure.

It is the office of the fecond foldier on the right to provide wad, and to put it into the piect, as well over the powder as aver the bullet; and that of his comtade on the left to provide 50 bullets, and every time the piece is to be charged to fetch one of them and put it into the piece after the powder has been rammed. Then they both take each an handfpike, which they pals under the hind part of the wheel, to pufh it in battery.

The offieer of artillery mult take care to have the piece diligently ferved.

In the night he mult employ the gunners and foldiers, who thall relieve thofe who have ferved 24 hours to repair the embrafures.

If there be no water near the battcry, care mult be taken to have a cafk filled with it, in which to dip the Spunges and cool the pieces every 10 or 12 rounds.

The carriage for a mortar of 12 inches of diameter mult be 6 feet long, the flafks 12 iuches long and 10 thick. The trumions are placed in the middle of the carriage.

The carriage of an 18 inch mortar mull be 4 feet long, and the flafks 11 inches ligh and 6 thick.

To mount the moltars of new invention, they ufe carriages of caft iron.

55
Muchod of
manaynug
macrtars.

In Germany, to mount mortars from 8 to 9 inches, and carry them into the ficld, and execute them horizontally as a piece of cannon, they make ule of a piece of wood 8 feet 2 inches long, with a hole in the middle to lodge the body of the mortar and its trumnions as far as their half diameter, and mounted on two whels four feet high, to which they join a vantrain propor-
tioned to it, and made like thofe which ferve to the carriages of cannons.
Having mounted the mortar on its carriare, the next thing is to caliber the bomb by means of a great calber, the two banches whereof enbrace the whole circumference of the bonsh: thefe two branches are brought on a rule where the differen: calibers are marktd, among which that of the bomb is fonnd

If no defect be found ia the bonb, its cavity is filled, by means of a funnel, with whole gunporder; a little Space or liberty is left, that when a fufee or wooden tube, of the figure of a truscated cone, is driven thro' the aperture (with a wooden malict, not an iron one for fear of accident). and faldond with a cement made of quicklime, aftes, brick-duft, and thel things, worked together in a glutinons watcr, or of four parts of pitch, two of colophory, oac of turpentine, and one of was, the powder may not be brifed. This tube is. filled with a combulible matter nade of two ounces of nitre, one of fulphur, and three or more of gunpowder dult well rammed. See Fuzfa.

This fufee fet on fire buns flowly till it reaches the gunpowder; which goes off at once, burting the fhell io piecer with incredible violence. Special care, howcver, mull be taken that the faree be fo froportioned as that the gunpowder do not take fire ere the hell arrives at the deftined place; to prevent which, the fufee is frequently wound round with a wot clammy thread.

Batteries confilt,-1. Of an epaulnent to fhelter the mortars from the fire of the enemy. 2. Of platforms on. which the mortars are placed. 3. Offmall magazines of powder. 4. Of a boyan, which leads to the great magazine. 5. Of ways which lead from the battery to the magazine of bombs. 6. Of a great ditch before the epaulnent. . Of a berm or retraite,

The platforms for mortars of 12 inches mul have 9 feet in length and 6 in breadth. -The lamoourds for common mortars muft be four inches thick; thofe of a. concave chamber of 8 lb . of powder, 5 inches; thofe of, 12 lb 6 inches; thofe of 181 b .7 inches or thereabouts. Their length is at diferetion, provided there be enoughto make the platforms 9 feet loug. - The forepart of the platform will be fituated at two feet diflance from. the eparlment of the battery. - The bombardiers, to fheler themfelves in theirtatery, and not be feen from. the town befieged, raife an epaulment of 7 feet or more. high, which epaulment has no embrafures.

To ferve expeditiouly a mortar in battery, there are rfquired, - five trong handfpikes; a dame or rammer, of the caliber of the conic chamber, t, ram the wal and the earth; a wooden knife a foot long, to place the earth round the bomb; an iron feraper two feet long, one end whereof mult be four inches broad and roundwife, to clean the bore and the chamber of the mortar, and the other end made in form of a fpoon to clean the little ehamber; a kiod of brazard to carry the bomb, a thovel, and pick-ax.

The officer who is to mind the fervice of the mortarmult have a quadrant to give the degrees of elevation.

Five bombardiers, or others, are employed in that fervice ; the firlt mult take care to feteh the powder tocharge the chamber of the mortar, putting lis primingiron in the turch-hole before he charges the chamber ${ }^{5}$.
lice. and never going to fetch the powder before he has alked his officer at what quantity of pouder he dcfigns to charge, becaufe more or lefs powder is wanted according to the diflance where it is fired ; the fame will take care to ram the wad and earth, which another foldier puts in the chamber.

The foldier on the right will put again two hovelful of earth in the bottom of the bore, which hould be likewife very well rammed down.

This done, the rammer or dame is returned into its place againlt the cpaulment on the right of the mortar: he takes an handfipe in the fame place to polt himfelf behind the carriage of the mortar, in order to help to pull it into battery: having laid down his handfpike, be takes out his priming.iron, and primes the twuchhole with tine powder.

The fecond foldier on the right and left will have by that time brought the bonb ready loaded, which muit be received into the mortar by the frit foldier, and placed very flrait in the bore or chafe of the mortar.

The firt on the right will furnith him with earth to put round the bomb, whieh he mud take care to ram clofe with the knife given him by the fecond on the left.

This done, each hall take a hondfpike, which the two firlt on the right and left thall put under the pegs of retreat of the forepart, and the two bethind under thufe of the hindpart, and they together pufl the mortar in battery.

Afterwards the officer points or dirtets the mortar.
During that time the firlt foldicr takes care to prime the touch-hole of the mortar, without ramming the powder; and the laft on the right mull have the match ready to let fire to the fulee of the bomb on the right, while the firlt is ready with his on the left to fet fire to the touch-hole of the mortar, which he ought not to do till he fees the fufee well tighted.

The foremont foldiers will have their handfpikes ready to raife the mortar upright as foon as it has difcharged, while the hindnots 'n the left fhall with the feraper clean the bore and chamber of the mortar.

The magazine of powder for the fervice of the battery hall be fituated 15 or 30 paces behind, and covered with boards and earth over it.-The loaded bonbs are on the fide of the faid magazine, at five or fix paces diftance.

The officer who commands the fervice of the mortar mult take eare to difoover as much as poffible with the eye the diftance of the phace where he inends to throw his bumb, giving the mortar the degree of clevation according to the judgment he has formed of the diflance. Having thrown the firt bomb, he mult diminifh or increafe the degrees of tevation according to the place upon which it thall fall. Several make ufe of tables to difeover the different dillances according to the differences of the elevations of the mortar, efpecially the degrees of the quadrant from a to +5 : but tiof $\{$, from the principles already laid down, mutt be falliacious.
The petard is the next piece of artillery which deferves our attention; and is a kind of engine of metal, fomewhat in hape of a high-crowned hat, ferving to break down gates, barricades, draw-bridges, or the like works, which are intended to be furprifed. It is very hurt, uarrow at the brecch and wide at the
muzale, made of copper mixed with a little brafs, or of lead wihtin.

The petards are not always of the fame height and bignefa: they are commonly 10 inclues high, 7 inches of diameter a-top, and 10 inches at bottom. They weigh commonly 40,45 , and 50 pounds.
The madrier, on which the petard is plaeed, and where it is tied with iron eireles, is of two fect for its greatelt width, and of 18 inches on the fides, and no thicker than a common madier. Under the madrier are iwo iron bars paffed croflwife, with a hook, which ferves to fix the petard.

To charge a petard 15 inches high, and 6 or 7 inches of ealiber or diameter at the bort, the intide mult be firtt very well cleaned and heated, fo that the land may bear the heat; then take the bell powder that may be foum, throw over it fome fpirit of wine, and expofe it to the fun, or put it in a frying. pan; and when it is well dried, 5 l . or 61 b . of this powder is put into the petard, which reaches within three fingers of the month: the vacancies are filled with tow, and flopped with a wooden tampion; the mouth being Itrongly bound up with eloth tied very tight with ropes: then it is lixed on the madrier, that has a cavity cut in it to receive the mouth of the petard, and faltand cown with ropes.

Some, inticad of gunpowder for the charge, ufe one of the following compolition, viz. gunpowder ieven pounds, mercury fublimate one ounce, camplior eight ounces; or gunpowder fix pounds, mercury fublimate three ounces, and fulphur three; or gunpowder lix, beaten glafs half an ounce, and camphor three quarters.

Before any of theic pieces are appropriated for fervice, it is neceffary to have each undergo a particular trial of its foundnefs, which is called a proof, to be made by or btfore one authorifed for the purpufe, called the provf. mafler.
'To make a proof of the piece, a proper place is chofen, which is to be terminated by a mount of earth very thick to receive the bullets fired againt it, that none of them may run through it. The piece is laid on the ground, fupporice only in the midale by a block of wood. It is fired three times; the lirt with powder of the weight of the bullet, and the two others with: of the weight; after which a litte more powder is put in to finge the piece; and after this, water, which is imprelfod with a fpunge, putting the linger on the touch-hole to difcover if there be any cracks; which done, they are examined with the cat, which is a piece of iron with three grafps, difpoful in the fom of at triangle, and of the caliber of the piece; then it is vifited with a wax-candle, but it is of wery little fervice in the fimall picces, beesufe if they be a little long the fmoke excinguithes it iamediately. Se Plate CCXXIV.

Betides the large pieces already mentioned, invent- of frasid ed for the deftruction of mankind, there are others called arms. fmall guns; viz. mukets of ramparts, common mufkets, fufls, carabines, mulketoons, and piltols.

A muket, or mufquet, is a fire-arm borne on the Moulder, and ufed in war, formenty firel by the applieation of a lighted mateh, but at prefent with a flint and lock. The common mufect is of the caliber of 20 leaden balls to the pound, and receives balls from 2: 10 $2+$ : its length is fixed to 3 fect 8 inches from the mazzle to the touch pan.
pranise

A fubl, or fire-lock, has the fame leagth and caliber, and ferses at prefont indead of a mullet.

A caratinc is a finall fort of fre-arm, flomter than a fufil. and carrying a ball of $2+$ in the pound, bone by the light-horfe, hanging at a belt over the left fhonl. der. This piece is a kind of medium between the piflol and the mullict; and bears a near affinity to the arqueburs, ontly that its bore is fmatler. It was for-
menly made with a match lock, but of late only with a flint-lock.

The mufquetoon is of the fame length of the cara. bine, the barrel polifhed, and clean within. It carries five ounces of iron, or feven and a half of lead, with an equal quantity of powder.

The barrel of a pithol is gencrally 14 inches long.

## $G \quad \mathrm{U} \quad \mathrm{N}$

Gunrowdir

GINPOWDER, a compofition of faltpetre, fulphur, and charcoal, mixed together, and ufually granulated; which cathly takes fire, and, when flocd, rarifies or cxpands with great vehemence, by means of its elatic force.

It is to this powder we owe all the action and effect of guns, ordnance, \&ec. fo that the modern military ant, fortincation, \&c. in a great meafure dopend thercon.

Invention of Genfomber. See Gun.
Method of mathr Gernomnfe. Dr Shaw's receipt for this putpofe is as fothows: Take four onnces of refincd faltpetre, an ounce of brimpone, and lix drams of fmall coal : reduce thice to a fine powder, and continue beating them for fome time in a thone mortar with a wooden pefte, wetting the mixture between whiles with water, fo as to form the whole into an uniform patte, which is reduced to grains, by paffing it through a wire-fieve fit for the purpofe; and in this form being ca:cfully dried, it becomes the common gunpowder.

For greater quantities mills are ulually provided, by means of which more work may be performed in one day than a man can do in a humdred.
'The nitre or faltpetre is relined thus: Difolve four pounds of rougt nitre as it comes to us from the Indies, by boiling it in as mucia water as will commodiently fulfice for that purpofe: then let it thoot for two or three days in a covered veffel of earth, with ficlss haid acrofs for the cryitals to adhere to. Thefe cryflals being taken out, are drained and dried in the upen air.

In order to reduce this falt to powder, they diffolve a large quantity of it in as frall a proportion of water as poffille; then keep it conthantly dtring over the fire till the water exhates and a white dry powder is jeft behind.

In order to purify the brimfione employed, they diffelve it with a very genle heat; then feum and pals it thrutsh a double thainer. If the brimftone fould happen to take fire in the melting, they have an iron cover that fits on clofe to the meling-veflel, and damps the flame. The brimfone is judsed to be fufficiently sffacd if it melts, withont fielding any fetid odour, betreen two hot iron-plates, into a kind of red lubflance.
'The coal for the making of gumpowder is either that of willow or haze, well charred in the ufual manimer, and reduced to powder. And thens the ingredients are prepared for maling this commodity: but as the fe ingredictits require to be intimately mixed, and as there would Le danger "f their firmg if heat in a dry form, the method is to keep them continually moift,

## G U N

either with water, urine, or a folusion of fal ammoniac: they continue thus famping them torgether for 24 hours; after which the mais is fit for corning and drying in the fun, or otherwife, fo as fedulouny to prevent its bring.

Diffront kinds of Guspornmer. The three ingre. dients of gunpowder are mixed in various proportions according as the po:der is intended for mufkets, great guns, or mortars: though thefe propontions frem not to be perfectly adjuited or fettled by competent expe. rience.

Semienowitz, for mortars, directs an hundred pounds of falipetre. twenty-five of falplaur, and as many of charcoal; for great guns, an hundred pound of faltpetre, infteen pouncs of fuiphur, and eigheen pounds of charcoal: for muflects and piltuls, an hundred pounds of faltpetre, eight pounds of fulphur, and ten pounds of charcoal. Miethius extols the proportion of one pound of faltpetre to three ounces of charcoal, and two or two and a quarter of fulphur; than which, he affirms, no gunpowder can pullibly be Aronger. He adds, that the ufual prantice of making the gunpowder weaker for mortars than guns, is without any foundation, and renders the expence needlefsly much greater: for whereas to load a large mortar, twentyfour pound of eommon powder is required, and confequently, to load it ten times, two hundred and forty pound, he hows, by calculation, that the fame cllect would be had by one hundred and fifty pound of the ftrong powder.

On this fubject Mr Thomfon 中obferses, that almoft thit. all thofe who tave writen upon gurpowder, particulatly thofe of the latt century, have given different receipts for its compohtion; and he propofes it as a query, Whether the le differences have not arifen from obferving that fome kinds of powder were better adapted to particular purpoles than others, or from experiments made on purpofe to afcertain the faet? "There is one circumflance (he fays) that would lead us to fuppofe that this was the cafe. 'That kind of powder defigned for montars and great guns was weaker than that intended for fmall arms: for if there is any foundation for thefe conjectures, it is certain, that the weakef powler, or the heavieft in proportion to its clatic force, ought to be ufed to impel the heavief bullets; and particularly in guns that are imperfectly formed, where the vent is large, and the wind gige very great. I am perfectly aware (adds he), that an objection may lure be made, viz. that the elatic fluid generated from gunpowder muit be fuppofed to have the fane properties very nearly, whatever may be the proportion of its feveral ingredients; and that therefore the only difference there can be in powder is, that
one kind may generate more of this huid, and annther lefs; and that when it is generated it acts in the fame manner, and will alike efeape, and with the fame ve. locity, by any paflage it can find. But to this I an. fwer, that though the fluid may be the fame, as it undoubtedly is, and though its denfity and elafticity may be the fame in all cafes at the inflant of its generation ; yet in the explofion, the elaftic and unclattic parts are fo mixed together, that I imagine the faid cannot expand without taking the grofs matter along with it; and the velocity with which the flame ifines at the rent is to be computed from the elatlicity of the fluid, and the denfity or weight of the flaid and grofs matier taken together, and not finphy from the denfity and clalicity of the flaid."

To increafe the ftrength of gowder, Dr Shaw thinks it proper to make the grains confderably large, and to have it well ifted from the fmall duft. We fee that gmapowder, reduced to dut, has little explofive force; but when the grains are large, the flane of one grain has a ready parfage to another, fo that the whole parcel may thus take fire nearly at the fane time, wherwife much force may be loit, or nany of the grains go away as flot untired.

In the 7 tit volume of tie Phil. Tranf. Mir Thomfon gives an account of feveral attempts to augment the force of gunfouder by the addition of different ingredients. The power of tleam has by many been overrated to fuch a degree, as to be fuppofed capabie of anfwering the purpotes of gunporter; but no attempts to accomplifh this have ever fucceeded in any degree. Mr Thomfon attempted to combine the forces of fteam and gunpowder together in the following manner. Having procured a number of air bladders of very fmall fifhes, he put different quantities of water into them from the fize of a fmall pea to that of a piftol bullet, and tying them up with lome very fine thread, hang them up to dry on the outfide. He then provided a number of cartridges mace of fine paper, and filled them with a quantity of gunpowder equal to the ufual charge for a common horleman's pittol. He then loaded the pillol with a bullet, fired it againa an oaken plank about fix feet from the muzzle, and obferved the recoil and penetration of the bultet. He next eried the effect of one of thefe frath bladucrs of water when put among the gunpowder, but always found the force of the powder very much diminimed, and the latger the quantity of water the greater was the diminution; the report of the explofion was alion diminifhed in a flill greater proportion than the force of the bullet or recoil. It being fuppofed that the bladder had burlt, and thus by wetting the gumpowler prevented it from taking fire, the experiment was repeated with highly rectified fpirit of wine, but the diminution of the force was very little inferior to what it had been with water. Etherial oil of turpentine and fmall quantities of quickfilver were alfo tried, but with no better fuccefs than before. Thinking, however, that the failure of the quickfilver inight be owing to its having been too much in a body, the experiment was repeated with the metal difperfed in fmall particles through the powder. To accomplif this difpertion the more completely, 20 grains of Ethiops mineral were mixed very intimately with 145 grains of powder: but fitll the force of the bullet was much kefs than if
the powder nad becn wfed without any aldition. As ren fow. the explofon of pulvis fulminans appears vatly finerior to that of gunpowder, fome falt of tartar, in its pureft tlate, was mixed in the proporsion of 20 graius to 14 ; of powder; but on bring the piecc, it was ftill found that the force of the cxplufion was lenined. Sal ammoriac was next tricd; which, under cer:ann circurnftances, is found to produce a great quantity of air er claftic vapour; but on mixing 20 grains of it with it5 of gunpowder, the force of the explufion was tlill found to be ciminimed. As mott of the me. tila, when diffulved in acids, particularly brafs in fpirit of nitre, are found to prosuce much claflic vapour, it was thought worth while to try whether the foree wit powder could tee augmented by this means. Twenty grains of brafs dult were therefore mised with 145 grains of powder; but Itill the force of the explofion was not augmented. In our author's opinion, howceer, neither brafs du? nor Eshiops mineral diminilit the force of the explation otherwife than by fitimes up the intertices between the grains, obitructing the pa?fage of the dame, and thus impeding the preyref; of the inflamination. Thus it appears, that little hope renains of augmenting the force of gunpowder by any addinion either of liquid or inlammable folids: the reafon is obvious; viz. becaufe all of then, the liquids efpecially, abionb great quantities of heat before they can be conversed into vapour; and this vapour, after it is furred, raquires more heat to make it expard more forcibly than air: hence, as the cffects of gunpowder decend critely upon the emiflion of a quantity of air, ard its rarefaction by wehement leat, the power mutt be greatly diminithed by the abforption of this heat, which ought to be fgent in rarefying the air. Even folid bodies cannot be fet on fire withont a previous abforption of heat to convert them into vapour* ; but liquids have this property flill more than' Sec Fton:s folids, as is explained unzer the articles Chemistry, Eraporation, isc. and mult therefore diminith the explofive furce ltiil more. Lime added to runpowder, however, is faid to augment the power of the explo. fion by one third.

In lis experiments on gunpowder, Mr Thomfon had the curiofity to compare the frength of aurum fulminais, when inclofed in a gun-barrel, with that of common gunpowder; but his experiment only veritied what has been found by others, viz. that this powder, which in the open air makes fuch a very violent report, has in cloie veffels fearce any power, comparatiwely Speaking, cither of explofion or projecting a bullet. Mr Thomfon, however, taking it for granced that the power of aurum fulminans would be found much greater than that of gunpowder, took care to have a bariel of uncommon ftrength plepared for the experiment. The weight of it was 7lb. 5 Dz ; the length 13.25 inches, and the width of the bore 0.55 inches. 'This barrel, being charged with 27.44 graius of aurum fulnsinans and two leaden bullets, which, together with the leather put about them to make them fit the bore without windage, weighed 427 grains: it was laid upon a chaffing-difh of live coals at the diRance of about ten feet from the pendulum, and the piece was dirested againf the centre of the pendulum. Some minutes elapfed before the powder exploded; but when it did fo, the explofion
did not macis eaceed the report of a well charged air. gun; and it was not until he faw the pendulum in motion, that Mr Thomfon could be perfund ad that the bullets had been difcharged. On examination, lowever, it was found that nothing had been left in the barri, and that the powder had probahly been all exploded, as a great many particles of the revived metal were thronn aloout. From a calculation of the motion communicated to the pendutam, it was found that the velocity of the bullets had been about +2 feet in a fucond; whence it appears that the power of au. rum fulminans, compared with that of gunpowder, is only as + to 13 very neariy.

Methoul of Trying cand Examining Guspomprr. There are two general methods of examining gunpowder; one with regard to its purity, the other with regard to its flengh. Its purity is known by laying two or three little heaps aear each other upon white paper, and tiring one of them. For if this takes fire readily, and the fmoke rifes upright, wihout leaving any drofs or foculunt matter behind, and without burning the paper, or firing the other heape, it is elteemed a fign that the falphur and nitre were woll purifed, that the coal was good, and that the three ingredients were thoronghly inconpurated together: but if the other heaps allo take thre at the fame time, it is prefumed, that either common fult was mixed with the nitre, or that the coal was not well gromid, or the whole mafs not well beat and mised together; and if either the nitre or fulphur tee not well puribied, the paper will be black or lpotted.

Several inftruments have been invented to try the Arength of gumpowder; but they have gerierally been complained of as inaccurate. Mr Thomfon, in the 7 Ift volume of the Philofophical Tranfactions, gives an account of an exact method of proving the Atrength of it. "As the force of powder (fays he) ariles from the action of an elallic fluid that is generated from it in its inflammation, the quicker the charge takes fire, the more of this fluid will be gemerated in any given fhort fpace of time, and the greater of courfe will its ffied be upon the bullet. But in the common method of proving gunpowder, the weight by which the powder is confined is fo great in proportion to the quantity of the charge, that there is time quite fufifient for the charge to be all inflamed, even when the powder is of the flowelt compofition, before the body to be put in motion can be fenfibly temoved from its place. The experiment therefore may thow which of the two kinds of powder is the ftrongell, when equal quantities of both are confined in equal fpaces, and both complutely intlamed; but the degree of the inflammability, which is a property difutial to the goodnefs of the powder, cannot by thefe means be afertained. Hence it appears how powder may anfwer to the proof, fuch as is eommonly required, and may neverthelefs turn ont very indiflerent when it comes to be ufed in fervice. But though the common powder-triers may how powder to be better than it really is, they can never make it appear to be worfe than it is; it will therefore always be the interet of thofe who manufacture the commodity to adhere to the old method of proof, but the purchafer will find his account in having it examined in a method by which its goodnefs may be afcertained with greater praccifion."

In order to determine the goodnefs of powder by Mr 'Thomifon's method, it is neceffary to have a barrel fufpended by two iron rode in fucin a maner that it can catily move backward or furward by the vibra. tion of the rods; and the fyace it moves through afo centained by marking it on a piece of ribbon. The barrel being then charged with powder, and fitted with a proper bullet, is to be fired, and the recoil marked upon the ribbon. The experiment is to be repeated three or four times, or oftener if there is any difference in the recoil; the extremes of which may be marked with black lines on the ribbon, and the word froof writen upon the midule line betwixt the two. Bus if the experiments are made with fufficient accuracy, there will eommonly be very little difference in the length to which the ribbon is drawn out. Thus the comparative gondnels of powder may eafly be aftertained: for the flronger the powder is, the greater will be the recuil, and conitquently the greater length to which the ribbon will be drawn out; and if care is taken in proportioning the charge to the weight of the ballet, to come as near as pofible to the needium proportion that obtai:s in practice, the determiation of the goodncfs of gunpowder from the refult of this experiment canot fa: to hold good in actual lervice. The bullets thould be made to fit the bore with very little windage; and it would be better if they were all calt in one monld and in the fane parcel of lead; as in that cate ther weights and dimenfions would be more accurately the fame; and the experiments would of courfe be more conclufive. The itated charge of powder might be half an ounce, and it thould always be put up in a cartrilge; and after the piece is loaded, it thould be primed with other powder, firlt taking eare to prick the cartilige by thruting a priming wire down the vent.

From feveral experiments it appears, that the effect of the charge is confiderably angmented or diminified, aecording to the greater or lefs force employed in ramming it down. To prevelut this inconvenience, Mr Thomfon advifes the ufe of a cs lindric ramrod of wood, fitted with a metal ring about an inch or an inch and an haif in diameter ; which being placed at a proper diflance from the end which goes up into the bore, will prevent the powder from being too much eompreffed. In making experiments of this kind, however, it is neceflary to pay attention to the heat of the barrel as well as to the temperature of the atmofphere; for heat and cold, dyynefs and moitture, have a very fen. fible effect upon gunpowder to augment or diminih its foree. When a very great degree of accuacy therefore happens to be reguifite, it will be proper to begin by firing the piece two or thrce times, merely to warm it; after which three or four experiments may be made with llandard powder, to determine the proof: mark a fecond time, for the ftrength of powder is different at different times, in confequence of the flate of the atmofphere. After this the sxperiments may be made with the powder that is to be proved, taking eare to preferve the fance interval of time between the difeharges, that the leeat of the picee may be the fane in each trial.

Having thus determined the comparative degrees of ftrength cf two dificent kinds of powder, their comparative value may be afcertained by angmenting the quantity of the weaker powder till the velocity of the

## G U N [ 239 ] G U N

ow. bullets in both cafes becomes the fame. The quantity of poweer as well as before it, they would in GunpmwAtrong powder is therefore precifely as much more valuable than the weak, as it produces the fame effect with a fmaller quantity. Thus if a yuarter of an ounce of one kind of powder difelarges a bullet with the fame velocity that half an ounce of another kind does, it is plain that the former is twice as valuable as the latter, and ought to be fold at double the priseHy comparifons of this kind, Mr Thomfon found that the beft battle powder (fo called from its being made at the village of Batte in Kent) is ftronger than goverment powder, in the proportion of 4 to 3 ; but from a comparifon of the prices, it appears that the former is no lefs than $+\frac{2}{3}$ fercent. dearer than it ought to be; and confecuently, that whecer ufes it in preference to government powder, does it at a certain lofs of $\mathrm{i}^{2}$ fer cent. of the muney it conts him.

There las been much talk of a white poweder, which, if it arfwered the character given it, might be a dangerous compolition; for they pretend that this white powder will throw a ball as far as the blick, yet without making a repott : but none of the white powder we have fien, fays Dr Shaw, anfwers to this character: being, as we apprehend, comnonly made either with touchwool or camphor, inftend of coal.

Under the article Gussers, the pliyfieal calufe of the explofion of powder, and the furce wherewith it expancs, have been fo fully confidered, that it would be fuperfluous to add any thing here eoncerning them. Only we may obferve, that thourh it is commonly made ufe of for military purpofes only in fmall quantities, and confined in cettain veffis; yet when large quantities are fired at once, even when unconfined in the open air, it is capable of producing terrible defluction. The accounts of damage done by the blowing up of magazines, powder-mills, \&e. are too numeions and well.known to be here taken notice of. The following is a relation of what even a moderate quantity of powder will accomplifh, when fired in the open air. "The king of Mavarre took Monfegur. Captain Milon inelofed 500 pounds of powder in a bag, which tre found mans to introduce, by a drain from the town, into the ditch between two principal gates; the end of the leader was hid in the grafs Every thing being ready to play off this machine, the king gave us leave to go and fee its effects; which were furpriling. For one of the gates was thrown into the middle of the town, and the other into the field fifty paces from the vall: all the vaults were deftroyed, and a paffage was made in the wall for three men to cnter abreafl, by which the town was taken.'-For further accounts of the force of large quantities of powder, fee the article Mines.

From this and other accounts of the dreadful effects of gunpowder, when fired in large quantity in the open air, it wonld feem, that great as its power is in clufe veffels, it is flill greater when the air has accefs to it ; for from the quantity of powder requifite to charge great guns, it is by no means probable that double the quantity of powder confued in firearms of any fize or capacity, and difcharged all at once againlt the walls, would have produced fuch effects; cfpecially when we confider that the power mult have treen equally great at an equal diflance all round; fo that had there been other walls and gates behind this ct.
all probability have been thrown doxin allo. This con. jecture feems to be fomewhat confirmed by the great diminution of the force of pulvis fulminans and aurum fulminans when confined in clofe veftels. Mr Tlomfon mentions likewife a very liagular fact relative to gunpowder, writich ferms to be fomewhat analoguns to that jult mentioned; and which indeed feems to explain it; namely, thai the heat communicated bygme powder when flightly confined, is much greater than when otherwife. "I was much furprifed (fays he), upon taking lold of the barrel immediately after an experiment when it was fired with 330 grains of powder without any bullet, to find it fo very hot that I could fearee bear it in my hand, evidently much hot. ter than I had ever found it before, notwithltanding the fame charce of powder had been mate ufe of in the two preceding experiments; and in both thefe experiments the piece was loaded with a bullet, which one would naturally inagine, by contining the flame, and prolonging the time of its action, would heat the barrel nach more than when it was fired with powder alone. I was consinced that I could not be miftaken in the fact; for it had been my contlant prac= tice to take liold of the piece to wipe it out as fuon as an experiment was finithed, and I never before lad found any inconvenience from the leat in bolding it. But in order to put the matter beyond all doubt, after letting the barrel cool down to the proper temperature, I repeated the experiment wice with the fame charge of powder and a bullet ; and in both thefe trials the heat of the piece was evidently much lefs than what it was in the experiment above mentioned. Being much ftruck with this accidental difcovery of the great degree of heat that pieces acquire when they are bired with powder withont any bullet, and being defirous of finding out whether it is a circumftance that obtains univerfally, I was very attentive to the heat of the barrel after each of the fucceeding experiments; and I confantly found the heat fenfibly greater when the piece was fircd with powder only, than when the fame charge was made to impel one or more bullets."

To account for this, our euthor firppotes, that very litsle of the heat aequired in firing a piece of ordnance comes from the powder; for the tine that it continuss in the piece, perhaps not exceeding the 20cth part of a fecond, is fo fnall, that were the thame four hundred times, inftead of four times, as Mr Robins fuppofes, hotter than red hot iron, it is by far too thort to communicate a fenfible degree of licat to one of out large pieces of cannon. Befides, if the heat of the fame was fufficien: to communicate fuch a degree of heat to the gun, it muf undoubtedly be capable of burning up all combullible -bodies that come in its way", and of melting lead thot when fuch were ufed; but infead of this, we fiequently lece the fireft paper dilcharged from the month of a gun without being inflamed, after it lias futlainad the action of the fire through the whole length of the bore; and the fimalleft lead-shot is difelarged willout being melted. The objection drawn from the heat of bullets taken up immediatel; aftertheing difcharged from fire-arms dues not hold; for bullets difcharged from air-guns and even crofs-bow: are likewite found hot, cfecially when they happenta. Atribe
 der. very foft budy, it will oot be fenfibly heated; but if it
lats a plate of iron or any other body which it cannot penctrate, it will be broken in picces by the blow, and the dipered parts will be found in a tate litele thort of : otual fultion. Honce our author concludes, that bullets are wot leated by the Alame, but by percuffor. Another objection is, that the vents of brafs guna are frequenty enlarged to fuch a degree by repeatedly finge them, that the piece becomes ufelefs. But this proves only that brafs is eafly carroded by the fanse of gunpowder; which indued is the cale with iron allo. Vie camot fuppofe that in either cafe any real folution takes phes; on the contrary, it is very cvident that it does not: for when the vents of fire-arms are laned with gold, they will remain withnut enlargement for any length of time, thourh it is w: 11 knewn that gold is much more eafily melted than iron. As the heat communicated to bullets, thucfore, is not to be alcribed to the flame but to percufion, fo the heat acquired by guns is to be attributed, in our author's opinion, to the motion and friction of the internal parts of the metal among themfelves by the violent action of the flame upon the indide of the bore. To generate beat, the ation of the powder muft be not only fufficient to Arain the metal, and produce a motion in its paris, but this effect moft be extremely sapid; and the offect will be much augmented if the exertion of the force and the duration of its action are momentancous: for in that cale the fibres of the metal that are violenily frctehed will return with their full foree and velocity, and the fwift vibratory motion and attrition above mentioned will be produced. Now the effort of any gisen charge of powder upon the gan is very nearly the fame whether it be fired with a bullet or without; but the velacity with which the generated thatic fluid makes its elcape, is moch greater when the powder is fired alone than when it is made to impel one or more bullets; the heat ought therefore to be much greater in the former than in the latter cate, as has been found by esperiment. " but to make this matter litll plainer, (Gays our authos), we will fuppose any given quantity of powder to be contined in a fpace that is jutl capable of containing it, and that in this fituation it is fit on firc. Let us huppofe this face to be the chamber of a piece of ordnance, and that a bullet or any other folid body is fo firmly fixed in the bore, immediately upon the charge, that the whole cffort of the powder thall not be able to remove it; as the powder goes on to be inflamed, and the elallic fluid to be generated, the preflure upon the iufide of the chamber will be increafed, till at length all the powder being burnt, the frain upon the metal will be at its greateit height, and in this fituation things will remain; the colsefon or claficioy of the particles of metal countebalancing the preffure of the Hoid. - Under thefe eireumanaces very litte heat wonld be generated ; for the continued effort of the ehattic fluid would approach to the nature of the preture of a weight; and that concuftion, vibrafion, and friction among the particles of the metal, which in the collition of elaltic bodies is the cau of the heat produced, would fearecly take effece. Dut inttead of being firmly fixed in its place, let the bullet $\mathrm{N}^{\circ} \mathrm{I}_{4} 6$.
now be moveable, but let it give way with great diff. calty, and by flow degrees. In this cafe the elaftic Cunge fluid will be generated as before, and will exert its whole foree upos the chamber of the piece; but as the bullet gives way to the preffure, and moves on in the bure, the fluid will expand itfelf and grow weaker, and the particles of the metal will gradually return to their former Lituations; but the velocity with which the metal reftores itfelf being bui fmall, the vibration that remains in the netal after the elaftic fluid has made its efcape will be very languid, as will the heat be which is generated by ii. But if, inftead of giving way with fo much diffically, the bullet is inade lighter, fo as to aflood but little refittance to the elattic fluid in making is cfcape, or if it is fited without any bullet at all; then, there being little or nothing to oppore the paf. fage of the tlame through the bore, it will expand itlelf with an amazing velocity, and its action upon the gun will ceafe almolt in an intant; the ftrained metal will rettore itelf with a very rapid motion, and a harp vibration will cufue, by which the piece will be nuch heated."

This reafoning of Mr Thomfon's, however, feems not to be very well founded. In the firlt place, we are by no means certain that heat is produced by the motion or vibration of the particles of a folid body among cachother. On the contrary, even in the botteft bedics we cannot be made feafble of vibration exif. ing among their particles, while certain founds will caufe the moft folid fublances vibrate perceptibly, and yet whout producing any heat. - From this as well as innumerable other expeliments, it is probable, that heat conliths in the emifion of a certain fubtile fluid from the heated body, which is every monent replaced from the atmof hate, or foom lome other fource. Heace the more air that has aceefs to any burning body, the hotter it will become, and the more will any other that is in its vicmity be heated. ' T his is evident from the contrisance of Argand's lamp, which is neither more nor lefs than the admifion of a larger quantity of air to the fame quantity of flame. The cafe is the fame with the firing of gunpowder, when a bullet is put into the pisce, the accefs of the air is much more ef. fectually presented than when only a limple wadding is made ufe of. In confequence of this, no fooner is the powder lired without a bullet, than the external air rulhes down the bore, mingles with the flame, and vchemently augments the heat, as well as the abfolute force of the explotion. It is true, that without the external air, the nitre in the gumpowder itfelf produces as much air as to inflame it very violently; but this does not prove that it could not be inflamed ftill more by the admitaon of more air. Befides, when the external air is thus admitted, the flame itfelf is agitated by its admifion, and driven againt the fodes of the piece with a fores fuperior to what it has by the mere expanfive preflure; whence the heat mult allo be confiderably augmented, in the fame manner that the heat of any other body will be by the having flame blown againd it, intlead of being blown away from it, or fuffered to burn quictly by its hise. Thus, withont any recourfe to an uaknown and conjeftural vibration among the particles of a folid metal, we may account for the augmented heat of a piece charged only with powder, and likewife in fome meafuse for the prodi-

## G U N

gious force of gunfowder, aurum fulminane, and pulvis fulm rans, when fired in the cpen air, compared with what they have when exploded in clofe veffls. The torce of gunpowicr is manifefly augmented in clofe veffels, as has been already faid, by being rammed down or comprefled together: but this arifes from another caufe, manely, that a greater quantity of name is comprefled into the fame Iipace than when the powder is not rammed; and this compreffion of the Hlame is in proportion to the compreffion of the powder in the chamber of the piece. But in this cafe the flame is probably lefs powerful than in the former, though the quantity inclofed in a fmall fpace may probably make up for the quality. Mr Thomfon's expcriments on the increaied force of gunpowder by compreffion are as follow:-Having put a charge of 218 grains of powder, inclofed in a cartridge of very fine paper, gently into the bore of the piece, the velocity of the bullets, at a mean of four experiments, was at the rate of 1225 feet in a fecond; but in a medium of three experiments, when the fame guantity of powder was rammed down by fre or fix ftrokes of the ramrod, the velocity was 1329 feet in a fecond. "Now (fays he) the total force or preflure exerted by the charge upon the bullet, is as the fquare of its velccity; and $\overline{132}$ : is to $\overline{1225^{2}}$ as $1,5,7$ is to 1 ; or reanly as 6 is to 5 : and in that proportion was the force of the given charge of powder inereafd by bein. rammed. - When, infead of ramming the powder, or prefing it gently together in the bore, it is put into a fpacc larger than it is capable of fillirg, the force of the charge is thereby very fenfifly leffened, as Mr Robins and others bare found by lefcated trials. In my 30 th cxperiment, the charge, confiling of to more than th, grairs of powder, was made to occupy 3.2 inches of the bore, intead of t .45 inchcs, which frace it jult filcd. When it was genty pufted into its ylace with. out being rammed, the conflquence was, that the velncity of the bullct, intead of being rioo feet or up. wards in a fecond, was only at the rate of 914 feet, and the recoil was lefiened in propntion.- Hence we may daw this praktical inference, that the powder with which a picee of ordnance or a firearm is charg $0^{\circ}$, ouglit always to be preffed together in the bore ; atd if is is rammed to a certain degree, the velocity of the bulke will be till farther increafed. It is well known that the recoil of a nufket is greater when its charge is rammod than when it is not; and there cannot be a Atronger proof that rainming increafes the force of powtct:"

To recorer domeged Gumionsis. The mantind of the powder-mectliants is, to put part of the powder on a fail cloth, to which they add an cqual weight of what is really good; ard with a froord mingle it well ingether, try it in the fun, and barrel it up, kecping it in a diy and proper fiace. Others again, if it be vcry bad, rellore it by moilening it with vinegar, water, urine, or braidy : then they beat it finc, featce it, and to every pound of powder ade an ource, an ounce and a half, or two ounces, ncencing as it is decayed, of melted falt-petre. Afterwaids, thefe in gredients are to be moiltened and mised well, fo that nothing can be difcerned in the compofiticn, which may be krown by cutting the mafs; and then they granulate it as aforefaid. In cafe the powder be in

Vot: VIII. Part I.
a manner quitc fpoiled, the only way is to extract the faltpetre with water according to the wfual manner, by boiling, filtrating, evaporating, and eryfallizing; and then with frefh fulphur and charcoal to make it up anew again.

In regard tu the medical virtues of gunpowder, Bocrhave informs us, that the flame of it affords a very licalthy fume in the hoight of the plague, becaule the explofive acid vapour of nitue ard fulphur corrects the air ; and that the fame vapour, if received in a fmall clofe pent-up place, kills infects.

It is enacted by 5 and 11 of Geo. I. and 5 Geo. II. c. 20. that gunpowder be carried to any place in a covered carriage; the barrels being clofe-jointed; or in cafts and bags of leather, \&c. And perfons keeping more than 200 pounds weight of gunpowder at one time, within the cities of London and Weftminther, or the fuburbs, ace. are liable to forfeitures if it be not remowed; and juftiens of peace may iflue warrants to fearcla for, feize, and remove the fame.

Gen-Sbor Wounls. See Surgery.
Ge's-Snith, a maker of fmall fire-arms, as mulkete, fouling-pieces, puitols, \&c.

Gun-Smithery, the bulinds of a gun-fmith, or the art of making fire-arms of the fmaller fort, as mulkets, fowling-pieces, piftols, \&c.

The principal part of thefe inftrments is the barrel, which ought to have the following properties. 1. Jighnefs, that it may incommode the perfon who carrics it as little as poffhle. 2. Suflicient Arength and other properties requilite to prevent its burfling by a difcharge. 3. It onght to be confruesed in fuch a manner as met to recoil with violence. And, $f$. It ought to be of fuficient length to carry the fhot to as great a diltance as the fores of the powder smployed is capable of doing.

The manufacture of fice arms is now carried to fuch a degree of perfection by oifterat leurpean nations, that it may perhaps be jutly doubsed whether any farther improvement in the repuitites juf mentioned can be made. For the materials, the fofteft iron that can be procurcd is to be :ade'e uic of. The beft in this country are formed of flats, as they are called, or old horfe-thoe nails; which atre procured by the gunfmiths from fariers, and from poor people who fubbit by picking them up on the great loads leading to London. Thefe are fold at about los. per ent. and 28 pounds are reyuifite to form a Incte mufiet barrel. The method of manufacuring them from this material is as folluws: A lroop of about an iricis broad, and fix ot Ceven inches diameter, is placed in a perpendicular fituatinn, and the llubs, previnnly wall cleaned, piled up in it with their brads outemnof on cach fide, till the lionp is quite filled and wedged tight with them. The whole then refembles a roust circular cake of iron; which being heated to a white heat, and then frongly hammercd, coalefees into one folid lump. 'Ihe boop is now removed, and the beatings and ham. merings repeated till the iron is rendered very tough and clofe in the grain; whon it is drawn ous into pieces of about $2 t$ inches in length, half an inch or more in breadch, and half an inch in thicknefs.

Four of thele pleces are entployed for one barrel: bue in the ordinary way a fingle bar of the belt foff iron is employed. The workmen begin with hammering out this into the form of a flat ruler, having its
length

GunSmithery.

## G U N

A1刀. Sitriethes.
lergth and breadth proportioned to the dimentions of the intenced barrel. By repeated heating and hammering this plate is turned somed a tempered iron rod called a mancrit, the dianeter of which is confederably fmaller than the intended bore of the barrel. One of the ederes of the plate beine luid over the other about half an inch, the whole is heated and welded by two or three inches at a time, hammering it hrikly, but with moderate ftrokes, upon an anvil which has a number of femicircalar furrows in it, adapted to barrels of difices nt liess. Every time the barrel is withurawn from the fie, the workmandrikes it genely agand the ansil once or iwice in an torizontal dircetion. By thes noerdion the partiales of the metal are more perfecaly conotidated, and every appearance of a feam in the bar"cl is obliterated. 'The mandil being then again inturnued into the cavity of the bartel, the latree is very fromgly lammered upon it in one of the femiciroub holltis co the anvil, by fatall portions at a itme ; the Anatinge and lammerings being repeated anti the whate barel has undergrone the operation, and its farts remdered as perfecty continnous as if they had been formed out of a folid piece. To effect this co- pletely, three welding heats are neceffary when the ven $\%$ belt iron is made ufe of, and a greater number for the coarfor kiads. The Fronch workmen imagine, that by givisg the barrel, whike in the fire, fight horizontal Erokes with the hammer, fo as to communicate a vibratory morion to the iron, thofe paticles are thrown off which are in a flate of fufion and cannot eafly be convertecl into malleable iron: but confodering the great number of operations already deferibed which the metal has undergone, we can fatce fuppofe this to be of mach confoquence.

The next uperation in forming the barrels is the horing of them, which is done in the following manner: ' $\Gamma$ wo beams of oak, each about dix inches in diameter, and tix or feven fect long, ane placed horizon1 ally and parallel to one another: laving each of their extromitics mortifed upon a flrong upright piece about three fect high, and firmly fixed. $A$ fpace of three or four inches is lefi between the lorizontal pieces, in which a pricce of wond is made to flide by having at citber erd a tenon let iato a groove ulachans on the irfide of each feam throughout its whole length. Through this fliding picce a flrong pin or bolt of iron is driven or forewed in a perpendicular direction, ha--ing at is lapper end a round hole large enourtin to ad. mit the breach of the barrel, which is fecured in it by means of a picce of iron that ferves as a wedge, and a $\because$ trical ferell paffing through the upper fart of the hole. A chain is fatlened to a taple in one fode of the Hiding piece which runs between the two horizontal heams; and pafing over a pully at one end of the machinc, has a weight hooked on to it. Bn upright piece of timber is fised above this pully and hotween the ends of the beams, having its upper end perforated by the axis of an iron crank furnibhed with a fquare focket; 2l.e other axis being fupported by the wall, or by a ilrong poft, and loaded with a heavy wleed of calt iron so give is fonce. The ases of this cranta are in a line s.j:h the hole in the bolt already mentioned. - The ?nrer being then fixed into the focket of the crank, Shas its otlier end, previonlly well oiled, introluced into tho bars! w wore Lrocela part is made fort in the lule
of the bot : the chain is then carried over the pully, and the weight hooked on; the crank being then turned with the hand, the barrel advances as the borer cuts its way, till is has paffed through the whole length. The boring bit confte of an ion rod formewhat longer than the bsrrel, one end of which fits the focket of the crank; the other is adapted to a cylinirical piece of tempered Alet aboui an inch and a half in length, hat ving its furface cut after the manner of a perpetual forew, with five or fix threads, the obliqnity of which is very fmall. The breadta of the furrows is the fame with that of the threals, an their depth fusivient 10 let the metal cut by the threals pafithrounh them eafily. Thus the bit gets a veryftrong hold of the metal ; and the threads, being harp at the edyes, fooop out and remove all the inequalities and roughnefs from the infide of the barrel, and render the eavity finooth and equal thronghout. A number of bits, each a little larger than the former, are alterwards fucce fively pafted through the barrel in the fame way, until the bore has acquired the magnitude intended. Ly this operation the bared is very much hated, efpecially the frift time the borer is paffed through it, by whach means it is apt to warp. 'Io prevent this in fone meafuc, the barrel is curercel with a cloth kepe conftantly wetted, which unt only preforves the barel from an excefs of heat, bat likewife preferves the temper of the bit from beiag geltoysed. The bore itfedf mat allo be withcrawn from tine to tine ; both to clean it from the thavings of the metal and to oil it, or repair any damages it may have fumainel. Every time a fre!h bit has been paned though the bartel, thas later moit be carcfaity examened, to foe it it las wapod; and 1 kewife if there are any fpots, by the work men called llads, on its infide. When warped, it mutt be tlataghtened on the anvil: for which a few aight firokes on the convex farts will be fulficient; and this is termed fiting up the barrel. When black foots are perceived, the correfpoading part on the outfode nut be marked, and driven in by gentie Rrohes with the hammer, when they will he complet.ly remond by pating the borer another time through the piece.

The equality of the bore is of the utmont confequence to the perfection of a barrel; infomuc! that the greatell pomble acuracy in every cther refpect will not make amends for any dedecency in this refect. The method ufed by gunfmiths ro afeertain this is by a cyindrical phur of tempered Aleel highty polithed, arous an iach in length, and listing the bore exatly. This is frewed topon the end of an iron rod, and introduced into the casity of the barrel, where it is mo. ved backwards and forwards: and the places where it paffes with difficulty being marked, the boring bit is repeatedly paifed until it moves with cqual eafe throurg evers part. Any perfon who withes to know the merit of his piece in this refpeet, may do it with tolerable acceracy by means of a pleng of lead caft on a rod of iron; or cuen by a mafket ball filed exactly to the bore, and puthed through the barrel by a ramrod; taking care, however, not to ufe much force left the ball be fattened, and its paflage thus rendered dillicult.

The dult flep towards the perfccion of the infide of the barrel is termed finc-boring; by which is meant the fmorthing it in fuch a marner as to remove all marks and inequaties left by the boras. 'lhe fine borer re-

## G U N

fembles the other in its general confru\&ion; but intead of the picce of teel cut in forin of a fcrew which belongs to that, it is furnifled with a fquarc broach 10 or 12 inches long, highly polifhed, and very fharp, by which means it cuts the netal very froothly. It is found to anfiver the purpofe beft when only two of its edges are alloswed to work; the other two are covered with fips of oiled paper, one or more additional flips being put on each time that the intrument is paff. ed through the barrel. The line borer is frequently paffed tirough, from the muzzle to the breech, and from the breech to the muzzle, until the whole intide prefents a perfectly equal and polifhed furface ; the barrel being Lekewife examined and fut up, if requilitc, after cach time. It is abfollutel) nccellary that this inAttument thould be perfectly true, and not in the lcalt caft or waiped in the tempering.

Befices the operations above deferibed, another, called pelijbing, is ufually performed on gun-barcels, though it is doubtful whether this lalt be atteaded with any good effect or not. It is perforned by a cyliuder of lead, five or fix inches long, call upon a road of iron, and filed exactly to the bore. The lead beeing then covered with very fine emery and oil, is wrought backwards and forwards through the whole tength of the barrel until the infide has acquired the requifite degree of polith. The difadvantages of this operation are, that it is fcasce pofible to perform it without prefling more upon one part than ano:her, and thus producing forie degree of inequality on the infide, which is of the very worfl confequence to lire-arms. The polith thus given is likewife very perimable; fo that the fine-boring amay jufily be confiditred as the l.hat operation neceffry for the inlide of a barrel; and it is then proper to give the external form and proportions by means of a Ele. For this purpofe, four faces are fult formed upoa it, then eiglit, then 16; and fo on till it be quite round, excep:ing the part next the breech, called the rinfforced ${ }^{\text {gret, wh }}$ which is always left of an octagonal form. It bcing abfolutely necelfary that the bareel fhould be equally thick on every fide, gunfraiths cmploy, for accomplining this purpore, a particular tool named a carparfs. This contilits of an ion rod bent in fuch a manner as to form t.\% parallel branclics about an inch dilant from one another. One of thefe branclics is intrnduced into the barrel, and kept clofely applied to the fide, by means of one or more fprings with which It is furninhed: the other defcculds parallal to this on the outfide, and lias feccral fcrews paffing through it with their points dircced to the barrel. By ferewing thefe until their points tonch the furface of the barrel, and then turning the infrument round within the bote, we perceive whecre the metal is too thick, and how much it mut be reduced, in order to render every part perfcetly uqual throughout its circumference. It may be made long enough to reach the whole length of the barrel, though it will be more convenient to lave it only half as much, and to introduce it firtt at one end and then at the otler. Infead of rounding the barrel by means of a file and compafs, however, fome people do fo by turning it in a lathe; which is no doubt more expeditions, though neither fo certain nor exact. A fpindle as long as a gun-barrel cannot, without great dificiculty, be prevented from fpringing confiderably under the tool eniployed to reduce or fmooth it in turn-
$2431 \quad \mathrm{G} \quad \mathrm{U}$ N
ing; whence it is found, that by this operation batreis oun are more frecuently warped than by all the borings suders. they undergo; and there is no:s this farther inconvenience, that they cannot be fet up as formerly, withoat danger of deftroying them entirely.

The barels being thus bored and formed externally, it is cultomary with the gunfmiths in France to folder on the loops and aim before they breech the harrei. The Englifh, bowever, do not reill rict themfelves in this manner: for as foft folder is fulticient for faltening on thefe, they never ufe any other; while the Fiench, who ufe hard folder, mult of confequence employ a great heat. Thus the indide is roughened fometimes io confiderably, that it is neceflary to repert the fine bo. ring; which could not be done without injuring the threads of the ferew formed for the breech, if the barrel were prepared for the latter without foldering on this former.

The firt toul employed in forming the breech. ferew is a plug of tempered ileel, fomewhat conical, with the threads of a male ferew upon its furface, and by the workman termed a foreze ta, Th. This being intraduced into the barrel, and worked from left to right and back again, until it has marked out the four init threads of the frew, another lefs conical tap is introduced; and when this has carried the impreflion of the ferew as far as it is iutended to go, a third one, nearly cylindrical, is made ufe of, fearcely differing from the plug of the breech intended to fill the ferew thus formed in the barrel. The plug iffelf has its ferew formed by mean; of a fcrew-plate of tempered theel, with feveral female fcrews, correfponding with the taps cmployed for forming that in the barrel. Seven or eight threads are a fufficient length for a plag: they ought to be neat and flarp, fo as completcly to lill the turns male in the barrel by the tap. The breecl-plug is then to be cafehardened, or to have its furface converted into fteel, ly covering it with fhavings of hom, or the parings of thi hoofs of horfes, and keeping it for fome time red hot; after which it is plunged in cold water.

The only thing now requifite for completing the barrels is to give them a proper' colour; as a prepardtion for which their outfide is fift to be neatly polifne ${ }^{t}$ with oil and encery. This being done, it was furmerly the cultom to give fuch a degree of heat as would make them blue throughout; but as this cannor be effected without a partial calcination of the furface, which of confequence affects the infide alfo, the blue colour hass been for forne time difufed, and a brown one fubllituted in its place. To give this colour, the pieces are firft rubbed over with aquafortis or fpirit of falt diluses with water; after which they are laid by till a complete coat of ruft is formed upon them: a little oil is then applied; and the furface being rubbed dry, is polined by means of a hard brufh and bces-wax.

Thus the common mulket-barrels for the purpofes, efpecially of fport manhip ane made; but there are fome other methods of manufacture, hy which the barfels are made to differ in fome refyects from thofe jull defribed, and are thought to be conliderally improved. One kind of thefe are called swifled barrels; and by the Englifh workmen are formed out of the plates mate of guls formerly defuribed. Four of thefe, of the lize already mentioned, are requifite to make one barrel. One of them heated red hot for tive or fis inelies is
turned like a cork.ferew by mears of the hammer and anvil ; the remaining parts being treated fuecetively in the fime manam until the whole is turned into a fipal, forming a tube the diameter of which correfon's with the bore of the intended banel. Four are generally fufficient to form a barrel of the ordinary length, i. 8 from $3=$ to 38 inches; and the two which form the wreech or ftrongett part, called the ecinforced part, are confoderably thicker than thole which form the mazale or fore part of the barrel. One of thefe tubes is then welded to a part of an old barrcl to ferve as an handle; after which the turns of the fuiral are united by heating the tube two or three inches at a time to a bright white theat, and ltriking the cod of it feveral times againft the anvil in a horizontal direction with eonfluerable ltrongth, which is called jumping the barrel; and the heats given for this purpofe are called jumping beats. The next llep is to introduce a mandril into the cavity, and to hammer the heated portion lightly in order to flatten the ridges or burrs raifed by the jumping at the place where the fpirals ate joined. As foon as one piece is jumped throughout its whole length, anoflacr is welded to it, and treated in the fame manner, until the four pieces are inited, when the part of the old barel is cut off, as being no longer of any uf?. Tlie wetding is repeated three times at lealt, and is performed exantly in the lame manner as directed for plain barrels; and the piece may afterwands be finthed according to the directions already given.

The operation for the French twilled barrels is very different from that jult mentioned, and much more exéptionable. It confilts in heating the barel by a few inches at a time to a flrong red heat; one end is then forewed into a vice, and a fquare piece of iron with an liandle like an augre is introduced into the other. By means of thefe the fibres of the heated portion are twilted into a fpiral direction, which is fuppofed to refilt the effort of the inflamed powder better than the other. To render this operation complete, however, it mult be obferved, that when once the feveral po:cions of the barrel have been twilled, the fubleguent heats ought not to be very great, or the grain of the metal will regain its former tate, and the barrel be no better for the twitting than hefore. To twifl a barrel in this manner, alfo, it uill be neceffary to forge it at leatt balf $\therefore$ foot longer than it is intended to be, that a fufficient length may be kept cold at each end to give a tufficient purchafe to the vice and twifting inttrument; and thefe portions mant afterwards be cut off before the barel is bored, or two pieces of an old barrel may be welded to the muzzle and breech of that which is to be twifted, and cut off when the operation is over. Thefe pieces may alfo be made fronger than ufual to refilt the force of the vice and twifting inllument; and in order to give the latter a firmer hold, the eavity of the muzzle may be made of a fquare form. The Englith workinen are unanimoufy of opinion that this mcthod of twitting is really injurious to the barra, by llaining the fibres of the metal. At any rate, from the injudicious methods followed by the French artilts, the greateft part of their barrels, faid to be twifted, are not fo in reality; there being at leaft fix or feven inches at the muzzle, and feven or eight at the breech, which are not aftected by the operation.

The French ribbon burre's have a great refomblance
to the Lnglifh twilled ones; but the procefs for ma. king them is much more oferofe, though is fecms not to potiefs any real advantage over that ufed by the Enghif artilts. A plate of irom, ahout the twelfth part of an inch in thicknefs, is turned round a mandri!, and welded its whole length in the fame inamer as a plain barrtl. Upon this llight barrel, which is called the liang, a plate of iron about an inch in breadth, and bevelled off at the edues, is by means of fucceffive heats relled in a fpiral direction; atter which it is termed the rilbon, and mull have a thicknefs correfponding with that part of the barrel which it is to form. As it would, however, be difificult to form a ribbon of fulficient longth for the whole barch, it is made in feveral picces; and when one piece is rolled on, another is welded to its end, and the operation continued until the lining be entirely covered. The edges are fo much bevelled, that the one folds over the other about a quarter of an inch. After the tibbon is all rolled on, the barrel mull be heated by two or three inches at a time, and the turns of the fpiral united to each other and to the lining by being welded in the fatne manner asthe twilted barrel; though, from what has been faid of the conltruction of thefe barrels, it is plain that the operation of jumping cannot be adnitted in them. The barrel is afterwards bored in fuch a manner that almut the whole of the lining is cut out, and fcarce any thing lefr but the ribbon with which the lining was covered.

The fuperiority of twifted and ribbon barrels over the plain kind gave oceation to a third fort named avired barre's. Thefe were invented by an ingenious workman at Paris named Barrois; whofe method was as follows: Upon a thin barrel, filed and dreffed as wfual, he rolltd, as clofe as potlible, and in a firal direction, a tempered iron wire about the thicknefs of a crow guill, the lirt layer covering only the reinforced part. The turns of the wire were foldered to each other and to the barrel with a compofition which he kept a feciet. The wired part was then filed fmooth and bright, but not fo ruch as to weakenit; a fecond layer of wire was applied over the hirt, extconding twothinds of the length of the barrel; and this being fmonthed and brightened like the frot, a third layer was applich, which covered the two former and reached quite to the muzzle.

The barrels macte af er this manner are fuppofed to be much fuperior to othcrs, though the fuppolition feems net to be wall founded. It is certan that wire is not preferable to other iron as a material for gunbarrels; and the folder ufed by M. Barrois in a quantity neally equal to the wise itfelf, mult be accounted a defect as far as it was ufed; for no metal has yet been found equal to iron for the purpofes of gunfmiths: fo that by the ufe of fo much of this folder in the compofition of the barrel, it mutt be undoubtedly waker than if it had been all made of iron. We are not to fuppofe the wire abfolutely free from flaws; and even thongh it were, there will always be fnall cavities between its turns, whieh the folder cannot fill completcly. Bidises, as the operation of wiring tras performed by M. Barrois upon a barrel that had been previoufly bored and dreffed within, the repeated heats to which it was afterwards fubjected in foldering, if they did not caufe it warp, at leall rendered it io rough

## $G \mathrm{U}$ N

rough that it was neceffary to fine-bere it afterwards. The only advantage therefore which thefe barrels were found to polefs was t..cir beautiful appearance; which was greatly overbalanced by the circumilances juft nentioned, as well as by the extravagant prices at which they were fold; a fingle barrel being fold at $; 1$. aud a double one at twice that fum; whence the tale of them never anfucred the expectation of the invent. or, and afier his death no body thought of making them.

The Spanifh barrels have long been held in great eftimation, both on accoumt of their being furmed of better iron than thofe of other countries, and likewife from an opinion of their teing more perfectly forged and bored. Thofe made at Madrid are the hent, and even of thefe fuch as lave been made by former gumfmiths are in the greatelt eftimation. The moft celebrated Spanilh gunfmiths were Niculas Biz, who lived in the beginning of the prefent century, and died in 1724; and the barrels fabricated by him in the former part of his life are held in greatelt eftimation. 'Ihofe of his cotemporaries, Juan Belau and Juan Fernandez. are no lefs valued; all of their barrels felling in France at 1000 lives, or 451.15 s . Aterling. The fucceffors of thefe great artits were Diego Efquibal, Alonz, Martiner, Agottin Ortiz, Mathias Vaera, Luis Santos, Juan Santus, Francifoo Garcia, Francifoo Targarone, Jofeph Cano, and N. Zelaya. The moft cetcbrated no. $s$ in life are Francifco Loper, Salvador Cenarro, Migucl Zeguarra, Ifidoro Soles, and Juan de Soto. 'Ihe thrce firt are gunfmiths to the king; and the barrels made by all of them feil for 1 bl. Alerting. Almolt all the Madrid barrel, are compofed of the old fhoes of horfes and mules, which are collected for the purpofe. They are manufactured fort by welding lorgitudinally, and then being joined together in four or five picces like the Englim bantls made from thuts, as already mentioned. In this, and indeed all osher operations for making gun-barrels, an immenfe walle of the iron takes place; but that of the Spanih iron is by far the greatelt, a auafs of 40 or +5 pounds bee ing required to make une barrel, which when rough from the forge weighs onty fix or leven pounds: fin that from 30 to $3^{8}$ pounds are loll in the hammenings. It may perhaps, however, be doubted, whether the no be really furified by this afle; for it is certain, that by long continued working in the fire it may be rasdered totally ufelefs and deftruyed; neither caa we be a fured that the other advantages pretended to relute from their method of manufacture are of any conlequence. The Spanifh artuts likewife value themelves on giving the infide of their batels a very high polith; hut the advantage of this, as has already been obferyed, is extremely dubious. The only thing requitite in a gun-barrel is that it do not lead; that is, that the mark of the bullet be not perceived on the intide after it has been difeharged, by fome of the lead rubbed off as it paffes through. In the opinion of very good jndgres, therefore, it is better to take a barrel immediately after it bas undergone the operation of fineboring than to give it any higher polifh; and in fuppart of this opinion, M. de Marolles, an author of great reputation, informs us, that he has feen a barrel rough from the borer throw a charge of hot decper into a quire of pajer than one which was highly polithed

## $2457 \quad G \quad U \quad N$

within, though the hay! 1, borc, and charge, wete Gunthe fame in boih.

Sm:thery.
As the Spanith iron is miverfally ahowed to be eacellent, it has not beco untcafonethly dumpoled ihat the fugeriority of the batrels manufasinced in that kisu!dom is owing more th the prou fhe fs of the maicriats than 20 the faill of the wombinen. It mult be obiorved, however, that iabteacl of making the phates overlap a lithe in the plase where they jom, they five one of them a complete turn; fo that wery spanilh birrel may be faid to he double througtious its whole length. The diflerent portions of the iron are alfo forged in fuch a manner, that the grain of the iron is difpofed in a fpiral manaer; whence it has the fame effect with a ribbon or twilled batel. "Lhe ounfide is finithed by turning them in alathe ; whence probably they are always lefs eleganty wrought than the lirench and Englith pieces. The great value put upon then is alfo thought to be more owing to fancy than to any real good qualities they polfers. Formerly they were made from three to three feet and a half long; their bore being fuch as to admit a bullet from 22 to 24 in the pound; and their weight from thee to three pounds and an half. The reinfurced part extends two.fifths of the length; and at 10 or 12 inches from the breech is placed a figbt, fuch as is ufually put upon rifle-barsels or thofe intended only for ball. According to Efpinas, arquebufs-bearer to Plilip IV. the weight of a Spanifh barrel onght to be four pounds and an half when their length is 4 ? inches; but both weight and length are now much reduced, they feldom excocding the dimention already memioned. Next to the harrels nade at Matid, the motl efleemed are thofe ut Butlindui and St Olatue at Placentia in Bifcay; and of Jem and Clement Jadwerteva, Eadal Pous, and Matin Marechal, at Barcelond ; the ufual price of them being about 3l. 103. Herling.

Having now defribed the method of forging barrels, we hall next proced to give an accomat of thofe imperfections to which chey are fumesines liable, and which render them apeto burt or recuil with violence. The priacipal of thete are the chink, crack, and fater. 'The fint is a timall reat in the direesion of the length of the barrel; the decond acrufs it; and the third is a kind of feake cir finall plate adhering to the barrel hy a nare w hale, from which it ipreads on like the head of a uail from its tlank, and when feparated leaves a pit or hullow in the metal. I'he chinis or faw are of arach wode contequence than the erack in fire-arms, the fores of the powder being exerted more upon the circumlerence than the length of the barrel. The flaw is much more frequent than the chink, the latter fearce ever occurring but in plain barrels formed out of a fingle plate of iron, and then only when the metal is delicient in quality. When llaws happen on the outfide, they are of co great confequence; but in the infide they are apt to ladge moifture and foulnefs which corrode the iron, and thus the cavity enlarges contimually till the piece burlts. I his accident, howeve:, may arife from inany other caufes, be fides the defect of the barrel itfelf. "line belt pieces will burlt when the ball is not fufficiently ramned home, fo that a fpese id lefi between it and the powder. A very fmall wind. age or paflage for the intamed powder between the fice's of the tarrel and tall will be fuffecient to prevert

Cobl:Smithory
the accilat ; but if the tall has been forcibly driven down with an iron ramron, fo as to flll up the cavity of the bard wiy exactly, the picce will almosk certain.ty innt, if only a vely frall face be left between it and the fowler; and the greater the lpace is, the wore centamy does the event take place. Of this Wh Rubins gives a remarkable inflance, accomnting at the fane time for the phenomemon. "A moderate Charge of poonder (fays he), when it has expanded itWhensurgh the vacant fpace and reaches the ball, will, by the whucity cach part has acquited, acceumulate ittelf behind the ball, and will thereby be condenfed perdigioully: whence, if the barrel be not of an extraondinary frength in that part, it mult infallibly burf. The truth of this I have experienced in a very good 'lower mutket forged of very rough iron: for charging it with 12 peanyweight of powder, and placins the ball loofely 16 incles from the breech; on the firing of it, the part of the barrel jult behind the tullet was fwellod ont to double its diameter like a thown bladder, and two large pieces of two inches in kength were burt cat of it." A piece will frequertly buth from having its mouth Ropped up with earth or forw; which accident fometimes happens to fortfmen in leaping a ditch, in which they have anited themfelves with their fowling-pisce, putting the mouth of it to the groutis; and when this does not happen, it is orty to be accounted for from the floppage being extremely flight. For the fame reafon a mulset wifl centrinly burlt if it be fired with the mazale immerfed oaly a very little way in water. It will alfo burft from an overcharge ; but when fuch an accident happens in other circumitances, it is mott probably to be attributed to a defect in the workmanflip, or in the fron itelf. Thefe defects ate principally an imperfection in the weding, a deep flaw having taken place, or an inequality in the bore; which lat is the mont common ot any, efpecially in the low-riced barrels. 'The reafon of a barrel's burting from an inecuatiey in the bore is, that the danice fluid, fat loofe by the in Thmmation of the powder, and endeavouring to expand itfla in every direttion, being repelled by the Aronger farts, acts with additional force againt the weaker once, and frequently burfs through them, which it would not have done had the fides been equally dick and itrong thronghout. With regard to defeets aring from the bad quality of the iron, it is impoffible to fay any thing certain. As the choice of the matesials depends entirely on the gunfmith, the only way to be alt red of having a barrel made of proper metal is to parctafe it from an artift of known reputation, zud to give a contiderable price for the piece.

The recoil of a piece becomes an object of importance only when it is very great; for every piece recoils in fome degrec when it is difcharged. 't he molt fecquent caufe of an exceffive recoil is an inequality in the bore of the barrel; and by this it will be occafic ned even when the inequality $i_{3}$ tuo fimall to be perceived by the eye. The explanation of this upon me. chanical principles indeed is not very eafy: for as it is there an invariable law, that action and reaction are equal to one another, we thould be apt to fuppofe that every time a piece is difcharged it hould recoil with the whole difference between the velocity of the bullet and that of the inflamed powder. But were this the
cafe, no man colld frre a mufket without being defroyed; for the bullet flies out only with a velocity of 1700 feet in a fecond, or not mach more, while that of the powder, as calculated by Mr Robins, is not leis than 7000 feet in the fame fpace. But was the eecoil to be made with the difference of thefe velocities, or with one half of it, it is plain that no man cond bear it. The fame thing thentfore mult take place in the recoil of a mulliet which Dr Prielley obferved in his cxperiments on the explotion of infam. mable and dephlogitlicated air, wiv. that the foree is exertect much more upon the part farthell from that where the inflammation begins than upon that next to it. At any rate, however, the Atrength of the recoid will always be found proportionable to the weight of the piece; that is, the lighter the picce is, the greater the recoil, and rice verfa. The recoil may be inerea. fed by any thing which retards the paffage of the thot; whance it is alfo augmented by the foulneis of the barrel by repeated firing. M. de Marolles informs us alfo, that a piece will recoil, it, from the breech-plug being made too fhort, forme turns of the fcrew remain empt $y$; as in thefe a part of the powder is lodged which forms an obtacle to the explotion; though in what manner this takes place is not roy apparent, as, though the powder lodged these mighe contribute little or nothing to the force of the explofion, it can faree be flown to fland in the way of it. The fame author likewile informs us, that a barret mounted upon a very ftraight Atck will recoil more than upon one that is confijerabiy bent. Sometimes alfo a fowliag piece will recois from the fportman applying it improperly to his floulder; thongh this ialt circumitance feems likewife inexplicable. It is molt probable therefore that the fuppoled grater tecoil taken notice of in this cafe, arifes ouly from the uinal recoil being more feribly felt in one polition than another.

Tlic caufe to which too great a recoil in mufiet3 has been afually attributed, is the placing of the touchbole at fome ditance from the breech pluy ; fo that the powder is fired about the mildile, or towards its fole-part, rather than at its bafe. To asoid this, fome artilts form a groove or channcl in the brecech-plug as deep as the fecond or third tura of the ferew; the touch-lole opening into this channel, and thus liring the powder at its veiy lowelt part. It appears, howcver, from a number of experiments made upon this fubject by M. le Clerc gunfmith to the king of France, that it made very little difference with regard to the recoil, whether the touch-hole was clofe to the breech or an inch diftant from it. The only circumflance to be attended to with refpect to its lituation therefore is, that it he not quite clafe to the breech-plag; as in fuch a cafe it is found to be more apt to be choaked up than when placed abont a quarter of an inch from it.

The only other circunitance now to be determined with regard to muket-barrels is their proper length. Formerly it was fuppofed that the longer they were made, the greater would be the diflance to which they carried the flot, and that without any limitation. This opinion continued to pevail till about half a century ago, when it was firt propofed as a doubt whether loug barrels carried farther than thort ones. With regard to cannon, indced, it kad long before this time

Been known that they might be made too long; and Balthazar Killar, a celebrated cannon-founder in the reign of Louis XIV. was able to account forit. When alsed by Monf. Suriry de St Remy, why the culverin of Nancy, which is 22 feet long, did not carry a ball equally far with a fhorter piece? he replied, that " the powder, when inflated, oaght to guit ihe cavity of the piece in a certain time, in order to cxert is whole foree upon the bullet: by a longer Ray, part of the force is lolt; and the fense caufe may produce an ine. quality in the thots, l g riving a variation to the ballet, for as to detroy its rectitincal courle, and throw it to bne lice or other of the marle". Mir Robins, whon no this as well as every cother quellon in gunnery has almolt exhaulted the fubject, informs the, that "if a mufert-larrel, of the common kngth and bore, be fired rribl a leaden bullet and hale its weight of powder, and if the fame barrel be afterwards fiortened one half and lired with the fame charec, the velocity of the bullst in this flortened batel will he abosut oneffixih $k$ efs than what it was when the batrel was entire; and if, inltead of flortening the hartel, it be increafed to tivice its ufual lengh, when it will be near eight fect longe, the velccity of the bullet will not hereby be angmerted more than one-eighth pat. Aad the rroater the length of the barrel is in proportion to the diame. ter of the bullet, and the fmalles the quantity of powder, the more itconliderable will the fe alterations of velocity bc." From thefe conliderations it appears, that the adran:agts grained by long barrels are by no neans equivalent to the difadrantages ariling from the weight and incumbrance of ufrag them; and from a maltitude of eaperiments it is now apprent, thatevery one may choofe what length he pleatis, withont any* fentible detriment to the range of his piece. Itac moll approved lengths are from 32 to 38 inches.

An opinion has generally promiled among fpuet!. men, that by fome uoknown manocure the gunfmish is able to matse a piece, luaded with fnall thet, throw the contents fo cluse together, that even at the ditance of 40 or 50 paces the whole will be conbined within the breadth of a hat. From fuch cxperiments as have been made on this fubject, lowever, it appeare, that the clofenefs or widenefs with which a piece throws its for is liable to innmmerable variations from caufes Which no Reill in the gunimith can pofibity reach. Bo vartable are thefe catufes, that there is no poffibility of making the fame piecc thow its flote eq:ally chore twice faccefiyely. In gental, however, the clofer the wadding is, the better difpofed the thot feems to lie to fall within a fmall compafs. The clofencis of the fhot therefore vould feem to depend in a great mafure on preventing the name of the powier fom intimating itfelf among its paticles: whence the for lowing method is faid to be practifed with faccefs by thole who floot for a wager at a mark with frall flo: ; dive to put in the thot by finall quantitics at a time, ramming down a little tow or thin paper over eacis; fo as to fill the interllices of the grains, and thus prevent the flame from getting in amonglt the grains ard feattering them. Inforing with fmall fhot, a curicas circumflance fometimes occurs, viz. that the grailes, initead of being equally diltributed over the fpace they ftrike, are thrown in clutters of $10,12,15$, or more ; whild everal coufiderable fraces are left withom a
grain in them. Somerimes oncethire or one hate of the charge will be caliected into a chufter of this kide: nay, fometimes, thongh much more rarely, the whole charge will be collected into one inafs, fo as to pierce aboard near an inch thick at the difance of to or 45 paces. Small birrcla are faid to lee mure liable to this clutlering than large ones: and M. de Marolles informs us, that this is cfpecially the cale when the barrels are new, and likewife when tisy are frefh. vahed; though he aclinowledres that it did not al. ways happen with the barrels he employed even after they were wafhed. It is probable, therefore, thot the clofenefs of the fhot depenels on fome circumilanes rehative to the wadding rather than to the mechanifm of the barrel.

Some pieces are compofed of two or more barels puined togcther; in which cafe the thicknefs of each of the barrels is fumewhat lefs than in tingle-barrelleel pices. After being properly dreffed, each of them is filed flat on the file where they are to juin each other, fo that they may fit more clofely together. Two correfponding notches are then made at the muzzle and breccir of each barrel; and into thefe are lited two finall pieces of iron to hohl thom more frongly together. Being then united by tinning the contignous parts, a triangular picee of i on called the $r$ ib is fattenad on in like manner, ranning tie whole leneth on the upacr lide; whieh ferves to lald them mose thongiy togethea. Afier this they are to be polifhed and co. loured in the manner defcribed for lingle barrels. Great care fould be taken that the barmels jniaed in this manne fondd be quite equal in frength to one anchaer, art ihat both mould be quite bparght or of ais cqual thicknefs thronghont. If amp inequality takes phece in the trength of the harrels, the weaker will te waper by the action of the Atr ager; and the waping from this caufe has fometimes been fo conderable as to renter one of the barels welafs. "i'o buing cvert part of the circumference of eacls harrel :o an cymal Atrength as reardy as pofible, fo that no pait may be itraned by the explofion, that fide where ibey tomelt tach other mult be fo reduced, that the pattition between the two calibers may be ro thicher than either barrel was at the fame place before it was fled is join in this manner. Former!y the duble harrillat pisces were thade with one barchly iage nver the other, eacls barrel having a feparate pan, hemmer, and limn-mer-fring, but only one cack fo: both. 'Phe lavel. were therefore made to iura round at the place whe:c the brectes joired with :he Rock: fo that ar won as one was fred of, the other coud be brougla inson its prace by prefing a fring moved by the guard with the light hand, while with the left the barochs were tursed upon their common asis; and as foon as the chared buncl was thus bronglat into its proper bitnation, tie fating delemued into a notch and kepi it. firm. In: this method wos found to be too compl:cated ard embarrafee, thongl lipon the fame plast : lnce and foar barrals were fonetimes mounted upor conc llock; but thefe pieces were intolerably heary, and have no teal fuperiority over the double-barielled pieces whicle co nct tum round, and which of confo. guence are now only made ufe of.

Gurter.
that wory litue be takended when by the boring and lifing: fon as the outer furface, by having undergone the astion of the hammor more immediately than any other pant, is rendered the moot conpact and pure, we fhould be carfull to remare as little of it as pollibic; and the fane holds, though in a lefs degree, with the infide, whin! is to be cat with the borer. Piftol-barrels are forsed in one picce, two at a time, joined by their muzzles, and are bored before they are cut afunder; by which means there is not only a faving of time and labour, but a greater certainty of the bore being the fame in both.

GUNTER (Edmuad), an excellent Englifh mathematician and aftronomer, was born in Hertfordfine in 1581 , and ftudied at Weftminher fchool; from whence he removed to Oxford, where he took the degree of mafter of arts in, 606 , and afterwards entered into holy orders. In 1615 he took the degree of bachelor of divinity: but being peculiarly eminent for his knowledge in the mathematics, he had two years before boen chofen profeffor of aftronomy in Grefham-college, London; where be ditinguifhed himfelf by his lectures and writings. He invented a fmall portable quadrant; and alfo the famous line of proportions, which, after the inventor, is called Cuntcr's fale. He likewife publiacd Canon Triaughlorum; and a work intitled Of the Sector, Crofs-ftaff, and other Inftruments. This laft was publifhed, with an Englifh tranfation of his Canon Triangulorum, in to, by Samuel Fufter profeffor of Gretham-college. Mr Gunter died at that college in 1026 .

Guntrk's Lime, a logarithmic line, ufually graduated upon feales, fectors, sic.

It is alfo called the line of lines and line of numbers; being only the logarithms graduated upon a ruler, which therfore ferves to folve problems mitrumentally in the fame manner as logarithms do arithmetically. It is ufually divided into 100 parts, every lenth whereof is numbered, beginning with 1 and ending with 10 : of that if the firf great divilion, marked i, fland for one tenth of any integer, the next divilion, marked 2 , will fiand for two tenths, 3 , three-tenths, and fo on; and the intermediate divithons will in like manner refrefent 1 codth-parts of the fame integer. If each of the great diviinons reprefent 10 integeas, then will the iefler divitions ftand for integers; and if the greater divifo:!s be fuppofed each 100, the fubdivifions will be each 10.
Ufe of Guntek's Linc. 1. To foul the proturt of tam nemblers. From 1 extend the compaltes to the maniplier; and the fame extent, applied the fume way from the multiplicand, will reach to the product. Thus if the product of $q$ and $a$ be required, extend the compaffes from 1 to 4 , and that extent laid from 8 the Fame way will reach to 32 , their product. 2. To dicide one number ly another. The extent from the divifin to unity will reach from the dividend to the quotient: thus, to divide 36 by 4 , extend the corpaffes from 4 to 1 , and the fame extent will reach from 36 to $g$, the quatient fought. 3. To thrce givon mumbers to find a fourth proportional. Suppofe the numbers 6 , 3,9: extend the compaffes from 6 to 8 ; and this extent, laid from 9 the fare way, will reach to 12 , the fourth proportional required. 4. To find a man proN 147.
fortional betruch cry two sizen numbers. Suppoie $\delta$ and $32:$ extund the companies from 8, in the letr-hand part of the line. th $3^{2}$ in the right; then bifferting this diflance, its hall will reach from 8 forward, or from 32 backward, to 16 , the meall proportional fought. 5. To catrua the fyure root of any number. Suppofe 25: bificet the diflance between 1 on the frale and the point reprefenting 25 ; then the half of this ditanee, fet off from $t$, will give the point reprefenting the root 5 . In the fame manner the cube root, or that of any higher power, may be fourd by dividing the difance on the line between 1 and the given number into as many equal parts as the index of the power expreffes; then one of thofe parts, fet from 1 , will find the point reprefenting the root required.

Gunter's 2 mudrant, one made of wood, brals, \&c. containing a kind of flereographic projection of the fphere, on the plane of the equinoctial; the eye being fuppofed placed in one of the poles.

GUnteris Sale, called by navigators fimply the gunter, is a large plain fcale, generally two feet long, and about an inch and a half broad, with artificial lines delincated on it, of great ule in folving quetions in trigonometry, navigation, Ece.

GUNWALE, or Gunsex, is the uppermolt wale of a fhip, or that piece of timter which reaches on either fide from the quarter deck to the forecafle, being the uppermoll bend which linihes the upper works of the lull, in that part in which are put the flanchions which fupport the walle-trecs.

GURK, an epifcopal town of Carinthia in Germany, feated on the river Gurk, in F. Long. 14. 15. N. Lat. 47. 10.

GURNARD, in ichthyology. See Trigla.
GUS'T, a fudden and violent fquall of wind, burting from the hills upon the fea fo as to endanger the fhipping near the fhore. Thefe are peculiar to fome coults, as thofe of South Barbary and Guinea.

GUSTAVIA, in botany; a genus of the polyandria order, belonging to the monadelphia clafs of plants. There is no calyx; the petals very numerous; the berry multilocular ; the feeds appendaged.

GUSTAVUS I. King of Sweden, fon of Eric de Yafa duke of Gripfola. Chistian II. king of Denmark having made himfelf mafter of the kingdom of Sweden, confined Gulavas at Copentagen; but he making his efcape, wanderd a long time in the forefts, till the cruelties of the tyraut having occafioned a revolution, lic was firt declared governor of Swelen, and in 1513 ctected king. This prince introduced Lutheranfm into his chominions, which in a little time fprcad itfelf all over the kingdom. He died in 1560; having made his kingdom hereditary, which was before elective. See Sweden.

Gustarus Aldiphus, furnamed the Gerat, king of Sweden, was born at Stockholm in 1594, and fucceeded his father Charles in 1611. He ctpoufd the caufe of the Proteflants in Cermany, who were oppreffed and almott entirely ruined by the emperor Ferdinand. He was a great warrior, and gdined ma:y victories, of which an account is given under the article Sweden. He was at laft killed in the batte of Lutzen, where his troops got the victory, and defeated two of the emperor's armies.

GUThalus, or Gurtalus, (anc. geog.), is

## $\begin{array}{lllll}\text { G U Y } & \text { F } & 19 & \text { G U Y }\end{array}$

tea thought to be the V'ialrus of Ptolemy. Now the Oder; which rifing in Moravia, runs through Silefia, Brandenburg, and Pomerania, into the Baltic.

GUT'FA, a Latin term for what in Englih we call drop.
Guyta Rofacea, in medicine, denotes a red or pimpled face; a ditemper which, though not always owing its original to hard drinking, is neverthelefs moll incident to tipplers of ftrong heer, wines, fpirits, \&c.

Guita Serena, a difeafe io which the patient, without any apparent fault in the eye, is deprived of fight. See (Index fubjoined to) Meincina.
Gurts, in architecture, are ornaments in the form of little cones ufed in the Doric corniche, or on the architrave underneath the triglyphs, reprefenting a fort of drops or bells.

GUTTURAL, a term applied to letters or founds pronounced or formed as it were in the throat.

GUTTY, in heralary, a term ufed when any thing is charged or fprinkled with drops. In blazoning, the colour of the drops is to be named; as gutty of fable, of gules, \&c.

GUY (Thomas), an eminent bookfeller, founder of the hofpital for dick and lame in Southwark bearing his name, was the fon of 'Thomas Guy lighterman and coal-dealer in Horfley-down, Southwark. He was put apprentice, in 1660, to a boukfeller in the porch of Mercer's-chapel; and fet up trade with a flock of about 2001 . in the houfe that forms the angle between Cornhill and Lombard-Arect. The Englifh Bibles being at that time very badly printed, Mr Guy engaged with others in a fcheme for printing them in Holland and importing them ; but this being put a ftop to, he contracted with the univerfity of Oxford for their privilege of prining them, and carried on a great bible-trade for many years to a confiderable advantage. Thus he began to accumulate money, and his gains refted in his hands; for being a fingle man, and very penurious, his expences could not be great when it was his cuftom to dine on his thop-counter with no other table covering than an old newfpaper: he was moreover as little fcrupulous about the fyle of his apparel. The bulk of bis fortune, however, was acquired by purchafing feamens tickets during queen Anne's wars, and by SouthSea fock in the memorable year 1720 . To thow what great events fpring from trivial caufes, it may be obferved, that the public owe the dedication of the greateft part of his immenfe fortune to charitable purpofes, to the indifereet officioufnefs of his maid•fervant in interfering with the mending of the pavement before the doar. Guy had agreed to marry her; and, preparatory to his nuptials, had ordered the pavement before his door, which was in a negleeted flate, to be mended, as far as to a particular fone which he pointed out. The maid, while her malter was out, innocently looking on the paviers at work, faw a broken place that they had not repaired, and mentioned it to them: but they told her that Mr Guy lad direeted them not to go fo far. Well, fays he, do you mend it : tell him I bad you, and I know he will not be anegry. It happened, however, that the poor girl prefumed too much on her influence over her careful lover, with whom a few extraordinary millings expence turned the fcale totally againt her: the men oleyed; Guy was enraged to find his orders excetded, his matrimo.
Vor. VIII. Part I.
nial fchene was renounced, and fo he built hofpitals in his old age. In the year 1707 he built and furnifhed three wards on the north fide of the outer court of St Thomas's Hofpital in Southwark, and gave rool. to it annually for cleven years preceding the erection of his own hofpital: and, fome time before his death, erected the flately iron-gate, with the large houfes on each fide, at the expence of about 30001 . He was 76 years of age when he formed the defign of building the hofpital contiguous to that of St Thomas's, which bears his name, and lived to fee it roofed in ; dying in the year 1724. The charge of crecting this saft pile amounted to $18,793 \mathrm{l}$. and he left $219,499 \mathrm{l}$. to endow it; a much larger fum than had ever been dedica. ted to charitable ufes in this kingdom by any one man. He crected an alms-houfe with a library at Tanworth in Staffordfhire (the place of his mother's nativity, and for which he was reprefentative in parlianent) for $I_{4}$ poor men and women ; and for their penfions, as well as for the putting out poor children apprentices, bequeathed 125 l. a-year. Laftly, he bequeathed roool. to every one who could prove themfelves in any degree related to him.
Gur, a rope ufed to keep. tleady any weighty body whilf it is hoitting or lowering, particularly when the mip is thaken by a tempelluous fea.

Guy is likewife a large hack rope, extending from the head of the main-matt to the head of the fore-matt, and having two or three large blocks faftened to the middle of it. This is chiefly employed to fultain the tackle ufed to hoift in and out the cargo of a merchant fhip, and is accordingly removed from the mat-head as foon as the veffel is laden or delivered.
'Gur's Cliff', in Warwiekthire, a great cliff on the weft fide of the A von and the north fide of Warwick, where in the Britons time was an oratory, and in that of the Saxons an hermitage, where Guy earl of Warwick, who is faid to have retired to it after his fatigues by the toils and pleafures of the world, b:ilt a chapel, and cohabited with the hermit; and that from thence it lad the name. This hermitage was kept up to the reign of Henry VI. when Rich. Beauchamp earl of Warwick eflablifhed a chantry here, and in memory of the famous Guy erested a large ftatue of him in the chapel eight feet in height, and raifed a roof over the adjacent Cpriags. The chapel is in the patifh of St Nicholas, in the fuburbs of Warwick.

GUYON (Johanna Mary Bouriers de la Mothe), a French lady, memorable for her writings, and for her fufferings in the caufe of Quietifm, was defcended from a noble family, and born at Montargis in $56+8$. Sbe gave fome cxtraordinary fymptoms of illumination frona her carlieft infancy, and tried to take the veil before The was of age to difpofe of herfelf; but her parents obliged her to marry a gentleman to whom they had pronifed her. She was a widow at the age of 28 ; when diftiaguifhing herfelf in, and making naany converts to, the way of contemplation and prayer known by the name of Quietifin, complaints were made of her fpiritualifm, and The was confined by order of the king, and feverely examined foreight mooths. She wasdifcharged; but was afterwards involved in the perfecution of the archbinop of Cambray, and thrown into the Baftile, where fhe underwent many examinations: but nothing being made out againft her, fhe once more

Hh
obtained

Guy, Guyou.

Gwinis obtained her liberty, and lived private to her death in 1717. She fpent her ldter years in mytical reveries: covering her tables, cielings, and every thing that would receive them, with the fallies of a vihonary imagination. Her pious verfes were collected after her death in 5 vuls, intitled Cariquas firituels, ots amblemes firr l'Anerer 1).i.a. Hier pubheations were, Lee moyn inart at tris fouit de fuirs Oraifors; and Le Connique as Cuntiques de Suicmon indoprete filen le fens mytiqu'; which wete condemned by the arehbithop of Parit.

GIVINIAD, in ichthyology. Sec Salmo.
GYARL'S (ane. vang.), one of the Cyctades, 12 miles in compare, heing to ihe eall of Delos. It was a defart illand, and aloneced tur a place of banifhment by the Rumans

GYBING, the att of hifing any boom fail from one fide of the maft to the other.

In under to underfand thi operation more clearly, it is necefary to remark, that by a boom-fail is meant any fail whofe bottom isextended by a boom, the foreend of which is houked to its refective malt; fo as to liwieg oecafionally on cither fide of the veflel, deferibing at areh, of which the inalt will be the centre. As the wind or the confe changes, it alfo becomes frequenty necelfary tu change the polition of the boom, together with its fal, which is accordinerly hiffed to the oflaer fide of the velfel as a door turns upon its hinges. The boom is pufted out by the effort of the witd apon the fail, and is rettrained in a proper lituation by a flong tackle communicating with the weffel's ften, and called the floect. It is alfo contined on the fore-pat by another tackle called the su".
G) G.EUS (anc. geog.), called alfo Colous; a lake of 1 , dia, diftant +0 fadia, or 5 miles, from Sades.

G YGES (fab. hilt.), a Lydian, to whom Candaules $k \operatorname{lig}$ of the country fhowed his wife naked. - The queen was fo incenfed at this inflance of imprudtree and infirmity in her hufband, that the ordered Gyges dither to prepare for death himkif, or to put Candatuls io death. He chofe the latier; and, marrying the queen, afeended the vacart thene about 718 years befure the Chintian era. He was the lirt of the Mermnat: who rigued in Lydia. He remed $3^{3}$ years, a did dinguithed hinfelf by the immenfe prefents which he made to the oracle of D. Hphi (Herge. i. c. S.) Aecording to Platu. Gyges defcended into a chafm of the carth, where he fuund a brazen horif, whofe fides be opened, and faw within the body the carcale' - If a man of uncommon fize, from whofe tinger he took abrazen ring. This ring, when he put it on his finger, rendered him invifible; and by means of its vitue he introduced himfelf to the queen, murdered her hufband, and married hor and ufurped the crown of Lydia. (Cic. Of iii. c. g.)

GYMNASIARCH, in antignity, the direcor of the gymnafium. Fie had two deputies under him; the one called ayfarch, who prefided over the athetre, and l.ad the overight of wrefling; the orher was gymagles, who bad the direction of all other execcifes.

GYNNASIUll, in Grecian antiquity, a place fitted fur gerfomang cxerifes ef the body, \&x. - The word is Cieck tomed of a onent. " naked;" by reafon tixy anionly put off their clothes, to practife with the more frocetm

Gymadia, according to Pot:er, were fort ufed at

Lacedxmon, but were afterwards very common in all Gyman parts of Creece; and imitated, very much augrmented, and improved, at Rome. 'There were three principal gymmatia at Athens; the academy where Plato taught; the $1 . y$ ceum, noted fur Arithotle's lectures; and the Cynolarges, allotted for the populace.

Vitruvius defcribes the ftructure and form of the ancient ingmalia, lib. v. cap. 11. They wese called gymathin, occanfe feveral of the exercifes were performed naked; and puleflre, from wretling, which was one of the mofl ufual exercifes there : the Romens fometimes allo called them therma, becaule the baths and baguios made a principal part of the bailditg.- It appears that they did not perform their excrifes quite naked fo early as the time of Homer, but alw:ys in dravers; which they did not lay alide before the $32 d$ Olympiad. One Oifippus is faid to have been the firlt who introduced the practice: for having been worlled by means of his drawers undoing and entangling him, he threw them quite afide, and the relt afterwards imitated him. 'Tlicy were not lingle edifices, but a knot of buildings united, being fufficienty capacious to hold many thoutands of people at once; and having room enumgh for philofophers, thetoricians, and the profeffors of all other feiences to read their lectures,-and wrehters, dancers, and all others who had a mind to exercife, - at the fame time without the lealt difturbance cr interruption. They confiled of a great many parts. Vi:tuvius recites no lefs than 12 , viz. I. 'The exterior porticus, where the philufophers, motoricians, nathematicians, phylicians, and other virtuofi, read public lectures, and where they alfo difputed and rehearfed their performances. 2. "I he ephebeum, where the youth affembled very early, to learn their exercifes in private, without any fpectators. 3. The coryceum, apudyterion, or gymnatterion, a kind of wardrobe, where they itripped, either to bathe or exercite. 4. The dioothelium, alipterion, or anctuarium, appointed fur the unctions, which either preceded or followed the ufe of the bath, wrething, pancratia, \&c. 5. The conillerium or conittra, in which they covered themfelves uith fard or dult to dry up the oil or fucat. 6. The palefta, properly fo called, where they practifed wrelling, the pugillate, pancratia, and divers wher exentifes. 7. The fphaxitterium or ten-nis-court, referved for extrcifes wherein they ufed balls. 8. large unpaved allcys, which comprehended the fpace between the porticus and the walls wherewith the editice was fursominded. g. 'The xyli, which were porticos for the wrellers in winter or bad weather. 10. Other xyllis or open alleys, allotred for fummer and fine weather, fone of which were quite open, and others plantel with tiecs. 11. The baths, confilting of feveral different apartments. 12. The fadium, a large fate of a lemicitcular form, covered with fand, and furrouncted with feats for the fpectators.

For the admipillration of the gymnafia, there were different officers: the principal wete, 1 . The gymnaharcha, who was the director and fuperintendant of the whole. 2. The aytarcha, who prefided in the xyltus on Aadium. 3. The gyinnalla, or matler of the exercifes, who undertood their difierent effects, and could accommodate the:n to the differtit complexions of the atblete. 4. 'The peitsmba, whofe butinets was mechanically to teach the exerciles, without undertianding
their theory or ufe. Under thefe four officers were a number of fubalterns, whofe names dittinguithed their different functions.

The gymnaftic exercifes may be reduced to two general clarfes; as they depend cither on the attion of the body alone, or as they require external agents or infruments. The latter contifted chiefly in mounting the horfe, driving the chariot, and fwimming. The former were chiefly of two kinds; orcheflice, and pakeftrice.
The orcheffice comprehended, I. Dancing. 2. Cubiftice, or the art of tumbling. 3. Spharifitice or tennis, including all the exercifes with pile or balls.

The paleffrice comprifed all exercifes under the denomination palefre; as wrefling, boxing, pancratia, hoplomachia, running, leaping, throwing the difcus, the exercife of the javelin, and that of the hoop, deno-
 ing an iton hoop five or fix feet in diamcter, befet with iron rings, the noife of which apprifing the people to give way, afforded them alfo an amuiement. Both fltength and fkill were requifite in directing this hoop, which was to be driven with an iron rod. To thefe mutt alfo be added the exercifes belonging to the medicinal gymnaflics; as, t. Walking. 2. Vociferation, or flouting. 3. Holding one's breath. Hoffman enumerates no fewer than 55 forts of exercifes that were practifed in the gymatia.
GYMNASTICS, Gymastice, or the Gymnastic art, denotes the art of performing exercifes of the body, whether for defence, health, or diverfion. Sce Gymnasium.
Several modern writers have treated of this art. M. Burette lias given the hittory of gymnatics in the Memoirs of the Royal Academy of Inferiptions.

On the firte eftablifhment of fociety, men, being apprifed of the neceffity of military exercifes, for repelling the infults of their neighbours, inftituted games and propofed prizes to animate their youth to combats of divers kinds. And as running, leaping, Arength and dexterity of arm in throwing the javelin, driving a ball, or toffing a quoit, together with wreftling, scc. were exercifes fuited to the manner of fighting in thofe days; fo the youth vied to excel in them, in the prefence of the aged, who fat as their judges, and difipenfed prizes to the conquerors ; till what was originally only amufement, became at length a matter of fuch importance, as to intereft greas cities and entire nations in its practice. Hence arofe an emulation and eagernefs to cxcel, in liopes, one day, of being proclaimed and crowned concuerors in the public games, which was the highefl lionour a mortal could arrive at: : hay, they went fo far as to imagine, that even gods and demigods were not infenfible of what men were fo captivated with; and, in confequence hereof, to introduce the greatell part of thele exercifes into their religious ceremnnies, the worlhip of their gods, and the funeral honours done to the manes of the dead.

Thouglh it be hard to determine the precife epocha of the gymaallic art, yet it appears from feveral paffazes in Homer, and particularly the 23 d book of the Iliad, where he deferibes the games celchrated at the funeral of Patroclus, that it was not unknown at the time of the Trojan war. From that defcription, which is the earlief monument now extant of the Grecian gymua.

Alcs, it appears, that they had chariot-races, boxing, wrettling, foot-races, gladiators, throwing the difcus, drawing the how, and hurling the iavelin; and it thould feem, from the particular account Homer gives of thefe cxercifes, that even then the gymnaltic art wanted little of perfection: fo that when Galen fays there was no gymnaftic art in Homer's days, and that it began to appear no earlier than Plato, lie is to be underftood of the medicinal gymnaftics only. This latt, indeed, bad its rife later; becaufe, while men continued fober and laborious, they had nooccafion for it; but when linxury and idlenefs had reduced them to the fad necefli:y of applying to phyficians, thefe, who had found that nothing contributed fo much to the prefervation and re-eitablithment of health as exercifes, proportioned to the different complexions, ages, and fexes, did not fail to refer them to the practice of gymnaftics.

According to Plato, one Herodicus, prior a litele time to Hippocrates. was the firf who introduced this art into phyfic ; and his fucceffors, convinced by experience of its ufefuluefs, applied themfelves in carnelt to improve it. Hippocraces, in his book of Regimen, has given inllances of it, where he treats of exercife in general, and of the particular effects of walking, with regard to liealth; alfo of the differeat forts of races, cither on foot or lorfcback; leaping, wreftling, the exercife of the fufpended ball, called corycus, chirono. my, unctions, frictions, rolling in the fand, \&c. But as phyficians did not adupt all the exercifes of the gym. naftic art in their practice, it came to be divided between them and the mafters of martial and athletic exercifes, who kept fchools, the number of which was greatly increafed in Greece. At length the Romans alfo cauglit the fane tafte; and, adopting the military and athletic exercifes of the Greeks, they improved and advanced them to the utmolt pitch of magnificence, not to fay extravagance. Bue the declention of the erapire involved the arts in its ruin. and, among others, gymaallics and medicine; which latl unhappily then relinquifhed the title it had to the former, and has neglected to refume it ever fince.

GYMNOPYRIS, in natural hifory, a name given by Dr Hill to the pyrita of a dimple internal ftructure, and not covered with a crift. See Prrites.

Of thefe there are only two fpecies. 1. A green varioufly thaped kind. 2. it botryoide kind.

The firt fpecies is the moll common of all the pyri$t \mathfrak{t}$, and appears under a great diverfity of Mapes. It is very hard and heavy, very readily gives tire with flecl, but will not at all ferment with aquaiortis. The fecond fpecies is very elegant and beautiful, and its cfual colour is a very agrecable pale green; but what mot diftinquifhes it from all other pyrite is, that its furface is always beautifully elevated into tubercles of variuus fizes, refembling a clutter of grapes.

GYMNOSOPHISTS, a tet of Indian philnfophers, famous in antiquity; fo denominated frum their going barefoot. The word is furmed of the Griek rukrocotismi, q. d. a fuphif or philofopher who goes naked.

This name was given to the Indian phitofophers, whom the exceftive heat of the country ohliged to go naked; as that of Peripatetics was given to inofe wiu philofophifed walking. The Gymnofophills, however, did not gro abfolutely naried; but only clothed themH h
fches

Gsmario. felves no farther than modefy required. There were belonging to the order of apodes. They lave two Grmn phits fone of thefe fages in Africa; but the molt celebrated yminotus. clan of them was in India. The Airican gymnofophiits dwelt upon a monutain in Ethiopia, near the Nile, without the accommodation either of houfe or eell. They did not foun themfelves into focieties like thofe of India; but each had his private recefs, where he ftudied and performed his deverions by himfilf. If any perfon had killed snother by chance, lee applied to thefe fages for abfolution, and lubmitted to whatever penances they emjomed. They offered an extraordinary frugality, and lived only upon the fruits of the earth. Lucan aferibes to thefe Gymuofophifls feveral new difcoveries in attronomy.
As to the Indian Gymnofophits, they dwelt in the woods, where they hed upon the wild produk of the eath, and neser drank wine wor mantied. Sume of them prateifed plyytic, and travelled from one place to another; thefe were particularly famous for their remedies againt barrennefs. some of them, likewife, pretended to practife magic, and to foretel future events.

In general, the Gymnofophifts were wife and learned men: their maxims and difourfes, recorded by hillorians, do not in the leall lavour of a barbarous cdication; but are plainly the refult of geat funfe and deep thought. They kept up the dignity of their character to fo high a degree, that it was never their cuflom to wait upon any body, not even upon prinecs themficues. They believed the immortality and tranfmigration of the foul: they placed the chief happineis of man in a contempt of the goods of fortune and the pleafures of fenfe, and gloried in having given faithful and difinterefted counfels to princes and magitrates. It is faid, that when they became old and infirm, they threw themfelves into a pile of burning wood, in order to prevent the miferies of an advanced age. One of then, named Calamus, thus burnt himfelf in the prefence of Alexander the Great.

Apuleius tdeteribes the Gymnofophifts thus: "They
tentacula at the upper lip: the eyes are covered with the common fkin; there are five rays in the membrane of the gills; the body is comprefled, and carinated on the belly with a fin. There are five fpecies, the molt renarkable of which is the cletricus, or electric eel, callct by the French anyuille tremblante. This fpecies is peculiar to Surinam ; and is found in the rocky part 3 Plate of the river, at a great diftance from the foa. The mon Cuxx accurate defcription we have of this fifh is in the Philofophical Tranfactions for 1775 , where Alex. Garden, M. D. gives an account of three of then brought to Charicfown in South Carolina. The targett was about three feet cight inches in length, and might lave been from to to $1+$ inches in cirenmference about the thickent part of its body. The head was large, broad, flat, and fmoo $h$; impreffed here and there with holes, as if perforated with a blunt needle, efpeciatly towards the fides, where they were more regularly ranged in a line on each lide. Thare were two noltrils on each fide; the firlt large, tubular, and clevated above the furface; the others fmall, and level with the 脽. The eyes werc fmall, flattifh, and of a bluih colour, placed about thrce quarters of an inch behind the noltrils. The whole body, from about fune inches below the head, was clearly dittinguifled into four longitudinal parts or divilions. The upper part or back was of a dark colour, and feparated from the other parts on each fide by the latural himis. Thefe lines took their rife at the bafe of the head, jult above the pectoral lins, and run down the fides, gradually converging as the fifh grew finalier to the tant. The fecond divilion was of a lighter and clarer colour than the firt, incliring to blue. It feemed to fwell out on cach fide; but towards the under part it is again contracted and flarpened into the third part or carina. I'his part is eatily diftinguinhed from the other two by its thinnefs, its apparent laxnefs, and by the reticulated f:in of a more grey and light colour, with which it is covered. The carina begins about fix or feven inches below the bafe of the head; aud, gradua!!; dccpening or widening as it goes along, reaches down to the tail, where it is thinnefl. The fourth part is a long, deep, foft, and wavy fin, which takes its rife about threc or four inches at moll below the head; and thus runs down the tharp edge of the carina to the extremity of the tail. The fituation of the anus was very fingular; being an inch more forward than the pectoral fins. Externally it feemed to be a pretty large rima; but the formed excrements were only the fize of a quill of a common dung-hill-fowl. There were two pectoral fins fituated juit belind the head, fcarcely an inch in length; of a very thin, delicate conliftence, and orbicular flape. They feemed to be chiefly ufeful in fupporting and raifing the head of the lifh when he came up to breathe; which he was obliged to do every four or five minutes. Acrofs the body were a number of fmall bands, annular divifions, or rather ruga of the fkin. By means of thefe the finh feemed to partake of the vermicular nature, had the power of lengthening or fhortening its body like a worn!, and could fwim back wards as well as forwards, which is another property of the vermicular tribe. Every now and then it laid itfelf on one fide in the water, as if to relt.-For an account of the fingular propertics of this tilh, fee Electricity, n 255 .

## $\left.G \begin{array}{lllll}\mathrm{G} & \mathrm{P} & 253\end{array}\right] \quad G \quad Y \quad P$

eceum GYN ECEUM, among the ancients, the apartment of the women, a feparate room in the inmer part of the houfe, when they employed themfelves in fpinning, weaving, and needle work.

GYNAECOCRACY, denotes the government of women, or a llate where women are capable of the fupreme command. Such are Britain and Spain.

GYNAECOCRATUMENI, an ancient people of Sarmatia Europra, inhabiting the taftern banks of the river 'Ianais, mear its opening into the Palus Micotis ; thus called, as authors relate, becaule they had no women anong them; or, rather, becaule they were under the dominion of women. The word is formed of
 overiome q. d. overcome by women.

Fa. Hardouin, in his notes on Pliny, fays, they were thus called, becaule, after a battle which they loit againt the Ama\%ons, on the bauks of the Thermodoon, they were obliged to have venereal commerce with them, in order to get them children: Ei guod vicricibus obfequaniur ad procurandam eis jobolem.- Hardouin calls them the hubands of the Amazons, Alrazzenum connubia; for, as the author obferets, the word unde inult be rettenched from Pliny, having been foilled into the text by people who were not malters of the anthor's meaning, nude Amazonum connubis. See Amazoss. They who take the Amazons for a fabulous people, will conclude the fane of the Gynzecocratumenians.

GYNANI)RIA, (from $\gamma^{\text {rin }}$ a " woman;" and asng a "man.") Tlit name of the zotl: clafs in I, innxus's lexual fyilem, conditing of plants with hermaphredite flowers, in which the flamina are placed upon the flyle, or, to Speak more properly, upou a pillarflaped receptacle, refembling a ftyle, which rifes in the middle of the flower, and bears both the Itamina and pointal ; that is, both the fuppofed organs of generation. See Botany, p. 430 .

The tlowers of this clafs, fays Linnaus, have a monArous appearance, arifing, as lie imagines, from the fingular and unufal fituation of the parts of fructiti. cation.

GYI'SIES, or Egyptiass, an outlandif tribe of vagabonds, who difguifing themfelves in uncouth habits, fmearing their faces and bodics, and framing to themfelves a canting language, wander up and down, and, wnder pretence of telling fortunes, curing difeafes, \&c. abule the common people, trick them of their money, and iteal all hat they can come at.

They are a ftrange kind of cominonwealth among themiclves of wandering impoltors and jugglers, who made their firft appearance in Germany about the beginning of the ath century. Munfter, it is true, who is followed and relied upon by Spelman, fixes the time of their firlt appearance to the year $1+17$ : but as he owns that the firlt whom he cver law were in 1529 , it is probably an error of the prefs for 1517 ; efpecially as other hittorians inforin us, that when Sultan Selim conquered Egypt in the year 15:7, feveral of the natives refufed to fubmit to the Turkifh yoke, and revolted under one Zinganeus; whence the Turks call them Zinganees; but being at length furrounded and banithed, they agreed to difperie in imall parties all over the world, where their luppofed fkill in the black art gave them an univerfal reception in that age of [u-
perflition and credulity. In the compals of a very fer Gipfies. years they gained fuch a number of idle proftlytes (who imitated their language and complexion, and betook themfelves to the fame arts of chiromancy, begging, and pilfesing), that they became troublefome, and cven formidable, to moll of the kates of Europe. Hence they were expelled from France in the year 1560, and from Spain in 1591. And the government of England took the alarm much earlier: for in 15.30 they are deferibed by Stat. 22. Hen. V115. c. 10. ab " an outlandifh people calling themlelves Egyptians, uling no craft nor feat of merchandize, who have come into this realm, and gone from thire to lhire, and place to place, in great companies, and uled great, Cubtle, and crafty means to deceive the people ; bearing them in hand that they by palmiltry could tell mens and womens fortuncs ; and fo many times by craft and fub. tilty have deccived the people of their money, and alfo lave committed inany heinous felonies and robberies." Wherefore they are directed to avoid the realm, and not to return under pain of imprifonment, and furfeiture of their goods and chattels; and upon their triais for any felony which they may have committed, they Thall not be intitled to a jury de medietatc lizsur. And afterwards it is enacted, by flatutes ift and 2 d Ph . and Mary, c. 4. and 5th Eliz. c. 20. that if any fuch perfous thall be imported into the kingdom, the importer Thall forkeit fol. And if the Egyprians themfelves remain one month in the kingdom, or if any perfon being 14 years old, whether natural-born fubjeet or Atranger, which hath been feen or found in the fellowfhip of fuch Iegyptians, or which hath difguifed him or herfelf like them, thall reuait in the fame one month at one or feveral times, it is felony without benefit of clcrgy. And Sir M. Hale informs us, that at one Suffolk affizes, no lefis than 13 perfons were executed upon thefe itatutes a few years before the reftoration. But, to the honour of our national humanity, there are no inftances more modern than this of carryiner thefe laws into practict; and the lat fanguinary act is itfelf now repaled by 23 Gen. III. c. 54 .

In Scotand try ferm to lave enjoyed tome fhare of indulgence: for a writ of privy feal, dated 150t, fupports John aw, lurd and earl of Little F.gypt, in the exccution of jultice on his company and folk, conform to the daws of Egypt, and in punithing certain perfons there named who rebelled againtt him, left him, robbed him, and refufed to return home with lim. James's fuijects are commandel to affit in apprehending them, and in alfilling Faw and his auherents to return home. 'There is a like writ in his favour from Mary Q. of Scots 1553 , and in 1554 he obtained a pardon for the murder of Nunan Saall. So that it appears he had thaid long in Scockand, and perhaps fome of the time in England; and from hin this kind of trolling people might receive the name of $F_{a}$ Gang, which they lill retain.

A very circomllantial account of this fingular race of vagrants has been lately given in an exprefs Inquiry concerning them, written in German by H. M. G. Grellinan, and tranlated by Mr Raper. It is incredible to think how this regular fwarm of banditti has fpread itfelf over the face of the earth. They wander about in Afia, in the interior parts of Africa, and, like loculls, have over-run molt of the European nations

Gypfies. In the reigns of Hemy VIII. and queen Eliza. beth, as we have feen, they were fet up as a mark of general perfecution in Fingland; yet their numbers do not appear to have much diminifhed. Spain is fuppofed by Mr Twils tu contain 40,000 of thefe vagraues; but by others 60,000 ; and by fome even double that number. They are leds numetous in France in confequence of the flrietnefs of the police. In Italy they abound, efpecially in the dominions of the church, on account of the bad police and the prevalence of firpertition, which permit and entice them to deceive the ignorant. Ther are feattered, though not in great numbers, through Germany, Deumark, Sweden, and Ruffia; but their chief population is in the fouth-ealt parts of Europe, which feem to be the general renduzvons of the gyply nation. At a moderate computation Europe contains more than feven hundred thoufand of thefe vagabonds. - For near four centuries they thave wandered through the world; and in every region, and among every people, whether barbarous or civilifed, they have cominued equally unchanged by the lapfe of time, the variation of climate, and the force of example. Their fingular phyfiognomy and particular manners are the fane in every country. Their fwartly complexion receives no darker thade from the burning fun of Africa, nor any fairer tincture from the temperate climates of Europe ; they contract no additional lazinefs in Spain, nor acquire any new indultry in England; in Turkey they behold the moique and the crefeent with equal indifference as they do the reformed and the cathatic church in Europe. In the neightourhood of civilifed life they continue barbarous; and, beholding around them cities and fettled imhabitants, they live in tents or holes in the earth, and wander from place to place as fugitives and vagabonds.

They are paffionately fond of ornaments; in which however they confult ueither propriety nor confill incs; they will wear an old laced coat, while the rett of the grarments fearcely hang together. In Hungary and Tranfylvania, their funmer habitations are tents; Alicir winter ones holes 10 or 12 feet deep in the earth, escept fuch as keep inns, or exereife trades. They ane fond of plate, particularly filver cups, which they hury under the heasth for fecurity. Their priacipal occupations are, fnith's wook, or tinkers, or wooden ware, and hone-dealing; and in Hungary and Tranfylumin they are excrutioners of criminals, flayers of eieal healls, and wathers of gold. The women deal in deld claaths, prollitution, wanton dances, and fortunctelling. Notwithtlanding thefe occupations, the najonty of this people are laky, beggars, and thieves. They bring up their ehildren to their own profefions, and are very fond of them. They have few diforders, except the mealles and fmall-pox, and weaknefs in their cyes, ocealioned by the fmoke, and live to an advanced are, wi.hallrong attachment to life. Their phyfic is fattion in their toups, or blecdiag.

Thefe people, however, appear to be ditinguifhed by diflerent ing gularities in different comatries. At leaft in che fulloning circumftances the Cerman gypfies differ widtly from thofe we commonly meet with in Lugland. It is a great feaft to them, our author fays, whenever they can procure a roaft of catte that dicd of any dittemper. It is all one to them, whether
it be carrion of a meep, hog, cow, or other bealt, horfe fleh only excepted; they are fo far from being difgutted with it, that to eat their till of fuch a meal, is to them the height of epicurifm. When any one cenfures their tatte, or thows furprife at it. they anfwer, "The flefh of a bealt which God kills, mult be better than of one killed by the hand of man." They therefore take every opportunity of getting fuch dainties. That they take carrion from a layitall, as is affirmed of the gypfies in Hungary, is by no means certain, any more than that they eat horfe-fleth. But if a bealt out of an lierd dies, and they find it before it becomes rotten and putritied; or if a farmer gives them notice of a cow dead, they proceed, without hefitation, to get poffifion of this booty. Their favourite object is animals that have been deftroyed by fire; therefore, whenever a conflagration has happened, either in town or country, the next day the g $\rho$ pfies, from every ncighbouring quarter, affemble and draw the fuffocated half confumed beatts out of the afhes. Men, women, and children, in troops, are extremely bufy, joyfully carrying the flefl home to their dwel-ling-places; they return feveral times, provide themfelves plentifully with this roaft ineat, and gluttonize in their huts as long as their notle fare lalts.

The gypfies have, at leaft in Tranfylvania, a fort of regular yovernment, rather nominal than real or effective. 'They have their leaders or chiefs, whom they dittinguifin by the Sclavonian title, W'ayzode. To this dignity every perfon is eligible who is of a family defeended from a former waywode; but the preference is generally given to thofe who have the beft clothes and the molt wealth; who are of a large ttature, and not patt the meridian of life.-Of religion, however, they have no fonfe; though, with their ufual cunning and hypocrify, they profels the eflablifhed faith of every country ill which they live. They alfo fpeak the languages of the repertive countries, yet have a language of their own; from whence derived, authors diffir. The only fcience which they have attained is mulic. Their poetry is ungrammatical indecent rlyme.

Their general character and capacities are thus deferibed: Inagine people of a childith way of thinking; their minds filled with raw, undigetted conceptions; guided more by fenfe than reafon; ufing undertanding and retlection so far only as they promote the gratitication of any particular appetite; and you have a per-
 unconmonly loquacious and chatering; fickle in the extrene, coifequently incouftant in their purfuits; faithlefs to every body, even their own caft; woid of the leat emotion of gratitude, frequently rewarding benefits with the mof infidious malice. Fear makes them Alavihly co:njliant when under fubjection; but having nothing to apprehend, like other timorous people, they are cruel. Dcife of revenge often caufes them to take the moit defperate refolutions. To fuch a degree of violence is their fury fometimes excitcd, that a mother has been known, in the excefs of paffion, to take her fmall infant by the feet, and therewith frike the object of her anger, when no other infirument has readily prefented itfelf. They are fo addicted to drinking, as to facrilice what is mofl neceflary to them, that they may fealt their palate with fpirite. They have, too,

## G Y P

what one would little expect, an enormous thare of vanity, which hows itielf in their fondnels for fine clothes, and ther trait an! deportment when crefed in them. One anghe imogine that this pride would have the gooll uf it t. rember a gepfy cautious not to be guilty of fuch crimes as fuhjo © him to public thame; lut here comes in the leviey of chancter, for he never houks to the right nor to the left in ! his tranfactions. In an hou's time he forgets that he is jut untied from the whipping pot. But their prise is grounded on mere idle conctit, as appears platily from their makiog it a proint of honour to abule their companions, and put on a terrible appearance ia the public market, where they are fure to have many fectutors; they cry out, make a vislent noife. challenge their adverfary to fighe, but very feldumany thing comes of it. Thas the gipfy feek's honour, of which his ideas coincide very thele with thofe of other people, and fometimes deviste entirely from propricty.
"Nothing (contivues our author) can exceed the tunceltrained de pravity of manners exitting anong thefe people, I allude particulaty to the other fes. Unchecked by any idea st thame, they give way to every defire. The mother endeavours, by the $m$ at feand alous arts, to train up lier daugher for an offering to fenfuality: and this is !earce grown up bcfure the becomes the feducer of others. Lavinufis is fo prevalent among thena, that were thay to fablit by their own labour only, they would herdly, have bread for two of the feven days in the week. This indolence incteafes their
 ants on idlenefs. They feek to avail themfelves of every opportunity to fatisfy their lawlefs delires. Their miserfal bad character thereforc for iocklenefs, infidehis, ingratitude, revenge, malice, rage, depravity, lazinefs, knavery, thievifnefs, and cuaning, though not deficient in capacity ant clevernefs, render thef people of no ufe in fociety, except as foldiers to form marand. ing parties. Ferfons in the ir company, and under their difguife, have formed dagerous detigns againl cities and comntries. They have been baniked frum alenot all civilized flates, in their turn, except Hungary and Tanfylvania, and to little purpofe Our author is of opinion, that as 'turkey would allo:v them teleration, it would be better for the European ils es to take frane theps for chivating aad civilizing them, and making them ufeful. But while they are intemble of religion and Irongly attached to their own manaers, it is to be feared the attempt will be impracticable. This appars from a very intelligent Hungarian lady's experience on the fubject, communicated in a letter as follows: 'There are a great number of them on my eflates, but I have permitted two families in particular to eftahlifh themfelves at the place of my own refidence, under the exprefs condition that no others thall come here and join them. I took a!l poffible pains to make them realonable creatures. I fet the elder ones to work; the younger ones tend the cattle. I obferved that they: were more fond of horfis than any thing elfe; for which reafon I placed a gypfy under cach groom. I had their children cluthed, that none of them might be ruaning about naked, according to their ufual practice. It appeated, however, that cuflom was become nature with them. The old oncs worked diligently fo long as any body ilood over them ; the momest their back was iarn-

255 ] G Y P
ed, they all got together in a circle, their legs acrufs, Gifica. facing the fan, and chattered. Thus they cannot poffibly earn more, indeed hardiy fo much, as wonld find them bread, although very choap with us; fur the bead!give them coes not atad me in halt a heruteer the pound. Even in winter they cannot bear a hat un their head nor moes on their feet. 'Ihe buys run like wild things wherever they are fent, cither un foot or on borfeback; but they ipoil horfis unnereifully, beat them on the !ead, jerk the bits in their movehs, to as to make them run down with bloort. They cannot he broteght by any means whatever tu dref horfes. Cluat!s them at you with, they always fell or lofe their clazisa. In a weris, one cannot but conlider them as void of realon; it is really thocking as fee even woll grown chin"ren put whatever they ind matheir mation like inimats bufore they can 〔peak; wherefore they eat cuery thing, even carrion, let it thak never fo mach. Whare a murtality happens among the cattle, there thete wretched beings are to be fuund in the greateit nuin. bers.'

The origin of this people, as we have feen, has been generdlly hetheved to be Eryptian ; and that belief is as old as their exittence in Europe. Thomalius, Satmon the Enghth geographer, and lately Signior Grifelini, have endeavoured to prove it by fatisfactory evidence. This theory, however, according to our author, is without foundation. The Egryptian defeent of thefe people, he thinks, is not only dettitute of proofs. but the molt politive evidence is foumd to coutradict it. Their language differs entirely from the Cuptic; and their cattoms are very different from thofe of the E. gyptiaas. They are insecd to be found in Egypt; but they wander about there as itrangers, and form a diftin people, as in other countries. The expreftions of Bellonius are Arong and decifive: "No part of the world, I believe, is free from thole han liti, wondering about in troops, whom we by millake call Eersptinns and Bobemians. When we were at Cairo, and in the villages bordering on the Nile, we found tromps of thete Arolling thieves litiong under paln-trets; an 1 they are elicemed foreigners in Egypt as well as a. monir us."

The Exyptian defeent of the supfies being rejected, wor aushor next endavenars to then that they come from Hindotan. The chicf balis of his theury, howcrer, is no other than that very dubions one, a finilarity of language. He adds a long vocabulary of the giply and the Hindotlanic languages: in which, it mull be coufefled, many words are the fame; but mary are different. A principal proot which he adjuces on this head is from the rclation of Captain szekely von Doba, to whom a printer in $177^{3}$ related, that a preacher of the Reforned church, when a fludent at letyen, being intinately acquanted with three young Malabar fludents, took dewn 1000 of their words, which he fancied correfponded with the gipfy lan:guage; and they adjed, hat a trast of land in their illand was named Ozigamit. He repeated thefe words to the Raber gyplies, who expluined them without trouble or hefitation. This account was publified in the Viemna Garette. Supphing thefe three young men to be fons of Bramins, who ufe the Sanfrit, the common language of Hindokan conves as near to that as moden Ltalian to pure Latin. The comparifor of

## G Y P [ 256 ] G Y P

Gypfiea. the two languages takes up above 30 pages; and Mr Grellman thinks it eftatithes his fythem. The fame opinion is maintained by Mr Marfden, in a paper upon this fubject in the ; th volume of the Archeologia. 'Whe numerals, however, both in Hindottanic and gipfy, dif. fer greatly as flated by the two authors. And here, as in other fuch comparifons, one is allonifhed at the credulity of the comparers of orthoepy and orthography (as a periodical critic obferves), which can lave no conneetion in languages with which we are not perfectly familiar, even were both languages reduced to writing by their refpective people: how much lefs, then, where one of the two languages is never reduced to writing, as is the cafe of the giply, but is blended with the languageof the country where the clan relides? This appears from the correfpondence of feveral words in all languages with the gipfy. Mr Grellman acknowledges the two giply verlions of the Lord's Prayer, at different periods, dific io widely, that one would almoft be inclined to doubt whether they were really the fame hanguage. We think we can difcern a few words differently indeed written, but probably pronounced alike. Nor can we, in all the languages in which Chamberlayne gives the Lord's Prayer, perceive the leatt refemblance to the gipiy name of father, Doule and Dad, except in the Wellh, Taad. In profecuting his argument, Mr Grellman does not infill on the dimilarity of colour between the two people, nor on the cowardice common to both, nor on the attachment of the Indians to tents, or letting their children go naked; all thefe being traits to be met with in other nations: but he dwells on the word Polgat, the name of one of the firlt gipfy leaders, and of the Indoftanic god of marriage; alfo on the correfpondence between the travelling fmitlis in the twe people, who carry two pair of bellows; the Indian's boy blows them in India, the wife or child of the gipfy in Europe: As if every travelling tinker, in every nation where tinkers travel, lad not the fame journeymen. In lafcivious dances and chiromancy the two people agree; nor are thefe uncommon in other parts of the globe. The exceffive loquacity of the two people is produced as fimilar ; as if no other nations in the world were loquacious. Fainter refemblances are, a fondnefs for faffron, and the intermarrying only with their own people. The laft pofition in the author's theory is, that the gipfies are of the loweft clafs of ludians, namely, Parias, or, as they are called in Hindoftan, Suders. He compares the manners of this clafs with thofe of the gipfiea, and enumerates many circumftances in which they agree: fome of the comparifons are frivolous, and prove nothing. As an inflance of which we may take the following: ' Giplies are fond of being about horfes; the Suders in India likewife, for which reafon they are commonly employed as horfe-keepers by the Europeans retident in that country.' This reafoning does not prove that the gipfies are Suders, any more than that they are Arabians or Yorkfhire farmers.

The objections, however, to which this learned and indull rious author's theory is liable, are fuch as only thow it to be by no means fatisfactory; but do not prove that it is wrong. It may poffibly be right; and upon this fuppotition the caufe of their emigration from their country, he conjectures, not without probability, to be the war of 'Cimur Beg in India. In the
$\mathrm{N}^{\circ} 147$.
years $1+08$ and $1 \neq 09$ this conqueror ravaged India; and the progrefs of his arms was attended with deva. ftation and creelty. All who made refiltance were deAroyed; thofe who fell into the enemy's hauds weremade Haves; of thefe very flaves 100,000 were put to death. As on this occation an univerfal panic took place, what could be more natural than that a great number of terrified inhabitants flould endeavour to fave themfelves by fight ?-In the lalt place, the author endeavours to trace the ronte by which the giplies came from Hindoftan to Europe: but here he juttly acknowledges that all that can be faid on the fubject is mere furmile; and, upon the whole, after perufing all the preceding details, the reader will probably be of opinion that there lill hangs a cloud over the origin of this extraordinary race.

GiPSOPHILA, in botany : A genus of the digynia order, belonging to the decandria clafs of plants; and in the natural method ranking under the 22d order, Caryoplyyllic. The calyx is monophyllous, campanulated, and angulated; the petals are five in number, ovate, and feffile; the capfule globofe and unilocular.

GyPSUM, Plaster-stone, or Alabofer; a natural combination of the calcareous earth with vitriolic acid. See Alabasper.

The properties of gypfum, according to Cronfledt, are, i. It is loofer and more friable than a calcareons earth. 2. It does not effervefee with acids either in its crude or calcined thate; or at molt butis a very light degree, in proportion to what it wants of the vitriolic acid for the complete faturation of its bafe. 3. It falls into powder in the fire very readily. 4. When burnt without being made red-hot, its powder readily concretes with water into a mafs which foon hardens; but without any fenfible heat being excited in the operation. 6. According to our author, it is nearly as difficult of fufion as limellone; and thows almolt the fame effects upon other bodies with limefone, though the acid of vitriol feem to promote the vitrification. M. Magellan, however, informs us, that he has found moft of the gypfeous kind, particularly the fibrous, to melt in the fire pretty cafily by themfelves. 7. When melted in the fire with borax, it puffs and bubbles very much, and for a long time during the fution. According to M. Magellan, when a fmall quantity of any gypfum is melted together with borax, the glafs becomes colourlefs and tranfparent; but fome forts of alabatter and fparry gypfx, when melted in quantity with borax, yield a fine ycllow tranfparent coloured glafs, refimbling that of the beft topazes; but if too much of the gypfum is ufed in proportion to the borax, the glafs becomes opaque, juft as it happens with the pure limeflome. 8. When burnt with any inflammable matter it emits a fulphureous fmell, and may thus be decompounded, as well as by either of the fixed alkaline falts; but if this lall method is followed, there ouglit to be tive or fix times as much falt as there is of gypfum. 9. On being decompounded in this manner the refiduum commonly thows fome figns of iton. The fpecies are,

1. Friable gypfeous earth of a white colour, found in Saxony.
2. Indurated gypfum of a folid texture, the particles of which are not vifible, commonly called alabufer. This is fometimes found unfaturated with vitriolic acid;

## G Y P $\quad[257] \quad G \quad Y$ S

fon. in which cafe ouly it will efervefce with aquafortis, as it is faid to do under the article Alapaster. It is very eafily fawed or cut, and takes a dull polifh. It is of feveral kinds; as, white; clear and traniparent from Perfia, opaque from Italy and Trapans in Sicily ; of a yellow colour, of which there are likewife two kinds, tranfparent and opaque; the furmer being neet with in the eaftern countries, the latter in Spain. Brunnick informs us, that in this country there are agreat many fine varicries of the fpecies we treat of; and from hence 'he fuppofes that the ancients obtained the beautiful alabafters they ufed. Fabronit tells us, that a great variety of fine alabatters are met with in Italy. Twentyfour quarries of them, each of a different colour, are now worked ont at Volterra; but he is of opinion that the Romans brought the greatef part of the daballers they made ufe of from Creece.
3. Gyplum of a fealy texture, or common plafter of Paris. This is found in many different counsries, of two kinds; viz. white with coarfe feales, or with fmall fcales yellowifh or greyith. According to leergnan,
 reous earth, and 22 of water. It is fuluble in 500 -times its weight of warm water, or 450 times its weight of boiling water. It is well known by its property of forming an hard mafs with water after heing fightly burned; and during this confnlidation a flig!t degree of heat is produced, though lets than when linie is flaked. It is often employed in buildiug; and may be taken off and ufed again and again for the fame purpoic.
4. Fibrous gypfum, or plafter flonc, has like wife two varieties, viz. with coarfe or with fine fibres. It is of a white colour.
5. Selenites, or fpar-like gypfum, by fome alfo called glacies mane, and confounded with the clear and tranfparent mica. It is found of two kinds, clear and Tranfparent, or yellowifh and opaque.
6. Cryflallized gypfum, or gypfeous drufen. This is found compored of ${ }_{3}$ wedge-flaped and fometimes of capillary cryfals, fometimes white and fometimes yellowin.
7. Stalactitical gypfum is found of a great many dif. ferent forms and colours. When found in large pieces it commonly varies between white and yellow, and likewife in its tranfparency in different parts of the fame mafs. It is ufed as alabafter in feveral works.

Befides the countries alrcady mentioned, Encland abounds with fubllances of a gypfeous nature. There
are plenty in Merby fhire and Nottinghamfire, fo lins as to be ufed like alabafer, that is, to take a fine polifi. In the counties juft mentioned there are laree pies of this kind, alfo in mof of the clifis of the Severn, efecially at the Oll Dafage in Sonerfe: mire A very fine Cemipellucid folid alabater is foum in Derbyfire. Very fine fibrous tales are allo fuand in the above mentioned pis of fone, and many other places. Selenites cvery where abound, fo that it is impotible to enumerate the difierent places. Very fine gypfenns drufen are found in Sheppey Ihe, and lome exceedingly beautiful, large and clear as crytal, have been durg froin the falt rocks at Nastwich in Chefhire. The fucnites rhomboidales is found in plenty in England, tho' rare in other countries. Shotover lill in Oxfordmire is re. marliable for them. The Ife of Sheppey afords a kind of fpar-like gypfa. of a fibrous nature, and always acecreting like the radiations of a far on the feptaria, and thence called fala fistarii.

The principal ule of gypfum is as a material for fmall flatues and figeres of various kinds, alfo for moulds for cafting wax-work, Eic. It has lately been introduced as a manure in Yrance and America, thourh its fuecels in this refpect liss not yet been fufficiently experienced.

GYR-facco, in zoology, the name of a hrge and Gerce fpecies of falcon, called is. Englifh the jer-falcon. See Eatco.

It is a very bold and daring bird, attacking all other fowl without referve, particularly the heron ard ftork kinds The other falcons are all afraid of this.

GYRINUS, in zoology ; a genus of infects of the coleoptera order. The generic characters are:. The anienne are cylindrical, fiff, and morter than the head; and the eyes are four, two on the upper ard two on the under part of the head. Mr Barbut, however, fays that the eyes only appear on the upper ard under parts of the head, but that they are not four. The natator, or common water flea, is of a bright black colour ; the feet are yellow, flat, and large; the infect is in length one-third of an inch. It runs with great celerity in circles on the furface of the waters, and is very difficult to catch, plunging down inflantaneoully when attempted to be taken. There are eight other fpecies, which frequent the waters in different parts of the globe.

GISHORN, a town of Germany, in the duchy of Lunenburgh, fituated on the river Aller, in E. Long. 10.45. N. Lat. 52.50.

mony is over, and the company breaks up, they wifh one another, not " a good night," but " a good week."
H. IBEAS corpus, in law, is the great remedy in cafes of Falfe Impisonment. The incapacity of the three other remedics referred to under that article, to give complete relief in every cafe, hath almof entirely antiquated them, and hath eaufed a general recourfe to be had, in behalf of perfons aggrieved by illegal imprifonment, to the prefent writ, the mult celebrated in the Englifi law. Of this there are various kinds made ufe of by the courts at Weftminiter, for removing prifoners from one court into another for the more eafy adminiftration of juttice. Such is the hatleas cerpus ad refrondendim, when a man hath a caufe of action againll ene who is confmed by the procefs of fome inferior court; in order to remove the prifoner, and charge him with this new action in the court above. Such is that ad fatisfucitndum, when a prifoner hath liad judgneut againt him in an action, and the plaintiff is defirous to bring him up to fome fuperior court to charge him with procefs of execution. Such alio are thofe ad profoquendum, tifificandum, deliterandum, \&e.; which iflue when it is neceltary to remove a prifoner, in order to profecute or bear teftimony in any court, or to be tried in the proper jurifdiction whercin the fact was committed. Such is, laftly, the common writ ad futiendum et recipsendum, which iffues out of any of the courts of Whtminfterhall, when a perfon is fued in fome inferior jurifdiction, and is defrous to remove the action into the fuperior court; commanding the inferior judges to produce the body of the defendant, together with the day and caufe of his eaption and detainer (whence the writ is frequently denominated an hateds corpus cum caufa), to do and reaive whatfoever the king's court fhall confider in that behalf. This is a writ grantable of common right, without any motion in court; and it in. Aantly fuperfedes all procecdings in the court below. But, in order to prevent the furreptitious difeharge of prifoners, it is ordered by fatute i \& 2 P. \& M. c. 13. that no babous copurs hall iflue to remove any prifoner out of any groal, umefs figned by fome judge of the court out of which it is awarded. And, to aroid vexatious delays by removal of frivolous caufes, it is cnacted by flatute 21 Jac. I. c. 23. that, where the judge of an inferior court of record is a barrilter of three years ftanding, no caufe flall be removed from thence by labias carpus or other writ, after iffue or demurrer deliberately joined: that no caufe, if once remanded to the inferior court by writ of procedondo or otherwife, fhall ever afterwards be again removed : and that no caule fall be removed at all, if the debt or damates laid in the declaration do not amoune to the fum of five pounds. But an expedtent having been found out to elude the latier branch of the ilatute, by procuring a nominal plaiutiff to bring another action for live pounds or upwards (and then by the courfe of the court the bateres corins removed both actions together), it is therefore cnacted by flatute 12 Geo. I. c. 29: that the inferior court may proced in fuch actions as ate under the value of five pounds, notwith!landing other actions may be brought againt the fame defendant to a greater amount.

But the great and efficacious writ, in all manner of illegal:

## H A B

illegal confinement, is that of babeas corpus ad fiujicitendum ; directed to the perfon detaining another, and commanding him to produce the body of the prifoner, with the day and caufe of his caption and detention, ad fuciendum, fuljiciendum, et recipiendun, to do, fub. mit to, and receive whatfoever the judge or contt awarding fueh writ hall confider in that behalf. This is a high prerogative writ, and therefore by the common law ifuing out of the court of king's bench, not only in term-time, but alfo during the vacation, by a fiat from the chief jultice, or any other of the judges, and running into all parts of the king's dominions: for the king is at all times intiled to have an accoun: why the liberty of any of his fubjects is reftrained, wherever that reftraint may be inflisted. If it iffues in vacation, it is ufually returnable before the judge himfelf who awarded it, and he proceeds by himfele thereon; unkfs the term fin whld intervene, and then it may be returned in court. Indeed, if the party werc privileged in the courts of common pleas and exchequer, as being an officer or fuitor of the court, an bad bcus corpus ad fubjicicondunn might alto, have been awarded from thence; and, if the caufe of imprifment were palpably illegal, they might have difcharged him: but if he were committed for any criminal matter, they could only lave remanded him, or taken bail for his appearance in the court of king's benct, ; which occafioned the common pleas to difeountenance fuch applications. It hath alfo been faid, and by very rejpectable authorities, that the like habeas corpus may iffue out of the court of chancery in vacation: but, upon the famous npplication to lord Nottingham by Jenks, notwithfanding the moft diligent fearches, no precedent could be found where the clancellor had if. Sued fuch a writ in vacation; and thercfore his lordflip refuled it.

In the court of king's.bench it was, and is ftill, neceflary to apply for it by motion to the court, as in the cafe of all other prerogative writs (cemiorari, probibition, mandamus, \&c.) which do not iffue as of mere courfe, without fhowing fome probable caule why the extraordinary power of the crown is called in to the party's aflittance. For, as was argued by lord chief juftice Vaughan, "it is granted on motion, becaule it cannot be had ef courfe; and there is therefore no neceffiey to grant it: for the court ought to be fatisfied that the party hath a probable caufe to be delivered." And this feems the more reafonable, becaufe, when once granted, the perfon to whom it is directed can return no fatisfactory excufe for not bringing up the body of the prifoner. So that, if it iffued of mere courfe, without fhowing to the court or judge fome reafonable ground for awarding it, a traitor or felon under fentence of death, a foldier or mariner in the king's fervice, a wife, a child, a rclation, or a domeftic, confined for infanity or other prudential reafons, might obtain a temporary enlargement by fuing out an babeas corpus, though fure to be remanded as foon as brought up to the court. And therefore Sir Edward Coke, when chief jultice, did not Scruple, in 13 Jac. I. to deny a bateas corphus to one confined by the court of admiralty for piracy; there appearing, upon his own flowing, fufficient grounds to confine him. On the other hand, if a probable ground be fhown, that the party is imprifoned without
jut caufe, and thercfure hach a right to be delivered, the writ of babeas corjaus is then a writ of right, which " may not be denied, but ought to be granted to every man that is committec, or detained in prifon, or otherwife reftrained, though it be by the command of the king, the privy-council, or any other."

In the articles Libfrty and Rigits, we expatiated at large on the perfonal liberty of the fubject. This was hown to be a natural inherent riglit, which could not be furrendered or forfeited unlefs by the commiffuon of fome great and atrocious crime, and which ought not to be abridged in any cafe without the fpecial permifion of haw. A doctrine coeval with the firtt rudiments of our conatitution ; and lamded down to us from the Anglo-Saxons, not withillanding all their Atruggles with the Danes, and the violence of the Norman conquelt : afferted afterwards and confirmed by the conquerer himfelf and his defeendants: and though fometimes a little impaired by the ferocity of the times, and the occalional derpotifm of jealous or ufurping princes, yet eflablifhed on the firmett bafis by the provitions of magna charta, and a long fucceffion of ftatutes enasted under Edward III. To affert an abfolute exemption from imprifonment in all cafes, is inconfiltent with every idea of taw and political fociety; and in the end would deftroy all civil liberty, by readering its protection impoffible: but the glory of the Englifh law confitts in elearly defining the times, the caufes, and the cxtent, when, wherefore, and to what degree, the imprifonment of the fubject may be lawful. This it is which induces the abfolute neceffity of exprefing upon every commitment the reafon for which it is made ; that the court, upon an babeas corpus, may examine into its validity ; and according to the circumitances of the cafe may difcharge, admit to bail, or remand the prifoner.

And yet, early in the reign of Charles I. the court of king's-bench, relying on fome arbitrary precedents (and thofe perhaps mifunderflood), determined * that . Stote they could not upon an babeas corpass either bail or Trials, viie, deliver a prifoner, though commitred without any ${ }^{1} 36$. caufe affigned, in cafe he was committed by the fpecial command of the king, or by the lords of the privecouncil. This drew on a parliamentary inquiry, and produced the petilion of right, 3 Car . I. which recites this illegal judgment, and enacts that no freeman hereafter Thall be fo imprifoned or detained. But when, in the following year, Mr Selden and others were committed by the lords of the council, in purfuance of his majelty's fpecial command, under a general charge of "notable contempts and flirring up felition againit the king and government," the judges delayed for two terms (including alfo the long vacation) to deliver an opinion how far fuch a charge was bailable; and when at length they agreed that it was, they however annexed a condition of tinding fureties for the good behaviour, which till protracted their imprifoninent ; the chicf jultice Sir Nicholas Hyde, at the fane
 for that caufe, perhaps the court would not afterwards grant a bubeas corpus, being already made acquainted with the caufe of the imprifonment.: But this was heard with indignation and aftonifhment by every lawyer prefent; according to Mr Selden's

## H A B

Hatcas Cospus.
own account of the matter, whofe refontment was not cooled at the ditance of four and twenty years.

Thefe pitiful evalions gave rife to the itatute 16 Car. 1. c. 10. §.8. wherehy it is enacked, that if any perfoas be committed by the king himedf in perfon, or by his privy council, or by any of the members thercof, he fhall have granted unto him, without any delay upon any pretence whatfoever, a writ of babeas coritus, upon demand or motion made to the court of king's bench or common-pleas; who fhatl thereupon, within three court.days after the return is made, examine and determine the legality of fuch commitment, and do what to jultice hall appertain, in detivering, bailing, or remaming fuch prifoder. Yet thill in the cafe of Jenks, ixfore alluded to, who in 16,76 was committed by the king in council fur a turbulent fpeech at Guldinail, new hiifts and devices were made ufe of to prevent his enlargement by law; the chief juttice (as well as the chancellor) declining to award a writ of babeas corpus ad fuljaziendura in vacation, though at lalt he thought proper to award the ufual writs add diliberandum, \&ice whereby the prifoner was difeharged at the Old Bailcy. Other abufes had alio crept into daily practice, which had in fome mealure defeated the bentfit of this great conflitutional re medy. The party imprifoning was at liberty to delay his obedience to the firf writ, and might wait till a fecond and a third, called an alius and a pheries, were iffued, before he produced the party: and many other vexatious fhifts were pracuifed to detain flateprifoners in cultody. Dut whoever will attentively confider the Englifh hiftory, may obfene, that the Qlagrant abule of any power, by the crown or its minitters, has always been productive of a Atruggle; which either difcovers the exercife of that power to be contrary to law, or (if legal) reftrains it for the future. This was the cafe in the prefent iatance. The opprefion of an obfeure individual gave birth to the famous babeas corpas act, 31 Car. H. c. 2. which is frequenty confidered as another mugha carta of the kingdom; and by confequence has alfo in fubfequent times reduced the mathod of proceeding on thefe writs (though not within the reach of that flatute, but ifinuing merely at the common law) to the trae flandard of law and liberty:

The ftatute itfelf enadts, 1. That the writ fhall be returned and the prifoner brought up, within a limited time according to the diltance, not exceeding in any cafe twenty days. 2. That fuch writs fhall be ender. fed, as granted in purfuance of this act, and figned by the perion awarding them. 3. That on complaint and requet in writing by or on behalf of any perfon committed and charged with any crime (unlefs commited for treafon or felony exprefled in the warrant, or for fufpicion of the fame, or as acceffary thereto before the fact, or convieted or charged in execution by legal procefs), the lord chancellur, or any of the twelve judges in vacation, upon viewing a copy of the warrant, or affdavit that a copy is denied, fhall (unlefs the party has neglected for two terms to apply to any court for his enlargement) award a babeas corpus for fuch prifoner, returnable immediately before himfetf or any other of the juiges; and upon the return made mall difcharge the party, if bailable, upon giving leeurity, to appear and anfiwer to the accufation in the
proper court of judicature. + That officers and keepers ueglecting to make due returns, or not delivering to the prifoner or his agent within fix hours afier denand a copy of the wariant of conmitment, or thifting the cutlony of a pilfoner from one to ano. ther without futficient reafion or authority (fyecified in the aft), hall for the firte offence forfeit icol. and for the fecund offence 2001. to the party grieved, and be difabled to hold his office. 5. That no perfon, ouce delivered by kabcas corpsiss, fhall be recommitted fur the fame offence, on penaliy of $j 001$. 6. That every perfon committed for treafon or felony thall, if he requires it the firit week of the next term, or the fi th day of the next feffion of oyer and termiace, be indited in that term or felfion, or elfe admitted to bail; unlefs the king's. witnefles cannot be produced at that time : and if acquitted, or if not indicted and tried in the fecond term. or foffion, he flall be difcharged from his inprifonment for fuch imputed offence: but that no perfon, after the allifes thail be opened for the county in whichs. he is detained, flall ber removed by bolleas corpess, till: after the ablifes are conded; but ilatil be left to the juttice of the judges of affife. 7. That any fuch prifoner may move for and obtaiu his bateas corpus, as well out of the chancery or exchequer as out of the king's bench or common pleas; and the lord chancellur or judges denying the fame, on fight of the warrant, or oath that the fame is refufed, forfeit feverally to the party grieved the fum of 5001 . 8. That the whit of babeas corpus fhall run iato the connties palatine, cinque prors, and other privileged places, and the ifands of Jerfey and Guernfey. 9. That no inhabitant of England (except perfons contracting, or conviets praying to be tranfoorted; or having committed fome capital offence in the place to which they are fent) Thall be fent prifoner to Scotland, Ireland, Jerfey, Guernfey, or any places beyond the feas, within or without the king's dominions: on pain. that the party committing, his advifers, aiders, and afflants, thall forfeit to the party grieved a fum nok. lefs than 5001 . to be recovered wich treble colts; Mall. be difabled to bear any oflice of tralt or profit ; thall incur the penalties of prem:mire; and hall be ineapable. of the king's pardon.

This is the fublance of that great and important flatute: which extends (we may ubferve) only to the cafe of commitments for fuch criminal charge as can. froduce no inconvenience to public jultice by a ternperary enlargement of the prifoncr; all other cafes of unjult impritonment being left to the baleas corpes at common law. But gevn upon write at the conimon law it is now expetted by the court, agreeable to ancient precedents and the fpirit of the act of parliament, that the writ fhould be imunediately obeyed, without waiting for any alias or phariss; otherwife an attachment will iflue. By which admirable regulations, judicial as well as parliamentary, the remedy is now complete for removing the injury of unjult and iltegal continemenr. A remedy the mere neceffary. becaule the oppreffica does not always arife from the ill-nature, but fometimes from the mere inattention, of government. For it frequently happens in foreign. countries (and has happened in England during tho tomporary fufpeniuass of the tazutc), that perfons ape
preheaded

## H A B

prehended upon fufpicion have fufiered a long imprifonment, merdy becanfe they were forgotten.

HABERDASHER, in commerce, a feller of hats and other finall wares. - The mather and wardens of the company of laberdafiers in London, calline to their afthlance one of the company of cappers, and another of the hat-makers, aad mayors, sec. of towns, may feareh the wares of all hatters who work hats with foreign wool, and who have not been apprentices to the trade, or who dye them with any thing but copperas and yalls, or woad and madder: in which cafes they are liable to penalties by Rat. S. Eliz. cap. 7 . and 5 Geo. II. cap. 22.

For the etymology of this denomination, fee Ber. dash.
HaBergion, or Haubergen, Harergetum, a coat of mail ; an ancient piece of defentive armour, in form of a coat, defcending from the neck to the middle, and formed of litule iron riugs or mafhes, linked into each other. - The word is alio written balerge, hanberge, baubeve, baubert, hauther, beatbert, and baulerk. Spelman takes it to have been formed from the ancient Firench kaule, "high," and bers, "armoer, cosering;" as ferving to defend the upper part of the body. Du Cange and Sxinrer choofe to derive it from the Belgic bads, or Tentonic bahz, "neck," and kergen," to cover ;" as if it were a peculiar defence for the neck. Others will have it formed of al, alla, q. d. all, and bersen, "to cover;" as importing it a cover for the whole body.

HABICO'T (Nicholas), a celfbrated furgeon, born at Bonny in Gatimois, acquired great reputation by his ikill in his protefion, and by tis writings; and died in 162 . He wrote a treat: $\mathrm{Fe}_{\mathrm{c}}$ on the plague, and feveral other curions works.

HABINGTON (William), an Englifh poet and hiftorian, was the fon of Thomas Habinginn, Eff. He was born in 1605 , at Hendlip in Worcelteshire; and was edscated at St Oncrs and at Paris. He died in 1054 , and left feveral manufcripts in the hands of his fon. His printed works are, I. Poems under the tille of Calura. 2. The queen of Arragon, a tragit-comedy. 3. Obfervations upon Hillory. 4. The hilory of Edward IV. king of England, written and publifined at the detire of Chatles I. This work is compofed in a very florid !?yle.

HAB i'T, in philofophy, an aptitude or difpofition either of inind or body, acquired by a frequent repetition of the fame act. See Custom and Habit.

Habit is alfo ufed for a drefs or garb, or the compofition of garments, wherewith a perfon is covered. The principal part of the drefs worn by the Jews and Greeks was the ration and the xulur. The imatov was an upper garment, confifting of a loofe fyrare piece of cloath wrapped round the body; the $\chi$ xisa was an under garment, or tunic, which was fallened round the body and embraced it clofely, falling down to the midthigh. It is proper in this place to obferve that a perCon divefted ot this upper garment or seaziov, in the eaftern language, is !!yled nolech, and in this fenfe David danced naked before the ark.
The feveral forts of garments in ufe with both fexes, amongf the Romans, were the toga, tunica, peluna, lacerna, chlamys, paludanentum, lana, Itola, palliam or palla. See 「uca, \&ec.

For the habits of the prielte amongt the Jews, Greeks, and Rumans, fere the article Paiests.
$\mathrm{H}_{\mathrm{A}} \mathrm{BIT}$ is particularly ufed for the unifurm garments of the religious, confarinable to the rule and order whereof they make profefion: as the habit of St Benedict, of St Aupuline, ice.
In this feufe we fay abfolutely, fuch a perfon has taken the liabit; mearing he has entered upon a noviciate in a certain order. So he is faid to quit the liabit, when he renounces the order. See Vow.

The liabits of the fereral religious are not fuppofed to have been calculated for fuggularity or novelty: the founders of the orders, who were at fult chietly inhabitants of deferts and folitudes, gave their monks the labit ufual among the country poople. Accordingly, the primitive labits of St Anthony, St Hilarion, St Bencdiat, \&:c. are defcribed by the ancient writers as conliting chiedy of theep fains, the common drefs of the peafants, flicpherds, and mountaincers, of that time; and the fande they gate to their difciples.

The urders ctlablifhed in and about cities and inhabited places took the habit worn by other eccleliaftics at the time of their inllitution. Thus, St Dominic gave his difciples the habit of regular canons, which he himfelf had always worn to that time. And the like may be faid of the Jefuits, Barnabites, Theatins, Oratorians, sec. who took the common habit of the cccleliatiics at the time of their foundation. And what makes them differ fo much from each other, as well as from the ceclefiattical habit of the prefent times, is, that they have always kept invariably to the fane form; whereas the ecceliaftics and laics have been changing their mode on every occation.

HABITE and Repute, in Scots law, the cons. mon opinion of the poople, among whom a perfon lives, with refpect to any circumitance relating to lim.

HABITUDE, among fchoulmen, the refpect or relation one thing bears to another. See Relation.

HABSBURG, or Hapsburg, an ancient cafte of Swifferland, is the canton of Bern. It is the place where the ancient counts of Hapiburg refided, and is feated near the lake of Lucern, and to the ealt of the town of that name. E. Long. 8. 10. N. Lat. 47. 22.

HACHA, a fea-port town of Souto America, inTerra Firma, feated at the mouth of a river of the fame name. Here the Spanifh gaileons touch at their arrival in South America, from whence expreffes are fent to all the fettienente to give them notice of it. W. Long. 72. 3. N. Lat. 1t. 30.

HACKE [ (Jobn), bimop of Litchfeld and Co. ventry, was born in 1592. In 1623, he was made chaplain to James I. and prebendary of Lincoln : and foon after obtained the rectory of St Andrew's Holborn, with that of Chean in Surry; his patron tell. ing him, he intcnded Folborn for wealth, and Chearn for health. In $6_{\neq 2}$ he was prefented to a prebendery and refidentiary ; but was deprived of the enjoyment of them, as wcll as of St Andrew's, by the enfuing troubles. He then lived retired at Cheam with litte difurbance, until he recovered his preferments by the reftoration of Charles II. by whom he was preferred to the fee of Litehfield and Coventry in 166 t . Findiug the beautiful cathedral of Litchlield almof battered to ti: 0

## $\begin{array}{lllll}\mathrm{H} & \mathrm{C} & {\left[\begin{array}{lll}262 & \mathrm{H} & \mathrm{A} \\ 2\end{array}\right]}\end{array}$

Haclaney. ground, he in eight years finiffed a complete church fuperior to the former, at his own expence of $20,000 \mathrm{l}$. excepting rocol. he had from the dean and clapter, with what he could procure from private benefac. tors. He laid out 1000 l . on a prebendal houfe, his palaces at Litchfictd and Ecelethall having been denoolifhed during the civil wars: and befide thefe acts of munificence, left feveral other benefactions at his death in 1690 . He publithed, before he entered into orders, a comedy intitled Lyola, which was twice acted before king James I. Alter his death there appeared a "Century of his fermons on feveral remarkable fubjects," in folio; and "The life of archbithup Williams," in folio, which was abridged in 1700 oy Ambrofe Philips.

HACENEY, a parith of Middlefex, on the northeaft fide of London, containing no lefs than 12 hamlets. At the bottom of Hackney- Marfh, through which the river Lea rums, between Old-Ford and the Wyek, there have been difeovered the remains of a great flone caufeway, which, by the Roman coins, \&c. found there, was no doubt one of the famous lighways made by the Romans. The church here is of a very ancient foundation, fo old as I.dward II. and the number of houfes near 800. That part next London is called Mare Strect; the middle Church Sirct ; and the north part Clatton; Dorleflon and Shaklewell are on the welt, and Hummerton, which leads to the Marh, on the ealt. Here are three mecting houfes and feveral boardingfehools, befides the free fchool in the church-yard, a charity-fchool, and I 7 almihoufes. It was from this place that the coaches let to the people in London frilt received their name; for in the laft century, many people having gone on vilits to fee their friends at Hackney, it occalioned them often to hire horfes or carriages, fo that in time it became a common name for fuch horfes, coaches, and chairs, as were let to the people of London; and the name has now diffuled itfelf not only throughout Britain, but likewife Ireland.

HACNNET-Coacbes, thofe expofed to hire in the Rreets of London, and Come other great cities, at rates fixed by authority. See Coach. -Thefe firll began to ply in the Itrects of London, or rather waited at inns, in the year 1625 , and were only 20 in number; but in 1635 they were fo much increafed, that kins Charles iffurd ont an order of council for reltraining them. In 1637, he allowed 50 hackney-coachmen, each of whom might keep 12 horfes. In $165^{2}$, their number waslimited to 200 ; and in $165+$, it was extended to 300. In 1661, 400 were licenfed, at 51 . annually for each. In 1694,700 were allowed, and taxed by the 5 and 6 of W. \& N. at +1 . per annum each. By 9 Anne cap. 23. 800 coaches were allowed in London and Weftminfter ; but by 8 Geo. 11 I. cap. 24. the number is increafed to 1000, which are to be licenfed by commiffoners, and to pay a duty of 5 h . per week to the king. On Sundays there were formerly only i 75 lackney coaches to ply, which were to be appointed by commiffoners; but their number is now aslimited.

The fare of hackney coachmen in London, or with. in ten miles of the city, is 12 fhillings and fixpence per day, allowing 12 hours per day. Ily the hour it is 1s. 6d. For the firit, and is. for every hour after; and none are obliged to pay above 1 s . For any diflance not exceeding a mile and a half; or above Is. 6 d . for
any ditance not exceeding two miles. Whare hack. Haddi ney coachmen refufe to go at, or csaet more than, their limited hirc, they are fuoject to a forfeit not under ics. nor exceeding 31 . and which the commifioners have power to determine. Every hackney.coach mutt be provided with clieck Arings, and every coach. man plying without them incurs a penalty of 5s. Drivers of hackney-coaches are to give way to perfons of quality and gentlemens coaches, under the penalty of 51 .

The duty ariling from licences to hackney-coaches and chairs in London, forms a branch of the king's exiraordinary and perpetual revenue*. This revenue $\cdot$ See $R_{1}$ is governed by commillioners of its own, and is invenue. truth a benelit to the fubject; as the expence of it is felt by no individual, and its neceffary regulations have ellablided a competent jurifdiction, whereby a very re. fractory race of men may be kept in fome tolerable order.

HADDING ION, a borough town of Scotland, in Eat Lothian, which, alongit with four others, fends one member to parliament. It is Currounded with many feats of nobility and gentry, and is about i 6 miles eaft of Edinburgh. It is the county town, and gives title of Earl to a branch of the Hamilton family. W. Long. 2. 25. N. Lat. 55. 50.

HADDOCK, the Englin name of a fpecies of Ganue.

HADDON (Dr Walter), a great reftorer of the learned languages in England, was born in 1516 . He dilinguifhed himfelf particularly by writing Latin in a fine tyle, which he acquired by a conltant Itudy of Cicero. He was a Arenuous promoter of the reformation under king Edward; and was therefore thought a proper perfon to fucceed bihop Gardiner in the maIterhip of Trinity Iall, Cambridge, on his deprivation. He lay conceated during the reign of queen Mary; but acquired the favour of Elizabeth, who condituted him one of the mathers of the court of requelts, and fent him one of the three agents to Druges in 1566 , to reftore commerce between England and the Netherlands. He was alfo engaged with Sir John Cheke in drawing up in Latin that ufeful code of eceleliallical law, publifhed in 1571 by the learned John Fox, under the title of Reformatio legun ceclefuflicarum; his other works are collected and publifhed under the title of Lucubrations. He died in 1572 .

HADERSLEBEN, a fea-port town of Denmark, in the duchy of Slefwiek, with a flrong citadel, built upon a fmall ifland. It is feated on a bay of the Baltic Sea, and has a well-frequented harbour. E. Long. 9. 35. N. Lat. 55.24 .

HADES, in the foriptures, is ufed in various fenfus. Sometimes it lignifies the invifible regions of the dead, fometimes the place of the damned, and fometimes the giare. In Greek authors it is ufed to fignify in general the regions of the dead. See Hell.

HADLEY, a town of Suffolk, feated in a bottom on the river Prefton. It confills of about 600 houfes; with a very handfome church, a chapel of eafe, and a Prefoyterian meeting-houfe. The flrects are pretty broad, but not paved. Large quantities of yarn are fpun here for the Norwich manufacture ; and this town had otice a confiderable woollen manufacture, which is now decayed. E. Long. I. O. N. Lat. 52.7. HADRI.IN. Sce Adrian.
HEMAGOGOS, among phyficians, a compound
nat medicine, confiting of fetid and aromatic fimples mixed with black hellcbore, and preferibed in order to promote the menflrua and hemorrhoidal fluxes; as alfo to bring away the luchia.

HAMANTHUS, the blood-flower: A genus of the monogynia order, belonging to the hexandria clafs of plants; and in the natural method ranking under the ninth order, Spathacea. The involucrum is hexa. phyllus and multiflorous; the corolla fexpartite fuperior; the berry tilocular.

Species. 1. The eoceineus, with plain tongue flaped leaves, rifes about a foot ligh, with a talk lupporting a elutter of bright red tubulous flowers. It hath a latge butbous root, from which in the autumn comes out two broad flat leaves of a fleihy con:iftence, fraped lise a tongue, which turn backward oa cach fide, and fpread on the ground, fo that they have a hlange appearance all the winter. In the fpring thefe decay ; fo that from May to the beginning of Anguft they are deflitute of leaves. The flowers are produced in the autumn juf before the leaves come unt. 2. The carinatus, with keel-flaped leaves, has a taller llalk and paler flowers thata the former; is leases are not Hat, but hollowed like the keel of a boat. 3. The puniseus, with large fpear-fhaped wared leaves, grows about a foot high, and hath flowers of a ycllowifl red coluur. Thefe are fucceeded by berties, which are of a beautiful red colour when ripe.

Culture. All thefe plants are natives of the Cape of Guod Hope, and do not propagate very faft in Europe, their roots feldom putting furth many off-icts. The bell method of managing thein is to have a bed of guod earth in a bricked pit, where they may be covered with glaffes, and in hard frolts with mats and ftraw. The earth in the frame thould be two fect deep, and the frame foould rife two feet above the furface, to albow height for the fower-feens to grow. The roots Aould be planted nine or ten incles afunder; and in winter, if they are protected from froft, and not fuf. fered to have too much uet, but in mild weather expofed to the air, they will hoveer cevery year, and the flowers will be much Aronger than with any other management. The third fors requires to be conflantly kept in a dry fove.
H FMATITES, on bloon stone, a hard mineral fubflariec, red, black, or purple, but the powder of which is always red. It is found in maffes iometimes Spherical, femi- fpherical, pyramidal, or cellular, that is like a honeycomb. It contains a large quantity of iron. Forty pounds of this metal have been extralled from a quintal of tlone; but the iron is of fuch a bad quality, that this ore is not commonly inelted. The great lardnef; of hematizes renders it fit for burnithing and polifhing metals.
HEMATOPUS, the SEA-PYE, in ornithology, agenus belonging to the order of grallix. This beak is compreffed, with an equal wedge-fhaped point ; the nottrils are linear; and the feet lase three toes without nails. There is but one fpecies, viz. the oft ralegus, or oyftercatcher, a uative of Europe and America. It feeds upon Thell-fifh near the fea-fhore, particularly oyters, and limpets. On obferving an oyfler which gapes wide enough for the infertion of its bill, it thrufts it in, and takes out the inhabitant : it wid alfo force the limpets from their
adhefion to the rocks with fufficient cafe. In turn it Hamafeeds on marine infects and worms. With us thefe birds taxylum. are often feen in conliderable flocks in winter: in the fummer they are met with only in pairs, though chichy in the neighbourhood of the fea or fale rivers. The fcmale lays four or live eggs, on the bare ground, on the thore, above high water mark: they are of a greenin grey, blothed with back. The yourg are Fidd to be hateled in about thate weeks. Thefe birds are pretty wild when in focks; yet are caffly brought up tame, if taken young.

HABMATOXYLUM, wogood or Cimpraly Wioul: A genus of the monorgmia order, belunging to the decaudria clafs of plants; and in the nataial inethot ranking under the 3 ado oder, Iomentaces. 'The ca$l_{y x}$ is quinguepratte; the petals five; the capful) lino colated; mailueular, and bivalved; the valves navicular or keeled like a boat.

Of this genas there is unly one fpecies, viz, the campechianum, which grows naturally in the bay of Campeachy at 1 Homburas, and cthor parts of the Spanith Wet Indics, where it rifes from 16 to $2+$ feet higho. Thi flems are gencrally crouked, and vert deformed; and fotdom thicker than a man's thigh. The branehes, which come out on each fide, are crooked, irregular, and armed with flrong thorns, garnihed with winged leaves, compofed of thrce pair of obfeure lubes indented at the top. The 目owers come in a racemus from the wings of the leaves, flanding erect, and are of a pale yellowith colour, with a purple empaiement. They are fucceeded by fat oblong prods, cach comtaining two or three kidney.feeds. - 1) r Wright infurms us, that this tree was introducel into Janaica foom Houduras i: 1715; and is at this time too common, as it has overrun large thacts of land, and is very difficult to root on:. It makes beautiful and itrong fence againfl cattle. If pruned from the luwer branches, it grows to a fizeable tree, and, when old, the wood is as good as that from Honduras. The trees arce cut up into billets or junks, the bark and white fap of which are chipped off, and the red part, or heart, is fent to England for fale.
Logwood is ufed in great quantities for dyeing purple, but efpecialiy black colours. All the colours, however, which ean be prepared from it, are of a facing nature, and canoot by any art be made cqually durable with thofe pregared from iome other materials. Ot all the colours prepared lrom logwood, the black is the moft durable. Dr Lewis recommends it as an ingredient in makiag ink. "In dyeing cloth (fays bee), vitriol and galls, in whatever proportions they are ufed, produce only browns of different thades: I have chten been furprifed that with thefe capital materials of the !'eek dye 1 nercr could obeain any true blackneis in white cloth, and attributed the failare to fome unheeded mifmanagement in the procefs, till I found it to be a known fack among the dyers. Lozwood is the material which adds blackuefs to the vitriol and gallbrown; and this black dye, though not of the noit durable kind, is the mof common. On blue eloth a good black may be dyed by vitriol and galls alone; but even liere, an addition of logwood contributes not a little to improve the colour." Mr Delaval, however, in his Elfay on Colours, infurms us, that with an infufion of galls and iron-filings, he not only made an
saceeding.

exceeding black and durabie iuk, but allo dual linen cloth of a very dep black. Siee Corma Madiag n $12,13,1+$; lmenge $n^{2} 17 \%$ and lan. loge wood is affor fund to have a confacrable allimbut wistue as a medicine, and an extract of it is fometmes given with great fuecefs in diarrhoras.

Hemoptysis, Hamatysis, or hamopió ; a fitting of blood. See (Indix fulljoined to) Medicine.
HAMORRHAGY, (componded of atuz "blood," and efroue " 1 burlt forth, " in medicine, a fius of Ulood at any part of the body; arifing either from a rupture of the uffels, as when they are too futl or too much preffed; or from an crofion of the fame, as when the blood is too tharp and corrofive. - The hremorrhagy, properly fpeaking, as undertood by the Giecks, was only a flux of klood at the noie; but the moderns extend the name to any kind of fux of blood, whether by the nefe, mouth, lungs, fomach, inteftines, fudament, matri:, or whatever part. See Medicine and Surgery

HAMORRHOIDAL, an appellation given by anatomits to the arteries and veins gring to the intestinum rectum.
haimorryoids, or Paes, an liemorrlage or iflue of blood from the hacmorrhoidal veflils. Sie (Sidex fubjoined to) Mrdicine.

HAMUS, (anc. greor.), a vaft ridge, ruming from Illyricun towards the Euxine, (Pliny); fo high as to afford a profpeet both of the Euxine and Adriatic. Here, in after ages, was confituted a province called Hamimons, or Hamimonius.

Heretico comburfnde, a writ which anciently lay agaiut an heretic, who, having once been consicted of herefy by his bifop, and having abjured it, afterwards falling into it again, or into fome other, is thereupon committed to the fecular power. This writ is thought by fome to be as ancient as the common Iaw itfelf; however, the convition of herefy ty the common law was not in any petty ecclefiafical court, but before the archbifop himfelf in a provincial fynod, and the delinquent was dedivered up to the king to do with him as he pleafed: fo that the crown had a control over the fpiritual power. But by 2 Hen. IV. cap. 15. the diocefan alone, without the intervention of a fynod, might convict of heretical tenets; and unFefs the convict abjured his opinions, or if after abjusation he relapled, the fherill was bound ex officio, if requiied by the bifhop, to commit the unhappy victim to the flames, without waiting for the confent of the crown. This writ remained in force, and was actually executed on two Anabaptits in the feventh of Elizabeth, and on two Arians in the ninth of James I.—Sir Edward Coke was of opinion, that this writ did not lie in his time; but it is now formally taken away by fta. thte 29 Car. 11. cap. 9. But this flatute does not exRend to take away or abridge the jurifdiction of Proteftaat atchbifhops or bifhops, or any other judges of any ecelefialical courts, in cafes of atheifm, blafphemy, herefy. or fehifin, and other damnable doctrines and opinions; but they may prove and punin the fame according to his majelty's ecclefiaftical laws, by excommunicacion, depivation, degradation, and otlier ecclefiailical cenfures, not extending to dcath, in fuch fort and no $\mathrm{N}^{2} 147^{\circ}$
other, as they might have done before the making of Hae

IHAGAlRENS, the deferdants of Ifmael. They arc called alfo iowndites and Sarderes; and lafly, by the general nanic of Aralians.
As to the Hagavens, they dweet in Arabia the Happy, according to Pliny. Sirabo juins them with the Nabathans, and Chatoterans, whofe habitation was rather in Arabia Deferta. Others think their capital was Petra, otherwife Agra, and confequently they mould be placed in Arabia Petresa. The iuthor of the lxaxiii. Plalm, ver. 6 . joins them with the Moabites; and in the Chronicles it is faid (1 Chr. v. Io.), that the fons of Renbea, in the time of Saul, made was againtt the Hararens, and hecame malters of their country callward of the mountains of Glead. This therefore was the true and ancient conmery of the Hagarens. When Trajan cime into Arabia, he befieged the capital of the Hagarens, but could not take it. The fons of Jagar valued themfelves of old upon their wifdom, as appears by Barvch iii. 23 .

HAGEDORN (Frederick de), a celebrated German poet, was born at Hamburg, where his fathor was refident for the king of Denmai, in 1708 . We fuilhed his fludies at Jena; and, in 1428 , publifhed a number of poetical pieces in Germany, which were well received. He afterwards came to England, where he obtained the friendfhip of many of the learned; and, at his return, was made fecretary to the Englifh Hamburgh company, a lucrative employment that left him fufficient time for cultivating the mufes. In 1738 , he publifled his Fables and Tales, the firt collection of the kind of which Germany can boalt. He afterwards publifhed ether pieces of poetry of different kinds, as Mural Poems, Epigrams, and five bonks of Songs: which of all his poerical pieces are moft etleemed. He died in 1754.

HAGENAU, a town of Germany, and capital of a bailiwick of the fame name, which was fommerly imperial, but now helones to the French. It was taken by them in 1673 ; the Imperialifts retook it in 1,02; after which it was feveral times takcu and retaken by both parties; but at lait the French got poffeflon of it in 1706 . It is divided by the river Motter into two parts; and is feated near a foreft of its own name, in E. Long. 7.53. N. Lat. 48.49.

HAGGAI, the tenth of the foall prophets, was born, in all probability, at Babylon, in the year of the world 3457, from whence le returned with Zerubbabel. It was this prophet who by command from God (Ezrav. t, 2, \&cc.) extrorted the Jews, after their return from the captivity, to finith the rebuilding of the temple, which they had intermitted for 14 years. His remonlirances had their effect; and to encourage them to proceed in the work, be affured them from God, that the glory of this latter houfe mould be greater than the glory of the former houfe; which was accordingly fulfilled, when Chrilt horoured it with his prefence: for with retpect to the building, this latter temple was nothing in comparifon of the former.

We know nothing certain of Haygai's death. The Jewa protend, that he died in the latt year of the

## H A G

reign of Darius, at the fame time with the prophets Zechariab and Malachi, and that thereupon the fpirit of prophecy ceafed among the children of Ifracl. Epiphanius will have it, that he was buried at Jertifalem anong the priefts. The Greeks keep his feftival on the 16 th of December, and the Latins on the $4^{\text {th }}$ of Joly.

HAGIOGRAPHA, a name given to part of the books of fcripture, called by the Jews Coturim. The word is compounded of ar:er "holy;" and ryamis "I write." The name is very ancient: St Jerom makes frequent mention of it : before him, St Epiphanius called thefe books fimply $\mathrm{r}_{\mathrm{p} \boldsymbol{z} \neq \mathrm{a}}$
The Jews divide the facred writings into three claffes: The Law, whicl comprehends the five books of Mofes : The Prophets, which they call Neviim: And the Cetuvim $\begin{aligned} \\ \text { ans, } \\ \text {, called by the Greeks, \&c. Hagio- }\end{aligned}$ grapha; comprehending the book of Pfalms, Proverbs, Job, Daniel, Ezra, including alfo the book of Nehemiah, Chronicles, Canticles, Ruth, the Lamentations, Ecclefiates, and ERher.

The Jews fometimes call thefe books the Writings, by way of eminence, as being written by immediate infpiration of the Holy Spirit. Thus fays Kimehi, in his preface to the Pfalms, Maimonides in More Nevoch, and Elias Levita in his Thifbi, under the word $2 \pi$ a.

They diftinguifin the hagiographers, however, from the prophets ; in that the authors of the former did not receive the matters contained in them by the way called Prophzey, which confifts in dreams, vilions, whif. pers, ecflafies, \&c. but by mere infpiration and direction of the Spirit.
HAGUE, a town of the United Provinces, in Holland, lituated in E. Long. 4. 10. N. Lat. 48. 49. -In Latin it is called Iiaga Comitis; in French, La Haye; in Dutch, der Haag, or 'S Gravenhaze, i. e. the Earl's Grove or Wood, from the wood near which it is built, and in which the earls of Holland liad a country-hnufe. Though it fends no deputies to the fates, it is one of the moft confiderable towns in Holland, pleafantly fituated, and exceeding beautiful. It may indeed compare with almont any city in Europe, though geographers account it but a village. The inhabitants alfo breathe a better air than thofe of the other cities, as it flands on a dry foil, fomewhat higher than the rell of the country. It has no gates or walls, but is furrounded by a moat over which there are many draw-bridges. Two hours are required to walk round it, and it contains about 40,000 or so,oco fouls. It is a place of much fplendor and bufinefs, being the feat of the high colleges of the republic and provinee of Holland, and the refidence of the fladtholder and foreign ambaffadors; and there are a great meny fine flreets and fquarcs in it. In the inner court all the high colleges and courts of juftice hold their aftemblies: there alfo the foot-guards do duty, as the horfe-guards in the outer, when the ftates are fitting. De Plaats is an open airy place, in form of a triangle, adorned with neat and beautiful buildings: the Vyverbery is an eminence, laid out into feveral fine flady walks, with the Vyver, a large bafon of water, at the bottom: the Voorhout is the mofl celebrated part of the Hague, and confits of the mall, and three ways for coaches on each fide, planted with trees, being much the fame as St James's park at LonVol. VIII. Part I.

## $265]$ <br> II A G

don : the palace of Opdan!, or Waftenaar, is built in a very elegant talle: the prince and princefs grafis are fine flreets: the plan, in Dutch Hed Pleyn, is a beautiful grove, laid out in feveral crofs walks, and furrounded with fately houfes. The Jewinin fynagogue is well worth being feen by a curious traveller; and alfo the palaces of the prince of Orange, the hotel of Spain, the new Woorhout, the maufoleum of the baron of Opdam in the great church, and the feveral hoipitals. The environs of the Hague are exceedingly pleafant. Among other agreeable objects are the wood, with the palace of Orange at the extremity of it, called the buife in the zuood; the village of Scheveling; and the fand-hills along the north fea; with the village of Voorburg, and the charming feats and fine gardens round it. Two miles from the Hagore is Ryfick, a village : and, a quarter of a mile from that, a noble palacc belonging to the prince of O range, famous for the treaty of peace concluded there in 169-. Loofdaynen, where Margaret, countefs of Henneburg, and daughter of Florence IV. count of Holland and Zealand, is faid to have been delivered of $3^{6} 5$ children at a birth in 1276 , is about five miles from the Hague. Five miles beyond Loodduynen, and not far from the beautiful village of Gravelande, is Honflardyck, another palace belonging to the prince of Orange, and onc of the tineft ifructurcs in the Low.Countries.

HAHN (Simon Frederick), a celebrated German hiftorian. At ten years of age he was not only far advanced in the Latin, but undcrilood feveral living languages. Four years after, he pronounced a fpeech on the origin of the cloytter at Bergen, the place of his birth, which was printed with fome other pieces; and in 1708 he publifhed a Continuation of Meibomius's Chronicle of Bergen. After having for feveral years given public lectures at Hall, he became, at the age of $2_{4}$, profeffor of liifory at Helmiladt; and was at length counfellor, hiftoriographer, and librarian, to the king of Great Britain, elector of Hanover. He died in 1729 , aged 37. -Befides the above, and fome other works, he wrote, 1. The tirt volume of the Hifory of the Empire. 2. Colledio monumentorum vieterum ot recentium ineditiorum, 2 vols 8 vo.

HAI-nas. Sec Harnan.
Hat-Tand, a beantiful Chinefe Mrub, originally brought fiom the bottom of the rocks which border the fea-coaft. It has been cultivated in China for more than ${ }^{4} 4$ centuries; and is celebrated as often in the works of the Chinefe poets, as rofes and lilies are in thofe of ours. Painters and embroiderers ornament almoft all their works with its foliage and flowers. The falk of the hai-tang is of a cylindtic form, and moots forth a number of branches of a purple tint towards their bafcs, and full of knots, which arc allo of a purple colour round the edges. It produces a number of noote, the tallef of which are about two feet and a half in height. Its leaves (which are much indented, of an oval form towards the flalk, pointed at their upper extremities, and full of fmall prickles) grow almott oppofite one another on the branches, and at the fame diltance as the knots. Their colour above is a decp-green; that below is much lighter, and almoft eflaced by their fibres, which are large, and of a delicate purple : all thefe leaves together have a beau-

HIdin
113i-T.s?

Hair Tang, tiful effect to the eye. The Howers grow in bunches Hall at the extremitics of the brauches. Dach flower is compofed of four petals, two great and two fmall, refembling in colour the bloom of a peach tree, and which luse almolt the fame figure as the blofom of our cherry-tres. The two large are cemented one upon the other, in the form of a purfe; and when they bow, the two fmall blow alfo in their turn; and then the whole four reprefent a crofs. The piftil is compofed of sery bright yellow grains, which feparate grajually one from anothor by the lengthening of the filanents to which they adhere; they then open into little bells, and compole a finall yellow tuft, fupported by a fender thalk, which rifes above the petals. The calys, whicin fultains each of the fowers, is compofed of two purplecoloured leaves, united in form of a purfe. In proportion as the fowers grow and incerenfe in lize, the two leaves of the calys open, become pale and dry, and drop off. The flowers, fupported hy finall Alaths, tiparate one from the other, and prodace of themWhes uther Howers, which rife up from a new calyx.

This plant is propagated from feed, but with deficuty. It thrives beft in a fandy foil ; dung or mould deftroy it ; and great care mult be taken to refefh it only with the parelt water. As it camou colure the fun in any feafon, it is always planted be. low walls that are expofed to the nurth. It generally begins to how atom the end of Augut. After it has $i$ ciaced feed, ill its branches are cut; and it comitong thouts furth new ones before the faring fis) loniag: but it is necelfary to hoap up gravel and picce of hath round its routs, to prevent them from rotting. Nowithttanding all the care that is taken to cultivate this tree at Paking, it does not thrive fo wedt there as in the fom! !em provinces. The farell of ito liaves has an affinity buct the that of the rofe and the viukt; but it is weaker, and never extends to any great diance.

HALL, in matural hatcry, a metcor genembly defined frozen rain, but diturint from it in that the hailtones are not formed of lingle pieces of ice, but of many litte fateruks ageghenazed together. Nother are thefe fincrules all of the fane cominence; fune of them briug had and folid like perfect ice; others foft, and mully hike fuow hardencd by a fevere frult. SomeLimes the hailfone lath a kind of core of this foft mater; but mure frequenly the core is folid and hard, while the outfic io formed of a fofter matter. Hand ftones affume various figures, being fometimes round, at other times pyramidal, crenated, angular. thin, and flat, and fometines fellated, with fix radii like the fmall cryftal of fnow.

Natural hifozians furnih us with valious accounts of furprifing thowers of hail, in which the hailanes wete of sxtraordinary magnitude. Mozray, fpeaking of the war of Louis X:I. in Italy, in the year 1510, relates, that there was for fome time an horrible dark. nefs, thicker than that of night; after which the clouds b:oke into thonder and lightning, and there fell a thower of hailtones, or ratice (as lace calls them) petb-ble-thones, which deftroyed all the fith, birds, and bealts of the country.-It was attended with a Itrong finell of fulphur; and the itones were of a bluifi colour, fome of them weighing in humird pounis. HI/b. do \& rance, Tum. II. 1.339.

At Lide in Flanders, in 1636 , fell hallones of a very large fize; fome of which contained in the middle a dark brown matter, which, thrown on the fire, gave a very great report. Phil. Tianf. No 203.
Dr Halley and others alfo relate, that in Cheflire, Lancafhite, Sic. April 29, 165,7, a thick black cloud, coming from Carnarvonthire, difpofed the vapours to congeal in fuch a manner, that for about the breadth of two miles, which was the limit of the cloud, in its progrefs for the face of 60 niles, it did ircunceivable danage; not only killing all forts of fouls and other fmall animals, but fplitting trecs, knocking duwn horfes and men, and cren ploughing op the earth; fo that the haillones buried themithes under ground an inch or an inch and a half deep. The liailifones, many of which weighed live ounces, and fome hatf a pound, and being live or dix inches about, were of varinus figures; fome round, others half round; fome fmooth, othos embofed and cremated: the icy fabitance of them was wery tranfarent and hard, but thene was a foury kermel in the :ridule of them.

In Fenfordhire, Misy 4 t the fame year, after a fevere flum of thander and lightning, a foower of hail fucceeded, whid ber execeicd the furmer: fome perfons were killed by it, their budies beat all bleck and blue; vall oaks were folit, and helids of rye cut down as with a feythe. The flomes mafured from 10 to 13 or $1+$ inchas abont. Their figures were various, fome oval, others picked, fome Hat. Philofoph. Tranf. N 222.
It is remarkable, that, fo far as we know, hail is a meterer which never produces any leneficial effect. The rainand dew inviguate and give lifc to the whole vegetable the: the froll, by exponding the water contaned in the earth, pulverites and renders the foil fertile; frow ecvers and preferos the tender veretaides from buing dencoged by too tovese a froth. Gut hail does nom of all the e. In winter, it lics not funciently clofe to curer veget:ibies from the nipping fools; and in friner and fumber it not only has a chillang and blating entect from is coldnefs, but often does great damage to the more tender ghans by the weight of the Atones, and in grat hathoms the damage done in this mannuer is prodigious.

Hail is cne of the natural phenomen for which it is amont impulate to aceount in any fetisfactory manner. It is certain, that on the tops of mountains laillunes, as wall as orops of rain, are very fmall, and continually increale in bulk till they rach the lower grounds. It would feen, therefore, that during their patfoge through the air, they attrakt the congealed vapour which increafes them in fize. But here we are at a lofs how they come to be folid hard bodiss, and not ahwass fuit, and compoled of many forall flars like frow. The flakes of fnow, no duabe, increafe in iize as they defcend, as wcil. as the donos of rain or laultones; but why fhould the one be in foft crytlals, and the othar in large havd lonips, feeing boll are produced from congealed vapour? Some modern philofophers aferibe the formation of hail to clectricity. Signior Becearia fuppofes hail to be formed in the higher regions of the air, where the cold is intenfe, and where the clectric mater is sery copions. In thefe circumitances, a great. number of particles of intier are brought near toge-
chyr,
ther, where they are frozen, and in their defcent collect other particles, fo that the denfity of the fubftance of the hailtone grows lefs and lefs from the centre ; this being formed firft in the higher regions, and the furface being collected in the lower. Agreeable to this, it is obferved, that, in mountains, hail-ftones, as well as drops of rain, are very fmall, there being but little fpace through which they can fall and increafe their bulk. Drops of rain and hail alfo agree in this, that the more intenfe the electricity that forms them, the larger they are. Motion is known to promote freezing, and fo the rapid motion of the electrified clouds may produce that effect. A more intenfe electricity alfo, he thinks, unites the particles of bail more clofcly than the more moderate electricity does thofe of fnow. In like manner we fee thunder-clouds more denfe than thofe that merely bring rain; and the drops of rain are larger in proportion, though they fall not from fo great a height.

HAILING, the falutation or accofting of a lhip at a diftance, either at fea, or in a harbour. The ufual expreffion is, "Hoa, the thip ahoay!" To which the anfwers, "Holloa! Whence came ye? Where are ye bound? Good voyage! What cheer? All well! How fare ye?" \&e.

HAlllan (Bernard de Giard, lord of), a celebrated French hiftorian. After having made fome figure in the literary world, and as a tranflator, he applied himfelf to hillory with fuch fuccefs, that in 157 , Charles IX made him liitoring rapher of France. His hittory of France extends from Pharamond to the deatb of Charles VII. and is the firt complete hittory of that kingdom compofed in the French tongue. He was honoured by Henry 111. with feveral marks of favour; and propofed to continue his hifory to the reign of Henry IV. but did not petform his promife. He died at Paris in 1610.

## HAlmsucken. Sce Hamesecren.

1. HAINAN, a confiderable ifland of Alia, fituated in between $18^{\circ}$ and $20^{\circ} \mathrm{N}$. Lat. It is fubject to China, and belongs to the province of Quang-ton. It has on the north the province of $\mathrm{Quang}-\mathrm{ti}$; on the fouth the chauncl formed between the bank Paracel and the eaftern coalt of Cochinchina: on the well, the fame kingdom and past of Tong.king; and on the eatt, the Chincfe fea. Its exicnt from ealt to welt is between 60 and 70 leagues, and from north to fouth 45 ; this inand therefore is about 160 leagues in circumference. Kiun telicon fou, is capital, Hands on a promentery, and hiaps often anctior as the bottom of its walls. Two different kinds of nandarins command here, as in all the other provisces of China: the firt are called literati; the fecond, mandarins of arms, or military officers. Its jurifdiction exiends uver three cities of the lecond ciafs and ten of the third. The greater part of the illand is under the dominion of the enperor of Clina; the rett is independent, and inhabited by a free people, who have rever ret been fubdued. Compelled to abandon their plains and ficl's to the Chinefe, they lave retreated to the mountatus in the certre of the ifland, where they are Anclered from the infulte of their neighbours.

Thefe people formerly had a free and open correfoondence with the Chincfe. Twice a year they ex. pored, in an appointed place, the gold which they dig
from their mines, with their eagle-wood and calamba, fo much efteemed by the Orientals. A deputy was fent to the frontiers, to examine the cloths and other commoditics of the Chinefe, whofe principal traders repaired to the place of exclange fixed on; and after the Chinefe wares were delivered, they put into their hands with the greateft fidelity what they had arreed for. The Chinefe gavernors made inmenfe profits by this barter.

The emperor Kang-hi, inforned of the prodigions quantity of gold which paffed through the hands of the mandarins by this traffic, forbade his fubjects, under pain of death, to have any commanication with thefe illanders: however, fome private emifiaries of the neighbouring governors fill find the means of having intercourfe with them; but what they get at prefent by this clandeftine trade is litte, in comparifon of that which they gained formerly. The natives of this ifland are very deformed, fmall of tature, and of a copper colour: both men and wronen wear their hair thrult through a ring on their forchead; and above they have a fmall thaw-hat, from which hang two ftrings that are tied under the chin. Their drefs confits of a piece of black or dark-blue cotton eloth, which reaches from the girdle to their knees: the women have a kind of robe of the fame thuff, and mark their faces from the eyes to the chin with blue flripes made with indigo.

Among the animals of this ifland are a curious fpecies of large black apes, which have the thape and features of a man; they are faid to be wery fond of women: there are alfo found here crows with a white ring round their necks; flarlings which have a finall crefcent on their bills; black-birds of a deep blue co. lour, with yellow ears rifing balf an inch ; and a multitude of other birds, remarkable for their colour or fong. Befides mines of gold and lapis lazuli, which enrich the ifland of Hainan, it produces in abundance various kinds of curious and valuable woot. The predeceffor of the prefent emperor caufed fome of it to be tranforted to Peking, at an immenfe expence, to adorn an editice which he iutended for a mauftcum. The molt valuable is called by the natives toalt, and by the Europeans rofe or avidet cuosd from its imell; it is very durable, and of a beanty which nothing can equal; it is therefore referved for the ufe of the emperor.

Hainan, on account of its fituation, riches, and extent, deferves to be ranked among the noft conthderable iflands of Afia. Not far from thence is another fmall ifland, commonly called Sen-cian. It is celcbrated by the death of St Francis Xavier : his tnmb is Aitl to be feen on a finall hill, at the bottom of which is a plain covered on one fide with wood, and on the other ornamented with feveral gardens. Thls illand is not a defert, as fome travellers bave pretcheed: it contains tive villages; the inhabitants of which are poor people, who have nothing to fubfilt on but rice and the finh which they catch.

HAINAULT', a province of the Netherlands, be. longing partly to France and partly to the houfe of Aullia. It is bounded to the fonth by Champagne and Picardy; to the north by Flanders; to the call by the duchy of Brabant, the county of Namur, and the bihopric of Liege; and to the wett by Artois and Kk2 Flanders.

Isinar, Hainau!e.

Hinaaulr, Flanders. Its extent from north to fouth is about 45 Hair. miles, and about 48 from ealt to welt. The air is pleafant and temperate, and the foil fruitful: it abounds in rich pallures, corn-fields, woods, and forefts, coal, iron, lead, beautiful marble, flate, and other ufeful ftones: it is well watered by rivers and lakes, and breeds abundance of black cattle, and nheep whole wool is very fine. Its principal rivers are the Schelde, the Selle, and the Dender. 'This province is reckoned to contain $2+$ walled towns, 9 ;o villages, one duchy, and feveral principalities, carldoms, peerdoms, and baronies. The abbeys in it arc 27. For fpiritual matters, the greater part of it is fubject to the archbithop of Cambray, and the reft to the bilhops of Iiege and drras. The Itates of the province confift of the clergy, nobility, and commoners. The clergy are the abbuts, deputies of the chapters, and rural deans; but the chapters of St Waudru and St Germain, in Mons, fend no deputies, as they contribute nothing to the public taxes. The nobility confitt of the ealls and barons, and all thofe who by their birth have a right to a feat in the affembly of the Itates. 'The commoners are compofed of the deputies of the towns. The clergy in this county are uncommonly rich. The ftates meet only when they are fummoned by the fovereign; but there is a Alanding committec at Mons which meets weekly. This county had counts of its own, till the year 1436; when Philip the Good, duke of Burgundy, arrived to the poffufion of it, upon the death of Jaqueline, the heirefs, without iffue. The French acquired that part of it which they porfefs, partly by the peace of the Pyrenees, and partly by thofe of Nincguen and Refwick. The arms of this county are quartered, and contain four lions, in a field or. For the government of it, tbere is a fovereign council, at the head of which is the high bailiff, who has very great authority; he reprefents the fovereign, is grovernor of Muns, and captain-general of the province.
HAIR, fmall filaments iffuing out of the pores of the kins of animals; and ferving moft of them as a - Sec Ana. tegument or covering*. In lieu of hair, the nakedwny, $n^{\circ} 82$ nefs of fome animals is covered with feathers, wool, fcales, \& c.

Hair is found on all parts of the human body, except the foles of the fect and the palms of the hands. - But it grows longeft on the head, chin, breait, in the arm-pits, and about the privities.

The ancients held the hair a fort of excrement, fed only with excrementitious matters, and no proper part of a living body.-They fuppofed it generated of the fuliginous parts of the blood, exhaled by the heat of the body to the furface, and there condenfed in paffing through the pores.- Their chicf reafone were, that the hair being cur, will grow again apace, even in extreme old age, and when life is very low: that in hectic and confumptive people, where the reft of the body is continually emaciating and attenuating, the hair fhall thrive : nay, and that it will grow again in dead carcafes. - They added, that hair does not feed and grow like the other parts, by introfufception, i. e. by a juice circulating within it; but, like the nails, by justapofition, each part next the root thrufting forward that immediately before it.

But the moderas are agreed, that every hair does
properly and truly live, and receive nutriment to fill and diftend it like the other parts : which they argue hence, that the roots do not turn grey in aged perfons fooner than the extremities, but the whole changes colour at once, and the like is obferved in boys, \&ec.; which fhows that there is a direct communication, and that all the parts are affected alike.

It may be oblerved, however, that, in propriety, the life and growth of hairs is of a different kind from that of the reft of the body; and is not immediately derived therefrom, or reciprocated therewith. It is rather of the nature of vegetation. They grow as plants do out of the earth; or as fome plants fhoot from the parts of others; from which though they draw their noumifhment, yet each has, as it were, its feveral life and a diftinct economy. They derive their food from fome juices in the body, but not from the nutritious juices of the body; whence they may live, tho the body be ftarved. - Wulferus, in the Pbilofoflical Collecions, gives an account of a woman buried at Norimberg, whofe grave being opened 43 years after her death, there was hair found iffuing forth plentifully through the clefts of the coffin; infomuch, that there was reafon to imagine the coffin had fome time been covered all over with hair. The cover being removed, the whole corps appeared in its perfect flape ; but, from the crown of the head to the fole of the foot, covered over with a thick-fet hair, long and curled. The fexton going to handle the upper part of the head with his fingers, the whole ftructure fell at once, leaving nothing in his hand but an handful of hair: there was neither kiull nor any other bone left ; yet the hair was folid and ftrong enough.-Mr Arnold, in the fame collection, gives a relation of a man hanged for theft, who, in a bittle time, while he yet hung upon the gallows, had his body Atrangely covered over with hair.Some moderns, however, deny the authenticity of thefe and other fimilar inftances.

The hairs ordinatily appear round or cylindrical ; but the microfcope alfo difcovers triangular and fquare ones; which diverGty of figure arifes from that of the pores, to which the hairs always accommodate themfelves. Their length depends on the quantity of the proper humour to feed them, and their colour on the quality of that humour: whence, at different flages of life, the colour ufually differs. Their exrtemities fplit into two or three branches, efpecially when kept dry, or fuffered to grow too long; fo that what appears only a fingle hair to the naked eye, feems a brufh to the microfcope.

The hair of a moule, viewed by Mr Derham with a microfcope, feemed to be one fingle tranfparent tube, with a pith made up of fibrous fubftances, running in dark lines, in fome hairs tranfverfely, in others fpirally. 'The darker medullary parts or lines, he obferves, were no other than fmall tibres convolved round, and lying clofer together than in the other parts of the hair. They run from the bottom to the top of the hair; and he imagines, may ferve to make a gentle evacuation of fome humour out of the body. Hence the hair of lairy animals, this author fuggefts, may not only ferve as a fence againt cold, \&c. but as an organ of infen fible perfpiration.

Though the external furface of the body is the natural place for hairs, we have many well-attelled in-

Atances of their being found alfo on the internal furface. Amatus Lufitanus mentions a perfon who had hair upon Lis tongue. Pliny and Valerius Maximus concur in their teltimonies, that the heart of Ariftomenes the Meffenian was hairy. Cælius Rhodiginus relates the fame of Hermogenes the rhetorician; and Plutarch, of Leonidas the Spartan.-Hairs are faid to have been frequently found in the breafts of women, and to have occafioned the dittemper called tricbiafis; but fome authors are of opinion, that thele are fmall worms and not hairs. There have been, howevcr, various and indifputable obfervations of hairs found in the kidneys, and voided by urime.

Hippocrates is of opinion, that the glandular parts are the moft fubject to hair; but bundles of hair have been found in the mufcular parts of beef, and in fuch parts of the human body as are equally firm with that. - Hair has been often found in ablceffes and inpothumations. Schultetus, opening the abdomen of a woman, found 12 pints of water, and a large lock or bundle of hair fwimming loofe in it. But of all the internal parte, there is none fo much fubject to an unnatural growth of hair as the ovaries of females, and that as well of the buman £pecies as of other animals. Of this Dr Tyfon relates three remarkable inftances; $t$ wo of thefe were young women, and the other was a bitch. The animal had been much emaciated in its hinder parts; the hair was about an inch and an half long: but the moft remarkable particular was, that hair was alfo found lying loofe in the cavities of the veins. We have feveral intances of mankind being affected in the fame manner. Cardan relates, that he found hair in the blood of a Spaniard ; and Slonatius in that of a gentlewoman of Cracovia; and Schultetus declares from his own obfervation, that thofe people who are afflicted with the plica polonica, have very often hair in their blond.
Difeafes of the Hair. Almoft the only difeafe of the hair, befides the remarkable one called plica polonica, is its falling off, or beldnefs. For this many remedies have been rtcommended, but fcarce any of them can be depended upon. The juire of burdock, and the lixivial falts of vine-afhes, are faid to be efficacious; alfo the powder of hermodactyls, and the decoction of boxwood. A remarkable inflance of the efficacy of this laft is given under the article Buxus.-Some authors give inftances of the hair changing its colour in a fhort time, through gricf, or by reafon of a fright, \&s.

HaIk as an Ornament, or as an Enfign of Dignity or of Religion. By the Jews hair was worn naturally long, jult as it grew ; but the priefts had theirs cut every fortnight, while they were in waiting at the temple; they made ufe of no razors, however, but fciffars only. The Nazarits, while their vow continued, were forbidden to touch their heads with a razor. Sce N.szarite.

The falling of the hair, or a change of its colour, was regarded amongt the Hebrews as a fign of the leprofy. Black hair was efleemed by them as the mott beautiful. Abfalom's hair was cut once a-year, and is faid to have weighed 200 hekels, by the kirg's weight, which is about 31 ounces. The law of God hath left no particular ordinances with refpee to the hair.

The bair of both Jewih and Grecian women engaged a principal fhare of their attention, and the Roman ladies feem to have been no lefs curious with refpect to theirs. They generally wore it long, and dreffed it in a variety of ways, ornamenting it with gold, filver, pearls, ke. On the contrary, the men amongt the Grecks and Romans, and amongtt the later Jews, wore their hair fhort, as may be collected from books, medals, ftatues, \&c. This formed a principal dilinction in drefs betwixt the fexes. This obfervation illuatrates a paffage in St Paul's epifle to the Corinthians (ICor xi. 14, 15.)

St Paul forbids the Corinthian women, when praying by divine infpiration, to have their hair dilhevelled; probably becaufe this made them refemble the heathen priefteffes, when actuated by the pretended influence of their gods.

Amought the Greeks, both fexes, a few days before marriage, cut off and confecrated their hair as an ofering to their favourite deities. It was alfo cuftomary among them to hang the hair of the dead on the dours of their houles previous to interment. They likewife tore, cut off, and fometimes fhaved their hair, when mourning for their deceafed relations or friends, which they laid upon the corpfe or threw into the pile, to be confumed together with the body. The ancients ima. gined that no perfon could die till a lock of hair was cut off; and this aft they fuppefed was performed by the invilible hand of death, or Iris, or fome other mef. fenger of the gods. This hair, thus cut off, they fancied confecrated the perfon to the infernal deities, under whofe jurifdiction the dead were fuppofed to be. It was a fort of firf fruits which fanctified the whole. (See Virg. Er. . 4. 694.)

Whatever was the falhion, with refpeet to the hair, in the Grecian ftates, flaves were forbidden to imitate the freemen. The hair of the flaves was always cut
 they no longer retained after they prucured eleir freedom.

It was eftcemed a notable honour among the ancient Guuls to have long lair, and hence came the appellation Gallia comata. For this reafon Julius Cefar, upon fubduing the Gauls, made them cut off their hair as a token of fubmiffion. - It was with a view to thrs, that fuch as afterwards quitted the world to go and live in cloifters, procuted their hair to be haven off; to thow that they bid adieu to all earthly urnaments, and made a vow of porpetual fubjection to their fuperions.

Greg. of Tours affures us, that in the royal family of France, it was a long time the peculiar mark and privilege of kings and princes of the blond to wear long hair, artfully dreffed and curled: every body clfe was obliged to be polled, or cut runad, in fign of in. feriority and obedience. Some writers affure us, that there were different cuts for all the different qualities and conditions; from the prince who wore it at fu:! length, to the have or villain who was quite cropt. - To cut off the lair of a fon of France, under the firlt race of kings, was to declare him excluded fron the light of fucceeding to the crown, and reduced io the condition of a fubject.
In the eighth century, it was the cuftom of people of quality to bave their childrens hair cut the firt time

Mair. by felfons they had a particular honour and efleem for ; who, in virtue of this ceremony, were reputed a fort of ipiritual parents or godfathers thereof: 'Tho' this pradice appears to have been more anceent; inalmuch as we read, that Confantime fent the pope the hair of his fon Herachius, as a token that he defired him to be his adoptive father.

The parade of long hair became fill more and more obroxious in the progrefs of Chrilianity, as fomething atterly incoufillent with the profefion of perfons who bore the crofs. Hence numerous injunctions and canons to the conirary.--Pope Anicetus is commonly fuppofed to have been the firl who forbade the clergy to wear long hair: but the prohibition is of an older flanding in the churches of the eaft; and the letter wherein that decres is witten, is of a much later date than that pape. - The clenical tonfure is related by Ifidore Hifpalentis, as of apoftolical inftitution.

Long hair was anciently held fo odious, that there is a canon fill extant of the year 1096, importing, that fuch as wore long hair flould be excluded coming into church while living, and not be prayed for when dead. We have a fulious declamation of Luitprand againt the cmperor Phocas, for wearing long hair, after the manner of the other emperors of the edfl, all except Theophilas, who being bald, enjoined all his fubjects to thave their heads.

The Erench hiflorians and antiquaries have been very exaet in recording the head of hair of their feveral kings. Chatlemagne wore it very fhort, his fon fhorter; Charles the bald had none at all. Under Hugh Capet it began to appear: again: this the ecclefaltics took in dudgeon, and cxcommunicated all who let their hair grow. Peter Lombard expoftulated the matter fo warmly with Charles the Young, that he cut off his hair ; and his fucceffors for fome generations wore it very fhort.-A profiffor of Utrecht, in 1650, wrote exprefoly on the quetlion, Whether it be lawful for men (1) wear long hair: and concluded for the negative. Another divine, named Reves, who had witten for the aifirnative, replied to him.

The ancient Britons were extremely prond of the length and beanty of their hair, and were at much pains in dreffing and adorning their heads. Sume of them carried their fondnefs for and admiration of their hair to an extravagant height. It is faid to have been the fall and mott earuell 1 equell of a young warnior, who was taken prifoner and condemned to be beheaded, that no have might be permitted to touch his hair, which was remarkably long and heautiful, and that it might not be flaind with his hood. We hardly ever meet with a defeription of a fiue woman or beautiful man, in the porms of Offian, but their hair is mentioned as ene of their greated beaties. Not contented with the natural colour of their hair, which was commonly fair or yellow, they made ufe of certain wathes to render it llill brighter. One of thefe wathes was a compontion of lime, the afnes of cortan vegetables, and tallow. They made ufe of various nits alio to make the hirr of their heads grow thick and long; which hall was not only etteemed a great beauty, Dut was confidered as a mark of dignity and noble birth. Boancia, gueca of the Iceni, is deferibed by Dio with very long hair, flowing over her houlders, and reaching down below the middte of her back.

The Britons haved all lheir beards, except their up. per lips; the hair of which they, as well as the Gauls, ailowed to grow to a very inconvenient leagth.

In after-times, the Anglo Saxons and Danes alfo confidered fine hair as one of the greatell beauties and ornaments of their perfons, and were at no little pains in drefling it to advartage. Young ladies before marriage wore their hair uncovered and untied, flowing in rimglets over their houders; but as foon as they were marited, they cut it horter, tied it up, and put on a head-dref ${ }_{3}$ of fome kind or other according to the prevailing fafhion. To have the hair entirely cut off was fo great a difgrace, that it was one of the greate!t punifhments inllicted on thofe women who were guilty of adultery. The Danifl foldiers who were quartered upon the Englith, in the reigns of Edgar the P'eaceable and of Ethelred the Unready, were the beaux of thofe times, and wete particularly attentive to the drefing of their hair; which they combed at leall onee every day, and thercby captivated the affections of the Englifh ladics. The clergy, both fecular and regular, were obligel to thave the crowns of their heads, and keep their hair hort, which dittinguithed them from the laity; and feveral canons were made againt their concealing their tonfure, or allowing their hair to grow long. The fhape of this clerical tonfure was the fubject of long and violent debates between the Englifh clergy on the one hand, and thofe of the Scots and Picts on the other ; that of the former being cilcular, and that of the latter only femicircular. It appears very plainly, that long fowing hain was univerfally elleemed a great ornament; and the tonfure of the clergy was confidered as an act of mottification and felt-denial, to which many of them fubmitted with reluctance, and endeavoured to conceal as much as pollible. Some of them who affected the reputation of fuperior fanctity inveighed with great biternefs againt the long hair of the laity; and latoured earneftly to perfuade them to cut it thort, in imitation of the clergy. Thus the famous st Wultan bifhop of Worcefter, is faid to have declaimed with great vehemence againll huxury of all kinds, but chiefly again!t long hair as moll criminal and moth univerfal. "The Englih (fays William of Matmbury in his life of St Wuhtan) were very vicious in their manners, and plunged in luxury, through the lung peace which they had enjoyed in the reign of Edwa:d the Confeflor. 'The holy prelate Wratitan reproved the wicked of all ranks with great boduefo; but he rabulied thofe with the greatelt fevenity who were proud of their long hair. When any of thofe vain peiple bowed their heads before him to receive his bleffing, before be gave it, he cut a lock of their hair with a little fharp knife, which he carried about him for that purpofe; and commanded them, by way of penance for their fins, to cut all the relt of tiecir hair in the fame manner. If any of thent retufed to comply with this conmand, he denounced the mott dreadful judgnents :tpon them, reproached them for their efleminacy, and fortold, that as they imitated women in the length of their hair, they would imitate them in their cowardice when their country was invaded; which was accomplithed at the landing of the Normans."

This continued to be long a topic of declamation among the elergy, who even repuefented it as oat of
the greatelt crimes, and moft cestain marks of reprobation. Anfelm archbifhop of Canterbury went fo far as to pronumnce the then terrible fentence of excommunication againlt all who wore long hair, for which pious \%eal he is very much commended. Serlo, a Norman bifhop, acquired great herour loy a fermon which he preached before Henry 1. A.D. 1104 , againt long and curled hair, with which the king aud a! his courtiers were fo much aireeted, that they confental to refign their flowing ringlet: of which they had been fo vain. 'The prudent prelate atave them no time to clange their minds, but immediatly pull da a pair of thears out of his feeve, and perfermed the operation with his own hand. Another incident happersed about 25 years after, which gave a temporary checl: to the prevailing fondnefs for long hair. It is thens : dated by a contemperary hiftorian: "An event happened, A. 1). 1129, which feemed very wonderfat to and young gallants; who, forgeting that they were men, had transformed themfelves atu women by the length of their hair. A certain Fnight, who wa: very proud of his long lu:miant hair, dremed that a perfon fuftocated lim with ite curls. As foon as he awoke from his lleep, he cut his hair to a decent length. 'Ihe report of this fpread over all Engizat, and almoll all the knighter reduced their han to the pioper flandard. But this reformation was not of long continuance; for ial lefs than a year all who withed to appear fahionable returned to their former wickednees, and contended with the lavies in kngti: of tair. 'likofe to whom nature l:ad duied that was:ont fupplied tite defect by art."

The Gretks, and, after their cxample, the Rumans, wore falle lair.

Commerce of If.tIk. Flair makes a very corfiderable article in commeree, ferceialiy fince the mode of perukes has oltained. The hair of the growth of the northern countrics, as England, \&ic. is valued much bcyond that of the more fouthern ones, as Italy, Spain, the fouth parts of France, \&c. The merit of good hair confits in its being well fed, and neither too coarfe nor too flender; the bignefs rendering it lefs fuiceptible of the artificial curl, and difpoting it rather to frizzle, and the finallnefs making its curl of too thurt duration. Its length ihould be about 25 inches; the noore it fatts thort of this the lefs value it bears.

There is no cestain price for hair ; but it is fold from five flillings to inve puan's an vance, accordiag to its quality.

The farcenefs of grey and white hair has put the dealers in that commodity upon the methods of redincing other colours to this. This is dene by foreading the hair to bleach on the grafs like liven, after intit wafting it out in a lixivicus water. 'I'his lye, with the force of the fun and air, brings the hair to fo puffect a whitene fe, that the mold experienced perion may be deceived therein; there being fearce any way of detcet. ing the artifice, but by boiling and dyying it, which leaves the hair of the colour of a dead walnuterce leaf.

There is alfo a method of dyeing hair with himuth, which renalers fuch white hair as buriers ton much upon the yllow of a bright fixu cuipur: buil: the' proof of this too, the bifnuth not being abie to Hiand it.

Hair may be allo changed from a red, grey, or other difagrecable colour, to a brown or deep black, by a fulution of filver. The liqnors fold under the name of bair zenters, are at tottum no more than folutions of filver in aquafortis, largly dilued with water, with the addition jerlaps of other ingredients, which contribnte nothins to their eflicacy. The folution hould be fully faturated with the filser, that there moy be no more acid in is than is neculidry for hoicing the metal diffolve:; and betides dilution with waicr, a little fipirit of wine may be adtled for the further dulcification of the acid. It mult be olferved, that for diluting the folation, diftilled waser, or pure rain-water, mutt be ufal ; the common fpring. waters turning it millo, and precipitating a part of the difulved filver. It is to be obferved aifo, that if the liquor touches the fkin, it has the fame effuct on it as on the matter to be Alained, changing the part moillened with it to an indelible black.-Hair may allo be dyed of any colour in the fume maner as woul. See Dreng.

Hir which dats not curl or buckle naturally is browht to it by art, by firt boiling and then baking it iu the fullowing manner: After having picked and forted the hair, and difpofed it in pareels aceording to len the they roll them ap and tie them tight down upon litele eylindrical infruments, either af wood or earchen ware, a quarter of an inch thick, and hollowed a litete in the midele, called piges; in which flate they asc put in a poi over the fire, there to boil fo: about tw hours. When taken out, they let then dy; and whan cried, they fipread them on a heer of browin paper, eover theon with another, and chus fom! then in the pafty cook; who making a cruft or coffia arourd them of common pale, fets them in an oven t.ll the coml is about thre-fourths baked.
$T$ he chaly which a bair grew to the hiad is cales the
 give the buckle, the poirt. Fornerly the peraks-nakers mad: ro difl rence botween the crids, bu: carled and wove thom by cher indiferently: but this made then unable to give a fine buckle; hair wove by the point never takillg a right curl. Foreizners owa thenidues obliget to the Englifh for this diforey, which was hril cancid atroul by a peruke-maker of our c. untry.

Ifair is atio wfed ia various ether arts and mamfa :-thes:- Ia particular, the hair ofbeavers, hates, conies, ※. is the principal matter whereof hats are made. Spead on the grouad, and left to putrefy on cornLinds, hair, as all other animal fubllances, viz. horns, houfs, b'oud, garbage, \&ic. proves good manure.

Hane, in farriesy, is generally called the coit; and, with regard tu horfes, deferve s particular conficration.

The hair growing on the fetlock ferves as a defence to tio prontaent part of it in travelling in thoney ways or in frolty weather. If the hair of a horfe's neck, and the parts inont uncuverus, be clofe, firmosth, and nock, it is an incticatition of hi, being in lwalth and gould cafe. In order to make the hair of an horfe forit and hock, Io onom be kept armat teart, for the leak ianwrd cold will caufe the hair to flare; alfo fweat him often, for inat witl lowen and raice the dull and filth that remas lificust that; and when he is in the here nfa frowt, itrain ofl . It the white foam, fieat, and 4.1t, that is raifed up with an clifword-blade; and a'fo wha la is haded, if you rub him an orer with

## II A I

llar, Ilake.
his om blood, repeating it two or three days, and curry and drefs him well, it will make his coat fhine as if covered with a fine varnifh.

Hair falliont from the manc or tail is caufed either by lis having taken fome heat, which has engendered a dry mange; or from fome furfeit, which caules the evil humours to refort to thofe parts. To cure this, anoint the horfe's mane and creft with black foap; make a flrong lee of aftes, and wah it all over wi:h it. But if a canker fhould grow on a horfe's tail, which will cat away both fleth and bone; then put fome oil of vitriol to it, and it will confume it: and if you fiad that the vitriol corrodes too much, you need only to wet it with cold water, and it will put a ftop to it.

If you would take away hair from any part of a horfe's body, boil half a pound of lime in a quart of water, till a fourth part is confumed, to which add an ounce of orpiment; make this into a plafter, and lay it $0 n$.

Halr, or Dozun, of Plants; a general term expreffive of all the hairy and glandular appearances on the furface of plants, to which they are fuppofed by naturaliats to ferve the double purpofe of defenfive weapons and veffels of fecretion.

Thefe hairs are minnte threads of greater or lefs length and folidity; fome of them vilible to the naked eye; whillt others are rendered vifible only by the help of glaffes. Examined by a microfcope, almoft all the parts of plants, particularly the young falka or Items, appear covered with hairs.

Hairs on the forface of plants prefent themfelves under various forms: in the leguminous plants, they are generally cylindric; in the mallow tribe, terminated in a point; in agrimony, maped like a filh-hook; in nettle, awl. Thaped and jointed; and in fome compound flowers wilh hollow or fumel-fhaped forets, they are terminated in two crooked points.

Probable as fone experiments have rendered it, that the hairs on the furface of plants contribute to fome organical fecretion, their principal ufe feems to be to 1 referve the parts in which they are lodged fiom the bad eficits of violent frictions, from winds, from extremes of heat and cold, and fuch like external injuries.
M. Guettard, who has eftablifhed a botanical method from the form, fituation, and other circumftanees of the hairy and glandular appearances on the furface of plants, has demonftrated, that thefe appearances are generally conftant and uniform in all the plants of the fame genus. The fame uniformity feems to characterife all the different genera of the fame natural order.

The different forts of hairs which form the down upon the furface of plants were imperfectly dittinguifhed by Grew in 1682 , and by Malphigi in 1686. M. Gnet. tard jut mentioned was the firt who examined the fubject both as a betanitt and a philolopher. His obfervations were publifhed in 1747.

Hofr-Cloths, in military affairs, are large pieces of cloth made with half hair. They are ufed for covering the powder in waggons, or upon batteries; as alfo for covering charged bombs or hand-grenades, and many other ufes in magazines.

Harr. Pozder. Sec Starch.
Harr. líorm. Sce Gordius.
HAKE, in ichthyology, the Englifh name of a N 147.
fith conmon in the Englifh and fome other feas, and called by authors the merlucius and lucius narinus. This filh was ufed of old dried and falted. Hence the proverb obtains in Kent, A's dry as a bake.

HAKLUYT (Richard), a naval hitorian, is fuppofed to have been born in London about the year 1553 , and defcended of a genteel tamily in Herefordihire, as the name frequently occurs in the litt of high fheriffs for that county in former reigns. He was educated at Weft-minfter- fchool; and thence, in 1570 , removed to Chriftchurch, Oxford; where he applied himfelf particulatly to the ftudy of cofmography, and read public lectures in that fcience. Sir Edward Stafford being fent ambaffador to France in 1583 , Mr Hakluyt wasone of hisattendants, probably in the capacity of chaplain. He was at this time mafter of arts and profeffor of divinicy. In $15^{8} 5$ he obtained the royal mandate for the next vacant prebend of Brittol, to which preferment he fucceeded during his refidence at Paris. Conftantly attentive to his favourite cofmographical inquirics, in fearching the French libraries, he found a valuable hiftory of Florida, which had been difcovered about 20 years before by Captain Loudonniere and others: this he caufed to be publifted, at bis own expence, in the French language, and foon after revifed and republithed Peter Martyr's book De orbe novo. After five years refidence in France, Mr Hakluyt returned to England in company with lady Sheffield, filter to the lord admiral Howard. In the year 1589 he publifhed his Collection of Voyages in one folio volume, which in 1598 was republifhed in three. In 1605 our author was made prebendary of Wettminter; which, with the rectory of Wetheringfet in the county of Suffolk, feems to have been the fummit of his preferment. He died in 1616 , and was buried in Weltminfter-abbey; bequeathing to his fon Edmund his manor of Bridge-Place, and feveral houfes in Tothil Itreet, Weftminfter. He was an indefatigable and faithful hiftorian. His works are, 1. A Collection of Voyages and Difcoveries, a fanall volume. 2. Hiltory of Florida, above mentioned. 3. The principal Navigations, Voyages, and Difcoveries of the Englith Nation, made by Sea or over Land to the farthell diftant Quarters of the Earth, at any time within the compars of thefe 1500 years, in three vols folio. 4. The Difcoveries of the World, from the firt Original to the Year 1555, written in the Portugal tongue by Ant. Galvano; corrected, much amended, and tranilated into Englifh, by Richard Hakloyt. 5. Virginia richly valued, by the Defcription of the Main Land of Florida, her next Neighbour, \&c. written by a Portugal gentleman of Elvas, and tranflated by Richard Hakluyt. Befides thefe, he left feveral mauufcripts, which were printed in Purchas's collection.

HALBERSTADT, a fmall principality of Germany, bounded on the northealt by the duchy of Magdeburg, an the fouth by the principality of Anhalt, on the welt by the diocele of Hildsheim, on the ealt by part of the electorate of Saxony, and on the north by Brunfwic Wolfenbuttle. It is near to miles in length and 30 in breadth. The foil in general is fertile in corn and flax; and there are fome woods, though in general fuel is fearce. There are three large towns in it which fend reprefentatives to the diet, together with 10 fmall ones, and $9 t$ county-towns and 6
villages.

## H A L

villages. The number of the inhabitants is computed at about 200,000: the greatelt part of them are Lutherans; but there are alfo Calvinits, Jews, and Roman Catholics. The manufactures are chiclly woollen (for the country produces a great number of fheep) ; the exports are grain, and a kind of becr called broihan. The annual revenue arifing from this principality, and the incorporated counties and lordfhips, is faid to amount to 500,000 rix-dollars. Till the treaty of Wetphalia in 1648 this country was a diocefe, but was then transferred to the electoral houfe of Brandenburg as a temporal principality. It is intitled to a vote both in the dict of the empire and that of the circle. The principal places are Halberlladt, Groningen, Ofcherlleben, Olterwick, \&c.
Halberstadt, a city of Germany, in the circle of Lower Saxony, feated near the river Hothein. It is a neat uniform place; and has fome good churches and other handfone buildings, of which the eathedral is the chief. There is an inn in this place, which is lookcd upon to be the largefl and to have the bett accommodations of any in Europe. Before the Refurmation, it was a bilhop's fee. E. Long. 11.29. N. Lat. 52.6.

HALDERT, or Halbard, in the art of war, a well-known weapon carried by the fergeants of foot and dragouns. It is a fort of fpear, the thaft of which is about five feet long, and made of afh or other wood. Its head is armed with a feel point, not unlike the point of a two-edged fword. But, betides this fharp point which is in a line with the fhaft, there is a crots piece of fteel, flat and pointed at both ends; but generally with a cutting edge at one extremity, and a bent fharp point at the other; fo that it ferves equally to cut down or to puth withal. It is alfo ufeful in determining the ground between the ranks, and adjufting the files of a battalion. 'The word is formed of the German bal, "hall," and bartl, " an hatchet." Voflius derives it from the German ballebacrt, of hel, "clarus, fplendens," and baeri, "ax."
The lalbert was anciently a common weapon in the army, where there were companies of halbardiets. It is faid to have been ufed by the Amazons, and afterwards by the Rhxtians and Vindelicians about the year 570 .
It was called the Danifan, becaufe the Danes bore an halbert on the left thoulder. From the Danes it was derived to the Seots, from the Scots to the Englifn Saxons, and from them to the French.
HALCYON, in ornitholugy, a name given by the ancients to the alcedo or king's fifler. See Alcedo.
Halcuon Days, in antiquity, a name given to feven days before and as many after the winter foltice; by reafon the halcyon, invited by the calmnefs of the weather, laid its eggs in nefts built in the rocks, clufe by the brink of the fea, at this feafon.

HALDE (John Baptift du), a leanned Fiench J:fuit, born at Paris in 1674. He was extremely well verfed in Afiatic geography; and we have of his compilation a work intitled Girand defiriftion de la Chine E' de la Tariarie, from original memoirs of the Jefuitical miffionaries, in 4 vols folio. He was alfo concerned in a collcction of letters begun by father Gobien, called Des lettres edifiantes, in it vols; and publithed fome Latin poems and orations. He died in $\mathbf{1}_{743}$.

Vol. Vill. Part I.

HALIE, in the fea languace, figuifies pull; as, to hale up, is to pull up ; to hate in or out, is to pull in or out. To over-hale a rope, is to hale it too fiff, or to hale it the contrary way.

Keel-Hale. Sce Duching.
Hale (Sir Mathew), lord chief juftice of the king's-bench in the reign of Charles II. Was the fon of Robert Hale, Efq; a barriter of Lincoln's Inn, and was born in 1609 . He was educated at Oxford, where he made a confiderable progrefs in learning; but was afterwards diverted from this thudies by the levities of youth. From thefe he was refurmed by Mr John Glanvill ferjeant at law; and applying to the itudy of the law, entered into Lincoln's lmm. Noy the attor-ney-general took early notice of him, and directed him in his Atudies. Mr Selden alio took much notice of him; and it was this aequaintance that firt fet Mr Hale on a more enlarged purfuit of learning, whieh he had before contined to his own profeflion. During the civil wars, he behaved fo well as to gain the efteern of both parties. He was employed in his practice by all the king's party; and was appointed by the parliament one of the commifioners to treat with the king. The murder of king Charles gave him very fenfible regret. However, he took the engagement; and was appointed, with feveral others, to confider of the reformation of the law. In 1653 he was by writ made fergeant at law, and foon after appointed one of the jultices of the Common Pleas. Upon the death of Oliver Cromwell he refufed to accept of the new conmifion offered him by Richard his fucceffor. He was returned one of the knights of Gloucefterfliire in the parliament which called home Charles II. Soon after he was made lord chief baron of the excliequer ; but declined the honour of knighthood, till lord chancellor Hyde, fending for him upon bufinefs when the king was at his houfe, told his majelty, that "there was his modelt chicf baron ;" upon which he was unexpectedly knighted. He was one of the principal judges that fat in Clifford's Inn about fetling the difference between landlord and cenant, after the fire of London, in which he behaved to the fatisfaction of all parties concerned, and alfo in his poft of chicf baton acted with inflexible integrity. One of the fint peers went once to his chamber, and told him, "That having a fuit in law to be tried before him, he was then to aequaint him with it, that he mighe the better underlland it when it flould come to be tried in court." Upon which the lord chief baron interrupted him, and faid, "He did not dal fairly to cone to his chambers abour fuch affairs; for he never received in!ormation of fuch caufes but in open court, where boh par. ties were to be heard alike." Upon wich his grace (for it was a duke) went away not a hetle difatisficd, and complained of it to the king as a rudenefs that was not to be endured: bat his majells bid him content himelf that he was ufed no worfe; and faid, "That he verily believed he would have ufed him no better if lie had gone to folicit him in any of his own caufes." Another remarisable incident happened in one of his circuits. A gentleman who had a trial at the affrecs had fent him a buck for his table. When judge Hale therefore heard his name, he aflicd "if he was not the fame perfon who had fent him the venifon?" and finding that he was the ferme, told him, hai "he conld

## H A L [ 274 H A L

not fufice the trial to go on till he had prid him for his buck." 'lhe gentleman anfwered, that " he never fold his renifon; and that he liad done nothing to him which he did not do to every judge who had gone that cirenit:" which was confirmed by feveral gentemen pretent. 'I'he lord chicf baron, howewer, would not furtio the trial to proceed till he had paid for the prefent: upon which the gentleman withdrow the record. In thont, lie was in 1671 advaned to be lord chied fallice of the king's bench; but about fow years after Bhis promotion, his health dechining, he religned his por in liburary io-j-t, and died in Decentaer following. 'This exediont man, who was an omamone to the tench, to his coumtry, and to hom n miture, wote, 1. An Efry on the (iravetationad Now-g avitation of Phat Budies. 2. Oblervations on the Phinciphes of noturd Motion. (6. The primitive Origination of Mankind. IXe alfoleft a great number of manuferipts, in Latin and Enghth, "om vamots lat. jects; anong whichare, his Pless of the Crown, funce publithed by Ex Emy!n in two solumes folio; and his Uniginal lnfitution, Power, and Juidiction of Parfaments.

Halfs (Stepten), D. D. a celebrated divine and philofopher, was born in 1677. He was the lixth fon of Thomas Hake, E q; the eldelt fon of Sir Robert Hakes, created a baronct by king Charles II. and Mary the heirefs of Richard Langley of Abbots. Wood in Hertordhare. In a by be was entered a pentioner at lennet-college, Cambridge; and was admitted a follow in 1703, and became bachelor of divinity in 171. He foon difcovered a genius for natural philofophy. Botany was his lint itudy ; and he ufd frequently to make excurlions among Cogmagog hills, in company with Dr Stukely, with a vies of profecuilmer that llady. In thefe expeditions he likewile coll. हted foffits athe infects, hoving contrived a curious inHrument for catching fuch of the latter as have wiogs. In company with this friend he alfo applied himiclf to the fludy of anatomy, and insented a curious method of ohtaining a reprefentation of the luags in lead. They next applied themfelves to the fludy of cheniftry; in which, howevor, they did not make any remarkable difcoveries. In the lluly of aftronomy Mr Hales was equally affiduous. Having made hinifelf acquainted mith the Newtonian fyttem, he contrived a machine for fhowing the phenomena on much the fame principles with that afterwards made by Mr Rowley, and, from the name of his patron, called an Orvery.

About the year 1710 he was prefonted to the perpetual cure of Teddington uear Twickenham, in Niddlefex; and afterwards accepted of the living of Porlock in Somerfethire, which vacated his fellow hip in the college, and which he exchanged for the living of Faringdon in Hamphire. Soon after, he married ATary, the daughter and heirefs of Dr Newce, who was rector of Halifham in Suffex, but relided at Much-Haddam in Hertfordfhire. On the 13 th of March 1718, he was elected member of the Royal Society; and on the 5 th of March, in the year following, he cxhibited an account of fome experiments he had lately made on the effect of the
fun's warmeth in rating the fap in trees. This procured hum the clanks of the fociety, whon alfo requelled lim to profecote the fubject. With this requett he comphed with great pleature ; and on the ifth of June 1725 exhibited a treatife in which he gave an account of his progrefs. This treatife being highly applanded by the fociety, he farther enlarged and improved it; and in April 1727 he publifhed it under the title of Iregetable Statics. 'This work he dedicated to has late majetty ling George II, who was then pirice of Wales; and le was the fame year chufen one of the council of the Royal Suciety, Sir Hans Sloan being at the fame anmedelecti. nchofon their prelident. 'the book being well received, a facond edition of it was ploblithed in 1731. In a preface to this edition Alr llales pomifed a fequel to t'ue wor, whish he publifised in 1723 under the ciale of Statical Elfins, \&e. In 1732 he was afpuintid one of the tratues for titablithing a new colony in Georgia. On the gth of July 1733 the maverity of Oxford honoured him with a dipluma for the degter of doctor in divinity; a mank of dithnction the more honourable, as it is not ufual for one univerfity to confor academicad honours on thofe who were educated at another. In 1734 , when the hatch and morals of the lower and mideling dafs of people were lubserted by the eacefire draking of gin, he publithed, though without his name, A friendly Admonition to the Drinkers of Erandy and other fpirituous Liquers; which was twice reprintad. The latter end of the fame gear he whblimed a fermon which he preached at St Buide's beture the relt of the rutuees for eftablifning a new colny in Georgin. His text was, "Bear $\because$ eone anothei $\therefore$ buthens, and fofultil the law of Chrift;" Galatians vi. 2. In 1739 he printed a volume in 8 vo, in. titled, Philofoplical Experiments on Sea-water, Corn, Fleth, and other Subflatees. This work, which contained many uiefui inltructions for royagers, was dedicated to the lords of the admiralty. The fame year he exhibited to the Rnyal Socict; an account of fome farther experiments towards the difcovery of medicines for difonving the llune in the didneys and bladder, and preferving meat in loner voyages; tor which he rece!ved the guid necial of Sir Godtrey Copley's donation. The year following he pullifined fome account of Experiments and Obfervations on Mis Stephens's Medicines for difolving the Stone, in which their diflulvent power is inquired into and dumontrated.

In 1741 he read before the Royal Socicty an account of an inttrument which he invented, and called a ventiatar, for couveyins frefh air into mines, hof pitals, prifons, and the chofe parts of thips: he had communicated it to his particular friends fome months before; and it is very remarkable, that a machine of the fame kind, for the fame purpole, was in the furing of the fame ycarimented by onc Martin Triewalet, an officer in the fervice of the king of Sweden, called captain of mechanics, for which the king and fenate granted him a privilege in October following, and ordered every flip of war in the fervice of that flate to be furnithed with one of them; a model alfo of this machine was fent into France, and all the fhips in the French navy were alfo ordered to have a ventilator of the lame fort. It happened allo, that about the fame time one Sutton, who kept a coffeeloufe in Alderfgate-

## H A L

fircet, invented a ventilator of another conlruction to draw off the foul a:r out of fips by means of the cookroum fire: but porr Sutton had not intereft enongh to make mankind accept the benefit he offered them; tho its fuperiority to Dr Hales's contrivance was cvident, and among others Dr Mcad and the late ingenious Mr Benjamin Robirs gave their tellimony in its farour: (See Arr-Pipes.) The public, however, is not lefs indebted to the ingenuity and benevelence of Dr Halcs, whofe ventilators came more calily into ufe for many purpofes of the greaterl importance to life, particularly for keeping corn fweet, by blowing through it frefh thowers of air; a practice very foon adopted by Fiance, a large granary having been made, under the direction of Duhamel, for the prefervation of corn in this manner, with a riew to make it a general practice.

In $17+3$, Dr Hales read before the Royal Society a defcription of a method of conseying liquers into the aldomen during the operation of tapping, and it was afterwards printed in their Trantations. In $17+5$, the publimed fome experiments and obfervations on tar.water, which he had heen indueed to make by the publication of a wook called Siris, is which the fate learned and moil excellent Dr berkler, bithop of Cloyne, had recommended tar-water as an univerfal medicine: on this oceation feveral letters paifed between them on the fubiect, particularly with refpect to the ure of tar-water in the difeafe of the homed catthe. In the fanc year he commaicated to the public, by a letter to the cliter of the Gentleman's Magazine, a defeription of a back-baver, which will minnow and clean com much fooner and better than can be done by the common method. He alfo, at the fame time, and by the fame channel, communicated to the public a cleap and eufy way to preferve corn fweet in facks; an invention of great benteft to farmers, efpecially to poor leafers, who want to keep finall quatitities of corn for fome time, but have no proper granary or repolitory for that purpofe. He alfo the fame year took the fame methad to publin directions how to ke-p corn fwect in heaps without turning it, and to fweeten it when mufty. He publifled a long paper, containing an account of fucral methods to preferve con by watilators; with a particular defeription of feveral forts of ventila:ors, illuilrated by a cut, fo that the whole mechanifm of them may be ealily known, and the machine conitructed by a common carpenter. He publifhed alion in the fame volume, but without hio udne, 2 detection of the fallacious boalts concerning the ethcacy of the liquid thell in diffolving the thane in the bladder. In 1746 he conmunicated to the Royal Society a propofal for bringing fmall paffable floncs fion, and with eafe, out of the blader; and this was allo printed in their Tranfactions. In the Gen:leman'z Magazine for Joly 1747, he publifed an acconat of a very conlidetable improvement of his back-licaver, by which it became capable of clearing corn of the sury frall grain, feeds, blac'ss, finut-balls, \&ec. to fuch perfection as to make it fit for feed-corn. In $17+3$ hee communicated to the Royal Socicty a propulal for checking, in fome degree, the progrefs of fires, nceafioned by the great fire which happened that year in Cornhill: And the fublance of this propolal was printed in their Tranfactions. In the fame gear he
allo communicated to the Society two mentuirs, which are printed in their 'l'ranfactions; one on the great benclit of ventilators, and the other on fome expeninuents in clectricity. In 1749 his ven. tilators were lixed in the Savoy prifon, by order of the right hon. Henry Fox, Efq; then fecretary at war, afterwards lord Holland; and the benefit was fogreat, that though 50 or too in a year often died of the gaol ditlemper before, yet from the year 1749 to the year 1752 inclulive, no more than four perions died, though in the year 175 ) the num. ber of prifoners was $24^{\circ}$; and of thofe fuur, one dicd of the lmali-pox, and another of intemperance. In the year 1750 be publifhed fome conliderations on the caufes of earthquakes; oceationed by the fight hooks felt that gear in London. The fublance of this work was alfo printed in the Philofophical T'ranfactions. The fame year he exhibited an cxamination of the frength of feveral purgimg waters, ef pecially of the water of 'felfop's well, which is printed in the P'inlufo. phical Tranfactions.

Dr Hales had now been feveral years honoured with the elteem and friendhip of his royal highnefs Frederick prince of Wales; whon frequenty vilited him at Teudington, from his neighbouring palace at Kcw . and took a picafure in firpriting liom in the midt of thofe curious refearches into the various parts of nature which alnont inceffancly employed him. Upon the p:ince's death, which happened this year, and the fettlement of the houfehold of the princefs-dowager, he was, without his folicitation, or even knowledge, apprinted clerk of the clofet or almoner to her royal hirgnefs. In 155 the was chufen by the college of phylicians to prach the annual fermon called Crowere's leature: 1)r William Crowne having lift a legaej for a formon to be anaually preached on "the wifom and good"efs of Cod dilplaved in the Eormation of man."
 leagth of days muly, inains, Job xii. 12. This fermon, as ufal, was publithad at the requell of the college. In the later end of the year $175:$, his rentilators, wo:'xd by a windnill, were hxed in Newgate, with bran. hing trunks to $2+$ wards; and it appeared that the difproportion of theofe that died in the gad before and after this eflablehnent was as 16 to 7. He pubDihed dios a farther account of their fuccefs, and fome obferidions on the great danger arifing from fual air, exemphifed by a marrative of feveral perions lemed with the gaol-fever by working in Newgate.

On the death of Sir Hans Sloane, which happened in :he year 15j3, Dr Hales was elected a member of the Acadeay of Sciences at Paris in his room. The fame year he publifned in the Gentleman's Magazine fome farther condiderations about means to draw the foul air out of the fick rooms of occalional armv-hnfpitals, and private houles in town. He allo publithed many other carions particulars relative to the ufe and fuccefs of ventilators. The fame year a defeription of 2 fea-gase, which the doctor invented to meafure unFathomable depths, was communicated to the public in the lame mifcellany: this paper was drawn up about the ycar 1732 or 4733 , by the doctor, for the late C o. lin Campbell, Efq; who employed the ingeniuus Mr Hawkibee to make the machine it deferibes, whish was tried in various depths, and anfwered with great
exachuriz,

## H A L

Hales. exacincfs, yet was at laft loft near Bernuda. In fecond wite, the firt being dead, and by the iift wen. Half.m 1754 , he comnunicated to the Royal Socicty forne experimenss for keeping water aud fifh fweet with lime-water, an account of which was publifhed in the Philor phtical Tranfackions. Fle alfo continued to en1:ch their memouiss with many nfefful artictes from this time till his death, particuisly a method of forwardang the ditillation of frell from fatt water by blowing Ahowers of fieth air up through the latter during the uperation. In 1757 he communicated to the editor of the Gentleman's Mrazaine an ealy method of purifying the air, and regulating its heat in melon frames and :reen-houfes : alio furth:cr improvements in his method of dimiting ica.water.

His scputation and the intereft of his family and fiends mifhe eafly have procurd hime farther preferment: but of farther preferisent he was not delirves: for being nominated by his late Majeity to a can-ny of Wintfor. he engaged the princefs to requeth hi, majetty to recal lis nomination. That a man io deveted to pilitufophicalal itsdies and employments, and fo confeicutious in the difharge of his duty, fheruld not dutire any prfernent which would reduce him to the dilemma either of negsesting his, daty, or foregring his anvurcment, is not itrange: but that he would refure an lonontrable and profiable appointracnt, for which no duty was to be done that would internupt his habits of life, can farce be imprited to hiis temperance and humility without impeaching lis bencelence ; for if he laat no wifh of any thing nore fur himfelf, a liberal misal would furely lave been highly gratiifed by the diftribution of fo couliferable a fum as a canonry of Windfor would have put into his powcr, in the reward of indutry, the alleviation of diftrect, and the fupport of helpiets indigerce. He was, however, remarkable for focial virtue and fweetnefs of temper ; his life was unt ouly blamelefs, but exemplary in a high degree; he was lappy in limelf, and beneficial to others, as appears by this account of his attainmonts and purinits; the contant firtuly and checrfuldefs of his mind, and the tomperance and regularity of his 1 fe , concarred, with a good confitution, to preferve him in hicalth and vighar to the uncomanon age of four core and four years. He died at Tedungton in 1761 ; and was bufich, purfuant to his nwn diredtion, under the tower of the parill.church, which he buit at his own expence not loug before his death.-Firr royal highnefs the princefs of Wales erected a monument to his menory in Weflrsintter abbey.
HALESIA, in botany : A genus of the monogynia briler, belonging to the dodecaadria clafs of plants; and in the natural method rankins under the 18 th order, Bizormes. The calyx is quatridentated, fuperior; the corolla quadrifid; the nut quadrangular and difpermolls.
HALESWORTH, a town of Suffolk in Englind, feated on a neck of land between two branches of the river Blith, ict milks from Lomilon. It is a well frequen :ed thiriving place, and lass a trade in lireny yarn ond dallututh. It las one lage church, and about 200 go ad houres; but the thetts ate weither wide nor pard. About the thwn is raifed a great deal of hemp.

ter he has a fon, and by his fecond venter has likewife a fon ; the two brothers, in this cale, are but of halfblood. Sce Consanguinary and Descent.

Half-Mirk; a moble, or 6s. 8 d .
Hale Moon, in fortification; an outwork compofed of two faces, forming a faliant angle, whote gorge is iil form of a crefeent or halfennon, whence the name. HAI,FPENNY, a copper coin, whofe value is exprefled by its name, in reference to the penny.

HALI-BEIGII, frat dragoman or inteppeter at the Grand Signior's court in the 1 gth century, was horn of Chuiftian parents in Poland; but having been taken by the Tartars when he was young, they fold him to she Turks, "his brourht him up in their religion in the feraglio. His name, in his native country, was Bubowki. He learnt many languages, and Sir Paul Ricaut owns he was indebted to him for foveral things which he relates in his Prefent flate of the Ottoman empire. He held a great correspondence with the Englifh, who perfuaded him to tranllate fome books into the Turkifh language; and he had a mind to return into the bofom of the Chritian chureh, but died before he could accomplifi the defren. Dr Hyde publitherl his brok Oj the litursy of the Turks, their pilgrimages to Mecca, their circumcifisn and vifating of the fick. He traniated the catechifm of the church of Eagland, ans the bible, into the Turkith language. The MS. is lodged in the litrary of Leyden. He wrote likewife a Turkifh grammar and dictionary.

HALICARNASSUS, (anc. geog.) a principal town of Caria, faid to be built by the Argives, and fituated between two bays, the Ceramicus and Jafius. It was the royal relidence, (called Zeplyra formerly); efpecially of Maulolus, made more illuitrions by his m mambat. This monument was one of the feven wonders, and erected by Artemilia. Halicarnaffeus, or Halicamatenfis, was the gencilitious name of Horocours and Dionytus The former was ealled the Fa:her of Hiftoly ; and the latter was not only a good hillorian but aloo a critic.

HaLIATUS. in onitholagy. See Falco.
HALAETJPICS, Habeutira, avertina, formed of araus, fighermon, which is derived from ans, fea; books treating of fithes, or the art of fithing. -We have llall extant the halicaties of Oppian.

IHAIMAX, the capital of the province of Nova Scotia in America, fituated in W. Long. 64 30. N. Lat. 4i. 45. It was founded in 1749 , in order to fecure the Britifh fettlements there from the attempts of the Frinch and Indians. It was divided into 35 fquares, cach containing 16 lots of 40 by 60 feet; one thablinhed chusch, and one mecting-houfe, and a finall number of houfes out of the regular itreets. The town was furrounded by pickettings, and guarded by forts on the outide; but fince the commencment of the American troubles, it has been very flrongly fortifed. Along the river Chebucto. to the foullward of the town, are buildings and tifte Eakes for at leaf two mile, and to the northward on the river for about ,ne mile. The plan, tumerer, has been greatly improved by the tall of Halifas, who was the original contriver. The proclamatom iffued for this fettliment. wifured 50 acres of land to every foldicr and failur who would foitle in that
part of America, without paying any rent, or doing any fervice for ten years, and no more than one fhil. ling per annum for each 50 acres ever afterwards: to every foldier and failor who had a wife and children, ten acres more were added for every individual of his family, and for every inceane that thould afterwards happen in the fane proportion: fo cach fubaltern officer 80 acres, and is for cach of his Family; 200 actes to eachenfign; 300 to edeh licutement +00 to each captain; 600 tu extiy officer in raik dimese a c:aptain and 30 for "ach of his family. The govern. ment aifo engrged to tranfport and maintain the new fettlers for robe year at its uwn expence, and to furnim them with fuch arms, pravifions, utenfles, iandements, \&e. as fhould be nectifary : put them in a way to cod tivate their lands, to build habetations, and to commence a bifley. The fane condizons were likewife oficed to all carpenters and othes landicraffomen; and furgeons were ofiered the fane conditions whith the tifigns.-'This proctanation was publithed in itarch, and by the monch of Niay 3:00 perforis hat offered themfelves. ?lbey accordingly embarked, and ctha. blified themfelves in the bay of Cichacto; calling their city Halifax, from the tiile of their patron. likfore the end of Ocrober the fame year, $35^{-2}$ eomfortable wooden houles wele built, and as many more during the winter. - 'Hoc fime gear in which the fettlers embarked, the giverment granted them qo,cool. for their expences. Io 1750 , they graneed 57,5821. 17 s . $3 \frac{1}{5} \mathrm{~d}$. for the fane purpofe ; in $1751,53.927 \mathrm{l}$. 14 s . 4d.; in 1752. 61, 492 1. 19s 4 t. d. in in $1753,94,685 \%$ 12 s .4 d . ; in $175+, 5 \mathrm{~s}+78 \mathrm{l} .2 \mathrm{s}$. ; and in 1755 , $49,+181.7$ s. Sd..- The place hes at leneth attained a degree of fplendor that hids farr to rival the tirtt cities in the revolted colonies; for which it has been equally indebted to the late war, to the great increate of population from the exiled loyalifts, and the fotering care of Great Britain; infomuch, that the number of inhabitants has been more than dunbied duriug the laft ten years.

The hatbour is perfectly flactered from all win is at the ditance of $t 2$ miles from the fea, and is fof foacoous, that a thoufand fail of thips may ride in it without the leat danzer. Upon it there are built a great number of commolims wharfs, which have fiom 12 to 18 fet water at all times of the tode, for the ennvenience of loading and unlading mips. The thecis of the town are regularly laid out, and ernfs cach other at right angles; the whole riting gradually from the water upon the fide of a hill, whofe top is regularly fortified, but not fo as to be able to withtand a regular attack. Many confiderable mershants refide at this place, and are poffefled of fhipping to the amount of feveral thoufand tons, employed in a Howihing trade both with Europe and the Weat ladies. There is a fnall but excellent careening yand for hips of the royal navy that are upon this tlation, or that may have occafion to come in to retit, and take water, fenel, or freth provifons on boart, in their paflage to and from the Wefl lndies. It is always kept well provided with naval Atores; and hips of the line are hove cown and repaired with the greatek eafe and fafety. Several batterices of heavy canmon command the harbour, yarticulatly thofe that are placed upon George's Inand. which being very leep and righ, and lituated in maid-
chamel, a little way below the town, is well calculated Habifac to annoy veffel: in any direstion, as they muth of neceffity pafs very near it before they are capable of doing any mifchief. Abnve the careenint ya-d, which is at the upper end of the town, there ins large bation, or piece of water, communicating with the hatbour below, near 23 miles in circumfersuce, and capable of constining the whate navy of Eusland, cutimely thaltued from all winds, and hasine coly one narow sho trance, whech, as be werved infure, lean, inte the harbur. There are a mamber of deathed culements lately formed by the loyatels upon the baion: the iands as a imall diltance from the water heing generalIy thonght be ter than thofe near to Halifax; but what fuceffinay attend their laboure, will require fore time on ecermine. An elegant and convenitut banking has beea ercetel near the inwn for the convalefuence of the navy; but the luealthinefo of the climate has as ye: prevented many perfons from becoming patience, fcarecly any flips in the wonld being fof iree from complaints of every kint, in regard to health, as thofe that are employed upon this ftation. There is a very fine lisht houfe, Handing lapon a finall ifend, jut iff the entrance of the harbour, whech is vithble, cither by night or day, fix or feven leaguts off at fa.
Halifax, earl of. See saville.
Halifax, a town in the weft riding of Yorkhire in England, feated on the river Calder, in W. Long. 2. O. N Lat. 53. 45. It has the title of ans carldom, and is very eminnt for the cluthicr trade. The parith is faid to be the mon populous, if not the mote extentive, in Eogland: for it is ahove 30 mikes in circumference: and, belides the mother church at Halifax, and 6 meeting-houfes, has 12 chapels, two of which are parochial. What is a little fiogular, all the mect-ing-tonfes here, except the quakers, have bells and burying grounds. The woollens pincipally manafactured hete are kerfeys and hathoms. Of the former it is affirmed, that one dealer lath fent by commifion 60,0:0 pounds worth in a ycar to Holland and Fhunurgh; and of the later, it is Caid, 100,000 picces ane made in thes parifly yonly. The inhabitasts here and in the weighthouring towne are fo entiocls apployed in tha fe manatanes, that agiculture. is but litte mineled. Nont of their porifions of all forts are brought from the oorth and call ridings, ard from Latcathire, Chethire, Notinghamhire, and Warwitahire. The matkets ate very much crowded for thic tugng and felling puovifions and manufacturs. The cloths, at the firt erecting of the woollen manufacurtes in thele parts, having been frequently thoken ofit the terters in the night, a law was make, by which the nagitrates of Halifax were empowered to pafs fertence on, and txecute all offenders, if thy wore baken i: the fact, or ox ned it, or if the flulen eloth was found upon them, provided alfo the crime wat commited, and the criminal apprethended, within the liberties of the foren of IIrrdwick. Thofe found guilty were exceuted in the fullowing manner: an axe was drawn by a pully to the top of a wooden engine, and fallened by a pis, which locing pulled out, the axe foll down in an inflant, and did its work. If they lind flole an nx, horfe, or any other beate, it was led with: them to the forthol, and there fattened by a chord w the pin, that beld up the axe; ard when the tignal waz
given by the jurors, who were the firt burghors with. in the feveral sown of the forell, the beat was driven awne, and the pin placked out, upon which the axe fell and did its uthec. This fevere and fummary confe of jutice gave occation to a litany, which is thill much more frequent in the mouths of the beggars and vagiants of thele pats, than is the common prayer, viz.
"From Efill, Huh, and Itifax, good Lord deliver us:"
though weither the engine, nor manner of procecding againt them, are now in ufe.

HALIO'l'S, the 1 ar shell, a gemus of infeets belonging to the order of vermes tellacea. 'This is an animal of the facil-kind, with an open thell refembling ata ear. There are feven ipecies, dilinguthed by the tigure of their flells. See Piate CCXXXIV.

If. A LITZ, a town of Poland, and capit. of a tersitory of the fame name, in Red Ruhtia, with a calle. It is feated on the river Neiler. E. Long. 26.c. N. Lat. 49. 20.

HAL.L, in architecture, a large room at the entance of a dine houle and palace. Vituwius mentions three kinds of lalls; the titralyle, with foar columns fupporting the platfond or celling ; the Corinthian, with columns all round let irto the wall, and vauled over ; and the Egyptian, which had a perityle of infulated Corinthian columns, bearing a fecond order with a ceiline.

The ha!l is properly the finet as well as forf member of an afariment: and in the houfes of mintters of ftate, magitnates, fic. is the place where they difpatel bufinefs, and give audience. In very magnificent buildings, where the hall is langer and loftier than ordinary, and placed in the middle of the houfe, it is called a faloon.

The length of a hall frould be at leat twice and a quarter its bracith; and in great buildings, three times its breadth. As to the height of liails, it may be two thirds of the breadth; and, if made with an arched ceiling, it will be much handfumar, and lefs liable to accidents by hire. In this cale, its height is found by dividing its breadth into hix parts, five of which will he the height from the four to the uader fide of the $k e y$ of the arch.

Hall is alfo paticulanly ufed for a court of jutice; or an edifice whetein there is one or more tribunats.

In Weitminter-hall are held the great courts of England, viz. the king's benc!, chancery, common plas, and exchequer. In arjoining apatments is likewife hed the high court of parlidment.

Wetlminter-hall was the royal palace or place of refidence of our ancient kings: who ordinarily held their parliancots, and courts of judicature, in their dwelling- houfes (as is thill done by the kinges of Spain), and frequently fat in perfon in the courts of judicature, as they fill do in parlianent. A great part of this palace was buent under Henry VIll. what remains is Alll referved for the faid judicatories. The great hall, wherein the courts of king's bench, sec. are kept, is faid to lave been built by William Rufus; others fay by Richard 1. on 11. It is reckoned fuperior, in point of dinentions, to any lall in Lurope; being 300 feet long and 100 broad.

Hall (Jofeph), an eminent predate of the church of

Enghome was born in 15:4, and chucated at Cambridse. Ile became poffefter of rhetoric in that miverficy, and then fuccefively was made rector of 11al. Aed in Suflolk, pretented to the living of Wathan in Effex, made prebendary of Wrulvelampton, dean of Worcetter, bihop of Excter, and lattly of Norwich. His works tettify his zeal agam! Popery, and are much elfeemed. He lamented the divilions of the Potcilants, and wrote fomething concerning the means of putting an end to them. Jily 1616 , he attended the embally of lord Doncatter into lirance, and upon his return was appointed by his tanaetly to be one of the disines who thould ateend him into Scotland. In 16 is he was fent to the fynod of Dant with other disines, and pitched apon to preach a I, atin fermon before that atmembly. But being oblised to return from thence before the fynod broke up, on account of his health. he was by the thates preiented with a gold medal. Ho wrote, 1. Mifcellaneous epithes. 2. Mundus difer ti item. 3. A jult cenfure of travellers. 4. The Chritian Sence.t. 5. Satires, in fix books. 6. A century of meditations; and masy oilher works, which, be tides the above fatires, make in all five volumes in fo'io and quarto. Ife died in 1656.

Hall (Juh), a poct of ditinguifhed learning, was born ai Durham, and euscated at Cambridge, where he was eflecmed the brightelt genius in that univerlity. In $16+6$, when he was but 19 years of age, he publifhed his Hora I'acion, or Efteys; and the dame year came out his poems. He tranflated from the Greek " Hicrocles upon the golden verfes of Pythagoras;" before whictu is an account of the ingenious tranffator and his works, by John Davies of Kidwelly. He died in 1656 . aged 29.

HAl.LAGE, a fee or toll paid for cloth brought to be fold in Blackwell-hall, London.

HAB.LAMAS, in our old wrices, the day of allhallows, or all-faints, viz. November 1. It is one of the crols quarters of the year which was computed, in ancient writing*, from Hall smas to Candlemas.

HALIAND, a country of Sweden, in the inand of Schonen, lying alons the fea-coall, at the entrance of the Baltic Sea, and oppolite to Joland. It is 60 miles along the coatt, but is not above 12 in breadth. IAlmatad is the capital town.
H. ILIA ATON, a town of Leiccterthire, in England. It is feated on a rich fuil, 12 miles fouh eat of Lacicalor, in E. Long. O. 50. N. Lat. ;2. 35.

HAIILE, a litile difmamid town of the Autrian Netherlands, ia Hainauk. 'Itac cherch of Nutre Dance contairs an imeste of the Virgin Mary, hold in great veneration. E. Loug. 3. 15. N. 1.att. 50. +4.

Hatie, a handfome and conivierable town of Germany, ia the circle of Upper San my, and in the duchy of Mugdeburg, with a Ganons miverlity and falt-works. It belongs to the king of Pinffa; and is feated in a pleafat plain on the riser Suc, in E. Long. 12. 23. N. Last. 51. 36.

Halle, a free and imperial town of Germany, in Suabia, famous for its falt-pits. It is feated on the river kochor, among rocks and mountainis, in E. Lon. 10. 50. N. Lat. +9.6.

HALILEIN, a town of Germany, in the circle of Bavaria, and archbihopric of saltburg; feated on

## H A L

clujath, the river Salcza, among the mountaing, wherein are mines of falt, which are the chief riehes of the town and country. E. Long. 12. 15. N. Lat. 47. 33.

HALLELUJA, a term of rejoicing, fonetimes fung or rehear fea at the cul of verfes on fueh occafions. The word is Hebrew; or rather, it is two Hebrew words joined together: one of them ism, ballech, and the other $n$ - jab; an abridgement of the name of God, -nio gebovab. The firt fignifies lampu", "praife ye ;" and the other, Dominum, " the Lord."

St Jerome tirft introduced the word haltanjah into the church fervice: for a confiderable ti ne it was oniy ufed once a year in the Latin church, viz. at Ealler; but in the Greek charch it was much more frepuent. St Jcrome mentions its heing fung at the iarcrments of the dead, which itill continucs to be done in that churel, as alto on fome ocecafions in time time of Lent.

In the time of Gregory the Great, it was appointed to be fung all the year round in the Latin church, which raifed fome complaints againt that pope; as giving too much into the Greeh way, and introducing the ceremonies of the church of Conllantinople into that of Rome. But he excufed himelf by alleging, that this had been the ancient ufage of Rones ; and that it had been brought from Conltantinople at the time when the word hadk dijzh was firt introducal under pope Damafcus.

HAl.LER (Albert Van), an eminent phyfician, was born at Bern, on the Gth of Octuber a ches. Ife was the fon of an advocate of conliderable eminence in his profeffion. His father liad a numerous family, and Alibert was the youngell of five funs. From the firll period of his education, he thowed a very great genius for hiterature of every kiad: to forward the prugrefs of his Audies, his father took into his family a private tutor, named Albrahom Billodz; and fuch was the difcipline exerted by this pedagogue, that the accidental fight of him, at any future period of life, ex. cited in Haller very great uneafinefs, and renewed all Lisis former terrors. According to the accounts which are given us, the progrefs of Hallers fiuches, at the earlieft periods of life, was rapid almolt beyond belief. When other chitdren werc regrimninit ondy to reatl, he was Aludsing Bayle and Moreri; and at nine years of age he was able to tranflate Greek, and was beginning the thady of Hebrew. Not long after this, however, the courfe of his eincation was fonew hat interrujted by the death of his father: an event which happened when he was in the $13^{t h}$, ear of his arye. Atter this he was fent to the puthic fichool at Dern, where he ex. hibited many fpecimens of carly and uncommon genivs. He was difinguilhed for his knowledge in the Graek and Latin languages; but he was chietly remarkable for his poetical genius: and his eflays of this kind, which were publifhed in the German language, were read and admired throughout the whole empire. In the 16th year of his age he began the turly of mediciue at Tubingen, under thofe eminent teachiers Duvernuy and Camerarius; and continued there for the fpace of zwo years, when the great reputation of the jufly yelebrated Boerlaave drew him to Leyden. Nor was this diftinguifhed teacher the only man from whole fupeniur abilities he had there an opportunity of prolit-
ing. Finyfoh was nail alive, and Ahbinus was rifing into fume. Animated by fuch examples, he fpent all the day, and the greatel pant of the night, in the moft intente tludy; and the proficiency which he made, gained him univerfal cttecm both from his teachers and fellow- Auderts. From Fuhtand, in the year 1727, he came to Englard. Here, howeter, his llay was but flort; and it was rather his intention to witht the illaArious men of dat period, than to profechte his Rudies at Londom. He formed connecturns with fome of the moit eminent of theas. He was honoured with the friendhip of Douglas and Cheielden; and he met with a reception yr wortioned to his merit from ؛iir Hans Sloans, prelident of the Royal society. After hus vifit wh britain, he went to France: and ahere, under thume eminent mailers, Winflow and Le Dran, with the lather of whom he refised durine his flay in Paris, be had oppertumties of profecoting anatomy, which he had not before enjoycd. But the zeal of our young anatomitt was geater than the projudices of the people at that period, even in the enligheened city of Parts, could admit of: An information being lodged againle him to the police for difecting dead bodies, he was obliged to cut thont lis anatomical invettigations by a precipitatc retreat. Still, however, intent on the farther profecution of his itudies, he went to Batil, where he became a pupil to the celebrated Bernouli.

Thus improved and influcted by the leetures of the mot dillinguifhed teachers of that period, by uncommon natural abilities, adst by unremitting indutry, he returned to the place of his nativity in the 26 th year of his age. Not long after this, he offered himfelf a candidate, firll for the office of phytician to an hofpital, and afterwarls for a profefforfhip. But neither the charakter which he had before he left his native country, nor the fame which he had acquired and fupported while abroad, were fufficient to combat the interetloppofed to him. He was difappointed in both; and it was even with diffoculty that he obtained, in the fulslowint year, the appointment of kecper of a public 1 :brary at Dern. The exercife of this office was inded by no means fuited to his great abilitics: but it was agrecable to him, as it afforled him a: opportmity, for thit exienfere reading by which he has been fo juthy dillinguithed. The vegicet of his merit which mark ed this brit oufet, weither dininimed his ardour for meedi. cal burfuis, nor detrated from his repuistion either at hume or abruad. And foon after he was neminated a profotur in the univerfity of Gottingen, by hing Geonge II. The dutics of this important offec he dra charged, with no lefs honow to hineflf than advantace to the public, for the fpace of 17 ycars; and it atturded him an ample lield for the exertion of thuie great talents which the pofiefed. Extenfively acquainted with the fantiments of otliers refpecting the conomy of the human body, flruck with the di.erfity of opinions which they held, and fenfible that tice only means of insefligating truth was by careful and candid experiment, he undertook the anduous tak of exploring the phavonena of human nature from the original fource. In thefe purfuits he was no lefs induftrious than fuccefsful, and there was lardly any function of the body on which his experiments did not reflect either a new or a Aronger light. Nor was it long neceffary for him, in

## H A L

Fatler. this arduous undertaking, to labour alone. The ex. ample of the preceptor infpired his pupils with the firit of induatious exertion. Zinn, Zimmerman, Caldani, and many others, animated by a generous eniulation, laboured with indefatignble induftry to profefecute and to perfect the difcoveries of their great maflet. And the matual exertion of the teacher and his ftudents, not only tended to forward the progrefs of medical fcience, but placed the philofophy of the human body on a more fure, and an almoft entirely new, balis. But the labours of Dr Haller, during his refidence at Gottingen, were by no means confined to any one department of feience. He was not more anxious to te an improver limfelf, than to in!tigate others to fimilar purfuits. To him, the Anatomical Theatre, the School of Midwifery, the Chirurgical Society, and the Royal Academy of Sciences at Gottingen, owe their origin. Such dillinguifhed merit could not fail to meet with a fuitable teward from the fovereign under whofe protection he then taught. The king of Great Britain not only honoured him with every mark of attention which he himfelf could beftow, but procured him alfo letters of nobility from the emperor. On the death of Dillenius, he had an offer of the profefforflip of botany at Oxford; the flates of Holland invited him to the chair of the younger Albinus; the king of Pruffia was anxions that he hould be the fucceffor of Maupertius at Berlin. Marthal Keith wrote to him in the name of his fovercign, offering him the chancellorthip of the univerfity of Halle, vacant by the death of the celebrated Wolf. Count Orlow invited him to Ruflia, in the name of his miftrefs the emprefs, offering him a dittinguifhed place at St Peterburgh. The king of Siveden conferred on him an unfolicited honour, by raifing him to the rank of knighthood of the order of the polar Itar ; and the emperor of Germany did hiin the honour of a perfonal vifit ; during which he thought it no degradation of his character to pafs fome time with him in the molt familiar converfation.

Thus honoured by fovereigns, revered by men of literature, and efteened by all Europe, he had it in his power to bave beld the ligheft rank in the republic of letiers. Y't, declining all the tempting offers which were made to him, he continued at Gottingen, anxioully endeavouring to extend the viling tanie of that medical fchool. But after 17 years refidence in that univertity, an ill Aate of health rendering him lefs fit fur the duties of the important office which he held, he fulicited and obtained permifion from the regency of Hanover to return to lis native city of Bern. His fchow-citizens, who might at fritt have fixed him among themfelves, with no lefs honour than advantage to their city, were now as fentible as others of his fuperior merit. A penfion was fected upon him for lifc, and lee ws nominated at different times to fill the mof important offices in the flate. Thefe occupations, howver, didd not diminifh his ardour for ufful improvements. He was the firlt prefident, as well as the greatet promoter, of the Occonomical Society at Bern; and he may be conndered as the father and fonder of the Orphan Hofpital of that city. Declining health, howerct, rettraned his exertions in the more ative sceries of life, and for many yars the was confined on$\mathrm{N}^{\circ}+{ }^{+}$

## H A L

tirely to his own houfe. Esen this, however, could Halleri not put a period to his utility: for, with indefatigable indull ry, he continued his favourite employment of writing till wichin a few days of his dea:h; which happened in the 70 th year of his age, on the 12 hh of De. cember 1777. His Elcmenta Pbifiologiz and Bibliotheca Medicina, will afford, to latelt poiterity, undeniable proofs of his indefatigable induftry, penetrating genius, and folid judgment. But he was not lefs diftinguifhed as a philofopher than beloved as a man; and he was not more eminent for his improvement in every department of medical fcience, than for his picty to God, and benevolence to all mankind.

HALLERIA, in botany: A gemus of the angiofpermia order, belonging to the didynamia clafs of plants; and in the natural method ranking under the 4oth order, Perfonata. The calyx is trifid; the corolla quadrifid; the filaments longer than the corolla; the berry inferior and bilocular, (the fruit not yet fully defcribed.)

HALLEY (Dr Edmund), an eminent aftronomer, was the only fon of a foap-boiler in London, and was born in 1656. He lirft applied limfelf to the fludy of the languages and fciences, but at length gave himfelf up wholly to that of afronomy. In 1676 he went to the iffand of St Helena to complete the catalogue of fixed fars, by the addition of thofe who lie near the fouth pole; and having delineaied a planifphere in which he laid them all down in their exact places, he returned to England in 1678 . In the year 1680 he took what is called the grand tour, accompanied by his friend the celeorated Mir Nelfon. In the midway between Calais and Paris, Mir Halley had a fight of a remarkable comet, as it then appeared a fecond time that year, in its return from the fun. He had the November before feen it in its defcent; and now haflened to complete his obfervations upon it, in viewing it from the royal obfervatory of France. His defign in this part of his tour was, to fertle a friendly correfpondence between the two royal aftronomers of Greenwieh and Paris; and in the mean time to improve himfelf under fo great a mafler as Caffini. From thence he went to Italy, where he fpent great part of the year 1681; but his affairs calling him home, he returned to England. 111683 , he publifhed his Theory of the variation of the marmetical compafs; in which he fuppofes the whole globe of the earth to be a great magnet, with four magnetical poles, or points of attraction : but afterwards thinking that this theory was liable to great exceptions, he procured an application to be made to king Willian, who appointed him commander of the Paramour Pink, with orders to feek by obfervations the difcovery of the rule of variatione, and to lay down the longiludes and latitudes of his majefty's fettlements in America. - lle fet out on this attempt on the 24 th of November 168 : but having crofed the line, his men grew lickly; and lis liemtenaut mutinying, he returned home in June 1699 . II aving got the lieutenant tried and calhiered, he fet fail a fecond time in September following, with the fame thip, and another of lefs bu'k, of which he had allo the command. He now traverfed the valt Atlantic ocean from one hemifphere to the other, as far as the iee would permit him to go ; and having made his obfervations at St Helena,

Brazil,

## H A L

Brazil, Cape Verd, Barbadoes, the Madeiras, the Canaries, the coaft of Barbary, and many other latitudes, arrived in Scptember 1700; and the next year publifhed a general chart, fhowing at one view the variation of the compars in all thofe places. Captain Halley, as he was now called, had been at bome little more than half a ycar, when he was fent by the king, to obferve the courfe of the tides, with the longitude and latitude of the principal head-lands in the Dritifh channel; which having executed with his ufual expedition and accuracy, he publifhed a large map of the Britith channel. Soon after, the emperor of Germany refolving to make a convenient harbour for hipping in the Adriatic, Captain Halley was fent by queen Anne to view the two ports on the coaft of Dalnatia. He embarked on the 22d of November 1702; paffed over to Holland; and going through Germany to Vienna, he proceeded to Iftria: but the Dutch oppofing the defign, it was laid afide; yet the emperor made him a prefent of a rich diamond-ring from his finger, and honoured him with a letter of recommendation, written with his own hand, to queen Anne. Prefently after his return, he was fent again on the fame bufinefs; when paffing through Hanover, he fupped with king George 1. then electoral prince, and his fitter the queen of Pruffia. On his arrival at Vienna, he was the fame evening prefented to the emperor, who fent his chicf engineer to attend him to litria, where they repaired and added new fortifications to thofe of Triefte. Mr Halley returned to England in 1703 ; and the fame year was made profeflor of geometry in the univerfity of Oxford, in the room of Dr Wallis, and had the degree of doctor of laws conferred on him by that univerfity. He is faid to have lot the profefforfhip of aftronomy in that city, becaufe he would not profefs his belief of the Chriftian religion. He was fcarcely fettled at Oxford, when he began to trmilate into Latin from the Arabic, Apollonius cie fetgioze rationis; and to reftore the two books De fectione fpatii of the fame author, which are loft, from the account given of them by Pappius; and he publifhed the whole work in 1706. Afterwards he had a fhare in preparing for the prefs Apollonius's Conics; and ventured to fupply the whole eighth book, the original of which is alfo loft. He likewife added Serenus on the fection of the cylinder and cone, printed from the original Greek, with a Latin tranflation, and publithed the whole in folio. In 1713 , be was made fecretary of the Royal Society; in $\$ 720$, he was appointed the king's aftronomer at the royal obfervatory at Greenwich, in the room of Mr Flamftead; and, in 1729, was chofen as a foreign member of the Academy of Sciences at Paris. He died at Greenwich in 1742 . His principal works are, 1. Catalogus Mellarum auffrahium. 2. Tabule afronomica. 3. An abridgment of the aftronomy of comets, \&c. We are alfo indebted to him for the publication of feveral of the works of the great S:r Ifaac Newton, who had a particular friendfhip for him, and to whom he frequently communicated his difcovcrics.

## Haleer's Quadrans. See Quadrant.

HALLIARDS, the ropes or tackles ufually employed to hoilt or lower any fail upon its refpective malt or flay. See Jears.

HALMOTE, or Halimote, is the fame with Vol. VIII. Part I.
what we now call a cours-baron, the word implyifg a Hininhade meeting of the tenants of the fame hall or manor. The name is ftill retained at Lufton, and other places in Hasterifte. Herefordfire. Sce Mote.

## Halmstadt. See Helmstadt.

halo, or Corosa, in natural hiftory, a coloured circle appearing ronnd the body of the fun, moon, or any of the large flars. Sec Corona.

HALORAGUS, in botany: A genus of the tetragynia order, belonging to the octandria clafs of plants. The calyx is quadrifd above; there are four petals; a dry plum, and a quadrilocular nut.

HALSTEAD, a town of Effex in England, feated on the river Coln, 45 miles from London. It has an old church, the ftecple of which was once burnt down by lightning, but rebuilt at the expence of an individual, (Robert Finie, Efq;). The town confilts of about 600 pretty good houfes, and is fituated on a rifing ground, but the ftreets are not paved. The inlabitants are about 4000 in number. Here is a good manufactory of fays, bays, callimancoes, \&cc. alfo a good free fchool for 40 boys, and a very aatique Bridewell. Its market on Friday is noted for corn.

HALT, in war, a paufe or ftop in the march of a military body.-Some derive the word from the Latin bultits, "breath;" it being a frequent occation of halting to take breath: others from allo, becaufe in balting they raifed their pikes on end, $\& c$.

HALTER, in the manege, a head-ftall for a horfe, of Hungary leather, mounted with one, and fometimes two flraps, with a fecond throat-band, if the horfe is apt to unhalter himfelf.

Halfer-Cof, is an excoriation of the pattern, occafioned by the halter's being entaugled about the foot, upon the horfe's endeavouring to rub his neck with his hinder feet. For the cure of this, anoint the place, morning and evening, with equal quartities of linfeed oil and brandy, well mixed.

HALTERISTE, in antiquity, a kind of playere at difcus; denominated from a peculiar kind of difcus called by the Grecks arrong, and by the Latins batiter. See Discus.

Some take the difcus to have been a leaden weight or ball which the vaulters bore in their hands, to fecure and keep themfelves the more Aeady in their leaping. Others will have the halter to be a lump or mafs of lead or ftone, with an hole or handle fixed to it, by which it might be carried; and that the halterifte were thofe who exercifed themfelvcs in removing thefe maffes from place to place.

Hier. Mercurialis, in his treatife De arte gymnafica, 1. ii. c. 12. dittinguifhes two kinds of halterifte; for though there was but one halter, there werc two waya of applying it. The one was to throw or pitch it in a certain manner; the other only to hold it out at arm'send, and in this pofture to give themfelves divers motions, fwinging the hand backwards and forwards, according to the engraven figures thereof given us by Mercurialis.-The halter was of a cylindrical figure, fmaller in the middle, where it was held, by one diameter, than at the two ends. It was above a foot long, and there was one for each hand: it was eitlier of iron, ftone, or lead.

Galen, De tuend. valttud. lib. i. v. \& vi. fpeaks of M m
this

## H A M

Ha'ton this exercife, and fows of what ufe it is in purging the
body of peccant humous; making it equivalent buth to purgation and phlebotomy.
halton, or Hallon, i.e. Hish Town, a town of Chenire, 186 miles from London. It itands on : ! till, where a cafle was built anno 1071, and is a member of the duchy of Lancalter; which maintains a large jurifdiction in the county round it, by the name of H.:.on. Fee, or the honour of Ifalton, having a court of record, prifon, \&e. within themfelves. About Micinacimas every year, the king's offiers of the duchy keep a law-day at the caftle, which itill remains a flately building; once a fortnight a court is kept here, to desermine all matters within their jurifdicion ; but felons and theeves are carried to the feffions at Cheiler, to receive their fentence. By the late inland navigation, it has communication with the rivers Merfey, Dee, Ribble, Oufe, Trent, Darwent, Severn, Humber, Thames, Avon, \&c. which navigation, including is windings, extends above 500 miles, in the counties of Lineohn, Nottinghom, York, Lancaller, WellmoreLand, Staford, Wanwick, Leicefter, Oxford, Worceller, \&c.

HALTWHISTLE, a town of Northmberland in Englaud, fittated in E. Long. 2. O. N. Lat. 55. O. It is pretty well built, and affords good entertainment for travellers.

HALYMOTE, properly fignities an holy or ecclefrafical court. Sce Ifalmote.

There is a court held in London by this name before the Lord Mayor and theriffs, for regulating the bakers. It was anciently held on Suaday next befare St Thomas's day, and for this reafen called the Halymoti, or Holy-court.

MALYS, (anc. geog.) the nobleft river of the Hither Afia, througli which it had a long courfe, was the boundary of Creffus's kingdom to the eall. Running down from the foot of mount Taurus, through Cataonia and Cappadocia, it divided almoft the whole of the Lower Alia, from the fea of Cyprus down to the Euxine, according to Herodotus; who feems to extend its courfe too far. According to Strabo, himfelf a Cappadocian, it had its fprings in the Great Cappadocia. It feparated Paphlagonia from Cappadocia; and received its name aso oov cxos, from falt, becaufe its waters were of a falt and bitter tafte, from the nature of the foil over which they flowed. It is famous for the defeat of Crofus king of Lydia, who was mintei by the amb:guous word of this oracle:

## 

If Crafus paffes over the Halys he fall deftroy a great ento pisc.
That empire was his own. See Croesus and Lydia.
HAi.YWERCFOLK, in old writers, were perfons who enjoyed land, by the pious fervice of repairing fome church, or defendine a fepulchre.
This word alfo fignified fuch perfons in the diocefe of Durham, as held their lauds to defend the corps of St Cuthbert, and who from thence claimed the privilege of not being forced to go out of the bihopric.

HAM, or CGAM (anc. gcog.), the country of the Zuzims (Gen. xiv. 5.), the fituation whereof is not known.
$H_{A M}$, the youngelt fon of Noal. He was the fa.
ther of Cuh, Mirraim, Phut, and Canaan; each whereof had the feveral countries peopled by them. With refpect to Ham, it is believed that he had all Africa for his inheritance, and that he peopled it with his children. As for himfelf, it is thought by fome that he dwelt in Esypt; but M. Bafnage is rather of opinion, that neither Ham nor Mizrainn ever were ins, Egypt, but that their pofterity fetted in this country, and called it by the name of their ancettors. And as to Han's being worhipped as a god, and called 7 yupiter. Hammon, he thinks people may have been led into. this millake by the fimilitude of names; and that Jupiter Haamon was the fun, to which divine honours have been paid at all times in Egypt. However that may be, Africa is called the land of Ham, in feveral places of the pialnis, (Pal. Ixxvii. 51 . civ. 23. cv. 22.) In Plutarch, Egypt is called Chemia; and there are fome footlleps of the name of Ham or Cham obferved. in Pfochenmis, Pfitta-chemmis, which are cantons of Egypt.

Ham, a Saxon word ufed for " a place of dwelling;" a village or town: hence the termination of. fome of our towns, Nottingham, Buckingham, \&c. Alfo a home clofe, or little narrow meadow, is called a. bann.

Ham, is alfo a part of the leg of an animal; being. the inner or hind part of the knee, or the ply or angle in which the leg and thigh, when bent, incline to each other.
$\mathrm{H}_{\mathrm{am}}$, in commerce, \&c. is ufed for a.leg or thigh. of pork, dried, feafoned, and prepared, to make it keep, and to give it a brifle agreeable favour.

Wettphalia hanns, fo much in vogue, are prepared: by falting them with faltpetre, preling them in a prefs eight or ten days, then fleeping them in juni-per-wattr, and drying them by the fmoke of juniper-. wood.

A ham may be falted in imitation of thofe of Weftphalia, by fprinkling a ham of young pork wih falt for one day, in order to fetch out the blood; then. wiping it dry, and rubbing it with a mixture of a pound. of brown fugar, a quarter of a pound of faltpetre, halfa pint of bay falt, and three pints of common falt, well flirred together in an iron pan over the fire till. they are moderately hot: let it lie three weeks in thisfalting, and be frequently tumed, and then dry it in a chimney.
$H_{a n}$, a city of Germany, in the circle of Weftphalia, capital of the county of Mark, and fubject to the king of Pruffia. It is feated on the river Lippe, on the frontiers of Munfter. The adjacent country abounds in corn, hemp, and flax ; and the inhabitants get a good deal of money by travellers. It was formerly a Hanfe-town, but is now reduced. E. Long. 7. 53. N. Lat. $5^{1.42 .}$
$\mathrm{H}_{\mathrm{Am}}$, a town of Picardy, in France, feated on the river Somme, among marthes. It has three parifhes, and there is here a round tower whofe walls are 36 fect thick. It was taken by the Spaniards in 1557 m . but reftored by treaty. E. Long.3.9.N. Lat. 49.45.

Hamadan. See Amaian.
HAMADRYADES (formed of a $\mu \alpha$ together, and. spuxs dryad, of spus oak), in antiquity, certain fabulous deities revered among the ancient heathens, and believed to pretide over woods and forefts, and to be in-
clofed under the bark of oaks. The hamadryades were fuppofed to live and die with the trees they were attached to; as is obferved by Servius on Virgil, Eclog. x. ver. 62. after Muefimachus, the fcholiaft of Apollonius, \&c. who mentions other traditions relating thereto.

The poets, however, frequently confound the Hamadryads with the Naiads, Napxx, and rural nymplis in general; witnefs Catullus, Carm. lxviii. ver. 23. Ovid, Faft. iv. 229. Met. i. ver. 695. xiv. ver. 628. Propertius, Eleg. xx. 32. Virg. Ecl. x. ver. G4. Georg, iv. ver. 382,383 . Feflus calls them Querquetulune, as being iffued or fprung from oaks. An ancient poet, Pherenicus, in Atheneus, lib. iii. calls the vine, tisiree, and other fruit-trees, hamadryades, from the name of their mother the oak.

This common idea among the ancients, of nymphs or intellectual beings annexed to trees, will account for their worthipping of rrees; as we find they did, not only from their poets but their hiforians. Livy feaks of an ambaffador's addreffing himfelf to an old oak, as to an intelligent perfon and a divinity. Lib. iii. 25 .

HAMAH, a town of Turkey in Afra, in Syria, fituated in E. Long. $3^{66.15 . ~ N . ~ L . a t . ~ 35 . ~ 15 . ~ B y ~ f o m e ~}$ travellers it is corruptly called Amarl and Amant. Sume miftake it for the ancient Apamea; but this is now called sfamigab, and is ituated a day's journey from Hamah. Hamah is fituated among hills, and has a caftle feated on a hill. It has all along been a confiderable place, and in the 13 th eentury had princes ef its own. It is very large, and being feated on the effent of a hill, the houfes rife above one another, and make a fine appearance. It is however, like molt other towns under the Turkifh government, going to decay. Many of the houfes are half ruined; but thofe which are ftill flanding, as well as the mofques and catte, have their walls built of black and white f.ones, difpofed in fuch manner as to form various figures. The river Affi, the ancient Orontes, ruas by the fide of the calle, and fills the ditches round it, which are cut very deep into the rock. This river, leaving the cafte, paffes through the town from fouth to north, and has a bridge over it, though it is pretty broad. In its coufc through the town it turns is great wheels, called by the natives foki, which raife great quantities of water to a confiderable height, and throw it into canals fupported by arches, by which means it is conveyed into the gardens and fountains. There are fome pretty good bavars or market-places in. Hamah, where there is a trade for linen, which is manufactured there, and fent to Tripoli to be export. ed into Europe.

HAMAMELIS, witch hazel: A genus of the digynia order, belongiag to the tetrandria clafs of plants; and in the natural method ranking with thofe of which the order is doubtful. The involucrum is triphyllous, the proper caly $x$ tetraphyllous; there are four petals; the nut herned and bilocular. There is but one fpecies, a native of Virginia. It hath a Mrubby or voody flem, branching three or four fect high; oval, indented, alternate leaves, refembling thofe of common hazel: and flowers growing in clufters from the joints of the young branches, but not fucceeded by feeds in this country. - The plant is hardy,

## 283 ] H A M

and is admitted as a variety in our gardens; but its flowers are more remarkable for their appearing in November and December, when the leaves are fallen, than for their beauty. - It may be propagated either by feeds or layers.

HAMAMLeEf, a town 12 miles eat from 'titnis, noted for its hot baths, which are much reforted to by the Tunitans, and are cflicacions in rheumatifm and many other complaints. Here the Bey has a very fine bath, which he frequen:ly permis the confuls and other perfons of difinction io ufe.

HAMATH, a city of Syria, capial of a province of the fame name, lying upon the Orontes. "The enter. ing iato Hamath,'. which is frequently Spoken of in feripture, (Joh. xiii. 5. Judges iii. 3. 2 kings xiv. 25 . and 2 Chr. vii. 8.) is the narrow pals leading from the land of Canaan through the valley which lies be. tween Libanus and Antilibanus. This entrance into Hamath is fet down as the northern boundary of the land of Canaan, in oppofition to the fonthern limits, the Nile or river of Egypt. Jofephus. and St Jerom after him, beliered Hamath to be Epiphania. But Theodoret and many other good geographers maintain it to be Emefa in Syria. Johtu (xix. 35.) affigns the city of Hamath to the tribe of Naphtali. Toi king of Hamath cultivated a good underftanding with David, ( 2 Sam. viii. 9.) This city was taken by the kings of Jadah, an 1 retaken from the Syrians by Jeroboam the fecond, ( 2 Ki ings xiv. 28.) The kings of Affyria made themfelves mafters of it upon the declenfion of the kingdom of Ifrael, and tranfplanted the inhabitants of H 3 math into Samaria, ( 2 Kings $x$ vii. 24. and xviii. 34 . \&c.)

HAMAXOBII, Hamaxoblans, in the ancient geography, a people who had no houfes, but lived in carriages. The word is formed from $x \not: x z^{z} x$ a carrirge or chariat, and 3,3 life.

The Hamaxobii, called alfo Hamaxobite, were an ancient people of Sarmatia Europra, inhabiting the fouthern part of Mufiovy, who inftead of houfes had a fort of tents made of leather, and tixed on carriages to be ready for hifting and travel.

HAMBDEN (John), a celebrated patriot, defcended of the ancient family of Hambden in Buckingham. Shire, was born in 1594 . From the univerlity he went to the inns of court, where he made a confiderable progrefs in the ftudy of the law. He was chofen to ferse in the parliament which began at Weftmintter February 5.1626 ; and ferved in all the fucceeding parliaments in the reign of Charles I. In 1636 he became uniserfally known, by his refufal to pay fhipmoney, as being an illegal tax; upon which he was profecuted, and his carriage throughout this tranfaction gained him a great character. When the long parliament began, the eyes of all men were fixed on him as their fater putris. On January 3. $166_{4}$, the king ordered articles of high treafon and other mifdemea. n Jurs to be prepared againtt Lord Kimbolton, $\mathbf{M r}$ Hambden, and four other members of the Houfe of Commons, and went to that houfe to feize them : but they were then retired. Mr Hambden afterwards made a fpeech in the houfe to clear himfelf of the charge laid againt him. In the beginning of the wars he commanded a iegiment of foot, and did good fer$M m 2$
vice

Hembug. vice to the parliament at the batile of Edge-hill. He received a mintal wound in an engagement with Prince Rupert, in Chalgrave-fitld in Oxfordhire, and died in $16+3$. He is faid to have had the art of Socrates to a great degree, of interrogating, and under the notion of doubts, intinuating objections, fo that he infured his own opinions into thofe from whom he pretended to learn and receive them. He was, fay his panegyrilts, a very wife man and of great parts; and poffeffed of the moft abfolute fpirit of popularity to govern the people, that ever was in any country: He was mafter over all his appetites and paffions, and had thereby a very great afcendant outr other mens: He was of an iuduftry and vigilance never to be tired out, of parts not to be impofed upon by the moft fubtile, and of courage equal to his beit parts.

HAMBURG, an imperial city of Germany, feated in E. Long. 9. +o. N. Lat. 54.0. Its name is derived from the old German word Hamme, fignifying a wood, and Burg, a calle; and Itands on the north-fide of the river Elbe. This river is not lefs than four miles broad oppofite the city. It forms two fpacious tarbours, and likewife runs through moft part of it in canals. It flnws above Hamburg many miles; but when the tide is accompmied with north-weft winds, a great deal of damage is done by the inundations occafioned thertby. There are a great many bridges over the canals, which are motly on a level with the Areets, and fome of them liave houfes on both fides. In the year 833, Ludovicus Pius erected Hamburg firt into a bifhopric, and afterwards into an archbifhopric ; and Adolphus III. duke of Saxony, among many other great privileges, granted it the right of fifhing in the Elbe, eight miles above and below the city. 'I'he kinge of Denmark, fince they have fucceeded to the counts of Holttein, have continually claimed the fovereignty of this place, and ofren compelled the citizens to pay large furms to purchafe the confirmation of their liberties. Nay, it has more than once paid homage to the king of Denmark; who, notwithllanding, keeps a minifer here with credentials, which is a fort of acknowledgment of its independency and fovereignty. Though Hamburg has been conftantly fummoned to the diet of the empire ever fince the year 1618, when it was declared a free imperial city by a decree of the anlic council; yet it waves this privilege, in order to keep fair with Denmark. By their fituation among a number of poor princes, the Hamburghers are continually expofed to their rapa. cioufnefs, efpecially that of the Danes, who lave exiorted valt fums from them. The city is very populous in proportion to its bulk; for though one may walk with eafe round the 1 amparts in two hours, yet it contains, exclufive of Jews, at leaft 100,000 inhabitants. Here are a great many charitable foundations, the regulations of which are greatly admired by foreiguers. All perfons found begging in the Atrects are committed to the houfe of correction to hard labour, fuch as the rafping of Brazil and other kinds of wood. There is an hofpital into which unmarried women may be admitted for a fmall fum, and comfortably maintained during the refidue of their lives. The number of hofpitals in this place is greater in proporxou to its biguefs than in any orher Proteltant city
in Europe. The revenue of the orplan-h'oufe alone Hambu is faid to amount to between 50 and 60,0001 . There is a large fumptuous hofpital for receiving poor tra. velles that fall fick. In one of their work-houfes or houfes of corredtion, thofe who have not performed their tak are hoilked up in a banket over the table in the common-hall while the relt are at dinner, that they may be tantahzed with the fight and fmcll of what they cannot talte. The eftablifhed religion of Hamburg is Lutheranifm; as for the Calvinilts and the Roman-catholics, they go to the ambaffadors chapels to celebrate their divine fervice aod worfhip. They have here what they call a private confeffon, previous to the holy communion, which differs in nothing from that of the church of England, and the abfolution is the fame, only the pooreft of the people here are forced to give a fee to the priefts on thefe occafions. Their churches, which are ancient large fabrics, are open thoroughfares, and in fome of them there are bookfellers fhops. The pulpit of St Catherine's is of marble, curioufly carved and adorned with figures and other ornaments of gold; and its organ, reckoned one of the bett in Europe, has 6000 pipes. The cathedral is very ancient, and its tower leans as if junt going to fall; yet, on account of the fingularity and beauty of its architecture, the danger attending it has been hitherto overlooked. There is till a dean and chapter belonging to this church, though fecularized; from whofe court there lies no appeal, but to the imperial chamber at Wetzlar. The chapter confifts of a provolt, dean, 13 canons, eight minor canons, and 30 vicarit immunes, befides others who are under the jurifdiction of the city. The cathedral, with the chapter, and a number of houles belonging to them, are unden the immediate protection of his Britannic majefty as duke of Bremen, who difofes of the prebends that fall in fix months of the year, not fucceffively, but alternately with the clapter. Hamburg is almoft of a circular form, and $\mathrm{fix}_{\mathrm{x}}$ miles in compafs. It has fix gates, and three entrances by water, viz. two from the Elbe and one from the Aliter, being divided into the old and new, which are frongly fortified with moais, ramparts, ballions, and out-works. The ramparts are very lofty, and planted with trees; and of fuch a breadth, that feveral carriages may go a-breaft. In the New town, towards Altena, are feveral freets. of mean houfes inhabited by Jews. Through that entrance from the Elbe, called the lower Baum, pals all fhips going to or cnming from lea. Every morning, at the opening of it, is feen a multitude of boats and fmall barks, whofe cargoes confift of milk, fiuits, and all kinds of provifions, rufhing in at the fame time. There are fome fine chimes here, efpccially thofe of St Nicholas, which play every morning early, at one o'clock in the afternoon, and on all fettivals and folemnities. The other public ftuctures in this city, befides the churches, make no great appearance: however, the yard, arfenal, and two armories, are well worth feeing. There are feveral convents or cloifters atill remaining; which having been feculaized, are now poffeffed by the Lutherans. One of them holds its lands by this tenure, "That they offer a glafs of wine to every malefactor who is carried by it for execution." There is a fine exchange, though inferior

## H A M

burg. to that of London. It is the cuftom of Hamburg, that a eitizen, when he dies, mut leave the tenth of his eftate to the city ; and foreigners, not naturalized, mutt pay a certain fum annually for liberis to trade. The eommon carts here are only a long pulley laid upon an axle-tree between two wheels, and drawn not by horfes, but by men, of whom a dozen or more are fometimes linked to thefe machines, with nings acrofs their thoulders. Such of the fenators, principal clders, divines, regular phylicians, and graduates in law, as affit at funerals, have a fee. The hangman's houfe is the common prifon for all malefactors; on whom fentence is always paffed on Friday, and on Monday they are executed. As, by their laws, no criminal is punif:able unlefs he plead guilty, they have five different kinds of torture to extort fuch confeffion. The government of this city is lodged in the fenate and three colleges of burghers. The former is velted with almolt every act of fovercignty, exccpt that of laying taxes and managing the finanecs, which are the prerogatives of the latter. The magiltracy is compofed of four burgomatters, four fyndics, and 24 alitcrmen, of whom fome are lawyers and fome mercliants. Any perfon elected into the magitracy, and declining the office, muft depart the place. No burgher is admitted into any of the colleges, unlefs he dwells in a houfe of his own within the city, and is pollefled of 1000 rixdollars in fpecie, over and above the fum for which the houfe may be mortgaged ; or 2000 in moveable goods, within the jurifdiction of the fame. For the adminittration of jutice, here are feveral inferior courts, from which an appeal lies to the Obergericht, or high court, and from that to the aulic council and other imperial colleges. For naval caufes here is a court of admiralty, which, jointly with the city-treafury, is alfo charged with the care of the navigation of the Elbe, from the city to the river's mouth. In confequence of this, 100 large buoys, fome white, others black, are kept conflantly floating in the river in fummer: but in winter, inftead of fome of them, there are machines, like thofe called icc. betaons, to point out the fhoals and flats. Subordinate to the admiralty is a company of pilots; and at the mouth of the Elbe is, or at leaft ought to be, a veffel always riding, with pilots ready to put on board the Mips. At the mouth of the river alfo is a good harbour, called Cuxbaven, belonging to Hamburg; a light houfe; and feveral beacons, fome of them very large. For defraying the expenee of thefe, certain tolls and duties were formerly granted by the emperors to the city. Beffles the Elbe, there is a canal by which a comnunication is opened with the Trave, and thereby with Lubeek and the Baltic, without the hazard, trouble, and expence, of going about by the Sound. The trade of Hamburg is exceeding great, in exporting all the commodities and manufactures of the feveral cities and flates of Germany, and fupplying them with whatever they want from abroad. Its exports conift of linens of feveral forts and countries; as lawns, diapers, Ofnaburgs, dowlas, \&c. linen-yatn, tin-plates, iron, brafs, and feel-wire, clap-board, pipe-faves, wainfcot-boards, oak-plank, and timber, kid- fkins, corn, beer in great quantities, with flax, honey, wax, anifeed, linfeed, drugs, wine, tobacco, and metals. Its principal imports are the woollen manufactures and oiber goods of Great

Britain, to the amount of feveral hundred thoufand Hamburb. pounds a year: they have alfo a great trade with Spain, lortural, and Italy, which is carried on molly in Englifh bottoms, on aceount of their Mediceranean paffes. Their whale-fiflery is alfo very confiderable, 50 or 60 hips being gencrally fent out every rear in this trade. Add to thefe a varicty of manufacinres, which are performed here with great fuccefs; the chief of which are, fugar-haking, calico-printing, the weaving of damafks, hrocades, velvcts, and other rich filks. The inlmd trade of Hamburgh is fuperior to that of any in Europe, unlefs perhaps we fhould except that of Amiterdam and London. There is a paper publified here at flated times called the Preifourant, fpecifying the courfe of exchange, with the price which evay comnodity and merchandife bore laft upon the exchange. "There is alfo a board of trade, erected on purpofe for the advancing every project for the insplovement of commerce. A nother grcat advantage tothe merchants is, the bank cftablifhed in 1619, which has a flourifhing credit. 'To fupply the poor with corn at a low price, here are public granaries, in which great quantities of grain are laid up. By charters from feveral emperors, the Hamburghers have a inght of coinage, which they adually excreife. The Englifh merchants, or Hamhurg company, as it is called, enjoy great privileges; for they hold a court with particular powers, and a jurifdiction among themfelves, and have a church and minitter of their own.- This city has a diftrict belonging to it of confiderable extent, which abounds with excellent patures, intermixed with feveral large villages and noblemens feats. A fmall bailiwic, called Bergedorf, belongs to this city and Lubcck. -Though Hamburg has an undoubted right to a feat in the diet of the empire, yet as the pays no contributions to the military cheft in time of war, and is alfo unwilling to draw upon herfelf the refentment of Denmark, the makes no ufe of that privilege. There is a fchola illufris or gymnafium here, wcll endowed, with fix able profeffors, who read lectures in it as at the univerfities. There are alfo feveral free fchools, and a great number of libraries, public and private. Tive public cellar of this town has always a prodigious ftock and vent of old hock, which brings in a confiderable revenue to the flate. Befides the militia or trained bands, there is an eftahlifment of regular forces, confilling of 12 companies of infantry, and one troop of dragoons, under the commandant, who is ufually a foreigner, and one who has diftinguithed limfelf in the fervice. There is allo an artillery company, and a night-guard ; the lat of which is pofted at niglat all over the city, and calls the hours.

HAMEL (John Baptifle du), a very learncd. French philofopher and writer in the 17 th century. At 18 he wrote a treatife, in which be explained in a very fimple manner Theodoffus's three hooks of Splectics; to which he added a tract upon tigonometry, extremely perfpicuous, and defigned as an in. troduction to aflronomy. Natural philofophy, as it was then taught, was only a collection of vague, knotty, and barren queltions; when our author undertook to eftablifh it upon right principles, and publihed his Afronomia Pbyfica. In 1666 Mr Colbert propoled to Louis XIV. a feheme, which was approved of by his. majefty, for eftablifhing a royal academy of fcicrees

Eymeita andappointed our author fecretary of it. He pub. of mere old age, being almolt 83 . He was regius
profeffor of phillofophy, in which polt he was fucceeded by M. Varignen. Ile wrote Latia with purisy and elegance.
HAMELIN, a ftrong tom of Germany, in the ducly of Calemberg in Lower Saxony. It is lituated at the extremity of the duchy of Brmalwick, to which it is the key, near the confluence of the rivers Hamel and Wefer, in E. Long. 9. 55. N. Lat. 52. 13.

HAMELLIA, in botany: A genus of the monoEyuia order, belonging to the peatandria clafs of plants; and in the natural method ranking with thofe of which the order is doubtful. The curoila is quinquelid; the berry quinquelocular, inferior, polyipermons.
hamesecken. Burclary, or Noilurnal HoufeIrcaking, was by the ancient Englifh law called Hamefocken, as it is in Scotland to this day.-Violating the privilege of a man's houfe in Scotland is as feverely punifhed as ravihing a woman.

HAMI, or $\mathrm{Ha}_{\mathrm{a}} \mathrm{m}$, a country of Afia, fubject to the Chinefe. It is fitnated to the north-eaft of China, at the extremity of that defert which the Chinefe call Cluns:o, and the Tartars Coli; and is only go leagues ditant from the molt wefterly point of the province of Chenfi. This conntry was inhabited in the early ages by a wandering people, named Iong. About the year 950 before the Chritian cra, they fent deputies to pay homage to the emperor of China, and prefented fome fabres by way of tribute. The civil wars by which China was torn about the end of the dyafty of Tchesu having prevented affilance from being fent to the fe people, they full under the dominion of the Hiongnou, who appear to have been the fame as the Huns, and who at that time were a formidable nation. The Chinefe feveral tines lof and recovered the country of Hami. In 131 (the fisth year of the reign of Chun$t y$, of the dynalty of the eattern Han), the emperor kept an officer there in quality of governor. Under the following dynalties, the fame viciffitudes were experienced: Hami was fometimes united to the province of Chenfi, fometimes independent of it, and fometimes even of the whoie empire. The fituation of thefe people (feparated by vat deferts from China, so which, bendes, they had no relation, either in language, manners, or cutoms) mult have greatly contributed to facilitate thefe revolutions. All the tributary flates of the empire having revolted in 6ro, that of Hami followed their exanple; but it again fubmitted to the yoke, under Tai-tiong, fecond emperor of the dynatty of Tang, who had fent one of his generals with an army to reduce it. This great prince paid particular attention to his new conqueft. He divided it inte three diftricts, and connected its civil and military government in fuch manner to that of the province of Chenfi and other neighbouring countries, that trancuillity prevailed there during his reign and feveral of thofe that Eollowed. Through Ham all the caravans which went from the wett to China, or from China to the wet, were obliged to pafs. The emperors, predecfiors of Tai-tfong, were fatisifed with cathfing wine to be tranfoorted from Hami in flins carried by camels; but "Tai-tfong (fays the Chinefe hisiory) having fubdued the kiugdom of Hami, or-
dered fome vine-plants of the fpecies called majon, to be brought him, which he caufed to be planted in his gardens; he, betides, learned the manner of making wine, the wie of which proved both ferviceable and hurtful to him." Luxury and effeminacy laving weakened the dynatty of Tang, the Malometans (who had made a rapid progrcís in all the countries that are fituated between Perfia, Cobi, and the Cafpian fea) advanced as far as Hami, which they conquered. It appears, that this country afterwards had princes of its own, but dependent on the Tartars, who fucceflively ruled thefe immenfe regions. The Yuen or Mogul Tartars again united the country of Hami to the province of Chenfi; and this reunion fublited until 1360 , at which time the cmperor formed it into a kingdom, on condition of its princes doing homage and paying tribute. The king of Humi was honoured with a new title in 1404 , and obtained a golden feal. After a conteft of feveral years for the fuccefion to the throne, the kingdom of Hami fell a prey to the king of Tou-culh.fan. This yoke foon became uneafy to the people of Hami : thicy revolted from their new mafters, and made conquefts from them in their turn. The new king whom they made choice of, did not long poffefs the throne: he was conquered and killed in a bloody battle which he fought with the king of Tou-euh fan, who alfo perifled fone time after. Since this epocha, the country of Hami has been fucceffively expofed to anarchy, or governed by its own princes. The prince who filled the throne in 1696, acknowledged himfelf a vaffal of the empire, and fent as tribute to Pcking camels, horfes, and fabres. Kangbi received his homage with the ufual ccremonies, and publifhed a diploma, which eftablifhed the rank that the king of Hami frould hold among the tributary princes, the time when he fhould come to render homage, the nature of the prefents neceffary for his tribute, the number of auxiliaries he was bound to furnifh in time of war, and the manner of his appointing a fucceffor. Ail thefe regulations have fubsifted till this time.

The country of Hami, though furrounded by deferts, is accounted one of the moft delightful in the world. The foil produces abundance of grain, fruits, leguminous planto, and palure of every kind. The rice which grows here is particularly efleemed in China; and pomegranates, oranges, peaches, railins, and prunes, lave a moft exquifite tafte; even the jujubes are fo juicy, and have fo delicious a flavour, that the Chinefe call them perfumed juybles. There is no fruit more delicate or more in requeft than the melons of Hami, which are carricd to Peking for the emperot's table. Thefe melons are much more wholefome than thofe of Europe; and lave this fingular property, that they may be kept frefh during great part of the win-ter.-But the moft ufeful and moll efteemed production of this country is its dricd railins. Thefe are of two kinds: The tirft, which are much ufed in the Chinefe medicine, feem to have a perfect refemblance to thofe known in Europe by the name of Corinthian. The fecond, which are in much greater requell for the table, are fimaller and nore delicate than thofe of Provence. The Chinefe authors porfectly agrce with Meffrs Leniery and Geoffroy, refpecting the virtue and qualitits of thefe dried grapes or railms; but they at 2
ni. tribute fo muth more efficacy to thofe of Hami than to thofe of China, that they preferibe them in fmaller dofes. They obferve, that an infulion of the hirft is of great fervice in facilitating an eruption of the fmallpox about the fourth day, when the patient either is or feems to he too weak; and to promote a gentle perfpiration in fome kinds of pletrifies or nalignant fevers. The dofe mont be varied according to the age, habit of body, and Atrength of the patient ; great care muft be taken to adminifter this remedy feafonably and with judgment. The emperor caufed plants to be tranfpotted from Hami to Peking, which were immediately planted in his gardens. As thefe plants were cultivated with extraordinary care, under his own cyes, they have perfectly fucceeded. The raifins produced by them are exceediagly fweet, and have a molt exquifite havour.

Although the country of Hami (the latitude of which is $42^{\circ} 53^{\prime} 20^{\prime \prime}$ ) lies farther towards the north than leveral of the provinces of France, we are aflured that its climate is more favourable to the eulture of vines, and that it gives a fuperior degree of quality to the grapes. It never rains at Hami; cven dew and fogs are fcarcely ever feen there; the country is watered only by the fnow which falls in winter, and by the water of this fnow when melted, which is colleeted at the bottoms of the mountains, and preferved with great care and incullry. The method of drying grapes in Hami is much finpler than that practifed in the provinces of China. The people of Chenti hold them ovet the fteam of hot wine, and cven fometimes boil them a few feconds in wine in which a little clarified boney has been diluted. In the kingdom of Hami they wait until the grapes are quite ripe; they then expofe them to the foorching rays of the fun; afterwards pick them, and lave them in that manner un. til they are quite dry. However dry thefe grapes may be, they become firivelled, without lofing any of their fubftance, and without growing flat: good raitins ought to be almolt as crifp as fugar.candy.

The kingdom of Hami contains a great number of villages and hamlets; hut it has properly only one city, which is its capital, and has the fame name. It is furrounded by lofty walls, which are half a league in circumference, and has two gates, one of which fronts the eall, and the other the weft. Thefe gates are exceedingly beautiful, and make a fine appearance at a diftance. The ftreets are ftraight, and well laid out; But the houfes (which contain only a ground.floor, and which are almoft all con?tructed of earth) make very little fhow : however, as this city enjoys a ferene纤y, and is fituated in a beautiful plain, watered by a river, and furrounded by mountains which fhelter it from the north winds, it is a moft agreeable and delightful refidence. On whatever fide one approaches it, gardens may be feen which contain every thing that a fertile and cultivated foil can produce in the mildetl climates. All the furrounding fields are enchanting : but they do not extend far; for on feveral fides they terminate in dry plains, where a number of beautiful horfes are fed, and a fpecies of excellent theep, which have large flat tails that fometimes weigh three pounds. The couritry of Hami appears to be very abundant in foffils and valuable minerals: the Chinefe have for a long time procured diamonds and a
great deal of gold from it; at prefent it fupplies them Haniteon. with a kind of agate, on which they fet a great value. - . With regard to the inlabitants of this fmall llate, they are brave, capable of enduring fatigue, very dexterous in all hodily exereifes, and make excellent foldiers; but they are fickle and foon irritated, and when in a pallion they are extremely ferocious and fanguinary.

HAMILTON, a town of scotland, in Clydefdale, feated on the river $\mathrm{Cl}_{\mathrm{d}} \mathrm{de}$, eleven iniles fouth ealt of Glafgow; from whence the noble family of II amilton take their name, and tisle of duke. The town is feated in the middle of a very agreeable plain; and on the welt of the town this family las a large park, which is near feven miles in circumference, inclofed with a ligh wall, full of deer and ofler gane. The rivulet called Avore runs through the park, and falls into the river Clyde, over which latl there is a bridge of frectane. W. Long. 3. 50. N. J.at. 55. 40. The original name of this place, or the lands abuut it, was Catson or Cadyoin, a barony granted to an anceftor of the noble owner, on the following occafion. In the time of Ed. ward II. lived Sir Gilkert de Harilton, or Hampron, an Englifhman of rank; who happening at coure to fpears in praife of Robert Bruce, received on the occafoon an infult from John de Spenfer, chamberlain to the king, whom he fought and few. 1)reading the refentmen of that potent family, he fled to the Scottifh monareh; who received him with open arms, and ellablifhed him at the place poffeffed by the duke of Hamilon. In altertimes the name was changed from Cadwoze to $H_{1 s}$ milton; and in $1+45$ the lands were erected into a lordthip, and the then orner Sir James fat in parliament as lord Hanilton. The fame nobleman founded the collegiate church at Hamilon in 1451, for a provoft and feveral prebendaries. The endowment was ratified at Rome by the pope's bull, which he went in perfon to procure. - Hamilton houfe or palace is at the end of the town; a large difagrecable pile, with two deep wings at right angles with the centre: the gallery is of great extent; and furnimed, as well as forse other roons, with moft excellent paintings.

Hamilton (Anthony, count), defeended from a. noble family in Scotland, was born in Ireland, and fettled in France. He wrote leveral poetieal pieces; and was the firft who compofed romances in an agreeable talle, without imitating the burtefo:1e of Scar. ron. He is allo faid to be the anthor of the Memoirs of the coumt de Grammont, one of the belt writen pieces in the French language. His works were printed in 6 vols 12 mo. He died at St Germaine-en-Laye, ia 1720.

Hamilton (George), earl of Orkney, and a brare warrior, was the fifth fon of William earl of Sclkirk, and early betouk himfelf to the profeffion of arms. Being made colvol in 1689 90, he diftinguthed himfelf by his bravery at the battle of the Boyne; and foon after, at thofe of Aghrim, Steinkirk, and Landen, and at the feges of Athlone, Limerick, and Namur. His eminent fervices in Ireland and Flanders, through the whule courfe of that war, recommended him fo bighly to king William II1. that, in 1696 , he ad vanced him to the dignity of a peer of Scodand, hy the title of earl of Orkney; and his lady, the filter of. Edward vifcount Villiers, afterwards earl of Jerfex; had a grant made to her, under the great feal of tree

Themitoo, land, of ahnot all the private eftates of the late king Hamle: James, of very confiderable value.

Upon the aeceffion of queen Anne to the throne, he was promoted to the rank of major-general in 1702, and the next year to that of lieutenant-general, and was likewife made kuight of the thittle. His lordflip afterwards ferved under the great duke of Marlborough; and contributed by his bravery and conduat to the glorious vietories of Bleinhim and Malplaquet, and to the taking feveral of the towns in Flanders.

In the beginning of 1710 , his lordhip, as one of the 16 peers of Scotland, voted for the impeachment of Dr Sacheverel; and the fame year was fworn of the privy-council, and made general of the foot in Flanders. In 1712, he was made colonel of the royal regiment of fuzileers, and ferved in Flanders under the duke of Ormond. In 1714 , he was appointed gentleman-extraordinary of the bed-chamber to king George I. and afterwards governor of Virginia. At length he was appointed contable, governor, and eaptain of Edinburgh caftle, lord-lieutenant of the county of Clydefdale, and field-marfhall. He died at his houfe in Albemarle-Areet, in 1737.

Hamilton (John), the 24th bihop of St Andrew's, to which he was tranflated from Dunkeld. He was natural fon of James the firt earl of Arran, and was in great favour at court whilht his friends remained in power. He was one of queen Mary's privy council, and a fleady friend to that unfortunate princefs. He performed the ceremony of chriftening her fon, and was at different times lord privy feal and lord treafurer. The queen had reafon to lament her not following the advice of this prelate, after the fatal battle of Langfide, viz. not to truft her perfon in England. By the regent earl of Murray, he was declared a traitor, and obliged to feek fhelter among his friends. He was unfortunately in the cafte of Dumbarton when that fortrefs was taken by furprife, from whence he was carried to Stirling, where on April 1. 1570 he was hanged on a live tree. The two following farcaftic verfes were written upon this occafion:

$$
\begin{aligned}
& \text { Vive diu, flix arbor femperque vireto } \\
& \text { F, ondibus, ut nobis balia poma feras. }
\end{aligned}
$$

Hamlet, Hamel, or Hampfel, (from the Saxon lam, i. e. domus, and the German let, i. e. membrum), fygnifies a little village, or part of a village or parifl; of which three words the firt is now only ufed, though Kitchen mentions the two laft. By Spelman there is a difference between villam integram, villam dinidiam, $\mathrm{N}^{0} 148$.
and bamictam; and Stow expounds it to be the leat of a freeholder. Several county-towns have bamlets, as there may be feveral hamlets in a parifh; and fome particular places may be out of a town or hamlet, though not out of the county.

Hamlet, a prince celebrated in the annals of Denmark; and whofe name has been rendered familiar in this country, and his ftory interefting, by being the fubject of onc of the nobleft tragedies of our immortal Shakefpeare.-Adjoining to a royal palace, which tands about half a mile from that of Cronborg in Elineur, is a garden, which, Mr Coxe informs us, is called Hamite's Garden, and is faid by tradition to be the very fpot where the murder of his father was perpetrated. The houfe is of modern date, and is fituated at the foot of a fandy ridge near the fea. The garden occupies the fide of the hill, and is laid out in terralfes rifing one above another. Elfuneur is the feene of Shasefpeare's Hamlet; and the original hiAtery from which our poet derived the principal incidents of his play is founded upon facts, but fo deeply buried in remote antiquity that it is difficult to diferiminate truth from fable. Saxo-Grammaticus, who flourifhed in the 12 th century, is the carlieft hittorian of Denmark that relates the adventures of Hamlet. His account is extracted, and much altered, by Belleforet a French author; an Englih tranflation of whofe romance was publifhed under the title of the Hiltorye of Hamblet : and from this tranflation Shakefpeare formed the ground-work of his play, though with many alterations and additions. The following fhort 隹tch of Hamlet's hitory, as recorded in the Danih annals, will enable the reader to compare the original character with that delineated by Shakefpcare.

Long before the introduction of Chritianity inte Denmark, Horwendillus, prefect or king of Jutland, was married to Geruthra, or Gertrude, daughter of Ruric king of Denmark, by whom he had a fon called Anlttitus, or Hamlit. Fengo murders his brother Horwendillus, marries Gertrude, and afcends the throne. Hamlet, to avoid his uncle's jealoufy, counterfeits folly; and is reprefeated as fuch an abhorrer of falfehood, that though he conftantly frames the moft evafive and even abfurd anfwers, yet artfully contrives never to deviate from truth. Fengo, fufpecting the reality of his madnefs, endeavours by various methods (A) to difcover the real tlate of his mind: amongtt others, he departs from Elfineur, concerts a meeting between Hamlet and Gertrude, concluding that the former would not conceal his fentiments from his own mother: and
(A) Among other attempts, Fengo orders his companions to leave him in a retired fpot, and a young woman is placed in his way, with a view to extort from him a corfeffion that his folly was counterfeited. Hamlet would have fallen into the fnare, if a friend had not fecretly conveyed to him intelligence of this treachery. He carries the woman to a more fecret place, and obtains her piomife not to betray him; which fhe readily confents to, as fhe had been brought up with him from her infancy. Being afked, upon his return home, if he had indulged his paffion, he anfwers in the affirmative; but renders himfelf not believed by the moft artful fubterfuges, which, though true, feemed evidently to mark a difordered underflanding, and by the pofitive denial of the woman. "Upon this woman," as Capell obferves, " is grounded Shakefpeare's Ophelia ; and his deliverance from this fnare by a friend fuggefted his Itoratio:"- "the rude outlines," as Mr Malone remarks, " of thofe characters. But in this piece there are no traits of the charadter of Polonius: there is indeed a cominfllor, and he places himfelf in the queen's chamber behind the arras; but this is the whole. The ghoft of the old Hamlet is likewife the offspring of our author's creative imagination.". See Capell's School of Shaleffeare, vol. iii. p. 20.; and Malone's Supplement, p. 353.
ec. and orders a courtier to conccal himfelf, unknown to both, for the purpofe of overhearing their converfation. The courtier repairs to the queen's apartment, and hides himfelf under a heap of firaw ( 3 ). Hamlet, upon entering the cabinct, fufpecting the prefence of fome fpy, imitates, after his ufual afectation of folly, the crow of a cock, and, Thakiug lis arms like wings, jumps (c) upon the heap of Rtaw; till, feeling the courticr, he draus his fword, and infantly difpa:ehes him. He then cuts the hody to preces, boils it, and gives it to the hogs. He then avows to his mother that he only perfonated a fool, reproaches her for her inceftuous narriage with the murderer of her hufband; and concludes his remondrances by faying, "Inkead, therefore, of eondoling $m y$ infanity, deplore your own infamy, and learn to lament the deformity of your own mind (D)." The queen is filent ; but is recalled to virtue by thefe admonitions. Fengo returns to Elfineur, fends Hamlet to England under the care of iwo courtiers, and requelts the king by a letter to put him to death. Hamlet ditcovers and alters the letter; fo that, upon their arrival in England, the king orders the two courtiers to immediaie exceution, and betroths his daughter to Hamlet, who gives many altonifhing proofs of a moft tranfeendant underfanding. At the end of the year he returns to Denmark, and alarms the court by his mexpected appearance; as a seport of his death had been fpread, and preparations were making for his funcral. Having re-affumed his affected infanity, he purpofely wounds his tingers in drawing his fword, which the byfanders immediately fatten to the icabbard. He afterwards invites the principal nobles to an entertainment, makes them intoxicated, and in that fate covers them with a large curtain, which he fattens to the ground with wooden pegs: he then fets fire to the palace; and the nubles, being inVol. VIII. Part I.

## H A M

veloped in the curtain, perit: in the flames. During Hanter. this tranfaction he repairs to Cengro's apartment; and, -taking the fworl whechlay by the lide of his bed, puts his own in its place: he iallantly awalens and informs him, that Hamlet is come to revenge the murtar of his father. Fenzo llarts from his be l, feizes the fword; but, beisgr mable to duw it, falls by the hand of Hamlet. The next morning, when the pupulace were affembled to viese the ruins of the palace, Hamlet fummons the remaining nohles; and in a maltenly fpeech, which is too lung to infort in this place, lays open the motives of his own eonduct, proves his micle to have been the affefin of his father; and concludes in the following words: "Tread upon the afhes of the monfter, who, p lluting the wife of his murdered brother, joined inceft to parricide; and ruled over you with the moll oppreflive tyranny. Receive me as the minifter of a jutt revenge, as one who felt for the fufferings of lis father and his people. Confider me as the perfon who lase purged the difgrace of his cuuntry; ex:iaguifhed the infamy of his mother; freed you from the defpotifin of a monfer, whufe crimes, if he had lived, would have daily incruafed, and terminated in your deltruction. Acknowledre ny fersices; and if I have deferved it, prefent me with the crown. Behold in me the author of thefe advantages: no degenerate perfon, no parsicide; but the right ful fuccedor to the throne, and the pious avenger of a father's murder. I have refened you from tavery, refored, on to liberty, and re-eftablifhed your glory: I have dedroyed a tyrant, and triumphed over an aflaflen. The recompence is in your hands: you can eftimate the value of my fervices, and in your virtue I relt my hopes of neward." This fpeech has the delired effect : the greater part of tho affenbly fhed tears, and all who are prefent umanimoully proclaim him king amid sepcated acclamations. Nn

Hamlet
(8) The reader will recollect, that flraw ufed furmaly to be fpread over the floors as an atticle of great luxury.
(c) This part Aands thus in the Englith account: "The counfllor entered fecretly into the quecns's chamber, and there hid himfelfe behind the arras, and long before the queene and Hamet came lhither: who being craftie and politique, as foone as he was within the chamber, doubting fome treafon, and fearing if he mould Speate fererely and wifly to his mother touching his feeret practifes hee thoukd be undertood, and by that neans interepted, ufed bis ordinary manner of dilimulation, aud began to come (r. crow) like a cocke, beating with his arms (infuch manner as cockes ufed to thike with theis wings) upon the hangings of the chambers; whenhy feeling fomething firing under them, he cried, ara!! arat! and prefently drawing his frorde, thrmf it into the hangings; which done, he pulled the counfellor (half deade) out by the heels, nade an end uf killing him; and, being flain, cut his body in pieces, which he caufed to be boiled, and then caft it interan open vaule or privie." Malone's sufplement, wol.i. p. 357.
(D) The clofet-feene, which is fo bcautiful in Shakefpeare's Ifamlet, is thus concifely, but wot lefs finely, defcribed by the Danih hiftorian: "Cumque mater magno ejulatu quella prefentis filii focordiam deflere cxpiffer: © Qid (inquit) mulierum turpiffina gravifimi chiminis difimulationem falfo lamenti genere expetis, qua fonti more lafciviens nefariam ac deteflabilem thori conditionem fecuta viri tui interfectorem fleno inceft finu amplecteris: et ei qui prolis tuæ parentem extinxerat ubfocniflimis blandimentorum illecebris adularis. Ita nempe eque conjugum fuorum victoribus maritaniur. Brutorum natura hace eft; ut in diverfa paffim con. iugia rapiantus: hoc thi exemplo prioris mariti memoriam exolevife conflat. Ego vero non ab re thelidi fpeciem gero, cum laud dubitem quin is qui fratrem oppriferit, in affines quoqte pari crudelitate debacehaturus fit: unde Aoliditatis que induftix habitum amplecti preftat, et incolumitatis prefidium ab extremá deliramentorum fpecie mutuari. It animotamen paterræ ulionis Itudium perfewerat; fed rerum oceadiones aucupor, temporum opportunitates opperior. Non idem omnibus locus competit. Contra obfeurum immitemque animum altioribus ingenii modis uti convenit. Tibi vero fapervacuum fit meam lamentari delipientiam, quæ tuam :uftes ignominian deplorare debueras. Itaque non aliene fed proprix mentis vitium defleas neceffe ct. Cxtera filete: monineris.' Tali consitio laceratam matrem ad excolcndum virtutis habitum revocavit, preteritofque ignes prefentibus illecebris praferre docuit."

Hammer I Yamlet foon after lis elevation fails to England, 11 and orders a mield to be made on which the principal lim with feigned demonftrations of joy, falfely affures
him that his daughter is dead, and recommends him to repair to Scotland as his ambaffador, and to pay his addrefles to the queen Hermetruda. He gives this indidious advice with the hopes that Hamlet may perith in the attempt ; as the queen, who was remarkable for her chattity aud cruelty, had fuch an avertion to all propofals of marriage, that not one of her fuitors had cfaped falling a facritice to her vengeance. Hamlet, in oppolition to all difficulties, performs the embaffy; and, by the affitance of his fhicld, which infpires the lady with a farcurable opinion of his wifdom and courage, obtains her in marriage, and returns with her to England. Informed by the princefs to whom he had been betrothed that her father meditates his affaffination, Hamlet avoids his fate by wearing armour under his robe; puts to death the king of England; and fails to Demmark with his two wives, where he is foon aftcrwards killed in a combat with Vigletus fon of Ruric. Hamlet, adds the hitorian, was a prince, who, if his good fortune had been equal to his deferts, would have rivalled the gods in fplendor, and in his actions would have exceeded even the labours of Hercules.

HAMIMER, a well-known tool ufed by mechanics, confifing of an iron head, fixed croftwife upon a handle of wood. There are feveral forts of hammers ufed by blackfmiths; as, 1. The hand-hammer, which is of fuch weight that it may be wielded or governed with one hand at the anvil. 2. The up-hand fledge, ufed with both hands, and feldom lifted above the head. 3. The about.fledge, which is the biggeft hammer of all, and held by both hands at the fartheft end of the handle; and being fwung at arms length over the head, is made to fall upon the work with as heavy a blow as poffible. There is alfo another hammer ufed by fmiths, called a rivetting bammer; which is the fmalleft of all, and is feldom ufed at the forge uniefs upon fmall work. - Carpenters and joiners have likewife hammers accommodated to their feveral purpofes.

HAMMERING, the act of beating or extending and fafmioning a body under the hammer. When it is performed on iron heated for the purpofe, the fmiths ufually call it forging.

Hammprang, in coining. A piece of meney or a medal is faid to be hammered when ftruck, and the impreffion given with a hammer and not with a mill.

HAMMERSMITH, four miles weft from London, is a hamlet belonging to Fulham, has two charityfchools, a workhoufe, a Prebyterian meeting-houfc, and a fair May 1. There are a number of handfome feats about it, efpecially towards the Thames; among which the moft remarkable is the late lord Melcombe's, which is a very elegant houfe, and contains a marble gallery finifhed at a very great expence.

HAMMOCK, or Hamac, a kind of hanging bed, fufpended between two trees, polts, hooks, or the like, much ufed throughout the Weft Indies, as alfo on board of mips. The Indians hang their hammocks to trees, and thus fecure themfelves from wild beatts and infects, which render lying on the ground there very
dangerous. According to F. Plumier, who has often $\mathrm{H}_{3}$ made ule of the hammock in the Indies, it confits of a large trong coverlet or theet of coarfe cotton, about fix feet fquare : on two oppofite fides are loops of the fame ftuff, through which a ftring is run, and thereof other loops are formed, all which are tied together with a cord; and thus is the whole fa!lened to two neighbouring trees in the field, or two hooks in houfes. This kind of couch ferves at the fame time for bed, quilts, fheets, pillow, \&c.

The hammock ufed on board of Mips is made of a piece of canvas fix fect long and three feet wide, gathered or drawn together at the two ends. There are ufually from fourteen to cwenty inches in breadth allowed between decks for every hammock in a fhip of war ; but this fpace muft in fone meafure depend on the number of the crew, \&c. In time of battle the hammocks and bedding are firmly corded and fixed in the nettings on the quarter-deck, or wherever the men are too much expoled to the view or fire of the enemy.
HAMMOND (Henry), D. D. one of the moft learned Englinh livines in the 17 th century, was born in 1605. He tludied at Oxford, and in 1629 entered into holy orders. In 1633 he was indueted into the restory of Penflurlt in Kent. In $16+3$ he was made archdeacon of Chichefter. In the beginning of $16+5$ he was made one of the canons of Chilt-church, Oxford, and chaplain in ordinary to king Charles I. who was then in that city; and he was alfo chofen public orator of the univerfity. In $16+7$ he attended the king in his confinement at Wooburn, Cavefham, HamptonCourt, and the Ine of Wight, where he continued till his majefty's attendants were again put from him. He then returned to O ford, where he was chofen fub-dean; and continued there till the parliament-vifitors firlt ejected him, and then imprifoned him for feveral weeks in a private houfe in Oxford. During this confinement he begran his Annotations on the New Teftament. At the opening of the year 1660 , when every thing vilibly tended to the reftoration of tie royal family, the doctor was delired by the bifhops to repair to London to affilt there in the compofure of the breaches of the church, his fation in which was defigned to be the bifhopric of Worcelter; but on the $4^{\text {th }}$ of April he was Ceized by a fit of the itone, of which he died on the 25 th of that month, aged 55. Befides the above work, he wrote many others; all of which have been pubhithed together in four volumes folio.

Hammond (Anthony, Efq;), an ingenious Englifh poet, defcended from a good family of Somerfham Place in Huntingdonhhire, was born in 1668 . After a liberal education at St John's college, Cambridge, he was chofen member of parliament, and coon dittinguifhed himfelf as a fine fpeaker. He became a commiffioner of the royal navy, which place he quitted in 1712. He publifhed A Mifcellany of original Poems by the moit eminent hands; in which himfelf, as appears by the poems marked with his own name, had no inconfiderable fhare. He wrote the life of Walter Moyle, Efq; prefixed to his works. He was the intimate friend of that gentleman, and died about the year 1726 .

Hammosid (James), known to the world by the Love. Elcgies which, fome years after his death, were pub-
mire. limed by the earl of Chefterfield, was the fon of Anthony Hammond above mentioned, and was preferred to a place about the perfon of the late prince of Wales, which he leeld till an unfortunate accident deprived him of his fenfes. The caufe of this calamity was a paffion he entertained for a lady, who would not return it: npon which he wrote thofe love-elegies which have been fo much celebrated for their tendernefs. The editor obferves, that he compofed them before he was $2!$ years of age: a period, fays he, when fancy and inagination commonly riot at the expence of judgment and correct. nefs. He was lincere in his love as in his friendfhip; and wrote to his miltrefs, as he fpoke to hio friends, nothing but the genuine fentiments of his heart. Tibullus. feems to have been the model our author judiciounly preferred to Ovid; the former writing directly from the heart to the heart, the latter too often yield. ing and addrefling himfelf to the imagination. Mr Hammond died in the year $17+3$, at Stow, the feat of lord Cobham, who, as well as the earl of Chefterfield, honoured him with a particular intimacy.

HAMIPSHIRE, or Haunts, a county of England, bounded on the wet by Dorfethire and Wilthire, on the north by Berkfhire, on the eaft by Surry and Suffex, and on the fouth by the Englifh channel. It ex. tends 55 miles in length from north 10 fouth, and 40 in breadth from eall to welt, and is about 220 miles in circumference. It is divided into 39 hundreds, and contains 9 forells, 29 parks, one city, 20 markettowns, 253 parithes, above 36,000 houlfes, and by the moft modell computation 180,000 inhabitants, who elect 26 members of parliament, two for the county, two for the city of Wincheler, and two for each of the following towns, Southampton, Portfouth, I'etersfield, Yarmouth, Newport, Stockbridge, Andover, Whitchurch, Lymington, Chrilt-church, and Newton. -'The air is very pure and pleafant, efpecially upon the downs, on which vall flocks of theep are kept and bred. In the champairn part of the county, where it is free of wood, the foil is sery fertile, producing all kinds of grain. The conutry is extremely well wooded and watered; for befides many woods on private eflates, in which there ate valt quantitics of well-grown limber, there is the new foreft of great extent, belong. ing to the crown, willtlored with vencrable oaks. In thefe woods and forelts, great numbers of hage run at large, and feed on the acorns; and hence it is that the Hampihire bacun fo far excels that of molt other countrics. The rivers are the Avon, Anton, Arle, Tefl, Stowre, and Itehin; befides feveral fmaller freams, all abounding in fifh, cipecially trout. As its fea-coalt is of a confiderable extent, it poffefles many good ports and harbours, and is well fupplied with fall-water fifh. Nuch honcy is produced in the cosuntry, and a great deal of mead and metheglin made. Here is alfo alemy of game, and on the downs is molt delightful humting. The manufacture of cloth and kerfies in this county, though not fo extenfive as that of fome others, is yet far from being inconfiderable, and employs great numbers of the poor, as well as contribute the conriching of the manufacturers hy what is fent abroad. The nesv intended canal in this county, from Balingftoke to the Wye in Surry, and from thence to the Thamer, cannot but be a great advantage to the county in general, and the panifhes it
is to pals through in particular; to carry which into Hmaymire, execution above $L .86,000$ have bern raifed amongt - . 150 proprictors in 1789 , and it will extend 53 miles
when completed. when completed.

Nezo Hampshire, a province of North America, ia New England. It is bounded on the north by Quebec; noth-eaf by the province of Main; fouth-ea!t by the Atlantie Occan; fouch by Maflachufets; well and north-weft by Conneaticut river, which divides it from Vernont. The thape of New Hamphire refenble. an open fan; Connecticut river being the curve, the fouthern line the thorteft, and the callern line the longett fide. It is divided into fire countics, viz. Ruckingham, Stafford, Hilliborough, Cheihire, Grafton. In 1776 , there were 165 fettled townithips in this Itate. Since that time the number has been greatly increafed. The chief town is Portsmouth. Exeter, 15 miles fouthweflerly from Portfouch, is a pretty town on the fouth lide of Exeter river. And Concord, fituated on the weft fide of Merrimak river, is a pleafant flourining town, which will probably, on account of its central fituation, foon be the permanent feat of government. There are two great rivers, the Pifcata and the Merrimak. The forner has four branches, Berwick. Cochechy, Excter, and Inorham, which are all navigable for fmall veffels and boats, fome 15 others 20 miles from the fea. Thefe rivers unite ahout eight milcs from the muath of the harbour, and form one broad, deep, rapid Atream, navigable for hips of the largell burden. This river forms the only port of New Hamphire. The Merrimak bears that name from its momb to the confluence of Pemigewalfet and Wianilipiokee rivers; the latter has its fource in the lake of the fame name. la its courfe, it receives numberlefo fmall Atreans iffoing from ponds and fwamps in the valleys. It tumbles over two confiderable falle, Amakaeg and P’antucket grent fills. From Haveril the river rons winding along, through a plafant rich vale of meadow, and pafting between Newbury Port and Salifbury empties itfelf into the ocean. The land next to the fea is gencrally low; bitt as you advance into the country, it rifes into hills. Some parts of the llate are mountainous. The White momitains are the highet part of a ridge whiche extends northeall and fouthweft to a length not yet afoltained. The whole circuit of them is not lefs than 50 miles. The height of thefe mountains above an aljacent mea. dow, is reckoned to be about 5500 fect. and the meadow is 3500 feet above the level of the fea. The fnow and ice cover them nine or ten momths in the year; during which time they exhibit tha: bri, he appearance from which they are denominaed the subite monnthins. From this fummit in clear weather is exhibited a noble view, extending 60 or, 0 miles in every dieretion. Althongh they are mute than 70 miles within land, they are feen many leagues of at fea, and appear like an exceeding bright clund in the borizon. Thefe immenfe heighs, being copionsly replenibed with water, afford a varicty of bembiful cafo cades. Three of the largelt rivers in New England receive a great part of their waters from thefe mumtains. A nranoofuck and Ifract rivers, two priscip.at branches of Connecticut, fall from their wellern fide. Peabody river, a branch of the Amarifeogen, fallis from the northealt fide; and almoll the whule of the
$\mathrm{Nn}_{2}$
Siaco

# H A M 

Hamploi., Saco defiends from the fouthern fide. The higheft - funmit of thefe monntains is about latitude $4 f^{\text {? }}$.

The air in New Hampinire is ferene and heallhful. The weather is not for fubject to change as in more fouthern clinates. This fiate embofoming a number of wer high mountains, and lying in the neighbourhood of ohers whofe towering fummits are covered with fnow and ice three quarters of the year, is intenfely cold in the wintor leafon. The heat of fummer is great, but of thort duration. The cold braces the contitution, and rendens the labouring people healthful and robutt.

On the fea coatt, and many places inland, the foil is fandy, but affords good patturage. The intervals at the foot of the mountains are greatly enriched by the frethets, which bring down the foil upon them, forming a fine mould, and producing corn, grain, and herbage, in the molt luxuriant plenty. The back lands which have been cultivated are generally very fertile, and produce the various kinds of grain, fruits, and vegetables, which are common to the other parts of New England. The uncultivated lands are covered with extenfive furells of pine, fir, cedar, oak, waluit, \&c. This flate affurds all the materials neceffary for thipbuilding.

No actual cenfus of the inlabitants has been lately made. In the convention at Pliliadtlphia, in 1787 , they were reckoned at 102,000 . There is no cha. racterittical difference betwcen the imhabitants of this anit the other New Englond Hates. The ancient inhabitants of New Hanpfhire were emigrants from England. Their pollerity, mixed with emigrants from Maffachufets, fill the lower and middle towns. Emigrants from Connecticut compofe the largetl part of the inhabitants of the weltern townis adjuining Connecticut river. Slaves there are none. Negroes, who were never mumerous in New Hamphire, are all fres by the Ertt article of the bill of rights.

In the townhip of Hanover, in the weftern part of this Itate, is Dartmouth College, fituated on a heautiful plain, about half a mile eall of Connecticut river, in latitude $43^{\circ} 33^{\prime}$. It was named after the right ho${ }_{1}$ orurable William Earl of Dartmouth, who was one of its principal benefactors. It was founded in 1769, for the cducation and intruction of youth, of the $\ln$ dian tribes, in reading, writing, and all parts of learning which hould appear neceffary and expedient for civilizing and chrillianizing the children of Pagans, as well as in all liberal arts and fciences, and allo of Englith youths and any others. Its fituation, in a frontier country, expofed it during the late war to many inconveniences, which prevented its rapid progrefs. It flourifhed, bowever, amidlt all its embarraffments, and is now one of the moft growing feminaries in the U nited States. In has in the four claffes about 130 Hadents, under the direction of a prefident, two profeffors, and two tutors. It has 12 truftees, who are a body corporate, invefted with the powers neceffary for fuch a body. The library is elegant, containing a large collection of the molt valuable books. Its apparatus confits of a competent number of ufcful inftruments, for making mathematical and philofophical experiments. There are three buildings for the ufe of the fludents. Such is the falubrity of the air, that
no inftance of mortality has happened among the Ru-Hampl dents fince the firft eftablihment of the college.

At Exeter there i, an academy; at Porifnouth a
Ham grammar fohool; and all the towns are bound by law to fupport fehools. The inhabitants of New Hamp thire are chetly congregationalifts. The other denominations are Prenyterians, baptits, ind Epicopatians.

The firt difcovery made hy the Englin of any part of New Hamp fhire was in 1614 , hy Captain John Smith, who ranged the Unene from Penobliot to Cape Cod; and io this route dicovered the river Pifataqua. On his return to England, he publiflaed a defoription of the country, with a map of the conal, which he prefented to prince Charles, whogave it the name of Nirw Enghond. The firll fethenaent wat made in 1623.

New Hamphite was for maty years minder the jurifdiction of the governor of Maffachufets, yet they had a feparate legiflature. They ever bore a proportionable hlare of the expences and levies in all enterprifes, expeditions, and military exertions, wherher planned by the colony or the crown. In wery fage of the oppufition that was made to the concrochments of the Britin pariament, the peophe, who teer bad a high fenfe of liberly, cheetfully bore thcir part.

HAMPSTEAD, a phafant village of Middefex, four miles northwen of Loudon, flands in a healthy; air, on a fine rife, at the top of which is a heath of about a mile every way, that is adoned with feveral pretty feats, in a moit irregular romantic lituation, and has a mull extentive proipect urcr London, into the counties all round it, viz. Buks and Hertfordnaire, and even Northamponflire, Elfex, Kent, Surry, Berks, Sce. with an minterrupted riew of Shooter's Hill, Banted-Downs, and Windfur.Catle. Its church was auciently a chapel of eafe to Hendon, till about $1+78$. This villare ifed to be reforted to furmerly for its mineral waters, which have Istely been neglected; but the wells are thill frequented. It is now crowded with good buildings, even on the very fteep of the hill, where there is no walking fix yards to 0 gether without meeting a hillock; but in the reign of Henry VIII. it was chiefly inhabited by the laundref. fes who wathed for the Londoners. its ofd ruinous church, the lord of the manor's chapel, was lately palled duwn, and a new one erected in its room. There is, belides, a handfome chapel near the wells, built by the contribution of the intabitants, who are chiefly citizens and merchants of London,

HAMPTON, a town of Gloucefterfhire in England, feated on the Cotfwold hills, and had formerly a nunnery. W. Long. 2.15 . N. Lat. $51.3^{8}$.

Hanpton, a town of Middlefex in England, feated on the river Thames, 12 miles weft of London, and two from Richnond and Kingllown. It is chicfly famous for the royal palace there, which is the finett in Britain. It was built by cardinal Wolfey, who had 280 lilk beds for frangers only, and furnithed it richly with gold and filver plate. The buildings, gardens, and the two parks, to which Willian 111. made contiderable additions, are about four miles in circunference, and are watered on three fides by the Thames. The inward court, built by king William, forms a piazza, the pillars of which are folow, that it looks
droken more like a cloyfter than a palace; however, the apart ments make ample amends, being extremely mas, nificent, and more exactly difpofed tian in any other palace in the world, and adorned with moll clegant furniture. Since the acceflion of his prefent majelly, however, this palace hath been much neplected, as the king has gencrally made choice of Windfur for his fummer retreat. Thofe imimitable painting by Raphacl Urbin called the cartoons, which, were placed there by king Willam, have been remoced to the queen's palace at Welmintler. Fior thefe pieces Loulis XV , is faid to have offerel 100000 l .

HAMEsOKEN, or Hamesecren. Sce Hamesecken.

HANAPER, or Hamper, an office in chancery, under the direction of a mafter, his deputy and clerks, anfwering, in fome meafure, to the filcus among the Romans.

HANAPER, ( (lerk of the) fometimes flyled zuarden of - the banaper, an olficer who receives all money due to the king for feals of charters, patents, commitions, and writs, and attends the keeper of the feal daily in term time, and at all time of lealing, and takes into his cuitody all fealed charters, patents, and the like, which he receives into bags, but anciently, it is fuppofed, into hampers, which yave denomination the office.

There is alio an officer who is comptroller of the hanaper.

HANAU, a town of Germany, and capital of a county of the fame name, is pleafanty fituated on the river Kenzig near its comflachec with the Nfayne. The river divides it into the old and new towns, both of which are furtified. 'I'te new town, which was built at firt by French and Flemith refugees, who had great privileges granted them, is regular and lamdrome. The cafle, in which the counts wfed to retide, and which flands in the old town, is fortilicd, and has a fine flower-garden with commodious apartments, but makes no great appearance. The Jows are colcrated here, and dwell in a particular quarter. The magifracy of the new town, and the diforal of all offices in it, belong to the French and Dutch congregrations. Here is an univerfity, with feveral manufactures, particularly of that of roll tobacco, and a very confiderable traffic. E. Long. 9 O. N. Lat. 49.58.

HAwisu-Munzenbers, a county of Germany. The greatelt part of it is furrounded by the electorate of Mentz, the bifhopric of Fulda, the lordhips of Reineck, Ifenburg, and Solms; as alfo by the territorics of Hefle-Homburg, Burg-Friedburg, and Fraukfort. Its length is near 40 miles, but its greateft breadh not above 12. It is exceeding fertile in corn, wine, and fruits; yielding alfo falt fprings, with fome cop. per, filver, and cobalt. The chief rivers are, the Mayne, the Kinzeg, and the Nidda. The prevaling religion is Calvinifm, but Lutherans and Catholics are tolerated. The country is populous, and trade and manufactures flourifh in it. In 1736, the whole male line of the counts of Hanau failing in Joln Rcinard, William VIII. landgrave of Hefle Caffel, by virtue of a treaty of mutual fueceltion between the famities of Hanau and Hefle Caffel, took poffeftion of the county, fatisfaction having been firt made to the houre of Saxony for their claims; and in the year 1754 tranderred it to prince William, eldeft fon to the theo
hereditary prince F ederic, aflerwards landgrave. The revenues $\mathbb{C}$ the lall count, arifing from this and other territories, are faid to lave amonned to 500,000 florins. The principal flaces are Hanau, Bergen, Steinau, and Glenhawion.

HAND, a part or member of the body of man, making the extremity of the arin. Sec Anatomy, $\mathrm{n}^{2} 53$, \&c.

The mechanifm of the hand is very curious; excellenty contrived to fit it for the various ufes and oce cations we have for it, and the great mumer of arta and manefaeture it is to be employed in. It conlifls of a compages of nerves, and latle bores joined into each other, which give it a great degree of Arength, and at the fane time an unutial flexibility, to enable it ta handle adjacent bodies, lay hold of them, and grafp them, in order either to draw then toward us or thrult them off. Anaxazoras is reprefented by ancient authors, as mamaining, that man owes all his widdom, knowled, a ad fuperiority over other animals, to the ofe of his hands. Galen reprefents the matter othenwife: mnn, according to him, is not the wifef creature, becaufe he has hands; hat he had hands giwn lim becaufe he was the wifent creature; for it was not our hands that taucht us arts, but our reafor. The hands are the organs of reafon, \&ec.

In foripture, the word bund was variouly applied. To pour water on any one's hand, fignifies to ferve him. To wath the hands was a ceremony made ure of to denote innocency from murder or manflaugliter. To kifs the hand was an act of adoration. 'To fill the hand ligniiced taking poffefion of the priefthood, and performing its functions. To lean upon any one's liand. was a mark of familiarity and fuperiority. To give the hand fignifies to grant peace, fwear friendhip, promife fecurity, or make allianes. The right land was the place of honuur and refpect. - Amungt the Greeks and komans is was cultomary for inferiors to walk on the left hand of fupariurs, that their right hand might be ready to afford protection and defence to their left fide, which was, on account of the aukwardneis of the left hand, more expofed to danger.
Imporition or lu:ing on of HivDs, fuguifics the conferring of holy orders; a ccremony wherein the hands are laid on che head of another, as a fugn of a mifion, or of a power given him to exercife the funtions of the minithry belunging to the order.
The apoffles began to appoint miffonaries by the impolition of hands. See Impusition.

Hasid, in falconry, is ufed for the foot of the lawk. To have a clean, ftrong, flender, glutinous hand, well clawed, are fome of the good qualities of a hawk or falion.

Hand, in the manege, fometimes ftands for the fore-feet of a horfe. It is alio ufed for a divifion of the horfe into two parts, with refpect to the riders hand. The fore-hand inclules the head, neck, and fore-quarters; the hind-land is all the reft of the horfe.

Hano is likewife ufed for a meafure of four inches, or of a clenched titt, by which the heighe of a horfe is computed.

Haso is alfo figuratively ufed in painting, foulp. ture, \&ic. for the manner of Bylc of this or that maller.

## H A N [ 294 ] H A N

lland, Handel.

Hinds are bone in coat-armour, deator and fmifer; tempt; but Atthito behaved to him with great kind. that is, right and left, expanded or open; and after other manners. A bloody hand in the centre of the efemetheon is the badge of a baronet of Great Britain.

Hand-Bradit, a meafare of three inches.
Flani)leh (George Frederic), a moll eminent mafter and compofer of mulic, was born at Hall, a eity of Upper Saxony in Germany. His father was a phyfician and furgeon of that place, and was upwards of Oo years of age when Handel was born. During his infaney young Handel is faid to have amufed himfelf with mufical infrumenta, and to have made confiderable progrefs before he was feven years of age, withour any inftruetions. His propenfity for mufic at lat be came fo itrong, that his father, who detigned him for the lludy of the eivil law, thought proper to forbid him, even at this eatly period of life, to touch a mufi. cal intrument, and would fuffer none to remain in his houfe. Notwithttanding this prohibition, however, Handel found means to get a littic clavichord privately conveyed to a room in the uppermoft flory of the houfe, to which roum he conflantly tole when the fao mily were afleep; and thus made lich adrances in his art, as enabled him to play on the harpfichurd. He was firt taken notice of by the duke of Saxe Weifenfels on the following occafion. His father went to pay a vifit to thother fun by a former wife, who was valet de chambre to the duke, ant refided at his court. loung Handel, being then in his feventh year, earnefly defired pernifion to go along with him; but being refufed, he followed the chaife on foot, and overtook it, the carriage being prubably retarded by the roughefs of the way. His father at firt chid him for his difobedience, hut at laf took him into the chaife slong with lim. While he was in the duke's court, be fill continved to thow the lame inclination for mufic: it was impofible so keep him from harpfichords; and he uftd fometimes to git into the organ loft at church, and phay after fervice was over. On one of thefe occafions, the duke happening to go out later than ufual, found fomething fo uncommon in Handel's maner of playing, that be inquired of his valet who It was; and reetiving for anfwer that it was his brother, be defied to fee him. This nobleman was fo much taken with the mufical genius thown by young Handul, that he perfuaded his father to let him follo: the bent of his incliuation. He made the boy a preFrat; and told him, that if the minded his ftudies, no eneouragcment flould be wanting.

On hie return to Hall, Handel was placed under one Zackaw, the organith of the cathedral church; and om young mancian pas even then able to fupply his matler's place in his abfonce. At nine years of age he begin to compofe charch lervices for roicea and intanments, and continued to compofe one fuch fervice every week for three yeara fucceffively: At the age of 14 , he fal excelled his matter, as he himfelf owned; and he vas sent to Betlin, where be had a relation in fome place about the court, on whole care und didelity his parcone could icly. She opura was then in a Howilhing conditon, being encouraged by the grandfather of the late king of Pruflia, and under the direction of many eminem perfons from fraly, among whom were Buononcini tha At:ilio. Buononcini, heing of a haugley difotition, treated Hand with con
nefs, and he profited much by his initructions. His abilities foon recommended him to the king, who frequently made lam prefents, and at latt propofed to fend him into Italy under liis own patronage, and to take him under his immediate protection as foon as his fitudies thould be completed. But Handel's parents not thinking proper to fubmit their child to the caprice of the king, declined the offer: upon which it became ne. ceflary for him to return to Hall.

Handel having now obtained ideas in mufic far ex. celling cevery thing that could be found in Hall, continued there very unwillingly, and it was refolved to fend him into Italy: but as the expence of this journey could not then be fpared, he went to Hamburg, where the opera was little inferior to that of Berlin. Soon after his arrival in this city, his father died; and his mother being left in narrow circumflances, her fon thought it neceflary to procure fome fcholars, and to accept a place in the orchellra; by which meane, inttead of being a burden, he became a great relief to her.

At this time, the frit harpfichord in Hamburg was played by one Kefer, a man who alfo exceiled in compofition; but he, having involved himfelf in forne debte, was obliged to abfcond. Upon this vacancy, the perfon who had been ufed to play the fecond harpfichord claimed the firit by right of fucceflion; but was oppofed by Handel, who founded a claim to the firf harplichord upon his fuperior abilities. After much difpute, in which alt who lupported or directed the opera enga. ged with much vehenence, it was decided in favour of Handel ; but this good fuccefs had alnoait colt him his life. His antagoailt refented the fuppoied affront fo much, that, as they were coming out of the orchettra together, he made a puh at Handel's breaf with a fword, which muft undoubtedly have killed him, had there not fortunately been a mulac-book in the bofom of his coat.
Handel, thongly yet hut in his $15^{\text {th }}$ year, became compofer to the houfe; and the fuccefo of Mmeria, his fint opera, was fo great, that it ran 30 nights without interrupton. Within lefs than a twelvemonth after shis, he fet two others, called Florinda and Norem, which were received with the fame applaufe. During his tlay here, which was about four or five ycars, he alfo compofed a coniderable number of fountas, which are now loft. Here his abilities procured him the acquaintance of many perfons of note, particularly the prinec of Tuicany, brother to John Gafton de Medicis the grand duke. This prince prefled him to go with lim to Italy, where he affared him that no convenience fhould be wanting; but this offer Handel thought proper to decline, being refolved not to give up his independency for any advantage that could be offred him.

In the tgth year of his age, Handel took a journey to Italy on his own botiom; where he was received with the greateft kinduefs by the prince of Tufcany, and had at all timea accefs to the palace of the grand duke. His Serene Highnefs was impaticnt to have fonechise corapod by fo great a matter; and not. withlanding the difference between the ayle of the Italian muic and the German, to which Handel had hithere been accutomed, le fer an opera called Rode.
adel. rigo, which pleafed fo well, that he was rewarded with 100 fequins and a fervice of plate. After llaying about a year in Florence, he went to Venice, where he is faid to have been firft difcovered at a mafquerade. He was playing on a harpfichord in his vifor, when Scarlati, a famous performer, cried out, that the perfon who played could be none but the famous Saxon or the devil. But a Atory fimilar to this is reported of many eminent perfons whofe atilities have been difcovered in difguife. Here he compofed his opera called $A_{3}$ rippina, which was performed 27 nights fucceffively, with the moll extravagant applaufe.

From Veniee our nulician proceeded to Rome, where he became acquainted with cardinal Ottoboni and many other dignitaries of the church, by which means he was frequently attacked on account of his religion; but Handel declared he would live and die in the religion in which he had been educated, whether it was true or falfe. Here he compofed an oratorio called Refurrectione, and 150 cantatas, belides fome fonatas, and other mufic. Ontoboni alfo contrived to have a trial of kill between him and Dominici Scarlatti, who was confidered as the greatelt mafter on that inflrument in Italy. The event is differently reported. Some fay thet Scarlatti was vietorious, and others give the victory to Handel; but when they came to the organ, Scarlatii himfelf aferibed the fuperiority to Handel.

From Rome, Handel went to Naples; after which, he paid a fecond vilit to Florence; and at lad, having fpent fix years in Italy, fet out for his native country. In his way thither, he was introduced at the court of Hanover with fo much advantage by the baron Kilmanfeck, that his Electoral Highnefs offered him a penfion of 1500 crowns a-ycar as an inducement for him to continue there. 'Phis generous offer he declined on account of his having promifed to vifit the court of the Elector Palatine, and likewife to come over to England in compliance with the repeated invitations of the duke of Manchetter. The elector, however, being made acquainted with this objection, generoully ordered him to be told, that his acceptance of the penfion Thould neither reftrain him from his promife nor refolution: but that be fhould be at full liberty to be abfent a year or more if be chofe it, and to go wherever he thought fut. Soon after, the place of mafter of the chapel was bellowed upon Handel; and our mufician having vilited his mother, who was now extremely aged and blind, and his old mafter Zackaw, and taid fome time at the court of the Elector Falatinc, fet out for England, where he arrived in 1710.
At that time operas were a new entertainment in England, and were conducted in a very abfurd manser: but Handel foon put them on a better footing; and fet a drama called Rinaldo, which was performed with uncommon fuccefs. Having flaid a year in England, he returned to Hanover; but in 1712 he again came over to England; and the peace of Utrecht being concluded a few months afterwards, he compofed a grand $T_{c}$ Deum and Gubilate on the oceafion. He now found the nobility very defirous that he fould refume the direction of the opera houfe in the Hay Market; and the queen having added her authority to their folicitations, and conferred on him a penfion of L. 200 a. year, he forgot his engazements to the elecior of Ha.
nover, and remained in Britain till the death of the Handel. queen in $174^{4}$. On the arrival of king George I. Handel, confcious of his ill behaviour, durf not appear at court ; but he was extricated from his dilemma by the baron Kilmanfeck. Having engaged feveral of the Englinn nobility in his behalf, the barou perfualed the king to a party of pleafure on the water. Handel was apprifed of the defign, and ordered to prepare fome mulic for the occafion. This he exceuted with the utmoll attention, and on the day appointed it was performed and conducted by himfelf. The king with pleafure and furprife inquired whofe it was, and how the entertailument came to be provided without his knowledge. The baronthen produced the delinquent; ard afked leave to prefent him to his majelly as one too fenfible of his faule to attempt an excufe, but fincerely de. firous to atone for it. This intercefion was accepted. Handel was reflored to favour, his water mufie was honoured with the bighel approbation, and the king added a penfion of L. 200 a-yest to that formerly betlowed on him by queen Anne; which he foon after increaled to I, 400 , on his being appuinted to teach the young princeffes mulic.

In the year 1715 , Handel compofed his opera of $A$. madige; but from that time to the year 1720 he coanpoled only Tefoo and Palbor Fillo, Buononciri and Attilio being then compofers for the operas. About this time a project was formed by the nobility for erecting a kind of academy at the Hay Market, with a view to fecure to themfelves a conflant fupply of operas to be compoled by Handel, and performed under his direction. No lefs than L. $50,0 c 0$ was fubferibed for this fcheme, of which the king limelf fubferibed L.. ©ceO, and it was propofed to continue the undertaking for $1+$ years. Handel went over to 1 ) refden, in order to cngage lingers, and returned with Senelino and Duriytanti. Buononcini and Atcilio had ilill a flrong party in their favour, but not equal to that of Handel; and therefore in 1720 he obtained leave to perform his opera of Radamillo. The houfe was fo crowded, that many fainted through exceffive heat: and 40 s . were offered by fome for a feat in the gallery, after having in vain attemped to get one elfewhere. The eontention, however, Atill ran very high between Handel's parly and that of the two Italian malters; and at laft it was determined that the rivals flould be jointly employed in making an opera, in which each thould take a dillinet act. and he who by the general fuffrage was allowed to lave given the bett proof of his abilities thould be put in poffeffion of the houfe. This opera was called hiszio Scarola, and Handel fet the laft ast. It is faid that Handel's fuperiority was owned even in the overture before it; but when the act came to be performed, there remained no pretence of doubt or difpute. The academy was now therefore firmly ettablifhed, and Handel conducted it for nime years with great fuccefs; but about that time an irreconcileable enmity took place between Handel himfelf and sencfino. Senefino accufed Flandel of tyranny, and Handel acculed Senefino of rebellion. The merits of the quarrel are not known: the nobility, however, became me fiators for fome time ; and having failed in that good difinn, they became parties in the quarrel. Handel was relolved to difmifs Senelino, and the nubility feemed alfor refolved not to permit him to do fo. The haughtinefs of Handel'

Handel. Handel's temper would not allow him to gicht, and the affar ended in the total diffolution of the academy.
Handel now found that his alilities, great as they were. could not fupport him againt the powerful oppofition he met with. After the difmifion of Senefino, lis audicnce fenfly dwindled away, and Hantel entercd into an agreement wilh Mr Heciekgter to carry on operas in conjunction with him. New fingers were engaged from laly; but the offended nobility raiced a fubfeription againt him, to carry on operas in the playhoure in Lincoln's-Inn fields. Handel bore up four years againt this oppoition; three in partuerthip with Heidegegr, and one by timfelf : but though this mafical abilities were fuperior to thofe of his antagonills, the afonining powers of the voice of Farineti, whom the oppofite party had engaged, determined the vietory againt him. At latt Handel, laving fipent all he was worth in a fruitlefs opporition, thought proper to defitt. His dilappointment had fuch an effect upon him, that for fume time he was difordered in his underllanding, and at the fane time his right arm was rendered wiflefs by a Aroke of the palfy. In this deplorable fituation, it was thought necefliry that he floutd go to the baths of Aix ta Chapelte; and from them he received fuch extraordinary and fudden relief, that his cure was looked upon by thic nuns as miraculous.
In 1736 , Handel again returned to England; and foon after his return lis Alexander's Feaft was performed with applaufe at Covent Garden. The fuceefs and fiplenior of the Hay Market was by this time fo much rediced by iepeated miffranagements, that lord Middlefex undertook the direction of it himfuf, and once more applied to Handel for compofition. He accordingly courpofed two operas called Farromonde, and All:Jomiluc Severo, for which in 1737 , he received L. 1000 . In 253 lie received L. 1500 from a fingle benefit, and nothing feemed wanting to retrieve his affairs, excepting fiucla conceflions on his part as his opponentshad a right to espect. Thefe conceffions, howeser, he could not be precailed upon to make; and that he might no longer be under bbligations to act as he was direted by othe s, he refufed io enter into any engagements upon fubfeription. After laving tried a few more operas at Covent Garden without fuceff, he introduced another fpecies of mulic called oratarios, which he thought better fuited to the native gravity of an Englin audience. Dat as the futbjects of thefe piccers were always taken from facred hithory, it was by fome thought to be a profanation to fet then to mulic and pefferm them at a playhoufe. In confequence of this prejudice, the onatorios met with very indifferent fucceff; and in $17+1$ Mr Handel found his affairs in luela a bad fituation, that he was obliged to quit Englaus, and go to Dubliu.

He was reccised in Ircland in a manaer fuitable to his kreat merit ; and lis performing tis oratorio called t1. IIfJith. for the beachit of the city-prifon, brought hil. wo unt., tal tavour. In nize montlis time he had brought his afifirs into a betcer fituation; and on his return to En, land in :7ta, he found the public much more favourably difpofed. His ratatios were now pirfornm:d witu great appplaufe: his Meffiah, which beffore had been but coldy received, becanse a favourite performance ; and Handel, with a generous humanity, dc$\mathrm{N}^{\circ} \mathrm{I}^{3}$.
termined to perform it annuaily for the benefit of the Hande fuunding hulpital, which at that time was only fupported by private leacfactions. In $17+3$, he had a return of his pardytie diforder; and in $1-5$ : became guite blimd by a gulla forma in his epes. This lalt misfortune for forme time fuak him into the deepet defpondency ; but at lathe was oblised to acquefce in has lituation, after having with at any relief undergone fome very painfu! operations. Finding it now impoffible to matage his oratorios atone, he was affifted by Mr Smith, who at his requett frequantly played for him, and conducted them in his lacad; and with this aflitance they were continued till within cieht days of his death. During the latier part of his !ife, his mind was often difordered; yet at times it appears to have refumed its full vigour, and he compofed feveral fongs. chorufes, \&ce. which from their dates may be conlidered alnott as the latl founds of his dying voice. From about Octuber ${ }^{2} 758$ his health declined very fatt; his appetite, which had been remarkably keen, and which he had gratilied to a great degree, lefe him; and he became fentible of the approach of death. On the Gth of April 1759, his latt utatorio was performed, at which he was peremt, and dicd on the 1 fth of the fame month. On the 2 cth lie was burid by the right revertad Dr l'arce, bifhop of Rochefter, in Weftmintter abbey; where, by his own order, and at his own cxpence, a monnment was erected to his memory.

With regard to the character of this moft eminent mofician, he is univerfally allowed to have been a great epicure: In his temper he was very haughty, but was feldum or never guilty of mean actions. His pride was uniform ; he was not by tums a tyrant and a flave. He appears to have liad a mott extravagant love for libeity and independeuce; infomuch, that he would, for the fake of liberty, do things otherwife the mof prejudicial to his own intereft. He was liberal even when poor, and remembered his former friends when he was rich. His mufical powers can pelhaps be bett exprefsed by Artuthnot's icply to Pope, who ferioully aked his opinion of him as a mufician: " Conceive (faid he) the highety you can of his abilities, and they are much beyond any thing you can conceive."

Commemoration of Mambes; a mufacal exhibition infituted fome years ago, and the grandefl of the kind ever attompted in any nation. Of the rife and proghts of the ditig, together with the manner in which the bilt colcbration was executed, an accurate and authentic dotali is given, as might be expected, by Dr Dunncy in the fth and lat volume of his Hiltory of Nulic, from which the following account is extracted.
" In a converfation between lord vifcount Fitzwilliam, Sir Watkin Willians Wynn, and Joah Bates, Efq; commifioner of the victualing-ofice, the beginning of lat year, 1783 , at the houfe of the latter; afetr remarking that the number of cminent mulical performess of all kinds, buth vocal and inltrumental, with which London abounded, was far greater than in any uther city of Europe, it was lamented hat there was no public periodical occalion for collecting and confolidating them into one band; by which means a perfomanee might be exhibited on to grand and magnificent a feale as no other part of the world could equal. The birth and death of Handel naturally occurred to
three

## H A N [ 207 ] H A N

del. three fuch enthufiaftic admirers of that great mafter; and it was immediately recollected, that the next year $(1784)$ would be a proper time for the introduction of fuch a cultom, as it formed a complete century fince his birth, and an exact quarter of a century fince his deceafe.
"The plan was foon after communicated to the governors of the Mufical Fund, who approved it, and promifed their affiftance. It was next lubmitted to the directors of the concert of Ancient Mulic ; who, with an alacrity which does honour to their zeal for the memory of the great artif Handel, voluntarily undertook the trouble of managing and directing the celebrity. At length, the defign coming to the knowledge of the king, it was honoured with his majelty's fanction and patronage. Weftminitter abbey, where the bones of the great mufician were depofited, was thought the propereft place for the perfounance; and application having been made to the bifhop of Rochefter for the ufe of it , his lordmip, finding that the fcheme was honoured with the patronage of his majefty, readily confented; only requefting, as the performance would interfere with the annual benefit for the Weftmintter Infirmary, that part of the profits might be appropriated to that charity, as an indemnification for the lof it would fullain. To this the projectors of the plan acceded; and it was afterwards fettled, that the profits of the firft day's performance thould be equally divided between the Mulical liund and the Weftminiter Infirmary ; and thofe of the fubfequent days be folely applied to the ufe of that fund which Handel himfelf fo long helped to futlain, and to which he not only bequeathed a thoufand pounds, but which almoft every mufician in the capital annually contributes his money, his performance, or both, to fupport. Application was next made to Mr James Wyatt, the architcet, to furnifh plans for the neceffary decoratione of the abbey; drawings of which having been thown to his majefly, were approved. The general idea was to produce the effect of a royal mutical cliapel, with the orcheltra terminating one end, and the accommodation for the royal family, the other. The arrangement of the pelformance of each day was next fettled; and it was at his majefty's inttigation that the celebrity was extended to three dajs inflead of two, which he thought would not he fufficient for the difplay of Handel's powers, or fulfilling the charitable purpofes to which it was intended to devote the profits. It was origiually intended to have celebrated this feftival on the $20 t \mathrm{~h}, 22 \mathrm{~d}$, and 23 d of A prit; and the $2 c t h$ being the day of the funetal of Handel, part of the mufic was, in fome meafure, fo felected as to apply to that incident. But, in confequence of the fudden diffolution of parliament, it was thought proper to defer the feltival to the 26 th, 27th, and 29 th of May, which feems to have been for its advantage : as many perfons of tunder conllitutions, who ventured to go to Weflminfter Abbey in warm weather, would not have had the courage to ge thither in cold. Impreffed with a reverence for the memory of Handel, no fooner was the project known, but moft of the practical muficians in the kingdom eagerly manifefted their zeal for the enterprife; and many of the moll eminent profeffors, waving all claims to precedence in the band, offered to perform in auy fubor.

Vol. VILI. Part I.
dinate ftation in which their talents could be mof Mandsi. ufeful.

## $\xrightarrow{\square-(J)}$

"In order to render the band as powerful and com. plete as poffible, it was determined to employ every feceics of inflrument that was capable of producing grand effects in a great orcheitra and fpacions building. Among thefe the facbut, or douhle trumpet, was fought; but fo many years had elapled fince it had been ufed in this kingdom, that neither the inftrument, nor a performer upon it, could cafily be found. It was, howcver, difcovered, after much ufelefs enquiry, not only here, but by letter, on the continent ; that in his majeft's military band there were fix mufi. cians who played the three feveral fpecies of facbut, tenor, bale, and double bale.
"The domble baftoon, which was fo confpicuous in the orchella, and powerful in its effect, is likewife a tube of 16 feet. It was made, with the approbation of Mr Handel, by Stainby the flute-maker, for the coronation of his late majefty George II. The late ingenious Mr Lampe, author of the jultly admired mulic of The Dragon of Wantley, was the perfon ininded to perform on it ; but, for want of a proper reed, or for fome other caufe, at prefent unknown, no ufe was made of it at that time; nor indeed, tho' it has heen often attempted, was it ever introduced in. to any band in England till now, by the ingenuity and [ewfeverance of Mr Aflly, of the Guards.
" The double bafe kettle drums were made from models of Mr Athbridge, of Diny Lane orcheltra, in copper, it being impofible to procure plates of brafa large enough. The lower drums, which, by permiffion of his grace the duke of Richmond, were brought to the abbey on this occation, are thofe which belong to the ordnance flores, and were taken by the duke of Marlborough at the battle of Malplaquet in 1709. Thefe are hemifpherical, or a circle divided; bat thole of Mr Afhbridge are more cylindrical, being much longer, as well as more capacious, than the common kictile-drum; by which he accounts for the fuperiority of their tone to that of all other drums. Thefe there fpecies of ketcle-drums, which may be called tenor, lafe, and double bofe, were an octave below each other.
"The excellent organ, erected at the welt end of the abbey, for the commemoratio performances only, is the workmanmip of the ingenious Mr Samuel Green in Inington. It was fabricated for the cathedral of Canterhury; but before its deparcure for the place of its deftination, it was permitted to be opened in the capital on this memorable occalion. The keys of communcation with the harpfichord, at which Mr Bates :lie conductor was feated, extended 19 feet from the body of the organ, and 20 feet 7 inclses below the perpendicular of the fet of keys by which it is ulually played. Similar keys were firt contrived in this countiy for Handel himfelf at his oratorios; hus to conver them to fogreat a diftance from the inftrument, without rendering the touch impracticably heavy, required uacommon ingenuity and mechanical refources.
"In celebrating the difpolition, difcipline, and ef. fects of this mott numerous and excellent band, the merit of the admirable architect, who furnifhed the elcgant defigns for the orcheftra and galleries, muft not be forgotten; as, when filled, they conllituted one of the grandelt and molt magnificent fpectactes which Oo ima.

Handel. imagination can delineate. All the preparations for receiving their majeltics, and the firft perfonages in the kingcom, at the calt end; upwards of 500 muficians at the weft ; and ite public ingeneral, to the number of betw. ${ }^{2}$ jocoand 4000 forlows, in the area and galleries ; fo wonderfully correfponded with the fyle of an chitecture of this venerable and beantiful fructure, that there was nothing vifible either for ufe or ornament, which did net harmonize with the principal tone of the building, and which may not metaphorically have been faid to have been in perfect tune with it. But, betides the wonderful manner in which this conftruction exhibited the band to the fpectators, the orcheftra was fo judicioully contrived, that almoft every performer, both vocal and iuftumental, was in full view of the conductor and leader; which tecounts, in fome neafure, for the uncommon eafe with which the performers confels they executed their parts.
"At the calt end of the aifle, jutt before the back of the choir-organ, fome of the pipes of which were vifible below, a throne was erected in a beantiful Gothic tyle, correfponding with that of the abbey, and a center box, richly decorated and furnihed with crimfon fattin, fringed with gold, for the reception of their majefties and the royal family: on the right hand of which was a box for the bilhops, and, on the left, one for the dean and chapter of Wefmintler ; immediately below thefe two boxes were two others, one on the zight for the families and friends of the directors, and the other for thofe of the prebendaries of Weltmintter. Immediately below the king's box was placed one for the directors themfelves, who were all diftinguihed by white wands tipped with gold, and gold medals, fll ruck on the oecation, appending from white ribbands. Thefe their majeflies likewife condefcended to wear at each performance. Belind, and on each fide of the throne, there were feats for their majefties fuite, maids of honour, grooms of the bed ehamber, pages, acc.-The orcheftra was built at the oppofite extremity, afceuding regularly from the height of feven feet from the floor to upwards of forty from the bafe of the pillars, and extending fiom the centre to the top of the tole aille.-The istermediate fpace below was filled up with level benches, and appropriated to the early fubfriibers. The faid ailles were formed into long galleries ranging with the orchellra, and afcending fo as to contain 12 rows on each fide: the fronts of which projected before the pillars, and were ornamented with fettoons of crimfon morine.-At the top of the orcheftra was placed the oceafional organ, in a Gothic frame, mounting to, and mingling with, the faints and martyrs reprefented in the painted glafs on the weft window. On each fide of the organ, clofe to the window, were placed the kettle-drums deferibed above. The choral bands were principally placed in view of Mr Bates, on fteps feemingly afeending into the clouds, in each of the fide aifles, as their termination was invilible to the audience. The principal fingers were ranged in the front of the orchellra, as at oratorios, accompanied by the choirs of St Paul, the abbey, Windfor, and the chapel soyal.

- Feve circumftances will perhaps more atonih veItran mufaians, that to be informed, that there was but one general rehearfal for each day's performance: an indifutable pronf of the high Itate of cultivation
to which pratical mufic is at prefent arrived in this country; for if good petformers had not been found ready made, a dozen rehearfals would net have been fuflicient to make them fo. Indeed, Mr Bates, in examining the lift of performers, and enquiring into their feveral merits, fuggefted the idea of what he called a drilling rehearfal, at Tottenham-Atreet Concert Room, a week before the performance; in order to hear fuch volunteers, particularly chorus fingers, as were but little known to himflf, or of whofe abilities his affitant was unable to fpeak with certainty. At this rehearfal, though it conifited of 120 performers, not more than two of that number were defired to attend no more.
"At the general rehearfal in the abbey, mentioned above, more than 500 perfons found means to obtain admiffion, in fite of every endeavour to fhut out all but the performers; for fear of interruption, and perhaps of failure in the firlt attempts at incorporating and confolidatiog fuch a numerous band : confilting not only of all the tegulars, botlinative and foreign, which the capital could furnifh, but of all the irregulars, that is, dilettanti, and provincial muficians of character, who could be mullered, many of whom thad nevert heard or feen each other bcfore. This intrufion, which was very much to the diffatisfaction of the managers and conductor, fuggefted the idea of turning the eagernefs of the public to fome profitable account for the charity, by fixing the price of admifion to half a guinea for each perfon.
" But, befides the profits derived from fubfequent rehearfals, the confequences of the firft were not without their ufe: for the pleafure and aftonifhment of the audience, at the fmall miftakes, and great effects of this firlt experiment, which many had condernned by anticipation, were foon communicated to the lovers of mulic throughout the town, to the great increafe of fubfribers and folicitors for tickets. For though the friends of the directors were early in fubfcribing, perhaps from perfonal refpect, as much as expectation of a higher mufical repalt than ufual ; yet the public in gemeral did not manifelt great earernefs in fecuring tickets till after this reheartal, Friday May 21. which. was reported to have allonifled even the performers themfelves by its correctnefs and effects. But fo interelting did the undertaking become by this favourable rumour, that from the great demand of tickets it was found neceffay to clofe the fubfription.
" Many familics, as well as individuals, were attracted to the capital by this celebrity; and it was never remembered to have been fo full, except at the coronation of his prefent majetty. Many of the performers came, unfolicited, from the remoteft parts of the kingdom at their own expence: fome of them, however, were afterwards reimburfed, and had a fmall gratuity in confideration of the time they were kept from their families by the two unexpected additional. performances.
"Foreigners, particularly the French, mult be much aftonifled at fo numeruus a band moving in fuch exact meafure, without the affiftance of a Coryphxus to beat the time, either with a roll of paper, or a noify baton, or truncheon. Rouffeau fays, that ' the more time is beaten, the lefs it is kept ;' and it is certain, that when the meafure is broken, the fury of the mu-
rdel fical general or director, increafing with the difobedience and confufion of his trocps, he becomes more violent, and his ilrokes and gelticulations more ridiculous in proportion to their diforder.
"As this commemoration is not only the firlt inftance of a band of fuch magnitude being affembled together, but of any band at all numerous, performing in a fimilar fituation, without the affillance of a manuductor to regulate the meafure, the performances in Weftminfter abbey may be fafely pronounced no lefs remarkable for the multiplicity of voices and inftruments employed, than for accuracy and precifion. When all the wheels of that huge machine, the orcheftra, were in motion, the effect refembled clock-work in every thing but want of feeling and expreffion. And as the power of gravity and attraction in bodies is proportioned to their mals and denfity, fo it feems as if the magnitude of this band had commanded and impel. ded adhefion and obedience beyond that of any other of inferior force. The pulfations in every limb, and ramifications of veins and arteries in an animal, could not be more reciprocal, ifochronous, and under the regulation of the heart, than the members of this body of muficians under that of the conductor and leader. The totality of found feemed to proceed from one voice and one inftrument ; and its powers produced not only new and exquifite fenfations in judges and lovers of the art, but were felt by thofe who never received pleafure from mufic before. Thefe effects, which will be long remembered by the prefent public, perhaps to the difadvantage of all other choral performances, run the rifk of being doubted by all but thofe who heard them, and the prefent defcription of being pronounced fabulous if it fhould furvive the prefent generation."

HANG-тснeou-fou, the metropolis of the province of Tche-kiang in China. See Tche-kiang. It is, according to the Chinefe, the paradife of the earth; and may be confidered as one of the richeft, beft fituated, and largefl cities of the empire. It is four leagues in circumference, exclufive of its fuburbs; and the number of its inhabitants amounts to more than a million. It is computed, that there are a thoufand workmen within its walls employed in manufacturing filk: what renders this city delightful, is a fmall lake, called Si-hou, which wathes the bottom of its walls on the weftern fide; its water is pure and limpid, and its banks are almoft every where covered with flowers. Halls and open galleries, fupported by pillars, and paved with large flag Hones, have been erected here on piles, for the convenience of thofe who are fond of walking; caufeways, cafed with cut flone, traverie the lake in different directions; and the openings which are left in them at intervals, for the paffage of boats, are covered by handfome bridges. In the middle of the lake are two illands, to which company generally refort after having amufed themfelves with rowing, and in which a temple and feveral pleafure-houfes have been built for their reception. The emperor has a fmail palace in the neighbourhood. Thiscity has a garrifon of 3050 Cbinefe, under the command of the viceroy, and 3000 Tartars, commanded by a general of the fame nation. It has under its jurnfdiction feven cities of the fecond and third clafs.

HANGING, a common name given to the mechod of inflicting death on criminals by fufpending
them by the neck.- Phylicians are not agreed as to the manner in which death is brought on by langing. De Haen hanged three dogs, whom he afterwards opened. In one, nothing remarkable appeared in the lungs. In another, from whom half an ounce of blood was taken from the jugular vein, the dura and pia mater were of the natural appearance; but the lungs were much inflamed. In the third, the meninges were found, and there was no effufion of blood in the ventricles of the brain, but the left lobe of the lungs was turgid with blood. Wepfer, Littræns, Alberti, Bruhierius, and Boerhaave, affirm that hanged animals die apoplectic. Their arguments for this are chielly drawn from the livid colour of the face; from the turgefeency of the veffels of the brain; the inflammation of the eyes; and from the fparks of fire which thole who have furvived hanging allege they have feen before their eyes. On the contrary, Bonctus, Petit, Haller, and Lancifi, from obferving that death is occafoned by any fmall body falling into the glotis, have afcribed it to the ftoppage of retpiration. Others, decming both thefe caufes ill-founded, have aferibed it to a lusation of the vertebræ of the neck.-Dr Haen adduces the authority of many eminent authors to prove the poflibility of recovering hanged perfons; and obferves, in general, that with bleeding in the jugular vein, and anointing the neck with warm oil, the fame remedies are to be employed in this cafe as for the recovery of drowned people. See Drowning.

HANGINGS, denote any kind of drapery hung up againt the walls or wainfcotting of a room.

Paper-Hangings. See Paper-Hungings.
Wove Mangings. See Tapestry.
HANGCLIFF, a remarkable point of land on the eaft coalt of the largett of the Shetland Iffands. It is frequently the firl land feen by mips in northern woyages. Captain Phipps determined its fituation to be in W. Long. $0^{\circ} 50^{\prime} 30^{\prime}$. N. Lat. $60^{\circ} 9^{\prime}$.

HANNIBAL, a famons Carthaginian general, of whofe exploits an account is given under the articles Carthage and Rome. After having had the miffortune to lofe a fea-fight with the Rhodians, through the cowardice of Apollonius one of the admirals of Antiochus the Great, he was foreed to fly into Crete, to avoid falling into the hands of the Romans. On his arrival in thes ifland, he took fanctuary among the Gortynii ; but as he had brought great treafure along with him, and knew the asarice of the Cretans, lie thought proper to fecure liis riches by thie following Atratagem. He filled feveral veffels with reltsd lead, jult covering them over with gold and filver. Thefe he depolited in the temple of Diana, in the prefence of the Gortynii, with whon, he faid, he trulted all his treafure: Jution tells us, that he kft this with them as a fecurity for his good behaviour, and lived for fome time very quietly in thefe parts. He took care, however, to conceal his riches in hollow llatues of brafs ; which, according to fome, he always carried along with him ; or, as others will have it, expofed in a public place as things of little value. At laft he retired to the court of P1 ulias king of Bithyna, where he found means to unite feveral of the neighbouring Hates with that prince into a confederacy againft ELmenes king of Pergamus, a profeffed friend to the Komans; and during the enfung war gave Eumenes fe-

Hannibsil.

Hannibal. veral defats, more through the force of his own genius than the valour of his troops. The Romans having received intelligence of the important fervices perforncl hy Hannibal, immediately difatched T. Quintins Flaminins as an ambaflador to Prufras, in order to procure his deftrustion. At his firlt audience, he complained of the protection given to that famous general, reprefonting him "as the mont inveterate and implacable enemy the Romans ever had; as one who had ruined both his oun comutry and Antiochus, by dawing them into a deflructive war wihh Rome."Prulias, in order to ingratiate himfelf with the Romans, immediatcly fent a party of fuldiers to furround Hannibal's houle, that he might find it impofible to make his efcape. The Carthatinian, having before difenvered that no confidence was to be repofid in Pratias, had contrived feven fecret paflages from his houfe, in order to cuade the machinations of his enemies, even if they thould carry their point at the Bihhynian court. But guards being polled at theie, he could not 月ly $^{2}$, though, according to Livy, he attempied it. Perceiving, therffore, no poffibility of eflaping, he lad recourfe to poifen, which he had long referved for fuch a melancholy occaliun. Then taking it in his hand, "Set ns (faid he) deliver the R mans from the difquietude with which they have long been tortured, fince they have not patience to wait for an nld man's death. Flaminius will not acquire any reputation or glory by a victory gained over a betrayed and defencelefs perfon. This fingle day will be a latting tettimony of the degeneracy of the Romans. Their anceftors gave Pyrrhus inteligence of a defign to prifon hin, that he might guard againt the impending danger, even when he was at the head of a powerful army in Italy; but they lave deputed a perfon of confular dignity to excite Prulias impioully to murder one who has taken refuge in his dominions, in violdtion of the laws of hofpitality." Then having denounced dreadful imprecations araintt Prufias, he llunk the poifon, and expired at the age of 70 years. Cornelius Nepos acquaints us, that he put an end to his life by a fubtile poifon which he earried about with him in a ring. Plutarch relates, that, according to fome writers, he ordered a fervant toflrangle him with a cloak wrapped about his neck; and others fay, that, in insitation of Midas and Themiflocles, he drank bull's blood.

With refpect to the character of this general, it appears to have been in military affairs what Demofthenes was in onatory, or Newton in mathematics; namely, abfolutely perfect, in which no human wifdom could difoover a fault, and to which no man could add a perfection. Rollin hath contrafted his character with that of Scipio Africanus. He enamerates the qualities which make a complete feneral ; and having then given a fummary of what hittorians have related concerning both commanders, is inclined to give the preference to Hannibal. "There are, however (he fays), two difficulties which hinder him from deciding; one drawn from the characters of the geaerals whom Hannibal vanquithed; the other from the errors he committed. May it not be faid (continues our author), that thofe victories which made Hanribal fo famous, were as much owing to the imprudence and temerity of the Roman gencrals, as to his bravery and fidl?

When a Fabius and a Scipio were fent againlt him, Hannil the firt itopped his progrefs, the other conquered Haun him."

Thefe reafons have been anfwered by Mr Hooke, who hath take:r fome pains to vindicate Hannibal's character, by fully and fairly comparing it with that of Scipis Africanus, and other Roman commanders. "I do not fee (fays he) why thefe diffaculties hould check our autho's inclination to declare in favour of the Cartharinian. That labius was not beaten by Hainibal, we cannot much wonder, when we remember bow teadily the old man kept to his refolution never to fight with lum. But from Fabius's taking this method to fre: a top to the victories of the ene$m_{\text {P }}$, may we nue conclude that he knew no other, and thougitit Hamibal an overmatch for him? And why does our author foryct Pablius Scipio (Africams's father), a prudent and able general, whon Hannibal vanquith at the Ticin? Livy relates fome vietories of Hantital over the crlcbrated Marcethus; but neither Marecllas nor any other general ever vanquifhed Harnibal before the batele of Zama, if we may believe Puybins (lib. xv. c. 16.). Terentius Varro, indeed, is icprecmed as a heaniferer ralim man; but the battle of Canne was not tull hio imprudence. The order in whish he drew eng nemy is no where condemned; and Chevalier Fulard thinks it excellent. And as to the cor hart of the batele, Emilius Paulus, a renowned captain, and a difciple of Fabius, had a greater fhare in it than his colleague. The imprudence with which_Varo is taxed, was his venturing, contrary to his colleague's advice, with above 90,000 men to encounter in a phaia iield an enemy who had only 50.000 , but was fuperior in horfe. And does not the very advice of Nmilius, and the charge of temerity on Varro for not following it, imply a confefion of Hannibal's fuperiority in military flitl over Æmilius as well as Varro? It ought likewife to be obferved, that Hannibal's infantry had gained the victory over the Roman infan. try, before this latter fuffered any thing from the Carthaginian cavalry. It was otherwife when Scipio gained the victory at Zama. His infantry would probably lave been vanquilhed but for his cavalry. Hannibal, with ouly his third line of foot (his Italian army), maintained a long fight againf Scipio's three lines of foot; and feems to have had the advantage over them, when Mafiniffa and Leelius, with the horfe, came to their affiltance. Polybius indeed fays, that Hannibal's Italian forces were equal in number to all Scipio's infantry ; but this is contradicted by Livy, and is not very probable. The authority of Polybius, who was an intimate friend of Scipio Amilianus, is, I imagine, of little weight in matters where the glory of the Scipios is particularly cuncerned. His partiality and flattery to them are, in many inflances, but too vifible."

Our author then proceeds to fhow, that Hannibal was not guilty of any of the faults laid to his charge as a general; and having contralted the moral characters of the two generals with each other, makes it evident, that as a man, as well as a general, Hannibal. had greatly the advantage of his rival. See Hooke's Roman bifory, vol. iv. p. 151. Ef fiq.

HANNO, general of the Carthaginians, was commanded to lail round Africa. He entered the ocean
ver. through the Straits of Gibraltar, and difcovered feveral countries. He would have continued his navigation, had it not been for want of provifions. He wrote an account of his voyagc, which was often quoted, but not much credited. Sigifmund Gelenius publifhed it in Greek at Bafil, by Frobenius, in 15 33. He lived, accurding to Pliny, whin the affairs of the Carthaginians were in the moft Bourifling condition; but this is a very indeterminate exprefion.

HANOVER, an electoral flate of Cermany, of which the king of Great Britain is elector. - Though the houfe of Hanover is the laft that has been raifed to the electoral dignity in the empire, it may vie with any in Germany for the antiquity and noblenefs of its family. It is likewife very confiderable for the extent of its territories, which at prefuat are, The duehy of Calenberg, in which are the cities of Hanover, Calenberg, Hamelen, Ncultadt, Gottingen, ice.; the duchy of Grubenhagen, the county of Diepholt, the county of Iloga, in the bifhopriek of Hildelheim ; the bailiages of Coldingen, Luther, Badenburg, and Weiterfoven, with the right of protection of the city of Hildefteim; and the county of Danneberg, ceded by the dukes of Wolfenbuttle to the dukes of Lunenburg, as an equivalent for their preteafions on the city of Brunfwic. The elector poffefles likewife the connty of Delmenhorft, and the duchics of Bremen and Verden, fold by the king of Dennark in 1715 : the righe of poffeffing alternatively the bifhopric of Ofnabruck belongs folely to the electoral branch; but if it thall happen to fail, the dukes of Wolfenbutte are to enjoy the fame right. This electorate has no navy, but a confiderable marine on the great rivers Elbe and Wefer.

In confideration of the great fervices performed by Ernef Auguftus, duke of Brunfwic-hanover, in the wars which the emperor Leopold had with Louis XIV. that emperor conferred the dignity of an elector of the holy Ruman empire upon him and his heirs male, of which he received the inveftiture on the 19th of December 1692 . This new creation met with great oppofition both in the electoral college and the college of princes: at laft, by a conclution of the three colleges on the 3oth of January ijc8, it was unanimoufly determined, that the electoral dignity Thould be confirmed to the duke of Hanover and his heirs male : but it was added, that if, while that electoral dignity fubfined, the Palatine electurate fhould lappen to fall into the hands of a Proteltant prince, the firt Catholic elector fhould have a fupcrnumerary vote.

The princes of this houfe have their feat in the college of princes, immediately after thofe of the electoral houfes; each branch having a vote. The elector, befides his feat in the electoral college, was invented with the office of arch flandard-bearer of the empire ; but this being difputed with him by the duke of Wirtemberg, the electur Palatine having obtained the office of arch-lleward, yielded that of arch-treafurer to the elector of Hanover, who was confirmed in this dignity by a decree of the diet of the 13 th of Janna. ry 1710.

The fovcreign power is adminiftered by the lords of the regency appointed by the elector. T'hroughout all the provinces they poffefs a contiderable thare of free-
dom, the people being reprefented in the aftemblies of the flates. No government can be more mild; and an air of content is fpread over all the inhabiants. The Confeil Intime, the High Court of Jutice, and the Regeney, are the principal courts of juttice; befides which, every province has its ravsicipal atminiPration with the iaferior divinons into balliwice, Ese. The police is excellent, and julice fairly adminntect. The elcator enjous the righe the non appellombio in all crimina! affairs, but in civil proctlés only as far as 2000 florins.

Lutheranifin is the ctlablifhed religion : but ail others enjoy a perfect tuleration, and are publiciy exerciled. Difference in religions fontiments here gives no interruption to that harnony which fhouid fubfit among fethow citizens. There are 750 satheran parilles, $1+$ Reformed communtics, a Romifh college, a conwent, and Some Catholic churches.

Literature is in a very advaneed flate throughout the Ce dominions. The univerfity of Cottingen is defervodly celebrated; and contains about 8 co itudents of different nations, and 60 puoffors. There are befises feveral colluges, and a number oi well eatailithed fchools, throughout the electorate. In general, education is mach attended to.

Although there are various tracts of heath and marthy ground, the foil in general produces ahundance of corn, truits, hemp, flax, tubaceo, madder, and fome wine. There are leveral large falt-works. A good deal of cattle are reared, and a great nuaber of excellent horfes. Moft metals and mincrals are found here. The forelts furnifh fuficient timber, and large quantities of pitch and tar.-The natural productions of the electorate furnith ample materials for connmeree, fo as to prevent the balance being againtt them, alhough their manufactures are nut fufficient for confumption. Cattle, horfes, falt, wrought iron, and fuel, are principal articles of export. Bremen is one of the greateit comnercial towns in Germany.

The elector of Hanover is defcended from the ancient family of the Guelphs, dukes and electors of Bavaria: one of whom, Henry the Lion, in $11+0$, married Maude, eldefl daughter of king Henry (Platagenet) 11. of England. Their fon William fucceeded to Brunfwic-Lunenburg, and his fon Otho was ereated duke thereof. The dominions defeended in a direa line to Erneth, who divided then upon his death in $154^{6}$ into two branches, that of Brunfiwic Lanenburg Wolfenbutele, and Branfuic Lanienburg Zell. The poffefor of the laiter, Ernef Augullus, was in1692 raifed to the dignity of an elector' ; before which he was licad of the college of German princes. Firnelt married Sophia, daughter of Frederic elector Palatine and king of Bohemia, by Elizabecth, daaghter of James I. King of England. Sophia being the next Proteltant heir to the houfe of Stuart, the parlianent fixed the crown of Great Britain upon her on queen Anne's demife; and George-Louis her eldeft fon became king of Great Britain in confequence thereof: fince which the electors of Hanover have filled the Britifh throne.
Hanover is alfo the name of the capital of the above clectorate; and is agreeably fituated in a fandy plain on the river Leync, in E. Long. 10. 5. N. Lat. 22. 5. It is a large well. built town, and pretty

Hanse. well fortified. It has fuffered greatly by the French, who got poffeflion of it in 1757, but were foon after driven out. It is noted for a particular kind of beer, reckoned excellent in thefe parts. This city was the refidence of the elector before he afcended the throne of Great Britain. The palace makes no great fhew outwardly, but within it is richly furnihed. The regency of the country is adminiftered in the fame manner as if the fovereign was prefent.

HANSE, or Hass, an ancient name for a fociety or company of merchants; particularly that of certain cities in Germany, \&c. hence called Hanfe-towns. See Hanse-Towns.-The word banfe is oblolete High Dutch or Teutonic ; and fignifies " alliance, confederacy, affociation," \&c. Some derive it from the two German words, $a m$ - $f e$ e, that is, "on the fea;" by reafon the firlt hanfe towns were all fituated on the feacoalt : whence the fociety is faid to have been firft called $a m$ zee. Renen, that is, " cities on the fea;" and afterwards, by abbreviation, banfee, and banfe.

Hituse-Towns. The lanfeatic fociety was a league between feveral maritime cities of Germany, for the mutual protection of their commerce. Bremen and Amiterdam were the two firft that formed it; whofe trade received fuch advantage by their fitting out two men of war in each to convoy their fhips, that more cities continually entered into the league: even kings and princes made treaties with them, and were often glad of their alfillance and protection; by which means they grew fo powerful both by fea and land, that they raifed armies as well as uavies, enjoyed countries in fovereignty, and made peace or war, though always in defence of their trade, as if they had been an united flate or commonwealth.

At this time alfo abundance of cities, though they had no great intereft in trade, or intercourfe with the ocean, came into their alliance for the prefervation of their liberties: fo that in 1200 we find no lefs than 72 cities in the litt of the towns of the Hanfe; particularly Bremen, Amfterdam, Antwerp, Rotterdam, Dort, Bruges, Ollend, Dunkirk, Middlehurgh, Calais, Rouen, Rochelle, Bourdeaux, St Malo, Bayonne, Bilboa, Lifbon, Seville, Cadiz, Carthagena, Barcelona, Marfeilles, Leghorn, Naples, Meflina, London, Lubee, Roftock, Strallund, Stetin, Wifmar, Konigfberg, Dantzig, Elbing, Marienburg.

The alliance was now fo powerful, that their fhips of war were often hired by other princes to affilt them againt their enemies. They not only awed, but often defeated, all that oppofed their commerce ; and, particularly it 1358 , they took fuch revenge of the Danifl fleet in the Sound, for having interrupted their commerce, that Waldemar III. then king of Denmak, for the fake of peace, gave them up all Schonen for 16 years: by which they commanded the paffage of the sound in their own right. -In 1428 they made war on Erick king of Denmark with 250 fail, carrying on board 12,000 men. Thefe fo ravaged the coatt of Jutland, that the king was glad to make peace with them.

Many privileges were beftowed upon the hanfe towns by Louis XI. Charles VIII. Louis XII. and Francis 1. killgs of France; as well as by the en.peror Charks $V$. who had divers loans of money from then; and by king Henry IIL. who alfo incorporated
them into a trading body, in acknowledgment for money which they adranced to him, as well as for the good fervices they did him by their naval forces in 1206.

Thefe towns exercifed a juriddiction among themfelves; for which purpofe they were divided into four colleges or provinces, dittinguilhed by the names of their four principal cities, viz. Lubec, Cologne, Brunfwic, and Dantzic, wherein were held their courts of judicature. They had a common ftock or treafury at Lubec, and power to call an alfembly as often as neceffary. - They kept mazagines or warehoufes for the fale of their merchandifes in London, Bruges, Antwerp, Berg in Norway, Revel in Livonia, Novogorod in Mufcovy, which were exported to molt parts of Europe, in Englith, Dutch, and Flemih bottoms. One of their principal magazines was at London, where a fociety of German merchants was formed, called the Alcelyard company. To this company great privileges were granted by Edward 1. but revoked by act of parliament in 1552 in the reign of Edward VI. on a complaint of the Englifh merchants that this company had fo engroffed the cloth-trade, that in the preceding year they had exported 50,000 pieces, white all the Englifh together Lad fhipped off but 1100 . Queen Mary, who afcended the throne the year following, having refolved to marry Philip the emperor's fon, fufpended the execution of the act for three years : but after that term, whether by reaion of fome new flatute, or in purfuance of that of king Edward, the privileges of that company were no longer regard$\epsilon d$, and all efforts of the hanfe-towns to recover this lofs were in vain.

Another accident that happened to their mortification was white queen Elizabeth was at war with the Spaniards. Sir Francis Drake happening to meet 60 fhips in the Tagus, loaden with corn, belonging to the hanfe-towns, took out all the corn as contraband goods which they were forbid to carry by their original patent. The hanfe-towns having complained of this to the diet of the empire, the queen fent an ambaffador thither to declare her reafons. The king of Poland likewife interetted himfelf in the affair, becaule the city of Dantzic was under his protegion. At laft, though the queen itrove hard to preferve the commerce of the Englifh in Germany, the emperor excluded the Englifh company of merchant-adventurers, who had conliderable factories at Stade, Embden, Bremen, Hamburg, and Elbing, from all trade in the empire. In fhort, the hanfe towns, in Germany in particular, were not only in fo flourihing, but in fo formidable a flate, from the 1 th to the I6th centuries, that they gave umbrage to all the neighbouring princes, who threatened a ftrong coufederacy againtt them; and, as the firit ttep towards it, commanded all the cities within their dominion or jurifdiction to withdraw from the union or hanfe, and be no farther concerned therein. This immediatcly feparated all the cities of England, France, and Italy, from them. The hanfe, on the other hand, prudently put themfelves under the protecton of the empire: and as the cities jult now mentioned lad withdrawn from them; fo they withdrew from feveral more, and made a decree among themfolves, that none fhould be admitted into cheir fo. ciety but fuch as flood within the limits of the German
empire,

## H A N

empire, or were depencent thereon : except Dantzic, which continued a member, though in nowife dependent on the empire, only it had been fummoned formerly to the imperial diet. By this means they maintained their confederacy for the protection of their trade, as it was begun, without being any more envied by their neighbours. Hereby likewite they were reduced to Lubec, Bremen, Hamburgh, and Dantaic; in the firtt of which they kept their regiller, and held alfemblies once in three years at leaft. But this hanfe or union has for fome time been diffolved; and now every one of the cities carries on a trade feparately for itfelf, according to the itipulation in fuch treaties of peace, \&c. as are made for the empire betwixt the emperor and other potentates.

HANWAY (Jonas), eminent for his benevolent defigns and ufeful writings, was born at Portmouth in Hampllire on the 12 th of Augut 1712. His father. Mr Thomas Hanway, was an officer in the naval fervice, and for fome years fore kecper to the dockyard at that place. He was deprived of his life by an accident ; and left his widow with four chitdren, Jonas, William, Thomas, and Elizabeth, all of a very tender age. Mrs Hanway, coming to L.ondon after the death of her hufband, put Jonas to fchool, where he learned writing and accounts, and made fome proficiency in Latin. At the age of 17 he was fent to Libon, where he arrived in June 1729 , and was bound apprentice to a merchant in that city. His early life, we are informed, was marked with that difcreet attention to bufinefs, and love of neatnefs and regularity, which afterwards diflinguithed his character. At Lifbon his affections were captivated by a lady, then celebrated for her beauty and mental accomplifments; but fhe, preferring another for her huband, returned to England, and fpent the latter part of her life in London with her family, on terms of friendhip with Mr Hanway.- On the expiration of Mr Hanway's apprenticelhip, he entered into bufinefs at Lifbon as a merchant or factor; but did not remain there long before he returned to London.

He foon after connccied himfelf as a partner in Mr Dingley's houfe in St I'cterburglt; where he arsived on the toth of Junc $17+3$. The trade of the Englifh nation over the Cafpian sica into Perlia at this period had been entrufled to the care of Mr Eliton, who, not content with the purfuit of commercial affairs, lad in. judicionlly engaged in the fervice of Nadir Shath to build fhips on the Cafpian after the European manner. This had alarmed the merchants in the Rulfian trade, and a refolution was formed that one of their body fhould make a journey into Perfia. On this occafion Mr Hanway offered his fervice, and was accopted. Hefet out on the loth of September; and after experiencing a variety of hazards in that kingdom during a courfe of 12 montlis, returned to St Peterfburg January 1. 1745, without being able to cftablith the intended trade by the Cafpian, partly througli the jealoufy of the Ruffian court on account of Elton's connections with the Perfians, and partly by the troubles and revolutions of the latter kingdom.
'Though Mr Hanway's conduct during this expe. dition feems to have been directed by the fricteft mules of integrity, yet fome diffieulties arofe in fettling his demands on his employers Thefe, however, in
the end were referred to the determination of impar. Hanway. tial arbitrators, who at length decided in his favour. "I obtained (he fays) my own; and as to any other perfonal advantage, it confitted in exercifing my mind in patience under trials, and encreafing my knowledge of the world." He now fettled at St Peterfburgh; where he remained five years, with no other variations in his life than fuch as may be fuppofed to occur in the dull round of a mercantile employment. During this time he intersfted himfelf greatly in the concerns of the merchants who had engaged in the Cafpian tracie: but the independence he liad acquired having excited a defire to fee hig native country, he, after feveral difappointments which prevented him from accomplifhing his wifh, left St Pcterfurgh on the gth of july 1750 . On his arrival in his native country, he did not immediately relinquifh his mercantile con. nections, though he feems to have left Ruffia with that view. He employed himfelf fome time as a merchant ; but afterwards, more beneficially to the world, as a private gentleman. In 1753 he publified "An Hiftorical Account of the Britifh Trade over the Cafpian Sea; with a Joumal of Travels from London through Ruffia into Perfia; and back again thro' Ruffa, Ciermany, and Holland. To whicb are added, the Revolutions of Perfia during the prefent Cen. tury, with the particular Hifory of the great Ufurper Nadir Kouli," + vols to : a work which was received, as it deferved to be, with great attention from the public. In 1754, we find Mr Hanway commending a plan offered for the advantage of Weftminfter, and furgetling hints for the further improvement of it, in "A Letter to Mr John Spranger, on his excellent Propofal for Paving, Cleanting, and Lighting the Streets of Weftminfter, \&c." swo. A few yeals afterwards, when a fcheme of the like kind was carried into effect, many of Mr Hanway's ideas, thrown out in this pamphlet, were adopted. In 1756, he printed "A journal of Eight Days Journey from Portfinouth to Kingiton upon Thames, with an Effay on 'Ica;" which was aiterwards reprinted in 2 volis Avo, 1757.

At this juncture, Great Britain being on the eve of a war with France, the event of which was vet important to the nation at large, and required cvery cffort of patriotifm and prodence to ward off the impending danger, Mr Hanway publithed " "Phoughts on the Duty of a good Citizen with Regard to War and Invafion, in a Letter from a Citizento his Friend," 8vo. About the fame time, feveral gentlemen formed a plan, which was matured and made pelfect by the affiduity of Mr Hanway, for providing the navy with failors, by furnilhing poor children with neceffaries to equip them for the fervice of their country. The fuccefs and propricty of this fcheme foon became apparent. Mr Hanway wrote and publifhed three pamphlets on this occafion; and the treafurer of the society, accompanied by Mr Hanway, having waited on the king, the Society received 1000 l. from lis majelly, 400 l . from tile p'rince of Wakes, and zcol. fiom the Princefs Donager. This excellut inflitution through life was the favourite object of Mr Hanway's care, and contimsed to flourifh under his aufpices greatly to the adrantage of the community. In 1758 he bccanse an advocate for another:

## H A N [ 304 ]. H A N

Hanezy, chatitable intitution, which derived confiderable emo lument from his patronage of it. This was the Mag. dalen Charity; and to affit it he publimed "A Letter to Kobert Dingley, Efq; being a proporal for the Relief and Employment of friendlefs Girls and repent ing Proftitutes," 4 to. He alfo printed ocher fmall performances on the fame fubject.

In 1759, Mr Hanway wrote" Reafons for an Aug. mentation of at lealt Twelve Thoufand Mariners, to be employed in the Merchants Service and Coafting Trade, in 33 Letters to Charles Gray, Efq; of Colchelter, 4 to." The next year he publifhed feveral performances: viz. I. "A candid hiftorical Account of the Hofpital for the Reception of expofed and deferted young Children; reprefenting the prefent Plan of it as productive of many Evils, and not adapted to the Genius and Happinefs of this Nation," 8vo ; which being anfwered by an anonymous Letter from Halifax in "Candid Remarks, 8vo 1760," Mr Hanway replied to it, and the Remarker rejoined. 2. "An Account of the Society for the Encouragement of the Britim Troops in Germany and Nortb America, \&c." 8vo. 3. "Eight Letters to - Duke of ——, on the Cultom of Vails-giving in England," 8vo. This practice of giving vails had arrived at a very extravagant pitch, efpecially among the Cervants of the great. It was Mr Hanway who anlwered the kind reproach of a friend in a ligh flation for not coming oftener to dine with him, by faying " Indeed I cannot afford it." The nobleman to whom the above letters were addreffed was the duke of Newcaftle. The letters are written in that humorous ftyle which is moft attractive of general notice, and was beft adapted to the fubject. It was Sir Timothy Waldo that lirft put Mr Hanway on this plan. Sir Timothy had dined with the duke of $\mathrm{N}-$-, and, on his leaving the houfe, was contributing to the fupport and infolence of a train of fervants who lined the hall ; and at laft put a crown into the hand of the cook, who returned it, faying, "Sir, I do not take filver."—" Don't you indeed!" faid the worthy baronet, putting it in his ;ocket; "then I do not give gold." Among the ludicrous circumftances in Mr Hanway's letters is one which happened to himfelf. He was paying the fervants of a refpectable friend for a dinner which their mafter had invited him to, one by one as the appeared; "Sir, your great coat ;" a shilling —" Your hat ;" a Thilling-" Stick;" a Shilling" Umbrella;" a milling-." Sir, your gloves ;"."Why, friend, you may keep the gloves; they are not worth a fhilling." In 1761 , Mr Hanway produced "Reflections, Effays, and Meditations on Life and Religion; with a Collection of Proverbs, and 28 Let. ters written occafionally on feveral Subjects," in 2 vols Svo.

The many ufeful and public-fpirited plans which Mr Hanway had promoted for the welfare of the community, had now rendered his character mofl iefpectably pupular, while his difintereftednefs, and the fincerity of his intentions, were confpicuons to all. Five citizens of I, ondon, of whom the late Mr Hoare the banker was one, waited on Lord Bute, at that time the minifter ; and, in ther own names, and the names of their fellow cilizens, requefted that fome notice might be taken of a man, who, at the expence of his own private fortune, and unromitting application, had ren$\mathrm{N}^{\circ} 148$.
dered fo many and fuch meritorious fervices to his country. In confequence of this requelt, he was in July 1762 appointed by a patent one of the commilfioners for victualling the navy; a polt which he held above 21 years. The next act of public benencence in which we find him engaged is the collettion of money for the fufferers by the bire which happened at Montreal, in the province of Quebec, in May 1765, when a fourth part of the city was confumed. On this occafion Mr Hanway, in conjunction with two other gentlemen, collected $8+151$.-The very next year a dreadful tire broke out in Bridge Town in Barbadoes, which confumed buildings and property to the amount of near 100,0001 . A fubfeription was opened, in which Mr Hanway was a principal actor, and $14,8861$. were collected, and tranfmitted to a committee appoint$\epsilon d$ at Barbadors to difribute it to the unfortunate fufferers At fubfequent periods he continued to interelt himielf in various other plans for relieving the diftreffes, and promoting the good, of different claffes of the community. His attention was particularly directed towards alleviating the miferies of young chim-ney-fweepers. Befides the diltreffes of thefe helplefo beings, which are open to general obfervation, fuch as a contortion of the limhs, and the prevention of their growth, they are liable to a difeafe peculiar to their occupation, now known by the name of the chimney fareper's cancer. Four children have been brought together into a workhoufe, all afficted with this dread. ful and incurable difeafe. After much inquiry and confideration, he publifhed, in 1773 , "The State of the Chimney-fweepers Young Apprentices; fhowing the wretched Condition of thefe diftreffed Boys; the ill Conduct of fuch Maflers as do not obferve the Ob ligation of Indentures ; the Neceffity of a ftriet Inquiry in order to fupport the civil and religious Rights of thefe Apprentices," 12 mo . 'I'his fmall pamphlet has already been productive of fome advantage to the oljects intended to be benefited by it. The fucceed. ing year 1774 he enlarged a furmer publication, entitled " Advice from a Farmer to his Daughter, \&.c." and republifhed it under the title of "Virtue in humble Life: containing Reflections on the reciprocal Duties of the Wealthy and Indigent, the Malter and the Servant," 2 vol. Svo; a work deferving the particular conlideration of every magiflratate. This edition in a few months heing fold. he reprinted it in two quarto volumes, with a dedication to Mrs Montague.

In 1783 , linding his health decline, he determined to refign lis office at the victualling board, which he did on the $2 d$ of October that year ; and immediately received a grant of his whule falary by way of a penfion, to continue for life. This favour he owed to the efleem which his majefty, to whom he was perfonally known, entertained of him; excited by his varions exertions in behalf of his country and mankind. - He was now releafed from his moft material bulinefs, but did not think it would conduce to his lappinefs to lead an idle life. He engaged again in behalf of the chimney-fweepers boys; and promoted, by every means in his power, the eftablifhment of Sunday. fchools, which are now in a fair way to be adopted in every county in England. He likewife promoted a fubfeription for the relief of the many black poor people who wandoicd about the metropolis in exircme diftefs;
15. and the lords of the treafury feconded the defign, by directing money, as far as 141 . a.head, to be iffued to the committee, to cnable them to fend the blacks to fuch places abroad as might be fixed on. After en. countering many obfacles, about 300 negroes were fent, properly accommodated with provifions and neceffaries, to Africa, under the conduct of a perfon approved for that flation. The object of this plan, behides relieving the mifery of thefe poor people, was to prevent in time the unnatural connectiens between black perfons and white, the difagreable confequences of which make their appearance but too frequently in our ftrects.

In the fummer of 1786 Mr Hanway's health declined fo vifibly that he thought it neceltary to attend only to that. He had long felt the approach of a diforder in the bladder, which, increafing by degrecs, caufed a ftrangury; and at length, on the 5 th of September 1786 , put a period to a life fpent almoft entirely in the fervice of his fellow-ercatures. On the ${ }^{1} 3$ th he was interred in the family vault at Hanwell, being attended to the grave by a numerous retinue of friends; and fince his death the public regard to his virtues has been difplayed by a fubicription of feveral hundred pounds towards erecting a monument to perpetuate his memory:

Mr Hanway in his perfon was of the middle fize, of a thin Spare habit, but well fhaped: his limbe were fafhioned with the nicefl fymmetry. In tlie latter years of his life he flooped very much; and when he walked, fuund it conduce to cafe to let his head incline towards onefide: but when he went firlt to Rulifa at the age of 30 , his face was full and comcly, and his pelfon altogether fuch as obtained for him the appellation of the Hundjome EnglifRnarn. In his drefs, as far as was contitent with his ideas of health and eare, lie accommodated limfelf to the prevailing fafhion. As it was frequently neceflary for him to appear in polite circles on unexpected occations, he ufually wore drefs cluthes, with a large Firench bag. His hat, omamented with a gold button, was of a fize and fathion to be worn as well under the arm as on the head. When it rained, a fmall parapluic - defended his face and wig. Thus he was always prepared to enter into any company without impropriety or the appearance of negligence. His drefs for fet public occafions was a fuit of rich dark brown; the coat and waitcoat lined thronghout with ermine, which juit appeared at the edges; and a fmall goldhilted fword. As he was extremely fufceptible of cold, he wore flannel under the linings of all his clothes, and ufually three pair of flockings. He was the firt man who ventured to walk the itreets of loudon with an umbrella over his head. After carrying one near $3^{\circ}$ years, he faw them come into general ufe. The precarious fate of his health when he arrived in England from Ruffia, made it neceflary for him to ufe the utmolt caution; and his perfeverance in following the advice of the medical practitioners was remarkable. After Dr Licberkyn phyfician to the king of Pruffia had recommended milk as a proper diet to reflore his flength, he made it the chief part of his food for 30 years; and though it at firt difagreed with him, he perfifted in trying it under every preparation that it was capable of till it agreed with his itomach. Dy this rigid attention and care, his healeh was eftablifited; - 'Vol. Vill. Pare 1.
his lungs acquired ftrength and clanicity; and it is probable he would have lived feveral years longer, if the diforder which was the immediate caufe of his death had left lim to the gradual decay of nature. His mind was the molt active that it is pomble to conceive; always on the wing, and never appraring to be weary. He rofe in the fummer at four or fiec, and in the winter at feven. Having always bufmefs before him, he was every day employed till the time of retiring to relt ; and, when in health, was commonly alleep within two minutes after his lying down in bed.

Writiny was his favourite employment, or rather amufement ; and when the number of his literary works is confidered, and that they were the produce only of thofe hours which he was able to fuateh from public bufnefs, an idea nay be formed of his applieation. But by leaving his work to tranfact his ordinary bufinefs, and afterwardy recurring to it with new ideas, all his literary labours are defective in the arrangement of the mater, and appear to have too much of the mifecllancous in their compofition. The original idea is fometimes left for the purfuit of one new!y farted, aud cither taken up again when the mind of the reader has almoll lolt it, or it is totally deferted. Yet thofe who are judges of literary compolition fay, that his language is well ealculated to have the ellect he defired on the reader, and imprefs him with the ided that the author was a man of infexible integrity, and wrote from the pure dictates of the heart. It is plain and unornamented, without the appearance of art or the affectation of lingularity. Its greatelt defect (fay they) is a want of concifenefs; its greatelt beauty, an unaffected and gennine fimplicity. He fpoke French and Portuguefe, and underftood the Rus and modern Purfic imperfeetly. Latin he had been taught at fchool, but had not much occafion to cultivate it after he entered intolife.
Mr Hanway, although never married himfelf, was yet an advocate for marriage, and recommended it to all young people. He thought it the moft effectual reftraint on liccontioufnefs, and that an increafe of unhappinefs was by no means the natural confequence of an increafe of domellic cares. A "local habitation," with the fociety of a fenlible woman, the choice of unbiaffed affection, he elteemed as the moft engaging perfuative to the love of order and conomy; without which he thought life, in whatever flation, mult be disjointed and preurbed and unhappy. The lady who engaged his firit affection was nncommonly handfome; and it is probable he was prevented from marrying only by his failing to obtain her, and the unfetted manner in which the firit years of his life were fpent: for he loved the fociety of women; and in the parties which frequently breakfatted at his houfe the ladies ufually made the greater portion of the company.

In his traufactions with the world, he was always open, candid, and lincere. Whateser he faid inight be depended on with implicit confidence. He adhered to the Itrict truth, ceven in the manner of his relation; and no brilliancy of thought could induce him to vary from the fact: but although fo frank in his own proceedings, he had feen too much of life to be eafily deceived by others; and he did not often place a contidence that was betrayed. He did not, however, think the world fo degecuerate as is commonly imagined:

## il A P [ 306 ] H A P

lanway "And if I did (he uled to fay), I nould not let it appear ; for nothing can tend fo effectually to make a inan wicked, or to keep him fo, as a marked fufpicion. Confulence is the reward of truth and fidelity, and thefe fhould never be exerted in vain." In his department of commifioner for victualling the navy he was uneommonly affiduous and attentive; and kept the contractors and perfons who lad dealings with the office at a great diftance. He would not even accept a hare or pheafant, or the fmalleft prefent, from any of them ; and when any were fent him, he always returned them, not in a morofe manner, as if he affected the excels of difintereftednefs, but with fome mild anfwer; fuch as, "Mr Hanway returns many thanks to Mr ___ for the prefent he intended him; but he has made it a rule not to accept any thing from any perfon engaged with the office: A rule which, whilt he acknowledges Mr —_s good intentions, he hopes he will not expect him to break through." With all this goodnefs, Mr Hanway had a certain fingularity of thought and manners, which was perhaps the confequence of his living the greater part of his tife in foreign countries, and never having been married. He was not by any means an inattentive obferver of the little forms of politenefs: but as he had ftudied them in various realms, felecting thofe which he approved, his politenefs differed from that of other people; and his converfation had an air of originality in it that was very pleafing.

Befides the works already mentioned in the courle of this artiele, Mr Hanway was the euthor of a great number of others; his diferent publications amounting all together to between fixty and feventy. A complete kift of them is given by his biographer Mr Pugh, from whofe grateful and well-written performance this article bas been chiefly extracted.

HAP, or HAPP, in law, fignifics to catch or fnatch a thing. Thus we meet with, to hap the pofelfion of a deed poll. Littleton, fol. 8. alfo, to hap the rent. If partition be made between two parceners, and more land be allowed the one than the other, fhe that liath moft of the land charges it to the other, and happeth the reat whereon allize is brought.

HAPPINESS, or Felicity, abfolutely taken, denotes the durable poffeflion of perfect good without any mixture of evil, or the enjoyment of pure pleafure unalloyed with pain; or a date in wlich all the withes are fatisfied: In which fenfer, Happinefs is known only by name upon the eath. The word lappy, when applied to any fate or condition of human life, will admit of no pofitive definition, but is merely a relative term: that is, when we call a man happy, we mean that he is happier than fome others with whom we compare him ; than the gremerality of others; or than he himfelf was in fome other fituation.

This interclting fubject has been treated by many eminent writcrs, and in a great variety of ways; but by none does it appear. to have been fet in a clearer and more delinite point of view than by Archdeacon Palcy in the dixth chapter of his Principles of Plulafophy. so In fricturss (fays that clegant writer), any condition may be denoninated happy in which the amount or ageregate uf plature exceeds that of pain; and the degre of happinefs depends upon the quantity of this oxcefs. Ard the greatelt quantity of it, ordinarily 3ttainable in buman life, is what we mean by happinefs,
when we inquire or pronounce what human happinels confilts in.

If any pofitive fignification, dilinet from what we mean by pleafure, can be affixed to the term happinefs, it may be taken to denote a certain ftate of the nervous fyftem in that part of the human frame in which we feel joy and grief, paffions and affections. Whe. ther this part be the heart, which the turn of molt languages would lead us to believe; or the diaphragm, as Buffon, or the upper orifice of the fomach, as Van Helmont thought; or rather be a kind of fine network, lining the whole region of the procordia, as others have imagined; it is pofible not only that every painful fenfation may violently thake and difurh the fibres at the time, but that a feries of fuch may at length fo derange the very texture of the fyftem, as to produce a perpetual irritation, which will thow itfelf by fretfulnefs, reftleffnefs, and impatience. It is pof. fible allo, on the other hand, that a fucceffion of pleafurable fenfations may have fuch an effeet upon this fubtle organization, as to caufe the fibres to relax, and return into their place and order; and thereby to recover, or if not loft to preferve, that harmonious conformation which gives to the mind its fenfe of complacency and fatisfaction. This fate may be denominated bappinefs: And is fo far diftinguifhable from pleafure, that it does not refer to any particular object of enjoyment, or confift like pleafure in the gratification of one or more of the fenfes; but is rather the fecondary effect which fuch objects and gratifications produce upon the nervous fyttem, or the flate in which they leave it. The comparative fenfe, however, in which we have explained the term bafpine/s, is more popular; and in profecuting the fubject, we may confider, x . What human happinefs does not conflat in; and, 2. What it does confilt in.
I. Fingl, then, happinefs does not confift in the pleafures of fenfe, in whatever profufion or variety they be enjoyed. By the pleafures of fenfe are meant, as well the animal gratifications of eating, drinking, and that by which the fpecies is continued, as the more refined pleafures of mufic, painting, architecture, gardening, fplendid fhows, theatric exhibitions, and the pleafures, lally, of active fports, as of hunting, fhooting, fifhing, sce. For, 1. Thefe pleafures continue but for a little while at a time. This is true of them all, efpecially of the groffer fort. Laying afide the preparation and the expectation, and computing flictly the actual fenfation, we thall be furprifed to find how inconfiderable a portion of our time they occupy, how few hours in the four and twenty they are able to fill up. 2. By repetition, they lofe their relim. It is a property of the machine, for which we know no remedy, that the organs by which we perceive pleafure are blunted and henumbed, by being frequently exercifed in the fame way. 'lhere is hardly any one who has not found the difference hetween a gratification when new and when familiar, and any pleafure which does not become indifferent as it grows habitual. 3. The eagernefs for ligh and intenfe delights takes away the relifin from all others; and as fuch delights fall rarely. in our way, the greater part of our time becomes from this caufe empty and uneafy. There is hardly any delofion by which men are greater fufferers in their happincis, than by their expecting too much from lights which vulgarly engrofs the name of pleafure. The very expectation fpuils them. When they do come, we are often engaged in taking pains to perfuade ourfelves how much we are pleafed, rather than enjoring any pleafure which fprings naturally out of the object. And whenever we depend upon bing valtiy delighted, we always go home fecretly grieved at miffing our aim. Likewife, as hath been obferved jult now, when this humour of being prodigisuly delighted has once taken hold of the imagination, it liinders us from providing for or acquiefcing in thofe tently foothing engagements, the due varitty and fucceflion of which are the only things that fupply a continued flream of happinefs.
The truth feems to be, that there is a limit at which thefe pleafures foon arrive, and from which they ever afterwards decline. They are by neceflity of thort duration, as the organs cannot hold on their emotions beyond a certain leugth of time; and if you endeavour to compenfate for this imperíction in their uature by the frequency with which you repeat them, you lofe more than yon gain by the fatigue of the faculties and the diminution of fenfibility. We' have in this account faid nothing of the lofs of opportunities or the decay of faculties, which whenever they happen leave the voluptuary deffitute and defperate; tealed by defires that can never be gratificd, and the memory of pleafures wbich mult return no more. It will alfo beallowed by thofe who have experiencell it, and perliaps by thofe :lone, that pleafure which is purchafid by the encumbrance of our fortune is purchated too dear; the plafure never compenfating for the perpetual irritation of embarrafted circunitances.

Thefe pleafures, after all, have their value: and as the young are always too eager in their purfuit of them, the old are fometimes tno remiis; that is, too fudious of their eafe to be at the pains for them which they really deferve.

Secondly, Neither does happinefs confift in an exemption from pain, labour, care, bufinefz, fuffenfe, moleftation, and "thofe evils which are without;" fuch a flate being ufually attended not with eafe, but with dcpreffion of fpirits, a tatteleffinefs in all our ideas, imaginary anxietics, and the whole train of hypochondriacal afections. For which reafon it feldom anfivers the expectations of thofe who retite from their fhops and counting-houfes to enjoy the remainder of their days in leifure and tranquility; much lefs of fuch as in a fit of chagrin flut themfelves up in cloyfters and hermitages, or quit the world and their tha. tions in it for folitude and repofe.
Where there exifts a known external caufe of uneafinefs, the caufe may be removed, and the uneafinefs will ccafe. But thofe imaginary dittreffes which men feel for want of real ones (and which are equally tormenting, and fo far equally real); as they depend upon no fingle or affignablc fubject of uneafinets, fo they admit oft-times of no application or relief. Hence a moderate pain, upon whiclu the attention may faften end fpend itfelf, is to many a refrelliment; as a fit of the gour will fometimes cure the fpleen. And the Fame of any moderate agitation of the inind, as a literary controverfy, a law-fuit, a contected election, and above all gaming; the paltion for wbich, in mea of
fortune and liberal minds, is only to be accounteci for Happinef:. on this principie.

Thirdly, Neither does happinels conlat in greatnefs, rank, or elevated fation.

Were it true that all fuperiority aftorded pleafure, it would follow, that by how much we were the grcater, that is, the more perfons we were fuperior to, in the tame proportion, to far as depended upon this caufe, we hould be the happier; but fo it io, that no fuperiority yields ary fatiofaction, fave that which we pulfefs or obtain over thofe with whom we imnediately compare oulfelves. The fiepherd perceives no pleafure in his fuperiority over his dog ; the farmer in his fuperiority over the thepterd; the lord in his fuperionty uver the farmer; nor the king, lally, in his fuperiority over the lord. superiority, where there is no competition, is feldom contemplated; what molt men indeed are quite uncoufcious of. But if the fane fhepherd canrun, inght, or wrelle, better than the pea. fants of his village; if the farmer can thow better cattle, if he keeps a better horfe, or be fuppofed to lizve a longer purfe, than any farmer in the hundred; if the lord have mure interett in an clection, greater favour at court, a beater houfe, or larger ctate, than any nobleman in the county; if the king poffefs a more extentive territony, a nore powerful flet or army, a more fplendid eftablifhment, more loyal fubjects, or more weight and authority in adjulting the atlairs of nations, than any prince in Eurupe; in all thefe cafes, the parties feel an actuai fatisfaction in their fupcriority. No fuperiority appears to be of any account but a fuperiority over a rival. This, it is manifstt, may exit wherever rivalhips do ; and rivallhipe fall out amongit men of all ranks and degrees. The object of emulation, the dignity or magnitude of this object, makes no difference; as it is not what either pollelles that conftitutes the pleafure, but what one puffefics more than the other. Plitofophy imiles at the contempt with which the rich and great fpeak of the petty drifes and competitions of the poor; not reflecting that thefe ilrires and competitions are jutt as reafonabie as their own, and the pleafure which luccefs afo fords the fame.

It appears evident then, that happinefs does not conilt in greatnels; fuce what are fuppoled to be the pecuhar adrantages of greatnefs, the pleafures of ambition and fuperiority, are in realiey common to all conditions. But whether the purfuits of ambition be ever wile, whether they contribute more to the happinefs or milery of the purfucrs, is a different quellion: and a gnethion concerning which we may be allowed to entertain great doubt. The pleafure of fuccefs is exquititc ; io alio is the anxiety of the purfuit, and the pain of difappointmen:; and what is the worit part of the acconmt, the pieature is Mort lived. We foon ceale to look back upon thoie whom we have left behind; new contefs are congaged in, new profpects unfold themfelves; a fuccefion of Arugg!es is kept up, whilit there is a rival left within the compafs of our views and profetion; amd when there is uone, the pleature with the puriuit is at an end.
II. Wre have feen what luappinefs does not conflat in. We are next to contider in what it does confift. In the conouct of life, the great matter is, to know beforehard what will g leale us, and what pleafieres will

Happinefs hold our. So far as we know this, our choice will be juitifed by the event. And this knowledge is more rare and diffienlt than at firlt fight it may feem to be: For fonetimes pleafures, which are wonderfully alluring and flattering in the profpeet, furn out in the poffeffion extremely infipid; or do not hold out as we expetted: at other times pleafures flart up, which never entered into our calculation, and which we might have mifled of by not forefeeing; from whence we have reafon to believe, that we actually do mifs of many pleafures from the fame caufe.

By reafon of the original diverfity of tafte, capacity, and conftitution, obfervable in the human fpecies, and the fill greater wariety which habit and famion have introduced in thefe particu!ars; it is impofifle to propofe any plan of happinefs which will fucceed to all, or any method of life which is univerfally eligible or practicable. All that can be faid is, that there remains a prefumption in favour of thofe conditions of life in which men generally appear molt cheertul and con: tented. For though the apparent happinefs of man. kind be not always a true neafure of their real happinefs, it is the belt meafure we have.

Upon this principle, then, happinefs appears to conlith,

1. In the exercife of the focial affections. Thofe perfons commonly pofiefs good fpirits who have about them many objects of affection and endearment; as wife, clildren, kindred, friends: and to the want of thefe may be imputed the peevifhnefs of monks, and of fuch as lead a monaftic life. Of the fame nature with the indulgence of our domeltic affections, and equally refrefting to the fpirits, is the pleafure which refults from acts of bounty and benificence, exercifed either in giving money, or in imparting to thofe who want it the affitanee of cur lkill and profeflion.
2. Another main article of human happinefs is, the exercife of our faculies, either of body or mind, in the purfuit of fome engaging end.

It feems to be true, that no plenitude of prefent gratifications can make the peffefor happy for a continuance, unlefs the have fomething in referve, fomething to hope for and look forward to. This may be inferred from comparing the alacrity and fpirits of men who are engaged in any purfuit which interells then, with the dejection and cmani of almott all who are either born to fo much that they want nothing more, or who have ufed up their fatisfactions too foon and dirained the fources of them. It is this intolerable vacuity of mind which carries the rich and great to the horfe-courfe and the gaming table; and often eugages shem in contefts and purfuits of which the fuccefs bears no proportion to the folicitude and expence with which it is fought.

The queftion now occurs, How we are to provide ourfelves with a fucceffion of pleafurable engagements? This requires two things: Judgment in the choice of endsadapted to our opportunities; and a command of imagination, fo as to be able, when the judgment has made choice of an end, to transfer a pleafure to the means; after which the end may be forgotten as foon as we will. Hence thofe pleafures are molt valuable, not which are molt raquifite io the fruition, but moft productive of engagement and activity in the purfuit.

A man who is in earned in his endearcurs afier the
lappinefs of a future flate, has in this refpect an ad- Happi vantage over all the world. For he has conttantly before his eyes an object of fupreme importanee, productive of perpetual engagement and activity, and of which the purfuit (which can be faid of no purfuit befides) lafts him to his life's end. Yet evio he mult have many ends befide the far end; but then they will conduct to that, be fubordinate, and in fome way orothes capable of being eferred to that, and derive their fatis* faction, or an addition of fatisfaction, from that.

Engagement is every thing. The more fignificant, however, our engagements are, the better; fuch as the planning of laws, inlitutions, manufatures, cha. rities, improvements, public works, and the endeavouring by our intereft, addrefs, folicitations, and activity, to carry them into effect: Or, upon a fmaller feale, the procuring of a maintenance and fortune for our fanilies, by a courfe of indullry and application to our callings, which furns and gives motion to the common occupations of life; training up a child ; profecuting a fcheme for his future eftablifhment; making ourfelves mallers of a language or a fcience; improving or matraying as eftate ; labouring after a piece of preferment: And, lafly, any engagement which is innoeent is better than none; as the writing of a book, the building of a houfe, the laying out of a garden, the digging of a fith-pond; twen the raifing of a cucumber or a tulip. Whillt the mind is taken up with the objects or bufinefs before it, we are commonly happy, whatever the object or butinefs be: when the mind is abfent, and the thoughts are wandering to fomething . elfe than what is pafing in the place in which we are, we are often miferable.
3. The art in which the fecret of human happinefs: in a great meafure confifts, is to fet the habits in fuch, a manner, that every change may be a change for the betier. The habits themflves are mach the fame; for whatever is made habitual becomes finooth, and: eafy, and indifferent. The return to an old habit is likewife eafy, whatever the habit be. Therefore the advantage is with thofe habits which allow of indulgence in the deviation from them. The luxurions receive no greater plealure from their daintics than the peafant does from his bread and cheefe; but the pean iant whenever he goes abrwad finds a feaf, whereas the epicere mult be well entertained to efeape difguth. Thofe who fpend every day at cards, and thofe.who go every day to plough, pafs their time much alike; intent upon what they are about, wanting nothing, regretting nothing, they are both in a ftate of eafe: But then, whatever fupends the occupation of the cardplayer diaroffes lim; whereas to the labourer, everyinterruption is a efrefhment: aud this appears in che different effect that the Sabbath produces upon the two, which proves a day of recreation to the one, but a lamentable burden to the other. The man wholas learned to live alone, feels his fpirits enlivened when ever he enters into company, and takes his leave withr out regret: another, who has long been aecuftomed to a crowd or continual fueceffion of company, experien, ces in company no elevation of firits, nor any greater fitisfaction than what the man of a retired life tinds ia his chimney-comer. So far their conditions are equal: but kt a change of place, fortune, or fituation, fepatats the companion from his circle, his vifitors, his
prinefs. club, common-room, or coffee houlf, and the difference of advantage in the choice and conftitution of the two habito will how itielf. Solitude comes to the one clothed with melancholy: to the other it brings liberty and quiet. You will fee che one fretful and reillefs, at a lofs how to difpofe of his time, till the hour comes round that he can forget himfelt in bed: the other eafy and fatistied, talsing up his book or his pipe as foon as he finds limfelf alone; ready to adnit any little amufement that cafts up, or to turn his hands and attention to the firl bufuefs that prefents itfelf; or content without either to lit dill, and let his trains of thought glide indolenty through his hrain, without much ufe perhaps or pleafure, but without hankering after any thing better and without irritation. A reader who has inured himfelf to books of fcience and argumentation, if a rowel, a well written pamphlet, an article of news, a narnative of a curions voyage, or the journal of a traveller, fall in his way, fits down to the repalt with relilh, enjoys his entertainment while it lats, and can return when it is over to his graver reading without diftalte. Another, with whorn nothing will go down but works of humour and pleafantry, or whoie curiofity mult be interelted by perpetual noselty, will confurne a bookfeller's wisdow in half a forenoon; during which time he is rather in fearch of divesfion than diverted: and as books to his talte are few and thort and rapilly real over, the flock is foon exhautied, whent he is lift without refource from this principal fupply of innocent amufement.

So far as circumflances of fortune conduce to happinefs, it is not the income which any man polfeffes, but the increafe of income that affords the pleafure. Two perfons, of whom oue begins with sool. and advances his income to 10001. a-year; and the other fets of with tocel. and dwindles down to 1 col. may, in the courfe of their time, have the receipt and fpending of the fame fum of money: yet their fatisfaction, fo far 2s fortune is concerned in it, will be very different: the feries and fum total of their incomes being the fame, it makes a wide difference which end they begin at.
4. Happinefs confitts in health; underttanding by bealth, oot only freedom from budily diftempers, but alfo that tranquility, firmnefs, and alacrity of mind, which we call good feirits. For the fake of health, according to this notion of it, no lacritices can be too great. Whether it require us to relinquith lucrative fituations, to abllain from favourite indulgences, to control inteinperate pafions, or undergo tedious regimens; whatever difficultics it lays us under, a man, who purfues his happinefs rationally and refolutely, will be content to fubinit to. Whien we are in perfeet bealth and fpirits, we feel in ourfelves a happinefs independent of any particular outward gratifcation whatever, and of which we can give no account. This is an enjoyment which the Deity has annexed to life; and probably confitutes, in a great meafure, the happinefs of infants and brutes, eipecially of the lower and fedentary orders of animals, as of oyfters, periwinkles, and the like.

The above account of human happinefo will jultify thefe two conclufions, which, althougll found in mot books of morality, have feldom been fupposted by any
fufficient reafons: ". "That happinefs is pretty equally diftributed amongt the different orders of civil fociery; and, 2. That vice has no advantage over virtue, eren with refpect to this world's happinefs."

IiAQUE, in our odd writers, a little hand gun, prohibited to be ufed for deftuction of game, \&e. by ftatute 33 Hen. VIII. cap. 6. and 2 \& 3 Ed. VI. cap. 14. Therc is alfo the half-haque, or demi-haque, within the faid acts.

11ARAM See Seraglio.
HARAN, otherwife Charres in Mefopotamia, a city celebrated for liaving been the place where Abroham lirlt retreated after he left Ur (Gen. xi. 31, 32 ); and where 'terah, Abraham's father, died and was buried. 'Thither it was liken ife that Jacob retired to Laban when he ded from the indignation of his brother Efau (id. xxvii. $+5 . x x v i i i .10, \& c$ ) Laltly, at Haran or Charre in inefopotamia, Cratlus the Roman generad was defcated and killed by the Parthians. Haras was litnated beween the Euphrates and the river Chebar, at a good dillance from the place where the fe two rivers join.

HARANGUE, a modern French name for a feech or oration made by an orator in public.- Menage derives the word from the Italian arenga, which lignifies the fame; formed, according to Ferrari, from arringo, "a jult, or place of julting." Others derise it from the Latio ara, " altar;" by reaton the fint harangues were made before altars: whence the verfe of Juvenal,

> Aut Liegduresfis rbecor diEturus aid aram.

Harangues were ufually made by the generals, previous to an engagement both anongil the Greeks and Romans. An harangue on fuch occafions was called allocutio: See Allocurio.

The word is alfo frequently ufed in an ill fenfe, viz. for a too pompous, prulix, or unfeafonable facech or declamation.

HARBINGER, an officer of the king's houthold, having four yeomen under him, who ride a day's journey before the court when it travels, to provide lodgeings, \&c.

HARBOROUGH, a town of Leiceftcrfhire, 8 . miles from London. It is a great thoroughfare in the road to Derby, near the fource of the river Welland; and waz famous, in Camden's time, for its bealt fair, where the belt horfes and colts are thill fold. Its fairs are April 29. and Oct. 1\%. The market is on Tuefday, for the ufe of which the Earl uf Harborough has lately built a neat market-houfe at his own expence. Here is a good free-fchool, and a fair chapel of eale to Great- Bowden its parih.

HARBOUR, a general name given to any fea-port or haven; as alfo to any place convenient for mooring fhipping, although at a grat ditlance from the fea. The qualitics requifite in a good harbour are, that the bottom be entisely free from rocks or falluws; that the opening be of fufficient extent to adruit the en. trance or departure of large thips without difficulty ; that it hould have good anchoring-ground, and be eafly of accefs; that it fhould be well defended from the violence of the wind and fea; that it floould have room and convenionce to reccive the fhipping of dilie. rent nations, and thofe which are laden with differetis merchandifes; that it be furnihed with a good light. howfe, and bave variety of propes rings, poils, moor.
tained thercin; and, fimally, that it have plenty of wood, and other materials for firing, befides hemp, iron, mariuers, \&ic.

HARBURG, a fmall town of Germany, in the cincle of Lower Saxony, aud duchy of Lunenbug, feated on the river Llbe over againft Hamburgh. It was furrounded with walls in 335 ; and 30 years after, a ftrong calle, which fill remains, was built by the bilhop. E. Long. 9.41. N. Lat. 53. 51.

HARDENING, the giving a greater degree of hardnefs to bodies than they had before.
There are feveral ways of hardening iron and Aeel, as by hammering them, quenching them in cold water, \&c. See Steel.

Cafe-Hzardening. See Cask-Hardening:
HARDERIWICK, a town of the United Provinces, in Dutch Guelderland. It is a well-built town, and the chief of the fea ports of this province. It has fereral good buildings, particularly the great church, which is much admired. In 1648 the public fchool here was turned into an univerfity. The French did it a great deal of damage in 1672 ; fince which time it has been on the decline. E. Long. 5.37. N. Lat. 52. 14.

HARDNESS, in bodies, a property directly oppofite to fluidity; by which they refiat the impreffion of any other fubftance, fometimes in an extreme de. gree. As fluidity has been found to confitt in the motion of the particles of a body upon one another in confequence of a certain action of the univerfal fuid or elementary fire among them; we mutt conchude that hardncis contilts in the abfence of this action, or a deficiency of what is called latent bect. This is confirmed by obferving, that there is an intermediate flate betwixt hardnefs and fluidity, in which bodies will yield to a certain force, though they ftill make a confiderable reffitance. This is principally obferved in the metals, and is the foundation of their ductility. It appears, indeed, that this laft property, as well as fluidity, is entirely dependent on a certain quantity of latent heat abforbed, or otherwife acting within the fubftance itfelf; for all the metals are rendered hard by hammering, and foft by being put again into the fire and kept there for fome time. The formor operation renders them hot as well as hard; probably, as Dr Black obferves, becaufe the particles of metal are thus forced nearer one another, and thofe of lire iqueezed out from among them. By keeping them for fome time in the fire, that element infinuates itfelf again among the particles, and arranges them in the fame manner as before, fo that the ducility returns. By a fecond hammering this property is again dettroyed, returning on a repetition of the heating, or annealing as it is called; and fo on, as often as we pleafe.

Hardnefs appears to diminith the cohetion of bodies in fome degree, though their fragility does not by any means keep pace with their harinels. Thus, glafs is very hard and very brittle; but fint, though fill harder than glafs, is much lefs brittle. Among the metals, however, thefe two properties feem to be more conneatel, though even here the connection is by no means complete. Stecl, the hardeft of all the metals, is indeed the moft brittle; but lead, the fofteft, is not the moll ductile. Neither is hardnefs connected with
the fpeeific gravity of bodies; for a diamond, the Hardnt hardelt fubftance in nature, is little more than half the weight of the lighteft metal. As little is it connected with the coldnefs, electrical properties, or any other quality with which we are acquainted : fo that though the principle above haid down may be accepted as a general foundation for our inquiries, a great number of particulars reinain yet to be difoovered before we can ofier any fatisfactory explanation.

All bodies become harder by cold; but this is not the only means of their doing fo, for fome become hard by heat as well as cold. Thus, water becomes hard by cold when it is frozen, but it becomes much harder when its fteam is paffed over red-hot iron, and it enters the fubftance of the metal, by an union with which it becomes almoft as hard as glafs.

Mr Quilt and others have conftructed tables of the hardnefs of different fubtances. The method purfued in conftructing thefe tables was by obferving the order in which they were able to cut or make any impreffion upon one another. The following table, extracted from M. Magellan's edition of Cronitedt's Mineralogr, was taken from Dr Quif, Bergman, and Mr Kirwan. The firft column fhows the hardnefs, and the fecond the fpecific gravity.

| Diamond from Ormus |  | 20 | - | 3,7 |
| :---: | :---: | :---: | :---: | :---: |
| Pink diamond |  | 19 | - | 3,4 |

HARDOUIN (John), a learned French Jefuit in the beginuing of the 18 th century, known by the remarkable paradoses he advanced in his writings; this in particular, That all the works of the ancient profane writers, except Cicero's works, Virgil's Georgics, Horacc's fatires and epiftes, and Pliny's natu-

## H A R

ritie ral hitory, are mere forgeries. He died at Paris in 1729, aged 83. His prineipal works are, I. An edition of Pliny's natural hiltory, with notes, which is much eftemed. 2. An edition of the councils, which made much noife. 3. Chronology reltored by medals, to $^{\text {to }}$. 4 A commentary on the New Teftament, folio; in which he pretends that our Saviour and his apofles preached in Latin, \&c.

HARDIWICKE. See Yorr.
HARE, in zoology. Sce Lepus.
The hare is a bealt of venery, or of the foreft, but peculiarly fo termed in the fecond year of her age. There are reckoned four forts of them, fron the place of their abode: fome live in the mountains, forne in the fields, fome in marfhcs, and fome wander about every where. The mountain-hares are the fwiftert, the field-hares are not fo nimble, and thofe of the marfhes are the flowelt: but the wandering hares are the moll dangerous to follow; for they are cunning in the ways and mazes of the fitlds, and, knowing the neareft wass, run up the hills and rocks, to the confufion of the dogs, and the difcouragement of the hunters. See the atticle Husting.

Hares and rabbits are very nifichievous to new planted orchards, by peeling of the barks of the tender and young trees for their food. They do allo the fame fort of mifchief to nurferies; for the presention of which, fome bind ropes about the trees up to fuch a height as they are able to reach; fome daub them with tar; but though this keeps off the hares, it is iffelf mifchievous to the trees; but this hurtful property of it is in fome degree taken off by mixing any kind of fat or greafe with it, and incorporating them well over the fire. This mixture is to be rubbed ever the lower part of the trees in November, and will preferve them till that time the next jear, without any danger from thefe animals. It is only in the hard weather in the winter feafon, when other food is fearce, that thefe creatures feed on the barks of trees.

People who have the care of warrens, pretend to an odd way of making hares fat when they get them there. This is the flopping up their ears with wax, and rendering them deaf. The hare is fo timorous a creature, that the is continually liftening after every noife, and will run a long way on the lealt fufpicion of danger ; fo that fhe always eats in terror, and runs herfelf out of fleth continually. Thefe anc both preversed by her feeding in a fafe place, and that withour apprehenfion; and they fay the will always readily be fattened in this way.

Though the hare lives on vegetablec and water only, yet the habitual exercife of this animal exalto its falts, and renders it fomewhat alcalefeent; and this tendency is much increafed, if it is killed immediately after being heated by Atrong exercife.

Fava Hare. See Mus.
Hare's Eair, in botany. See Bupletrum.
HARE (Dr Francis), an Englith bifhop, of whofe Dirth we have no particulars, was bred at Eton fchool, and from that foundation became a member of King's college, Cambridge ; where he had the tuition of the marquis of Blandford, only fon of the illuftrious duke of Marlborough, who appointed him chaplain-general to the army. He afterwards obtained the deanery of Worcefter, and from thence was promoted to the bi-
thopric of Chichefter, which he held with the deanery Harefury of St Paul's to his death, which lappened in 1740 . He was difmiffed from being chaplain to George I. in 1718, by the Itrength of party prejudices, in company with Dr Mols and Dr Sherlock, perfons of diftinguifhed rank for parts and learning.-About the latter end of queen Anne's reign he publifhed a remarkable pamphlet, intituled. The difficulties and difcouragements which attend the fludy of the feriptures, in the way of private judgment: in order to thew, that fince fuch a fludy of the fcriptures is an indifpenfable duty, it concerns all Chrittian focieties to remove, as much as poffible, thofe difeouragements. In this work, his manner appeared to be fo ludicrous, that the conrocation fell upon him, as if he were really againt the fudy of the holy feriptures: and Whiton fays, that finding this piece likely to linder that proferment he was feeking for, he aimed to conceal his being the author. He publifhed many pieces againft bifhop Hoadly, in the Bangorian Controverfy, as it is called; and alfo other learned works, which were collected af. ter his death, and publithed in four vols. Svo. 2. An edition of Terence, with notes, ia 4 to. 3. The book of I'falms in the Hebrew, put into the original poctical metre, 4to. In this laft work, he pretends to have difcovered the Hebrew metre, which was fuppofed to be irretrievably loft. But his hypothetis, though defended by fome, yet las been confuted by feveral learned men, particulally by Dr Lowth in his Metrice Harcanse lere is confutatio, annexed to his le Cures De Sacra Poff Hebraorum.

HARESBURY a town of Wilthire, or the Willy, near Warminter, 94 miles from London, is in old records called Hiogbybury, or Heytfoury; and now it is wnit Hatchbury. It was once the feat of the emprefs Mand. Here are fairs May $1+$ th, and September 15 th; and it has fent members to parlianment ever fince Henry VI. it being an ancient borough by preieription. There is an almfhuufe here for 12 poor men and a woman. Here is a collcgiate church with four prebendaries, and a free fchool, and the place is governed by a bailiff and burgefles.

HARFLEUR an ancient town of France, in Normandy ; but is now a poor place, on account of its fortifications being demolifhed, and its harbour choaked up. It was taken by the Englith, by affauk, in the year ${ }^{1}+5$. It is feated on the river Lizarda, near the Seinc, five miles from Havre de Grace, forty norith-weft of Rouen, and one hundred and fix northwett of Paris. E. Long. $0.17 . \mathrm{N}$. Lat. 49. 30.
hariot', or Heriot, in law, a due belonging $t$ a lord at the death of his tenant, confifting of the beft heaft, either horfe, or cow, or ox, which he had at the time of his death; and in fome manors the beft goods, piece of plate, \&ec. are called hariots.
Hariot (Thomas), See Harriot.
HARLECH, a town of Merionethfhire, in north Wales. It is feated on a rock, on the fea-flore; and is but a poor place, though the fhire-town, and fends a merober to parliament. It had formerly a Atrong handfome caltle, which was a garrifon for Charles 1 . in the civil wars, for which reafon it was afterwards demolifhed by the parliament. W. Long. 4.O. N. Lat. 54. 47.
HARLEIAN Coliection.-A mof valuable
$\underbrace{\text { Harlcian. }}$

Istatian, collcation of ufefu\} and curious manufcripts, bequa thrien. ley of Brampton Bryan, Efq; in Herefordhire, after- wards eart of Oxford and lord high treaforer ; and which was conducted upon the plan of the great Sir Robert Cotion. He publihed his firlt confiderable collétion in Avgur 1705, and in Jefs than ten jears he got together near 2500 rare and curions MSS. Soon after this, the celebrated Dr George Hicks, Mr Anltis garter king at arms, binhop Nicolfon, and many other eminent antiquaries, not only offered him their aftitanee in procuring Miss. but prefented him with feveral that wese very valuable. Jeeing thus ericouraged to perfererance by his fuccerf, le kept many perfons employed in purchafing MSS. for him abroad, giving them written infructions for their conduct. By thefe means the MS. library was, in the year 1721 , increafed to near 6000 books, 14,000 original charters, and 500 rolls.

On the 2itt of May $17^{2}+$ lord Oxford died: but his fon Edward, who fucceeded to his honours and eilate, fill farther enlarged the collection ; fo that when he died, June 16 ch $_{17+1}$, it confifled of 8000 volumes, feveral of them containing diftinet and independent treatifes, bdides many loofe papers which have been fance forted and bound up in volumes; and above 40,000 original rolls, charters, letters patent, grants, and other deeds and inftruments of great antiquity-

The principal delign of making this collection was the eflablithment of a MS. Englith hittorical library, and the refeting from defruction fuch national records as had cluded the diligence of preceding collectors: but lord Oxford's plan was more extenfive ; for his collection abounds alfo with curious MSS. in every feience.-This collection is now in the BritifnMufeum; and an enumeration of its contents may be feen in the Annual Regitter, vi. $140,8 \mathrm{c}$.

HARLEM, a town of the Uniced Provinces, in Holland, fituated on the river Sparren, in E Long. 5. 37. N. lat. 53.22. It is a large and populous city, and Atands near a lake of the fame name, with which it has a communication, as well as with Amferdam and Leyden, by means of feveral canals. Schemes have oeen often formed for daining of this lake, but were rever put in execution. To the fouth of the town lies a wood, cut into delightful walks and vittas. The town is famous for the fiege which it held out againt Che Spauiards for con months in 1573 ; the townimen, before they capitulated, being reduced to eat the vilef animals, and even leather and grafs. The inhabitants correfponded with the prince of Orange for a contiderable time by means of carrier-pigeons. Harlem, as is well known, clains the invention of printing; and in fack, the erft eflays of the art are indifputably to be atiributed to Lanrentius, a magiftrate of that city. [Sce Laurenties, and (Higory of) Printing.] Before the Reformation, Harlem was a bifhop's fee; Fud the l'apits thill greatly ontnumber the Proveltants. An acadeny of fciences was founded here in 1752. Valt quantities of linen and thread are bleached here; the waters of the lake having a peculiar quality, which yenders then very fit for that purpofe.-A fort of phenfy with regard to flowers, particularly tulips, once prevailed here, in confequence of which the molt beauticall forts were bought and fold at an extravagat price. $\mathrm{Ni}^{\mathrm{H}}+8$.

HARLEQUIN, in the Italian comedy, a bufioon, drefed in party.coloured cloaths; anfwering much the fanc purpofe as a merry-dndrew or jack-pudding in our drolls, on mountehanks flages, icc. We have alfo introduced the harlequin upon our theatres; and this is one of the flanding charactens in the modern grotefore or pantomime entertaiunsents.-- The term took its rife fiom a famous Italidn comedian who came to Paris under Henry III. and who frequenting the houfe of M. de Harlay, his companions aled to call him Harlcquino, q.d. little Harlay ; a nanae which has defcended to all thofe of the fame rank and profeflion.

HARLEY (Robett), earl of Oxford and Mortimer, was the dueft fon of Sir Edward Harley, and born in roft. At the Revolution, Sir Edward and his fon raifed a troop of horfe at thcir own expence; and after the acceffion of king Wiliiam and queen Mary, he obtained a feat in parliament. His promotions were rapid: in 1702, he was chofen !peaker of the houfe of commons; in 1704 , be was fimen of queen Anne's privy council, and the fame year made fecretary of thate; in 1;06, he aited as one of the commiffioners for the treaty of Union; and in 1710, was appointed a commiffoner of the tredfury, and chancellor and under-treafurer of the exchequcr. A daring attempt was made on his life, March 8.1711 , by the marquis of Guifcard a French papill ; who, when under an examination before a committee of the privy council, Itabbed him with a penknife. Of this wound, however, he foon recovered; and was the fame year created earl of Oxford, and lord high-treafurer, which office he refigned jnft before the queen's death. He was impeached of high treafon in 1715 , and committed to the Tower; but was cleared by trial, and dicd in 1724. His charader has been varioully reprefented, but cannot be here difcuffed. He was not only an encourager of literature, but the greatelt collector in his time of curious books and MSS. his collection of which makes a capital part of the Dritifh Mufeum. See Hanletin Colluction.

## Harling. Sce Herling.

HARLINGEN, a fea-port town of the United Nethenlands, in Welk Frictlaad. It flands on the coad of the Zuyder fea, at the mouth of a large canal, in E. Long. 5. 25. N. Lat. 53. 12. It was only a hamket till about the year 1234 , when it was deftroyed by the fea; and being afterwards rebuilt, became a confiderable town. In 1579, it was contiderably elr. larged by the care of William prince of Orange. It is now very well fortified, and is naturally trong, as the adjaeent country can very eafily be laid under water. The city is fquare; and the freets arc handfome, ftraight, and clean, with canals in the midule of them. It has tive gates; fuur towards the land, and one towards the fea; but though the harbour is good, yet weffels of great burden cannot get into it until they are lightened, for want of watcr. The admiralty college of Friefland has its feat here. The manufactures are falt, bricks, and tiles; a conliderable trace is alfo carried on in all forts of linen cloth, and the adjacent country yields abundance of corn and gool paftures.

IfARloch, or Harlach, a town of Merionethfhire, in Nortl Wales, 223 miles from London, on the fea coall, tear the nothewer point of the county.

## $\mathrm{H} A \mathrm{R}$ [ 313$] \quad \mathrm{H}$ A R

It is naturally ftrong, a garrifon being kept bere for the fecurity of the coalt. Its caftle lies now in ruins. Tlle town, though a corporation and geserned by a mayor, makes but a very mean appearance. It has a market on Saturdays, and four fuirs in the year.

H a RLOT, a woman given to incontinency, or that makes a habit or a trade of proftituting her body.--The ward is fuppufed to be ufed for the diminutive whoreled, a "lithl, whore."-Others denive it from Artetic, mithets to Robert duke of Normandy, and mother to William the Conqueror: Camien detives it from one Arlods, concubine to William the Conqueror: Others from the ltalian Arloth, " a proud whore."

Harlots were tolerated amongt Jews, Grecks, and Romans. Formication indced was prohibited among the Jews, under forere penalties; but thefe they explaned as extending enly to women of their own mation. The prablic kews were therefore focked with foreign proflitutes, who feem to have been taken under the protection of government. Hence appears the reafon why the worl grange seman is often found to fignify a halot. Profitutes at firlt wore seils or moks ; but by and by their modelly was entirely put to A ght, and they went abrond bate-faced. At Athens the proftitutes were generally trangers; and fuch as debauched an thenian fernale were liable to a penalty. To frequent the public Hew was not held difgraceful! The wifest of the Heathen fages allowed it! Solun pernitted common whores to go publicly to the roung new who had engaged them, and encouraged the youth of Athens to gratify their luft with the fe, rather than feduce and debanch the wios or danghters of citizens. Cato the Confor wats of the fame fentiments: and Cicero challenges all perfons to name a time when men were cither reproved for this practice, or not countenanced in it. Amonglt the Jews, the harlots ufd to ply in the highways and trrets of cities; at diliens thicy frequented the ceramicus, feiros, and the old fontum. - In fome places they were diltingruished by their drefs from oiber women. Corinth was a remarkalle nurfery of harbots, and gave birth to the noted Lars. The ir accomphibments wre oftentimes great, in all the polite and elegant parts of fenale education, viz. philofophy, dancing, finging, rhetoric, \&c. Alpalia, the miftrefs of Pericles, was admired by Socrates for her learnineg. 'I he more accomplithed profitutes frequently amaled large fortunes; a remarkable intance of which we have in Phryne, who offered to esbuild the walls of 'Thetes, when dellooged by Alexander, on condfion that they would perpetwate her memory and proftefion by an infeription. Proftitutes at Rome were obliged to bix a bill owe their doors, indicating their character and proftfion. It was alfo culomary for them to change their names, atter they had fignified to the prator their intention of leading fuch a diffolnte life: this they did, hecaule their trade was unbecoming their birth and condition; but they reaffumed their family names when they quitted their infameus mode of lising. Women whofe grardfather, father, or hubland, had been a Romanknight, were forbiden by the laws to make a public profelfon of lewdnefs.

HARMA'I"I'AN, the name of a remarkable periodical wind which blows from the interior parts of $A$ Vob. VIIf. Part I.
frica towards the At'antic ocean. Of this wind we have the fultowing account in the l'hilofophical Tranf actions, wol. 71. monithed by Mr Norris, a genticman who had freyment of portuntics of obferveng its inger lar propertics and efliets.
"On that part of the coalt of A frica whied lies between Cape Ferd and (ape Lopere, an catlerly wimd prevaits during the wanita of Necenberr, Jmuary, and Febuary, which by the lanteces. a nation on the Gaid coalt, is calls d the Hermathon. Cape Vers is in 15 N . latitude, and Cape Loper in I S. Inture; and the coall between thef two Capes runs, in an oblique direction, duarly from W. S W. to E. S. E. forming a range of upward, of 2100 miles. At the illes de Los, whichare a litte to the northward of Sierra Leont, and to the fouthward of Cape Verd, it bluws from the E. S. E. on the Gold coall from the N. le. and at Cape Lopers, and the river Gabon, from the N. N. E. This wind is by the Fronch and Portustuefe, who frequent the Gold conatl, called fomply the N. E. wind, the quarter from which it bluws. The Englih, who fometinss botrow words and phafes from the Fantee language, which is If fo guttural and more harmonions than that of their neighbuurs, adupt the Fantee word Harmattan.
'The harmattan comes on indiferminately at any hour of the day, at any time of the tide, or at any period of the moon, and contimues fometimes only a day or two, fometines live or fix days, and it has been known to latl fifteen or fixteen days. There are generally three or four returns of it every feafon. It blow: with a moderate force, not quite follrong as the feabrecze (which every day tets in during the fair feafon from the W. W.S. W. and S. W) ; but fomewhat ftronger than the land wind at night from the $\mathbb{N}$. and N. N. W.

1. A fog or haze is one of the peculiarities which always accompanies the hamattan. The ghom occahoned by this fog is fo great, as fometimes to make even near objects obfeure. The Englith Fort at Whydah flands about the midway betwen the French and Portugucfe forts, and not quite a quarter of a mile from cither, yct very often from thence neither of the other forts can be difcovered. The fun, conceald the greateft part of the day, apeears only a few hours abount noom, and then of a midd red, exciting no painfol fenfation on the eye.
2. Extreme drynefs makes another extraordinary property of this wind. No dew falls during the continuance of the harmattan; nor is there the leat appearance of moiture in the atmofphere. Vegetables of every kind are very much injured; all tender plants, and moit of the productions of the garden, are deAroyed; the grafs withers, and bccomes dry like Bay; the vigorous ever-greens likewife feel its pernicions influence; the branches of the lemon, orange, and limettees droop, the leaves become Haccid, wither, and if the harmattan continues to blow for 10 or 12 days, are fo parched, as to be eafily rubbed to dut between the fingers: the fruit of thefe trees, deprived of its nourihment, and ftinted in its growth, only appears to ripon. for it becomes yellow and dry, without acquiring half the ufual dize. The natives take this opportuanty of the extreme drynefs of the grafs and young trecs to fet fire to them, efpecially near Qq theis
tatras.
tan.

## $\left.\begin{array}{lllll}\mathrm{H} & \mathrm{A} & \mathrm{R} & 314\end{array}\right] \quad \mathrm{H}$ A R

Lh: their roads, not only to keep thofe roads open is tra--3... :ellers, bat:o delt:oy the fhelter which long grafs, and thickets of young trees, would afford to Rulking parties of their enemies. A fire thus lighted flics with fuch rapidity, as toendanger thofe who travel: in that fituation, a common method of efcape is, on difeovering a tre :o windward, to fet the grats on tire to leewate, and then follow your own fire. There are other exiraordiatry effects produced by the extreme dryuefs of the lamatian.

The parching effects of this wind are likewife evident on the external parts of the body. The eyes, nuthils, lips, and palate, are rendered dry and uneafy, and drink is often required, not fo much to quench thint, as to remove a painful aridity in the fauces. The lips and nofe become fore, and even chapped; and though the air be cool, yet there is a troublefome fenfation of prickling heat on the Kin. If the harmattan continuts four or tive days, the fearf kin pecls off, firlt from the hands and face, and afterwards from the other parts of the body if it continues a day or two longer. Mr Norris obferved, that when fweat was excited by exercile on thole parts which were covered by his cloaths from the weather, it was peculiarly acrid, and tafted, on applying his tongue to his arm, fomething like fpirits of harthorn diluted with water.
3. Salubrity forms a third peculiarity of the harmatan. Though this wind is fo very prejndicial to vegetable life, and occalions fuch difagretable parching effeets on the human fpecies, yet it is highly conducive to licalih. Thofe labouring under fluxes and intermitting fevers generally recover in an harmattan. Thofe weakened by fevers, and linking under evacuations for the cure of them, particularly bleeding, which is often irjudicioufly repeated, have their lises faved, and viguor reflored, in fpite of the doctor. It ftops the progrefs of epidemics: the fmall-pox, remittent fevers, Sic. not only difappear, but thofe labouring under thefe difeafes when an hamatan comes on, are alnot certain of a fpeedy recovery. Infection appears not then to be eafly communicated even by art. In the year 1770, there were on board the Unity, at Whydah, above 300 hlaves; the fmall-pox broke out among them, and it was determined to inoculate; thofe who were inoculated before the harmattan came on, got very well through the difeafe. About 70 were inoculated a day or two after the harmattan fet in, but no one of them had either ficknefs or eruption. It was imagined that the infection was effectually difperfed, and the fhip clear of the diforder; but in a very few weeks it began to appear among thofe feventy. About 50 of them were inoculated the fecond time; the others had the difeafe in a matural way: an hat. mattan came on, and they all recovered, excepting one girl, who had an ugly ulser on the inoculated part, and died fome time afterwards of a locked jaw."

This account differs remarkably from that given by Dr Lind, who calls the harmattan a malignant and fatal wind: (See his Difeafes of Hot Climates.) As to the nature of the foil over which it blows, it appears, that excepting a few rivers and fone lakes, the country about and beyond Whydah is covered for 400 miles back with verdure, open plains of grafs, clumps of trees, and fome woods of no confiderable cxtent. The furface is fandy, and below that a rich reddith
earth : it rifes with a gentle afcent for 150 miles from Harmid the fea, before there is the appearance of a hill, with. out affording a flone of the fize of a walnut. Beyond thefe hills there is no acconnt of any great ranges of mountains.

HARMODIUS, a friend of Arillogiton, who delivered his country from the tyranny of the Piffitratidx. (See Aristogiton.) The Athenians, to reward the patriotifm of thefe illutrions citizens, made a law that no one thould ever after bear the name of Arillugiton and Harmodius.

HARMONIA, in fabulous biftory, the wife of Cadmus, both of whom were turned into ferpents. Sce Cadmus.

Though many of the ancient authors make Harmonia a princefs of divine origill, there is a paftage in Athenres from Euhemerus, the Vanini of his time, which cells us, that the was by profedion a player on the flute, and in the fervice of the pince of Zidon previous to her departure with Cadmus. 'I'his circumitance, howerer, misht encourage the belief, that as Cadmus brought letters into Greece, his wife brought barnony thither; as the word egurvix barmonia, has been faid to have no other derivation than from her name: which makes it very diffecult to afeertaia the fenfe in which the Greeks made ufe of is in their mufic $\dagger$; for it has no roots by which ic can be decom- $\dagger$ See $H_{c}$ pounded, in order to deduce fiom them its etymolergy. The common account of the word, however, that is given by lexicographers, and generally adopted by the learned, does not confirm this opibion. It is ge: nerally derived from aoworio, and this from the old verb Agar upto, to fit or join.

HARMONIC. As an a ljêtive, it fignifies in general any thing belonding to harmony; thoush in our language the adjective is more properly written burmonical. In this cafe it may be applied to the barmonical divifions of a monochord; or, in a word, to contonances in general. As a fubtantive neuter, it imports all the cencomitant or acceflary \{ounds which, upon the principles refulting from the experiments made on fonorous bodies, attend any given tomnd whatever, and render it appretiable. Thus all the aliquot parto of a mufical ftring produce barmonial founds, or barmonics.

IIARMONICA. This word, when originally appropriated by Dr Fianklin to that peculiar form or mode of mufical glaffes, which he himfelf, after a number of happy experiments, had conftituted, was written Amonica. In this place, however, we have ventured to reftore it to its native plenitude of found, as we have no antipathy againll the moderate ufe of afpirations. It is derived from the Greek word $\dot{\rho} \rho u \sigma v a$. The radical word is agen, to fuit or fit one thing to another. By the word águova the Greetss exprefled aptitudis of various kinds; and from the ufe which they made of that expreffion, we have reafon to conclade, that it was intended to import the highelt degree of refinement and delicacy in thofe relations which it was meant to fignify. Relations or aptitides of found, in particular, were underfood by it ; and in this view, Dr Franklin could not have feleeted a nane more expreffive of its nature and genius, for the inftrument which we are now to defcribe; as, perhaps, no mufical tone can pofibly be finer, nor confequently fuf-

## H A R [ 315 ] H A R

armoni- ceptible of jufter concords, than thofe whichit produces.
In an old Englifh book, whofe tite wc cannot at prefent recollect, and in which a number of various amufements were defcribed, we remember to have feen the elements or firft approaches to mufic by glafles. That author enjoins his pupil to choofe half a dozen of fich as are ufed in drinking; to fill each of them with water in proportion to the gravity or acutenefs of the found which he intended it fhould produce; and having thus adjulted them one to another, he might entertain the company with a churcli-tune. 'Thefe, perhaps, were the rude and barbarous hints which Mr Puckeridge afterwards improved. But, for a farther acconnt of him, of the ftate in which he left the inftrument, and of the flate to which it has afterwards been carried, we mult refer our readers to the following extracts from Dr Fianklin's letters, and from others who have written upon the fame fubject.

The Doctor, in his letter to Father Bcccaria, has given a minute and elegant account of the Harmonica. Nor does it appear that his fucceffors have either more fenfibly improved, or more accurately delineated, that angelic inflrument. The detail of his own improvements, therefore, fhall be given in his own words.
"Perhaps (fays he) it may be agrecable to you, as you live in a mufical country, to have an account of the new inltrument lately added here to the great number that charming fcience was poffeffed of before. As it is an intrument that feems peculiarly adapted to Italian mufic, efpecially that of the foft and plaintive kind, I will endeavour to give you fuch a defeription of it, and of the manner of conftructing it, that you or any of your friends may be enabled to imitate it, if you incline fo to do, without being at the expence and trouble of the many experiments I have made in endeavouring to bring it to its prefent perfection.
"You have doubtlefs heard the fwcet tone that is drawn from a driuking glafs, by prefling a wet finger round its brim. One Mr Puckeridge, a gentleman from Ircland, was the firt who thought of playing tunes formed of thefe tones. He collected a number of glafles of different fizes; fixed them near each other on a table; and tuned them, by putting into them water, mote or lefs as each note required. The tones were brousht out by prefling his fingers round their brims. He was unfortunately burnt here, with his inftrument, in a fire which confumed the houfe he lived in. MrE Delaval, a moft ingenious member of our Royal Socitty, made one in imitation of it with a better choice and form of glaffes, which was the firft I faw or hoard. Being charmed with the fiveetnefs of its tones, and the mufic he produced from it, I wifhed to fee the glafies difpoed in a more convenient form, and brought together in a narrower compafs, fo as to admit of a greatcr number of tones, and all withis reach of hand to a perfon fitting before the inftrument; which I accomplifhed, after various interinediate trials, and lefs commodions forms, hoth of glaffes and confruction, in the following manner.
$\therefore$ "The glaftes are blown as near as poflible in the form of hemifpheres, having each an open neck or focket in the middle. The thicknefs of the glafs near the brim is about the tenth of an inch, or hardly quite So much, but thicker as it comee nearer the neck;
which in the larget glames is about an inch deep, and an inch and a half wide within; thefe dimenfions lef. fening as the glaffes themfelves diminifi in fize, except that the neek of the fmallett ought not io be horter than half an inch. -The largeft glafs is ninc inches diameter, and the fmallef three inches. Between thele there are 23 diferent fizes, differing from each other a quarter of an inch in diameter. To make a fingle infrument there hould be at leaflix glafles blown of each fize; and out of this number one may probably pick 37 glafies (which are fufficient for three octaves with all the (emitones) that will be cach either the note one wants, or a little tharper than that note, and all fitting fo well into cach othicr as to taper pretty regularly from the largef to the fmallef. It is true there are not 37 fizes; but it oftea happeng that two of the fame fize differ a note or half a note in tone, by reafon of a difference in thicknefs, and thefe may be placed one in the other withoui fenibly lurting the regularity of the taper form.
"The glaffes being chofen, and every one marked with a diamond the note you intend it for, they are to be tuned by diminining the thicknefs of thofe that are ton fharp. This is done by grinding them round from the neck towards the brim, the breadth of one or two inches as may be required; often trying the glafs by a well. tuned harpfichord, compating the note drawn from the glafs by your finger with the note you want, as founded by that lling of the harpfichord. When you come near the natter, be careful to wipe the glafs clean and dry before each trial, be . caufe the cone is fomething flatter whea the glais is wet than it will be when dry;-and griading a very little bet ween each trial, you will thereby tun: to great exactnefs. The more care is neceffary in this, becaufe if you go below your required tone there is ma harpening it agaiu but by grinding fomewhat of the brimwhich will afterwards require polifhing, and chus increafe the trouble.
"The glaffes being thus tuned, you are to be provided with a cafe for them, and a fyindle on which they are to be fixed. My cafe is about three feet long, eleven incles every way wide within at the biggeit end, and five inches at the fmattent end; for it tapers all the way, to adapt it better to the conical ligure of the fet of glaffes. This cafe opens in the middle of its height, and the upper part turns up by hinges fixed behind. The fpindle is of hard iron, lies horizontally from end to end of the box within, exaitly in the middle, and is made to turn on brals grodgeons at each end. It is round, an inch diameter at the thickeft end, and tapering to a quarter of an inch at the finalleft. - A fquare fhank comes from its thickeft end through the box, on which thank a wheel is fixed by a ferew. This whel ferves as a fy to make the motion equable, when the Spindle, with the glafles, is turned by the foot like a fpinning-wheet. My wheel is of mahogany, 18 inches diametcr, and pretty thick, fo as to conceal near its circumference about 25 lb . of lead. -An ivory pin is lixed in the face of this wheel, about four inches from the axis. Over the neck of this pin is put the loop of the fling that comes up from the moveable flep to give it motion. The cale flands on a neat frame with four legs.
"To fix the glafes on the โpinde, a cork is fir't to Qq 2

IIsmani-

Famon. he fited in cah muk preny tighe, and projecing a Ca littie whander the nex, that the neek of one may mot trah the intide of ansolier when put tugether, for that woult meke a jarring. Thefe corks are to be perforated whithes of diterent damters, fo as to ficit that part of the fpindle on which they are to he noxal. When a glafo is purt on, by holding it llifly between both hands, while another turns the Cpindle, it man be araduilly brought to its place. But care mult be tahen that the liule be not too faral, lett in furcing it up the neek fhuld $\mathrm{C}_{\mathrm{p}}$ hit; nor too large, leth the glafs, not being intmly fixed, fhould turn or move on the fpindle, fo as to touch or jar againt its neighbouring glafs. The gheffes thus are placed one in another ; the largetl on the bigget end of the fpindle, which is to the left hand : the neek of this glafs is towards the whecl: and the next goes into it in the fame potituon, only about an inch of its brim appearing berond the him of the firil: thus proceeding, every ghafs when fixed thows about an inch of its brin (or three quarters of an inch, or half an inch, as they grow fmaller) beyond the brim of the glafs that contains it; and it is from thefe expofed prarts of each ghafs that the tone is crawi, by laying a finger on one of them as the fpindle and glafies cam round.
" My largett glafs is G a lietle below the reach of a common voice, and my lingheft $G$, incloding three complete octaves.-To diftinguifh the glaffes more readity to the eye, I have painted the apparent parts of the glafes within-lide, every femitune white, and the other notes of the octave with the feven prifmatic colours; viz. C, red; D, orange; E, yellow; F, green, G, Hue; A, indigo, B, purple; and C, red agaia;fo that the glafes of the fame colour (the white excepud) are always octaves to cach other.
" This inflrument is played upon by fitting before the middle of the fet of glafies, as before the keys of a harplichord, turning them with the foot, and wetting them now and then with a fpunge and clean water. The fingers frould be firt a little foaked in water, and quite free from all grealinels; a little fine chalk upon them is fometimes $f$ feful, to make then catch the glafo ard bring out the tone more readily. Both hands are uted, by which means different parts are played to-gethitr.-Obferve, that the tones are befl drawn out when the glafics turn from the ends of the fingens, not when they turn to them.
"The advantages of this inftrument are, that its tones are incomparably fweet beyond thofe of any other; that they may be fwelled and foftened at pleafure by ftronger or weaker preffures of the finger, and continued to any length; and that the inflrument, being once well tumed, never again wants tuniny."

Such was the thate in which this learned and ingenious author found, and fuch the perfection to which he carried, that celetial intrument of which we now tieat. We call it celffithl; becaufe, in comparifon with any other inltrument which we know, the founds that it produces are indeed heavenly. Some of them, however, are itill conflucted in the fame imperfect manIter as the inftrument of Mr Puckeridge. They are contained in an oblong elett; their politions are cither exactly or nearly rectilined? the artilicial femitones by which the fall nutes are divided form another paralLel line; but the ditances between each of them are
